hives; face swelling; itching; rash; This is a spontaneous report from a contactable nurse (patient). A 71-year-old female patient received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EH9899), intramuscular in left arm on 22Dec2020 11:08 at single dose for COVID-19 vaccination. Medical history included ongoing blood pressure high, ongoing cholesterol, ongoing depression. Concomitant medication included atenolol (tablet, strength 50 mg) from an unknown date and ongoing for blood pressure high, simvastatin (tablet, strength 20 mg) from an unknown date and ongoing for cholesterol, paroxetine hydrochloride (PAXIL, tablet, strength 40 mg) from an unknown date and ongoing for depression. The patient experienced hives, face swelling, itching and rash on 27Dec2020. No additional vaccines administered on same date of the Pfizer suspect. Prior vaccination within 4 weeks was none. She got the first Covid 19 dose on 22Dec2020 and was fine, then on 27Dec2020 she had hives, itching, and face swelling for several days. Caller stated her lungs were clear and she was okay other than the extreme itching. The face swelling was what worried her. The hives and itching went away within about 36 hours. The face swelling kind of got worse for a couple of days before it went away. Caller verifies she recovered from the hives/rash/itching within 36 hours. She got a steroid shot and things like that and it went away pretty quickly. The face swelling was completely gone but did last for a good 5 days. She didn't know if this reaction was related to the vaccine. She wanted to call and let Pfizer know and see if there was any reports of anything else like that or similar to that type of reaction. She was not sure if that really matters or not except she was not sure about taking the booster. She was kind of leaning towards taking the second vaccine. She didn't have any breathing issues. She asked as far as the second

dose after those side affects, was it recommended? Her doctor said she could get the second one and prescribed her an Epi pen and would give a dose of Benadryl at the time of the second vaccine. She may take some Benadryl before getting the second vaccine and have her EpiPen with her just in case. She hadn't seen her doctor about this experience with the COVID-19 vaccine. She only went to an urgent care. The caller stated she went to urgent care twice. She received a steroid shot but doesn't have any name, NDC/UPC, Lot number or expiration date for any of the medication she received. She probably threw that paperwork out. She knew she wasn't given anything the second time she went to the urgent care. The second time she went back was because the face swelling was getting worse. She was prescribed an EpiPen and was told to take Zyrtec which did help. Everything had gone away. She would consider these events to be medically significant because of the face swelling, it kind of scared her. She made the comment she was taking high blood pressure medicine and cholesterol medicine, but other than that she was very healthy. She was not really an allergic person. She had not had any testing done since she received the vaccine. She did have bloodwork done prior but not since the vaccine. The patient underwent lab tests and procedures which included blood work prior vaccine with unknown result. The outcome of hives, rash and itching was recovered on an unspecified date of Dec2020 (within about 36 hours); face swelling was recovered on 01Jan2021.; Sender's Comments: Based on the time gap between the vaccine and the events there is not a reasonable possibility that the reported events were related to the suspect product, events are most likely due to patient underlying contributory factors The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators as appropriate.

drop in blood pressure resulting in fainting; drop in blood pressure resulting in fainting; Severe headache; fever; This is a spontaneous report from a contactable other healthcare professional (patient). A 26-year-old female patient (non-pregnant) received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EK9231), via an unspecified route of administration on 03Jan2021 at single dose at left arm for immunization. Medical history included allergies to Penicillins. The patient's concomitant medications within 2 weeks of vaccination included birth control pill, prenatal vitamin. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, patient was diagnosed with COVID-19. Since the vaccination, patient has not been tested for COVID-19. The patient experienced severe headache, fever, and drop in blood pressure resulting in fainting the morning following receiving the vaccine on 04Jan2021 with outcome of recovering. Patient didn't receive treatment for events. Adverse events resulted in doctor or other healthcare professional office/clinic visit. This report is considered non-serious. No follow-up attempts are possible. Information about Batch number cannot be obtained. No further information is expected.; Sender's Comments: Based on the close temporal relationship, the association between the event fainting with BNT162b2 can not be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Test positive for COVID-19/have symptoms on 26, 27 and 28Dec2020; Test positive for COVID-19/have symptoms on 26, 27 and 28Dec2020; This is a spontaneous report from a contactable physician (patient). A 59-year-old male patient started to receive first dose of BNT162B2 (Batch/lot number: EH9899) intramuscular into left deltoid on 15Dec2020 at single dose for covid-19 immunisation. Medical history included hypertension and the patient was on blood pressure (BP) medications. The patient received no other vaccines on the same day as the COVID Vaccine. The patient received first dose on 15Dec2020 and was exposed to someone with COVID on 24Dec2020 and tested positive for COVID 28Dec2020. The patient stated that he was wondering what the recommendations are for receiving the second dose of the product, if someone contracted COVID-19 after receiving the first dose. He tested Positive for COVID-19 on 28Dec2020 and he does not know if it is ongoing or not, as he does not re-test for COVID-19 until Wednesday (30Dec2020), but he currently has no symptoms. The patient stated that he did have symptoms on 26, 27 and 28Dec2020. The lab tests and included COVID-19 PCR test: positive on 28Dec2020. The outcome of events was unknown.; Sender's Comments: The association between the event lack of effect (COVID-19) with BNT162b2 can not be completely excluded.

Patient fainted in the ICU setting.; dizziness; hypotension; This is a spontaneous report from a contactable Other HCP. A 25-year-old male patient received BNT162B2 (Lot number: eh9899) via an unspecified route of administration on 24Dec2020 13:00 at single dose for covid-19 immunisation. The patient did not have any known allergies or medical history. Prior to vaccination, the patient was not diagnosed with COVID-19. There were no concomitant medications. On 24Dec2020, patient experienced dizziness and hypotension. Patient's blood pressure (BP) was 50/30 and heart rate (HR) 45. Patient fainted in the intensive care unit (ICU) setting. This happened during work hours while treating a patient. Patient was treated in the emergency department (ED). The adverse events resulted in emergency room/department or urgent care. It was unknown if treatment was received for the adverse event. Since the vaccination, the patient has not been tested for COVID-19. The outcome of events was recovered.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

temperature of 101 ¦F; body aches; headache; nausea; chills; This is a spontaneous report from a contactable Other HCP (patient). A 26-year-old female patient started to receive BNT162B2 (Batch/lot number: EK9231) at right deltoid via an unspecified route of administration on 03Jan2021 12:20 at single dose for covid-19 immunisation. Medical history was none. The patient's concomitant medications were not reported. The patient experienced temperature of 101 ¦F, chills, body aches, headache and nausea on 04Jan2021 02:00. Patient stated for the second one, she was hoping for the best, but she got the vaccine yesterday (03Jan2021), at 12:20, and today (04Jan2021), at 2 AM, she had a temperature of 101, and chills, body aches, headaches, and nausea. She was out of it today, she was not feeling good, and was told to do this. Caller got the vaccine at Employee Health. After 4 hours of Tylenol (expiry is May2021, lot is P115252), her temperature went right back up. It was about 99 when she had Tylenol.

Chills started late this morning (04Jan2021) and were ongoing when she was not on Tylenol, but her body aches were ongoing. 9AM was when her headache started, and she was intermittently on Tylenol, but if past the 4 hour mark, they were as bad as they were this morning, but with Tylenol they were better. Nausea was mostly this morning, and had gotten better. Patient stated that due to her current symptoms her employer had required her to be tested for COVID-19. She had not yet received the results of that test. Seriousness for events temperature of 101 ¦F, chills, body aches, headache and nausea was Medically significant. Lab data included COVID test on 23Dec2020 was negative. The outcome of temperature of 101 ¦F, headache and nausea was recovering; of body aches was not recovered; of chills was unknown. Primary Source Reporter (Method of assessment was Global Introspection) considered the events were related to BNT162B2.; Sender's Comments: There is a reasonable possibility that the events reported were related to BNT162b2 based on known drug safety profile and close temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

"Itching and redness over whole body/I turned all red and was itching all over my body by about 10:30-10:45 am/I still have mild itching; Itching and redness over whole body/I turned all red and was itching all over my body by about 10:30- 10:45 am/I still have mild itching; Elevated heart rate and blood pressure; Elevated heart rate and blood pressure; Had an allergic reaction; This is a spontaneous report from a contactable nurse (patient). A 43-year-old female patient received the first dose of bnt162b2 (BNT162B2) lot no: EK9231, via an unspecified route of administration in left arm on 30Dec2020 09:00 at a single dose for COVID-19 immunization. Medical history HTN and exercise-induced asthma, both from an unspecified date and unknown if ongoing. The patient was not pregnant at the time of vaccination. The patient had no covid prior to vaccination and was not covid tested post vaccination. Concomitant medication included colecalciferol (VITAMIN D), montelukast sodium (SINGULAIR), and biotin. No other vaccines were administered in four weeks. Known allergies include tapendalol (NUCYNTA) and trimethoprim/sulfamethoxazole (BACTRIM). On 30Dec2020 09:30, the patient experienced itching and redness over whole body, elevated heart rate, and blood pressure. The patient was given IV diphenhydramine (BENADRYL) 50 mg, IV famotidine (PEPCID), IV methylprednisolone (SOLU MEDROL), ""flui"" as treatment for AEs. The patient further clarified that she received the COVID 19 vaccine on 30Dec2020 at 9:00 and she had an allergic reaction. She turned all red and was itching all over her body by about 10:30- 10:45 am and was at the ER by about 11am. She started on prednisone 40mg for 3 days and diphenhydramine every 6 hours, as needed on 30Dec2020. On Sunday (03Jan2021), she was still severely itching and turning red so prednisone was continued for an additional 3 days and was switched to cetirizine (ZYRTEC) because she can't function on diphenhydramine. Cetirizine was not helping so she had to take diphenhydramine yesterday morning (04Jan2021). Last night (04Jan2021), she was ok without any diphenhydramine but this morning (05Jan2021), she still have mild itching, and no redness. The redness comes and goes; it is on the face, chest, arms, legs. When it first started, it was whole body redness. Then it moved to different areas on different days; she don't have a rash or hives, just redness. She had a 4 inch band of redness on both arms one day. The events were reported as non-serious. The

patient had not recovered from the events.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of allergic reactions cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The underlying predisposing condition of drug allergies to multiple materials may put the patient at high risk of allergic reactions. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate"

contracted Sars-Cov-2 in between her two doses; contracted Sars-Cov-2 in between her two doses; This is a spontaneous report from a Contactable Other HCP. A female patient of an unspecified age started to receive the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on unknown date at single dose for covid-19 immunisation. The patient medical history was not reported. The patient's concomitant medications were not reported. Patient was due for her 2nd dose of Pfizer-Biontech Covid19 vaccine on 06Jan2020. She contracted Sars-Cov-2 in between her two doses, want to know if she should receive her second dose as scheduled. Patient had COVID-19 test with unknown result. Outcome of events was unknown. Information about lot/batch number has been requested.; Sender's Comments: The association between the event lack of effect (contracted SARS CoV 2) with BNT162b2 cannot be completely excluded.

tested positive for COVID-19 more than a week after receiving our COVID-19 vaccine; tested positive for COVID-19 more than a week after receiving our COVID-19 vaccine; This is a spontaneous report from a non-contactable consumer. A 45-years-old patient of an unspecified gender started received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiration date not reported), via an unspecified route of administration from an unspecified date at a single dose for Covid-19 immunization. The patient medical history and concomitant medications were not reported. The patient tested positive for COVID-19 more than a week after receiving COVID-19 vaccine. Outcome of the event was unknown. No follow up attempts are possible. Information on lot/batch number cannot be obtained.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

"I was pretty sick, I felt palsy; I was pretty sick, I felt palsy; I developed the fever for all about 30 hours after the vaccination; Headache; This is a spontaneous report from a contactable physician. This physician reported for himself that a 67-years-old male patient received BNT162B2 (BioNTech Covid 19 vaccine; Batch/lot number: EL1284), via an unspecified route of administration on 30Dec2020 at SINGLE DOSE for ""Because I am a physician, a healthcare provider"" (covid-19 immunization). Medical history included had Covid back on the 4th of December. There were no concomitant medications. Physician stated he was wondering he just took your Pfizer Covid vaccination, the first one. He took it couple of

days ago. He took it on the 30th of this month, two days ago. Physician further stated he developed the fever for all about 30 hours after the vaccination. Just because he developed the fever with the first one, it was like a 101.7 that was about 36 hours. So the question was just because he developed the fever with the first one, he was pretty sick, he meant he felt palsy, you know headache and all that it was like probably developed the same with the second one? Patient weight was maybe 125 pounds. When probed if vaccine was prescribed by any Physician, Physician stated he went himself. Causality by physician stated as ""he think so"". Lab work reported as He did not have the results yet. He just look a Covid screening test because he had Covid back on the 04Dec. So, he just took a Covid screening test. Treatment received included aspirin. The outcome of all events was unknown.; Sender's Comments: The causal relationship between BNT162B2 and the event palsy cannot be excluded as the information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate."

had the COVID-19 vaccine on 28Dec2020 and was tested positive today (04Jan2021) for COVID-19; had the COVID-19 vaccine on 28Dec2020 and was tested positive today (04Jan2021) for COVID-19; This is a spontaneous report from a contactable other hcp via the Pfizer-sponsored program. A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 28Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient had the COVID-19 vaccine on 28Dec2020 and was tested positive today (04Jan2021) for COVID-19. Outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The reported positive with Covid 19 test after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

blurriness on the right eye with consistent optic neuritis; read up on transverse myelitis that may be related to her condition; blurriness on the right eye with consistent optic neuritis; This is a spontaneous report from a contactable physician. This physician (patient) reported for self that the 31-year-old female patient received bnt162b2 (BNT162B2, PFIZER-BIONTECH COVID-19 VACCINE, lot: EK5730), via an unspecified route of administration on Deltoid, Left on 20Dec2020 13:00 at single dose for covid-19 immunisation. Medical history and concomitant medications were none. Reported she has a flu vaccine in Sep2020, and had no reaction to the flu vaccine. She clarified she has never had a reaction to a vaccination before. The patient received the vaccine last 20Dec2020 and has reported to have blurriness on the right eye with consistent optic neuritis since 24Dec2020. She has already consulted with an ophthalmologist who said her case was interesting and referred her to Pfizer. She is scheduled to have her second dose on 10Jan2021 and is asking if she should still take it. She also mentioned that she read up on transverse myelitis that may be related to her condition and is asking for any information we may have on this. Doctor reporting she is having a possible adverse event to the COVID-19 Vaccine. The

patient clarified she received the COVID-19 Vaccine on Sunday, 20Dec2020 at approximately 1:00PM. Reported the COVID-19 Vaccine was administered at her employer. Doctor reported she is experiencing blurry vision in her right eye only, consistent with optic neuritis in Dec2020 (Medically significant). She said her right eye blurry vision gets worse after working out or showering. She said she has read some medical information that states some kind of autoimmune reaction, like transfer myelitis, may occur after receiving the COVID-19 Vaccine. The patient asked if she should get the second COVID-19 Vaccine, clarifying she is scheduled to receive her second dose on 10Jan2021. Clarified she started experiencing the right eye blurry vision on either 24Dec2020 or 25Dec2020. Treatment: Reported she saw an ophthalmologist, and the ophthalmologist said he didn't see anything concerning or not normal. She said the ophthalmologist referred her to see a neurologist, and to get a MRI of her head. She clarified her MRI appointment is on 19Jan2021. She clarified her ophthalmologist called her back 2 hours after she left her appointment. She said the ophthalmologist told her he found what she was experiencing to be interesting, as to when she received the COVID-19 Vaccine, and the start of her right eye blurry vision, and that he wanted her to get further evaluation. She said the ophthalmologist performed visual field testing, and took a fancy picture of her retina. No further details provided. Vaccination Facility Type was hospital. No Vaccine Administered at Military Facility. History of all previous immunization with the Pfizer vaccine considered as suspect (or patient age at first and subsequent immunizations if dates of birth or immunizations are not available) was none. Additional Vaccines Administered on Same Date of the Pfizer Suspect was none. No AE(s) required a visit to Emergency Room but AE(s) required a visit to Physician Office. Prior Vaccinations (within 4 weeks) was none. Patient's Medical History(including any illness at time of vaccination) was none. Family Medical History Relevant to AE(s) was not provided. Relevant Tests included Visual field test, and picture of her retina. The outcome of the events was not recovered.; Sender's Comments: Based on temporal association, the causal relationship between bnt162b2 and the events optic neuritis, vision blurred and myelitis transverse cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

tested positive for Covid-19; tested positive for Covid-19; This is a spontaneous report from a contactable healthcare professional (reporting for herself). A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date not reported) via an unspecified route of administration, on 24Dec2020, single dose for COVID-19 immunization. Relevant medical history and concomitant medications were not reported. The patient tested negative for Covid-19 on 22Dec2020, received her first vaccine dose on 24Dec2020 and then tested positive for Covid-19 on 26Dec2020. Outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The efficacy of a drug varies from patient to patient and can be affected by different factors; however, a contributory role of the suspect product bnt162b2 to the reported drug ineffective and SARS-CoV-2 test positive cannot be ruled out.

Cp initially that resolved in seconds. Then severe muscle aches, fatigue, temp 1 week,excruciating joint pain continues now. Malaise.

full body rash; heart palpitations; reaction to drug excipient; This is a spontaneous report from a contactable nurse, the patient. A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: UNKNOWN), via an unspecified route of administration on 26Dec2020 as a single dose for COVID-19 immunization. Medical history included several outdoor allergies, but no known food allergies. The patient's concomitant medications were not reported. On 28Dec2020, the patient experienced full body rash and heart palpitations. The clinical course was as follows: the patient developed a full body rash and heart palpitations on 28Dec2020 and went to the emergency room. The patient had a full work-up which included electrocardiogram, troponin levels, and electrolytes, and all were normal. She was instructed to take diphenhydramine hydrochloride (BENADRYL). She thought it may have been due to the polyethylene glycol; however, she did mention that she previously took macrogol 3350 (MIRALAX) on unknown dates for an unknown indication and was fine. The clinical outcomes of the full body rash, heart palpitations, and reaction to polyethylene glycol, were unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported full body rash and the administration of the suspect, BNT162B2, based on the reasonable temporal association. While the possibility of allergic to polyethylene glycol (drug excipient) might have provided alternative explanations. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

neuropathy; This is a spontaneous report from a contactable Nurse. A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. Reporter called about Covid vaccine and has a question connected to the AE he has reported. Wants to know if neuropathy is a side effect of the vaccine. Event outcome was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Very limited information was provided in this case, pending further details such as medical history, clinical course, specified event description, at this moment, the mentioned neuropathy is considered related to BNT162B2 for reporting purpose. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

Development of microemboli on distal, fourth right phalange on the ventral surface. Just past the DIP. Small blue hue below skin surface with mild tenderness on deep palpation.; This is a spontaneous report from a non-contactable Physician (patient). This adult female patient (not pregnant at the time of vaccination) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number:

EH9899), intramuscular on 23Dec2020 09:30 at single dose on right arm for COVID-19 immunisation. Medical history included migraine with aura. Concomitant medication included propranolol, loratadine (CLARITINE) and multivitamin. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient previously took cefprozil (CEFZIL) and experienced allergies. The patient experienced development of microemboli on distal, fourth right phalange on the ventral surface. Just past the DIP. Small blue hue below skin surface with mild tenderness on deep palpation on 24Dec2020 12:00. The event was considered as non-serious. Treatment for the events was unknown. The outcome of the event was unknown. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient had not been tested for COVID-19. No follow up attempts are possible. No further information is expected.; Sender's Comments: Based on the close temporal relationship, the association between the event microemboli on distal phalange with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Went to ER left side of face sagging. They did MRI it showed he had stroke. happened before 4pm that same day as vaccine. Happened between 2-4 pm; Went to ER left side of face sagging. They did MRI it showed he had stroke. happened before 4pm that same day as vaccine. Happened between 2-4 pm; This is a spontaneous report from a contactable consumer (patient). A 78-year-old male patient receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number: EK5730), on 31Dec2020 11:00 AM via unknown route of administration at single dose for COVID-19 immunization. Medical history included high blood pressure, but went up and down and had to readjust. His BP was high and not sure how long it was that way. Concomitant medications included unspecified blood pressure medications. There were no known allergies. Patient went to ER left side of face sagging. They did MRI it showed he had stroke. It Happened before 4pm that same day as vaccine on 31Dec2020 02:00 PM. And it Happened between 2-4 pm. Patient received treatment. Patient had ER test blood, cat scan, MRI. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient did not have been tested for COVID-19. The outcome of the events was recovering. This case was assessed non-serious by reporter. And the events did not result in death, Life threatening, Caused/prolonged hospitalization, Disabling/Incapacitating, Congenital anomaly/birth defect.

occipital neuralgia; left-side Bells Palsy; bilateral headache; This is a spontaneous report from a contactable physician (patient). A 65-year-old male patient received BNT162b2 (Lot/batch number and Expiration date were not provided), via an unspecified route of administration at right deltoid on 21Dec2020 19:00 at single dose for covid-19 immunization. The patient's medical history included low high density lipoprotein (HDL). There were no concomitant medications. The patient previously took influenza vaccine (longer than 4 weeks ago, and he did not have any reaction), pravastatin for low HDL. Reported 2 days ago (02Jan2021) he developed a bilateral headache. He stated he was asymptomatic until then. He said he now has Bells Palsy on 02Jan2021, clarified he has left-side Bells Palsy. He said it is

unknown to him if the bilateral headache and Bells Palsy are related to taking the COVID-19 Vaccine. He stated he started wearing a N95 mask for the past 2 weeks. He said the N95 mask is very tight on the back of his head. He said he believes he is experiencing occipital neuralgia caused by wearing the N95 mask. He said studies show that the N95 mask can cause Bells Palsy, and the N95 mask maybe a confounding factor. He stated he doesn't have any further information on the N95 mask he was using. Initially he had a severe headache and administered to himself a sphenopalatine block of Lidocaine 1% in his nose. He stated being an ER doctor, he knows how to administer the sphenopalatine block to a patient. He went to the ER on 03Jan2021 to make sure he did not have a tumor or a stroke. He said the hospital performed a CT of his head, a MRA, labs, and a COVID-19 test (clarified as a PCR COVID-19 test) with a full viral count. He said all the tests were negative. His wife noticed his Bells Palsy yesterday, 03Jan2021. He said he thinks the Bells Palsy started the night before on 02Jan2021. He said he noticed on the night of 02Jan2021 when he was brushing his teeth, he hit a tooth on that side (clarified as left side) of his mouth with his tooth brush. He hasn't started taking steroids yet, but will be starting steroids real soon. He clarified his doctor prescribed a Medrol dose pack and Valtrex for the Bells Palsy. He stated he has not started the Medrol dose pack and Valtrex. He is ordering Lidocaine 1% viscous for himself, so he can do an internasal sphenopalatine block on himself. He does not know if the bilateral headache and Bells Palsy were caused by taking the COVID-19 Vaccine. The events required Emergency Room visit. The outcome of the event Bell's palsy was not recovered, Headache was recovering, Occipital neuralgia was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: A possible causal association between administration of BNT162b2 and the onset of Bell's palsy/Headache might not be excluded, considering the plausible temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Headache; Fever: She said that she started with kind of chills and shakes; Fever: She said that she started with kind of chills and shakes; she was not feeling too good; real high heart rate that were in the 110's that last for lasted for hours; Fever; This is a spontaneous report from a contactable nurse reported for herself. A 59-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot number: EK9231 and expiration date unknown), via intramuscular on left deltoid on 03Jan2021 09:13 at single dose for COVID-19 prophylaxis. The patient medical history and concomitant medications reported as none. The reporter is a registered nurse that reported that she had the first Covid-19 vaccine yesterday morning on 03Jan2021 and she had side effects. She reported that she had a fever, headache, and a real high heart rate that was in the 110's that last for lasted for hours. She said that she started with kind of chills and shakes 11 hours and 40 minutes after receiving the vaccine. One minute she was fine and the next minute she was feeling chilled. By the time she got home from her mother's house, which is a hours drive, she was not feeling too good. Her fever broke today 04Jan2021 at around 04:00 and when she checked her temperature it was 98.7 degrees. She said that 100.2 degrees was the highest temperature she recorded. The patient said that it was a mild fever. Her headache started about 22:00 03Jan2021. The patient said that she still has the headache a little bit and she has been treating it with Tylenol and it has gotten better. She said that she wears a fit bit that tracks

her heart rate and she can hear her heartbeat in her ears and she could hear it going fast. Caller said that her heart rate was down to 98 beats per minute at 06:30 this morning. She said that her current heart rate was Body temperature. Caller said that her high heart rate had her very concerned. She said that it is not normal. She is supposed to go back on 30Jan2021 to get her 2nd injection. Should she still plan on getting the second part of the vaccine? The reporter assessed event real high heart rate that were in the 110's that last for lasted for hours as serious with medically significant. Other events were assessed as non serious. The outcome of the events fever and real high heart rate that were in the 110's that last for lasted for hours was recovered on 04Jan2020, outcome of the event headache was recovering, outcome of the other events was unknown.; Sender's Comments: Based on the close temporal relationship, the association between the event high heart rate with BNT162b2 can not be completely excluded.

I was having trouble clearing my throat, felt like it was closing up; high heart rate/rapid heart rate agai; uncontrollable rigors; numb lips and hands; numb lips and hands; nausea; shortness of breath, difficulty catching my breath; This is a spontaneous report from a contactable Other Health Professional (patient). A 38-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) lot number: EJ1685, intramuscular in the left arm, on 30Dec2020 09:15 at a single dose for COVID-19 immunization. Medical history included bariatric surgery, had anterior vaginal repair and bladder sling, had her gall bladder and tonsils removed. Concomitant medication included rizatriptan and paracetamol (TYLENOL). The patient had no known allergies but mentioned that she cannot take the NSAIDs eventhough she was not allergic to them. She had no allergies to food or to other products. It was reported that within about 10 minutes of the injection of the vaccine, she had trouble clearing her throat, felt like it was closing up, had uncontrollable rigors, high heart rate, numb lips and hands, and nausea on 30Dec2020 at 09:30 AM. She was discharged from the ED (emergency department), went home and took a nap. Later that evening, she began to have a rapid heart rate again, began to had shortness of breath, difficulty catching her breath and she was admitted to the emergency department again and given more IV medications. The onset of the events was reported to be 30Dec2020 at 09:30 AM with outcome of recovering. As a result of the events, the patient visited that Emergency room/department or urgent care. Treatment received with IV medications (unspecified), breathing treatment, and epinephrine injection. The patient had no covid prior vaccination. She had not had Covid test post vaccination.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events throat tightness, heart rate increased, chills, hypoaesthesia oral, hypoaesthesia, nausea and dyspnoea cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

fibromyalgia and neuropathy on the lower cervical/pain has exacerbated; fibromyalgia and neuropathy on the lower cervical/pain has exacerbated; headache; channeled body pain; fever at 100.7F; This is a

spontaneous report from a contactable consumer (patient). A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on an unspecified date (reported as 31Jan2020) as a single dose for COVID-19 immunization. Medical history included fibromyalgia and neuropathy on the lower cervical. The patient's concomitant medications were not reported. The patient experienced fibromyalgia and neuropathy on the lower cervical/pain has exacerbated, headache, channeled body pain, and fever at 100.7 F on an unspecified date. It was reported that headache, channeled body pain, and fever at 100.7 F occurred 1 hour after vaccination. The patient underwent lab tests and procedure, which included: body temperature: 100.7 Fahrenheit on an unspecified date. The patient has been taking unspecified medications for the condition, in addition to acetaminophen (TYLENOL FOR ARTHRITIS). Therapeutic measures were taken as a result of all of the events as aforementioned. The clinical outcome of fibromyalgia and neuropathy on the lower cervical/pain has exacerbated, headache, channeled body pain, and fever at 100.7 F was unknown.

Fainting; This is a spontaneous report from a non-contactable consumer (patient). This consumer reported similar events for 02 patient. This is the 1st of 2 reports. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 23Dec2020 at single dose for COVID-19 immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient experienced fainting on 31Dec2020. The patient went to the emergency department in regards to fainting and was told the fainting couldn't be related to the COVID-19 Vaccine. Then she heard about someone else fainting. Outcome of the event was unknown. No follow-up attempts are possible, information about lot/batch cannot be obtained. No further information is expected; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021006463 same reporter/drug/event, different patient

difficulty breathing/swallowing; difficulty breathing/swallowing; Hives/hives all over including in her mouth; This is a spontaneous report from a contactable consumer (spouse). A 46-year-old female patient (wife) received BNT162B2 (Pfizer-Biontech Covid-19 Vaccine, lot number: EH9899) via unspecified route of administration at arm right on 29Dec2020 at single dose for Covid-19 vaccine. Medical history included ongoing anxiety diagnosed 22 years ago. Concomitant medications were not none. Patient received the vaccine and was one big hive (01Jan2021). She went to the ER on sat and will have to go back. Caller is asking where she should go. patient went through the VAERS report 3 times. She did not have any sides effects. patient is a frontline worker. On 29Dec2020 she got the Covid vaccine. On Sat 02Jan2021 she went the ER with hives all over including in her mouth, stated she had difficulty breathing/swallowing, was given medication to take home and discharged. She was readmitted yesterday 05Jan2020 with worsening symptoms and needed to be given a prednisone nebulizer. they had two ER visits. No Investigation Assessment. patient was not recovered from the event hives/hives all over including in her mouth, the final outcome of other events was unknown.

"What I believe may have triggered this reaction is that in October I had a carpal and ulnar tunnel release in the same extremity/affected the nerves; my entire upper arm began aching-pain from my trapezius down to my elbow; my index and middle finger began tingling; I am noting pain in each of the major joints of my arm-shoulder, elbow and wrist; I am noting pain in each of the major joints of my

arm-shoulder, elbow and wrist.; I am noting pain in each of the major joints of my arm-shoulder, elbow and wrist.; This is a spontaneous report from a contactable nurse (patient). A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration on the arm on 19Dec2020 as single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced the following: "" my entire upper arm began aching-pain from my trapezius down to my elbow "" in Dec2020 with outcome of unknown; ""my index and middle finger began tingling "" in Dec2020 with outcome of unknown; "" I am noting pain in each of the major joints of my arm-shoulder, elbow and wrist "" in Dec2020 with outcome of unknown; "" what I believe may have triggered this reaction is that in October I had a carpal and ulnar tunnel release in the same extremity "" in Dec2020 with outcome of unknown. Therapeutic measures were taken as a result of the events. Details were as follows: The injection itself was without any issues. However, 6-7 hours later, the patient described the following: patients entire upper arm began aching-pain from trapezius down to the elbow. This continued throughout the weekend and then Monday, patients index and middle finger began tingling (as if asleep). This symptom never subsided. The patient noted pain in each of the major joints of the arm shoulder, elbow and wrist. The patient tried trigger injections in the trapezius, ibuprofen, muscle relaxers, heat, exercises, and a steroid burst-all without relief of symptoms. Patient was able to move arm and had strength in the extremity. Patient saw a specialist in physical medicine and rehabilitation. The patient believed that what triggered this reaction is that in October the patient had a carpal and ulnar tunnel release in the same extremity. The patient wondered whether the medication affected the nerves that had been manipulated during surgery. The events outcome was unknown. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up .; Sender's Comments: Based on the time association, the possible contribution of suspect BNT 162B2 injection to the event Neuropathy peripheral cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

"Rash; Itching at different spot at different time; Hives; This is a spontaneous report from a contactable consumer. A 58-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL3246), via an unspecified route of administration on 02Jan2021 at single dose as reported for ""Indication: Consumer stated, ""Because I work in Covid testing, in healthcare."" Medical history included hypertension and allergy. Concomitant medication included amlodipine, lisinopril, metoprolol, hydrochlorothiazide (HYDROCHLORZIDE), desloratadine and montelukast. The patient stated, ""had the first dose of the Pfizer vaccine yesterday for the Covid 19, 2 hours after I started itching and it has been different places all over my body. I do not know has it anything to do with the way that it goes through the body, I do not know. I have had to take a lots of Benadryl. I have had to take some steroids that I had here at the house I never had started and I thought it was okay. Last night my husband put hydrocortisone cream (later clarified as treatment) on areas I was itching and had hives. I slept all night I did not have any problem since I got up this morning I started itching in other place. So, I have done the whole thing again. I am going to has to go. I did not want to go ER because I am not

having trouble on breathing or anything like that but I have got various places it is like different places every time it starts. So, I need to I am going to go and have a probably a strong steroid shot and have strong steroid given to me, not for oral but I just want to let you know if that is a side effect and I do not know whether I am going to take the second one or not?"" I have taken Benadryl and I have taken Methylprednisolone and I have used on the Cortisone Cream, the topical cream"". The outcome of the events was unknown.; Sender's Comments: A causal association between BNT162B2 and the events rash, pruritus and urticaria cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate."

"Coughing so hard; coughed during COVID but not like this; Hard to stand up; Pain/body wrecking pains; Fever; Started heaving; Dizzy; Nauseous; Throwing up; Chills; Draining; This is a spontaneous report from a contactable consumer. An adult female patient (consumer's daughter) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. Medical history included covid-19 from Nov2020. The patient had COVID in the middle of Nov2020 and her father and reporter had it two weeks before and then about two weeks later, she got it. She took her 14 days quarantine, she coughed and had some tummy issues. She had fever, the aches and pains with Covid, a little bit of dry cough. She did not feel good for probably about 5 days, after that she started working again. She had COVID and did not have to be hospitalized, any IV drip or anything before vaccination. 6 weeks later, she got the vaccine shot. The patient's concomitant medications were not reported. The vaccine came out on Wednesday (30Dec2020), the patient signed up at work to take it. Within about 12 hours (unknown onset date), she did start to feel 'oily', and had started having aches, pains and very shortly after that she started running a fever, all of a sudden the cough came out of the blue, she started heaving, dizzy, nauseous and it's three days later, she was coughing so hard. She coughed during COVID but not like this, this was like COVID ten times over, same symptoms though, throwing up, throwing up, hard to stand up, aches, pains, fever, chills, body wrecking pains. The patient can hardly talk because she kept coughing and draining. The reporter asked that ""Should her daughter be given vaccine? Does her antibodies, daughter was asked - Did you have any severe case, and she told - No, I was able to stay home and just stay in bed, they said - Okay we'll give it to you. Should she have gotten so close to the signs that she had COVID? Why her daughter be asked that question? What is going on regarding the symptoms. What should we do about it?"" Consumer tried to get daughter to go to a COVID Clinic today (02Jan2021), and know she didn't have COVID, that's not how it worked, but normal doctors didn't want to see her daughter. Consumer called the COVID Clinic and they said ""Yes, we could probably see her"". The outcome of events was unknown. Information about lot/batch number has been requested; Sender's Comments: A causal association between BNT162B2 and the reported events cough and difficulty standing cannot be excluded based on temporal relation of vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety

concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate."

3:07 pm lung sounds diminished oxygen sats 68%, oxygen applied Oxygen sats remained low for next 36 hours (patient on Hospice care) expired 6:22 am 1-8-21

1/6/21 Pt received vaccine and complained of difficulty swallowing and rapid heart rate. Pt received methylprednisolone 125mg IVP, diphenhydramine 25mg IVP, & famotidine 20mg IVP. Pt reported improvement and was discharged. Sent home on diphenhydramine and oral prednisone. 1/7/21 Pt unable to swallow her own secretions and experienced eyelid swelling. Pt vomitted. Pt received epinephrine and Benadryl X 1 dose each. Pt then transported to hospital via ambulance. Reason for admission - acute respiratory failure secondary to anaphylactic reaction. Decision was made to emergently intubate the patient for airway protection despite aggressive intervention. Pt successfully extubated 1/8/21. Plan to discharge home and start Medrol Dose Pack 1/9/21.

Sudden onset of tinnitus followed by complete hearing loss in Right ear upon awaking from sleep (7 hours)

Swelling of lips & tongue, tightening of throat. Quivering of arms & legs. Tightening of chest. Dizzyness lightheaded.

tested positive for COVID-19; tested positive for COVID-19; Headache; feeling unwell; muscle pain; This is a spontaneous report from a contactable nurse reporting on himself. A 61-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) (lot number/expiration date: not provided), via an unspecified route of administration, on 28Dec2020 at 08:15 AM (at the age of 61 years old) as a single dose in the left arm for COVID-19 vaccination. Relevant medical history and concomitant medication were not provided. The patient did not have any known allergies to medications, food, or other products. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 01Jan2021, the patient experienced mild side effects consisting of headache with feeling unwell and muscle pain. The patient reported this happened on 01Jan2021, and 02Jan2021 and on 03Jan2021 and later, the patient did not experience any side effect. Since the vaccination, the patient was tested for COVID-19 on 02Jan2021 with a Nasal Swab Rapid Test and tested positive for COVID-19. The adverse events resulted in Emergency room/department or urgent care visit. The patient did not receive any treatment for these events. The outcome of the events headache with feeling unwell and muscle pain and tested positive for COVID-19 was recovering. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

felt the need to have a COVID test, which turned out positive; felt the need to have a COVID test, which turned out positive; felt the need to have a COVID test, which turned out positive; Chills; Fever; This is a spontaneous report from a contactable Other HCP. A 55-year-old female patient received frist dose of BNT162B2 (Batch/lot number: EK5730) via an unspecified route of administration on 21Dec2020 at single dose for covid-19 immunisation. The patient medical history was not reported. There were no concomitant medications. The patient explained receiving the COVID-19 vaccine on the 21Dec2020 and experienced fever and some chills. She pursed explaining that she was fine afterwards but felt the need to have a COVID test, which turned out positive of the 31Dec2020. The patient stated that she only had chills and fever the evening of 29Dec2020 and had been fine every since. Her fever that night did not hit 100 degrees. She thought that it would be better if she did not go to work on that Wednesday since she had had a fever the night before. She called her doctor who told her to come into the office on 31Dec2020 to have a rapid COVID test done and it came back positive. She only had fever and chills that one night and has not had any other symptoms. She received no treatment and did not take anything for the fever. This all happened during the night. She felt fine when she got up the next morning. Because she had received the first dose of the COVID vaccine, she thinks that this helped her. She thinks if she had not had the vaccine, then the virus would have been a lot worse. She stated that her second dose of the vaccine is scheduled on the 11Jan2021, and asked if it is safe to get the second dose of the COVID-19 vaccine. The outcome of events chills and fever was recovered; of other events was unknown.; Sender's Comments: The association between lack of effect (suspected COVID-19, SARS CoV2 test positive) with BNT162b2 can not be completely excluded.

Caller tested positive for COVID after the first dose; Caller tested positive for COVID after the first dose; This is a spontaneous report from an other Health Care Professional (HCP). A male patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE lot number and expiration date unknown) via an unspecified route of administration on an unspecified date (at an unknown age) at an unspecified dose for COVID-19 vaccination. The patient's medical history was not reported. The patient's concomitant medications were not reported. The patient tested positive for COVID after the first dose. The patient underwent lab tests and procedures which included sars-cov-2 test: positive on an unspecified date. The clinical outcome was unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available.

got the 1st dose of the vaccine then tested positive after; got the 1st dose of the vaccine then tested positive after; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient got the 1st dose of the vaccine then tested positive after. She was asking if she can get the 2nd dose even if she is tested positive. She asked if it can cause to have a false positive result if she received the vaccine.

Outcome of the event was unknown. Information about lot/batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available.

his regular COVID test came back positive; his regular COVID test came back positive; This is a spontaneous report from a contactable nurse (reporting for himself) from a Pfizer-sponsored program. A 48-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date not reported) via an unspecified route of administration, on 23Dec2020, single dose for COVID-19 immunization. Relevant medical history and concomitant medications were not reported. On 23Dec2020, the patient received the COVID vaccine. On 28Dec2020, he had a negative rapid COVID test, and then on 01Jan2021 his regular COVID test came back positive. The patient would like to see if he should still get the second dose of the vaccine. Outcome of the events was unknown. Information on the Batch/Lot number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported event SARS-CoV-2 test positive based on the known safety profile. However given the short duration of 9 days since the vaccine first dose, it is unlikely patient would have fully developed immunity.

"tested positive for covid ""yesterday""/asymptomatic; tested positive for covid ""yesterday""/asymptomatic; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 21Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the first dose of the vaccine on 21Dec2020 and was scheduled for the second on 11Jan2021. The patient tested positive for COVID yesterday, 03Jan2021 and wanted to know what to do about her second dose. The patient added that she was asymptomatic at this point and not taking any medications. Outcome of the events was unknown. The events was assessed as non-serious. Information on the lot/batch number has been requested.; Sender's Comments: The reported positive test with Covid-19 after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration."

severe anaphylaxis; This is a spontaneous report from a non-contactable consumer. This consumer reported similar events for 6 patients. This is the first of 6 reports. A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an unspecified route of administration from an unspecified date at a single dose for vaccination. The patient's medical history and concomitant medications were not reported. The patient experienced severe anaphylaxis, on an unspecified date. Outcome of the event was unknown. "diagnosed with COVID-19; diagnosed with COVID-19; This is a spontaneous report from a contactable nurse. A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date were not reported), via an unspecified route of administration on 19Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient stated, ""I received the first dose of the COVID-19 vaccine last 19Dec2020 and unfortunately was exposed to COVID-19 in the evening. I was diagnosed with COVID-19 on 22Dec2020 or 23Dec2020. Should I have my second dose as scheduled tomorrow considering that I have the COVID-19?"". The outcome of the event was unknown. Information on lot number has been requested.; Sender's Comments: The efficacy of a drug varies from patient to patient and can be affected by different factors; however, a contributory role of the suspect product bnt162b2 to the reported drug ineffective and COVID-19 cannot be ruled out."

"Received the first COVID vaccine and then tested positive for COVID; Received the first COVID vaccine and then tested positive for COVID; This is a spontaneous report from Pfizer sponsored program Pfizer First Connect. A contactable nurse (patient) reported that a 22-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an unspecified route of administration on 15Dec2020 at single dose for COVID-19 immunization. There were no medical history and concomitant medications. The patient received the first COVID vaccine on 15Dec2020 and then tested positive for COVID on the 25Dec2020. He was not sure on the time frame, but he wanted to call in for an adverse event, just in case (incomplete sentence) and then he was scheduled to get the second dose within the next week or so. He forgot what date it was but, he wants

to see if it was safe for him to get the second dose. The patient stated that he has a lot of lab work like blood cultures, basic metabolic panel, lactic acid, CBC; results were unknown. The outcome of the event was unknown. Information on the lot number/batch number has been requested.; Reporter's Comments: :; Sender's Comments: Based on available information, a possible contributory role of BNT162B2 vaccine cannot be completely excluded for reported ""tested positive for COVID""."

Tested positive for covid a week later after his first shot; Tested positive for covid a week later after his first shot; This is a spontaneous report from a contactable consumer. A 68-year-old male patient received the first dose of BNT162B2 (Pfizer-BIONTECH Covid-19 Vaccine), via an unspecified route of administration in the left arm on 28Dec2020 at 12:00 PM in a hospital at a single dose as a COVID vaccine. The patient's medical history and concomitant medications were not reported. The patient had no known allergies but had other medical history (unspecified). The patient did not receive any other vaccine within four weeks prior to the COVID vaccine, had other medications in two weeks (unspecified), and was not diagnosed with COVID-19 prior to the vaccination. The patient tested positive for COVID a week later after his first shot. The test used was via nasal swab on 04Jan2021. The patient did not receive any treatment for the events. Outcome of the events was reported as recovering. The case was reported as non-serious (did not result in death, was not life-threatening, did not cause/prolong hospitalization, was not disabling/incapacitating, and did not result to any congenital anomaly/birth defect). Information on the lot/batch number has been requested.

Patient received Positive Covid 19 test result on 02Jan2021; Patient received Positive Covid 19 test result on 02Jan2021; This is a spontaneous report from contactable consumers. An adult male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: IL0140), via an unspecified route of administration on 28Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received positive COVID 19 test result on 02Jan2021. The patient had unknown test with positive result on 31Dec2020. The case was identified as non-serious by reporter. Facility where the most recent COVID-19 vaccine was administered was in hospital. It was unknown that the patient received any other vaccines within 4 weeks prior to the COVID vaccine. It was unknown that the treatment received for the adverse event. Prior to vaccination, patient was not diagnosed with COVID-19. Since the vaccination, the patient had been tested for COVID-19. The outcome of event was recovering.

"developed active Covid within 24 hours of receiving vaccine; developed active Covid within 24 hours of receiving vaccine; This is a spontaneous report from a contactable physician received via a Pfizer sales Representative. A female patient (physician) of an unspecified age received first dose of BNT162B2 via an unspecified route of administration on an unspecified date at a single dose as vaccine. Medical history included exposed to COVID-19 a few days prior to receiving the COVID-19 vaccine (works within a hospital and had been exposed to COVID-19 active infected patients). Concomitant medications were not reported. A physician reported that a female physician developed active Covid within 24 hours of receiving vaccine (also reported as received the vaccine and within 24 hours developed active symptoms of Covid) on an unspecified date. Requested information on whether to receive the second vaccine at this point. Unsure of the need or complications that could potentially rise from receiving a second vaccine in the series. The events took place after use of product. The outcome of the events was

unknown. Information about Lot/Batch number has been requested.; Sender's Comments: There is not a reasonable possibility that reported ""active Covid"" is related to BNT162B2 vaccine. Event occurred within 24 hours of receiving vaccination, when the vaccine is not expected to achieve the effect. The event is most likely intercurrent medical condition."

"developed Covid infection after being vaccinated with COVID-19 vaccine; developed Covid infection after being vaccinated with COVID-19 vaccine; This is a spontaneous report from a contactable physician (patient) received via a Pfizer sales representative. A female patient of an unspecified age received BNT162B2 via an unspecified route of administration on an unspecified date at a single dose as COVID-19 vaccine. Medical history included exposed several days prior to patients with Covid (exposed prior to receiving the vaccine to individuals who had an active Covid infection). Concomitant medications were not reported. It was reported that on an unspecified date, the female physician developed Covid infection after being vaccinated with COVID-19 vaccine (also reported as she received the COVID-19 vaccine and developed active Covid a few days later). The events took place after use of product. The outcome of the events was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: There is not a reasonable possibility that reported ""Covid infection"" is related to BNT162B2 per current available information. The patient exposed to individuals who had an active Covid infection prior to receive the vaccine."

received a covid positive diagnosis; received a covid positive diagnosis; This is a spontaneous report from a contactable nurse (patient). A 35-year-old non-pregnant female patient received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular in the left arm on 21Dec2020 09:45 at a single dose for COVID-19 immunization at the hospital. The patient has no medical history. The patient has no known allergies. The patient's concomitant medications were not reported. The patient did not received any other vaccines within 4 weeks prior to the COVID vaccine and did not received other medications within 2 weeks of vaccination. The patient received a COVID positive diagnosis on 29Dec2020, 8 days later. The events led to a doctor or other healthcare professional office/clinic visit. The patient underwent COVID tests post vaccination on 29Dec2020 - Nasal Swab (NAA nasal swab) and Rapid COVID test, both showed positive test results. The patient was not diagnosed with COVID-19 prior to vaccination. Outcome of the events was recovering. No treatment was given for the events. The events were assessed as non-serious. Information on the lot/batch number has been requested.; Sender's Comments: The efficacy of a drug varies from patient to patient and can be affected by different factors; however, a contributory role of the suspect product BNT162B2 to the reported drug ineffective and COVID-19 cannot be ruled out.

tested positive after taking the first dose of the vaccine; exposed to a family member with the virus/tested positive after taking the first dose of the vaccine; tested positive after taking the first dose of the vaccine; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A contactable nurse reported for a 60-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 28Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient who tested and was positive for the virus after being exposed to a family member with the virus after taking the first dose of the vaccine. Patient was asymptomatic. The Nurse asking if

we have any recommendations for the 2nd dose. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The association between the events lack of effect (suspected COVID-19, tested and was positive) with BNT162b2 can not be completely excluded.

contracted covid after getting the vaccine; contracted covid after getting the vaccine; This is a spontaneous report from a Pfizer-sponsored program. A contactable physician reported similar events for 4 patients. This is 1st of 4 reports. A 46-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: Unknown, does not have lot number to provide) via an unspecified route of administration on 24Dec2020 at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. The patient contracted COVID after getting the vaccine on 01Jan2021. The outcome of the events was unknown. Information on the Lot/Batch number has been requested; Sender's Comments: The association between the event lack of effect (contracted COVID) with BNT162b2 can not be completely excluded.,Linked Report(s) : US-PFIZER INC-2021003894 same reporter/drug/event, different patient;US-PFIZER INC-2021003893 same reporter/drug/event, different patient;US-PFIZER INC-2021003895 same reporter/drug/event, different patient

Contracted covid after getting the vaccine; Contracted covid after getting the vaccine; This is a spontaneous report from a Pfizer Sponsored Program. A contactable physician reported similar events for 4 patients. This is 2nd of 4 reports. A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiration date not provided), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced contracted covid after getting the vaccine on an unspecified date. The report was non-serious per the reporter. The outcome of the events was unknown. Information on Lot/Batch number has been requested.; Sender's Comments: The association between the event lack of effect (contracted COVID) with BNT162b2 can not be completely excluded.,Linked Report(s) : US-PFIZER INC-2021003873 same reporter/drug/event, different patient

contracted covid after getting the vaccine; contracted covid after getting the vaccine; This is a spontaneous report from a Pfizer-sponsored program. A contactable Physician reported similar events for 4 patients. This is 3rd of 4 reports. A patient of an unknown age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: Unknown) via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient contracted COVID after getting the vaccine. The outcome of the events was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021003873 same reporter/drug/event, different patient

contracted covid after getting the vaccine; contracted covid after getting the vaccine; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A contactable physician reported similar events for 4 patients. This is 4th of 4 reports. A patient of unspecified age and

gender received bnt162b2 (lot/batch number and expiration date not provided), via an unspecified route of administration, on an unspecified date, at single dose, for Covid-19 immunization. The patient medical history and concomitant medications were not reported. The patient contracted COVID after getting the vaccine. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The association between the event lack of effect (contracted COVID) with BNT162b2 can not be fully excluded.,Linked Report(s) : US-PFIZER INC-2021003873 same reporter/drug/event, different patient

"Headache; Body aches; This is a spontaneous report from a contactable nurse (patient). A 55-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EH9899), intramuscular (hope it was IM, but did not know for sure because she was not watching) at right arm deltoid on 29Dec2020 08:40 at single dose for COVID-19 immunization, at the hospital where she works. The vaccine was not administered at military facility. The patient's second dose was scheduled to be 19Jan2021. The patient's medical history included potassium low, hypertension, pericarditis, asthma, herniated disc in back, pain, gastrointestinal infection (GI), Vitamin D low, wheezing, exposed to someone who was positive with COVID at a wedding on 28Dec2020, ""diuretic"", ""cardiac/heart"" and ""Cholesterol"". Concomitant medication included ranolazine (RANEXA) for heart, isosorbide for cardiac, potassium chloride for potassium Low, furosemide for diuretic, atorvastatin (LIPITOR) for cholesterol, acetylsalicylic acid (ASPIRIN) for cardiac, montelukast sodium (SINGULAIR) for asthma, pregabalin (LYRICA) for herniated disc in back take for pain, nebivolol hydrochloride (BYSTOLIC) for blood pressure, pantoprazole sodium sesquihydrate (PROTONIX) for GI, celecoxib (CELEBREX) for pain, spironolactone for diuretic, vitamin D for Vitamin D low, nitroglycerin for angina, salbutamol (ALBUTEROL) for wheezing, and oxycodone for pain; all ongoing. History of all previous immunizations with the Pfizer vaccine considered as suspect was reported as none. No additional vaccines administered on same date of the Pfizer Suspect. No prior vaccinations within 4 weeks. The patient reported events on the Pfizer COVID Vaccine. She reported after getting the vaccine she had body ache and headaches. On 30Dec2020 16:00, the patient experienced headache and body aches. The event headache was reported as serious medically significant. She received the COVID vaccine on 29Dec2020 and had significant body aches, but she still had a headache that had not gone away since she got the vaccine. The patient explained the body aches were mild to non-existent/resolved, later confirmed as still ongoing, but better. Her main issue was the headaches that had not gone away. The events headache and body aches started around 16:00. She worked nightshift and she woke up with it. The events did not require a visit to the emergency room or physician office. The day after she received the COVID Vaccine she was tested for COVID. She found out she was exposed the day before she received the COVID vaccine, 28Dec2020 to someone who was positive with COVID at a wedding. She later found out her COVID test on 30Dec2020 was negative. The reporter assessed both events headache and body aches as related to the suspect vaccine. She believed the body ache and headache were related to the COVID Vaccine itself. She added, she felt it's related because these events are not part of her typical health problems. She added they're not going away even with medications (oxycodone, Celebrex, and ibuprofen). Oxycodone was located in an orange pharmacy filled bottle and she was unable to provide a lot/exp/NDC. Celebrex was located in an orange pharmacy filled bottle and unable to provide a lot/exp/NDC. She saw a use by date of 10Mar2021. Ibuprofen (Lot number: OCE2824A and expiration

date: Dec2021). The outcome of the event headache was not recovered, for the event body aches was recovering.; Sender's Comments: There is a reasonable possibility that the event headache was related to BNT162b2 based on known drug safety profile and close temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

covid 19 test result came up positive; covid 19 test result came up positive; severe left arm pain; This is a spontaneous report from a contactable unspecified Healthcare professional reporting for himself. This 52-year-old male patient received on 20Dec2020 02:30 PM first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot EK5730) at single dose intramuscular in the left arm for COVID-19 immunization. No allergies to medications, food, or other products. Medical history was not reported. Prior to vaccination, the patient was not diagnosed with COVID 19. Concomitant medications (all started on an unknown date and received within 2 weeks of vaccination) included buspirone hydrochloride (BUSPIRON), atorvastatin (manufacturer unknown) and acetylsalicylic acid (BABY ASPIRIN). On 21Dec2020, 10 hours after getting vaccine the patient had body aches, cold and severe left arm pain. 4 days after getting vaccine again the patient had cold, body aches and sore throat for couple of days. On 28Dec2020, covid 19 test (nasal swab) result came up positive. The patient went to Emergency room. Outcome was recovered on an unknown date. It was unknown if a treatment was performed.; Sender's Comments: The association between the event lack of effect (COVID 19 nasal swab test result came up positive) with BNT162b2 can not be fully excluded.

Anaphylactic reaction 6 days post vaccine 24Dec2020; I had severe chest tightness; SOB; throat soreness; hoarse voice; mouth swelling; This is a spontaneous report from a contactable physician, the patient. A 34-year-old non-pregnant female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EL0140), via an unspecified route of administration in the left arm on 18Dec2020 at 15:30 (at the age of 34-years-old) as a single dose for COVID-19 immunization. Medical history included severe dust mite allergy (based on skin test). Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included cetirizine hydrochloride (MANUFACTURER UNKNOWN), hydrocodone bitartrate/paracetamol (NORCO), ibuprofen (MANUFACTURER UNKNOWN), and ondansetron (ZOFRAN); all for unspecified indications from unknown dates and unknown if ongoing. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 24Dec2020 at 10:00, 6 days post vaccination, the patient experienced anaphylactic reaction, severe chest tightness, shortness of breath, throat soreness, hoarse voice, and mouth swelling; all reported as life threatening. The events led to an emergency room visit and she was given epinephrine (EPI-PEN), methylprednisolone (SOLUMEDROL), and diphenhydramine hydrochloride (BENADRYL) as treatment. The patient stated that she developed the reactions 45 minutes after she took premedications for a dilatation and curettage procedure. The premedications included ibuprofen, hydrocodone bitartrate/paracetamol, ondansetron. She stated she had taken these medications several times before and this was the first time she had this reaction. Since the vaccination, the patient had not been tested for COVID-19. The clinical outcomes of the anaphylactic reaction, severe chest tightness,

shortness of breath, throat soreness, hoarse voice, and mouth swelling were recovered on unknown dates.; Sender's Comments: Anaphylactic reactions presented as chest tightness, shortness of breath, throat soreness, hoarse voice, and mouth swelling, developed 45 minutes after premedications including included ibuprofen, hydrocodone bitartrate/paracetamol, ondansetron for a dilatation and curettage procedure and 6 days post vaccination with BNT162B2, the event therefore is most likely attributed to these premedications unrelated to the vaccine use. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"Tested positive for covid; Received first Pfizer covid vaccine on 23Dec, tested positive for covid; This is a spontaneous report from a contactable pharmacist. A 75-year-old patient of an unspecified gender started to receive bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 23Dec2020 at SINGLE DOSE for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The reporter stated ""75 year old patient with some comorbidities who received first Pfizer covid vaccine on 23Dec, tested positive for covid on 28Dec. Patient has been treated at home and is doing well. What is the protocol for their second dose of Pfizer covid vaccine due on 13Jan?"" The outcome of the events was unknown. Information about lot/batch number has been requested."

Covid positive/ testing positive for the virus/ asymptomatic; Covid positive/ testing positive for the virus/ asymptomatic; This is a spontaneous report from a contactable consumer who reported for herself. A 30-year-old female consumer received her first single dose of BNT162B2 (Pfizer/ BioNTech Covid-19 vaccine, Lot number: EH9899) on 17Dec2020 per works recommendation (COVID-19 immunization). The patient had a history of back pain and had no concomitant medications. The patient got the vaccine and tested for Covid as a preventative to make sure she was safe to travel for a wedding. Her Covid test was pending and she found out that she was Covid positive the day after receiving her first dose of the Pfizer Covid vaccine. Her primary care informed her to get the booster despite testing positive for the virus. She was told since she was asymptomatic that she could get the vaccine. She received the second dose on 04Jan2021. The outcome of the event Covid positive was not reported.

COVID; COVID; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect from a non-contactable consumer (patient). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on Tuesday 29Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient was diagnosed with COVID on Saturday 02Jan2021. The outcome of the event was unknown. No follow up attempts are possible; information about lot/batch number cannot be obtained.

Tested positive for COVID; Tested positive for COVID; This is a spontaneous report from a contactable other HCP via a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A patient of unspecified age and gender started to receive BNT162B2, via an unspecified route of administration from

23Dec2020 to 23Dec2020 at first single dose for COIVD-19 immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. Pharmacy student on the line who had patient who received the first dose of the COVID vaccine shot on 23Dec2020. Then the patient went home on Christmas break and later tested positive for COVID on 29Dec2020. She was calling to see how to proceed with the second dosage. Outcome of the event was unknown. information on the lot/batch number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported event positive for corona virus infection based on the known safety profile. However given the short duration of 6 days since the vaccine first dose, it is unlikely patient would have fully developed immunity.

I tested positive for COVID-19; I tested positive for COVID-19; This is a spontaneous report from a contactable nurse. A 29-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), intramuscular in left arm on 17Dec2020 19:45 at single dose for covid-19 immunisation. Medical history was not reported. There were no concomitant medications. The patient tested positive for COVID-19 on 03Jan2021. Outcome of event was recovering. Patient has not been diagnosed with COVID-19 prior to vaccination.

Patient tested positive for COVID-19 about 2 weeks after receiving the 1st dose of COVID vaccine; Patient tested positive for COVID-19 about 2 weeks after receiving the 1st dose of COVID vaccine; This is a spontaneous report from a contactable consumer reported that a male patient of unspecified age received his first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date, at single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. Patient is a health care worker who works with COVID patients as part of his daily work duties. He tested positive for COVID-19 about 2 weeks after receiving the 1st dose of BNT162B2. Outcome of the events was unknown. No follow up attempts are possible; information about lot/batch number cannot be obtained.

Tested positive; Tested positive; This is a spontaneous report from a contactable nurse via Pfizer sales representative. A 35-year-old female patient received BNT162B2 (lot: EKS730), via an unspecified route of administration on 17Dec2020 at single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. Patient received 1st COVID vaccine dose on 17Dec2020 and tested positive on 23Dec2020. Patient was exposed to COVID. She was curious if and when she should get a second dose having tested positive after her first dose. Outcome of the events was unknown.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported event SARS-CoV-2 test positive based on the known safety profile. However given the short duration of 6 days since the vaccine first dose, it is unlikely patient would have fully developed immunity.

C/o shortness of breath routine oxygen increased cannula changed to mask oxygen sats at 88%

started to feel a little sick; had COVID-19 test and results came back positive; had COVID-19 test and results came back positive; This is a spontaneous report from a contactable healthcare professional. A 27-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for

injection, lot number EH9899/expiration date unknown) via an unspecified route of administration on 27Dec2020 at a single dose for COVID-19 immunization. The patient had no relevant medical history. Concomitant medications were not reported. The patient stated that he got the vaccination on the 27th and then that same night he started to feel a little sick. He was assuming that it has just to be the side effect of the vaccine (unspecified vaccine). On 28Dec2020, he was feeling pretty sick; he did not go to the work. He had COVID-19 test (Dec2020) and results came back positive. He added that he didn't know if it was the COVID because he was reading up on the vaccines and it said that one could not get COVID from the vaccine. The outcome of the events was unknown.; Sender's Comments: The reported positive with COVID-19 test after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

Labored breathing with oxygen running at 4l/min, muscle weakness

Fever to 103.7F, respiratory rate 36. Was transferred from facility to hospital. Since then has been found to have gram-negative rod bacteremia, although urinalysis was negative, urine culture pending. Patient has since defervesced after receiving 1 dose of cefepime. Overall the most likely cause of fever seems to be urosepsis w/ bacteremia, pending confirmation with urine & blood cultures.

The patient was found deceased at home about 24 hours after immunization. Date of Death:: 12/29/2020; estimated time of death 6:00pm

Patient received vaccine on 1/4/2021. He was in Hospice for CHF and renal failure, but was able to get up in his wheelchair and eat and take medications and talk. On 1/5/2021 am, he was noted to be very lethargic an could only mumble, could not swallow. No localizing neurologic findings. He was too lethargic to get up in chair.

initial; swelling of tongue, tingling and numbness in legs, syncope. later; HA

Swelling of throat and tongue, anaphylaxis, hives, redness, swelling

shoulder joint pain, injection was given in joint.... I am now on prednisone, physical therapy, if this doesnt help will need a MRI .

She began with an earache and dizziness. Pain got so severe that she could no longer take it. Went to the doctor which she was put on pain medications. Went to ER on 1/6 and on 1/7 went to her PCP. Still in severe pain.

Patient experiencing Chest pain and elevated troponin. Patient taken to the cath lab and treated for suspected stress induced cardiomyopathy.

ITP Plt 2

Notified today that he passed away. No other details known at this time.

Hospital on 1/2 - then again on 1/5, transferred and admitted to hospital, discharged 1/6 Abnormal reflex/weakness back pain paresthesia and weakness of legs abdominal pain evaluation for possible GBS post covid 19 vaccine

29-year-old previously healthy female presenting today with difficulty sleeping, sore throat, and nausea after receiving the second Pfizer COVID-19 vaccine around 10 AM. Patient says that after her first dose of the vaccine she had mild sore throat and hoarse voice that resolved spontaneously. She had her vaccine around 10, several hours later before coming to the emergency department between 2--230 she had the sudden onset of difficulty speaking with associated sore throat and nausea. She has had dry heaving but no large amounts of vomiting. She has not had stridor, wheezing, shortness of breath, syncope, or the development of a rash or hives. She has not had a reaction to her prior vaccines she does not have any other allergies in general. She has otherwise been well recently without infectious symptoms including fevers, chills, cough, and has not been exposed to Covid to her knowledge. Medications administered in ED included diphenhydramine 50 mg IV once, dexamethasone 10 mg IV once, famotidine 40 mg IV once, ondansetron 4 mg IV once. Had brief episode of shaking and R arm rigidity in the ED. Patient denies LOC during the episode, did not have a post ictal state, no tongue biting or episodes of incontinence. Given single event without LOC, less concern about episode being a seizure. Patient has had no further episodes of shaking since admission. CT brain was wnl, no FNDs noted on exam.

I am breastfeeding. My daughter had seizure like episodes starting on Saturday 1/2, Sunday 1/3, Monday, 1/4 and 2 times on Tuesday 1/5.

Patient received first dose of vaccine on 12/28, developed COVID-19 infection shortly thereafter and expired on 1/6/2021.

Patient received first dose of vaccine on 12/28, developed COVID-19 infection shortly thereafter and expired on 1/4/2021

Cardiac event, 2 days after vaccination, patient expired.

Fever, shortness of breath and chest pain that resulted in a heart attack a few hours after vaccination

Acute allergic reaction Tongue swelling Facial swelling Throat swelling Rash on throat and chest Redness in throat Diaphoresis Momentary loss of consciousness

Altered Mental Status began the middle of the night of 01/06/21 and 01/07/21 with worsening overall status- definitive symptoms unknown to this reporter, this person was admitted to the local hospital at

approximately 1800 01/07/2021. This reporter was not told the admitting diagnosis or any defining symptoms, only that the person was admitted.

Medical docter state patient has a acute cardiac attack

Initial itching at injection site, observed and returned to work. Came back ~30-40 minutes later with itchiness in throat and hives to arm. Given Benadryl PO and observed for extended period of time. Symptoms not resolving. Patient transferred to Emergency Department for further care. At that point observed to have full body rash, SOB. Given Epi while in ED. Developed tachycardia, hypotension. Treatment continued.

After about 15 min: hr went to over 170bpm , flushed sensation, brain fog, was driving at the time and my brain wouldn?t figure out how to call 911 , eventually I figured it out but it took extreme mental effort. Paramedics came and my pulse was From 100 - 170 changing rapidly, bp 150-175/x changing rapidly, symptoms would come and go about 8 times on way to hospital. In ER same thing then about 2 hrs go by and then all started again. Pulse remained at 90- 100bpm at least until 2am. (My resting hr is between 40 and 50, my normal bp is usually sub 120/80) I later realized my hands were swollen, mostly on my left side. Lingering symptoms include brain fog, tiredness, and headache. Maybe an exasperating issue was I had low potassium levels likely making symptoms worse - I worked out heavily early in the morning, probably had low intake of potassium that day and day before, and maybe slightly dehydrated from my workout - I do Functional lifting, run, and other types of exercise regularly.

Developed hypercapnic respiratory failure, CHF exacerbation - readmitted to Hospital. In ICU with BIPAP

patient begin to feel bad that night was admitted into hospital sometime in the next couple of days for dehydration, patient discharged home and then readmitted to hospital for positive covid testing after feeling very ill.

At 1431, pt received the first dose of the Moderna COVID-19 vaccine. Hx of anaphylactic reactions to penicillin as a child. At 1445, pt started complaining of tongue swelling, which proceeded to increase in severity. At 1449, Epi-Pen administered (0.3 mg) in R deltoid. At 1450, 50 mg diphenhydramine IM administered in L deltoid, followed by an additional dose at 1452 in R deltoid. 911 was called between 1445 - 1450. Pt was moved to another exam room where she could lay down because she was hypotensive, lightheaded, and pale. O2 sats remained between 95-98%, BP 81/53-190/100, P 94-136, RR 16-24 throughout. Tongue swelling improved slightly after receiving Epi-Pen. EMS arrived and were able to start an IV before transporting her to the local hospital at 1502.

Patient presented to the emergency department with sensory loss and loss of reflexes, evaluated by neurology and diagnosed with Guillain- Barre Syndrome thought to be secondary to the Pfizer Covid Vaccine

Death

I had a myocardial infarction on December 27, 2020. I had received my first vaccination for COVID-19 on December 22, 2020. Not sure if these are related but I felt I should report it.

Low grade Fever, headache needing admission Intracranial hemorrhage with hypertension Medical management for hypertensive emergency Received surgical evacuation admitted in Intensive care,

1/4/21: Headache, Dizziness & Fatigue 1/7/21: Left Sided Facial Droop

Shortness of breath, cough, rash on face and neck, arthralgia

Patient received COVID vaccination around 12:15pm. Patient was monitored for the appropriate amount of time by nursing staff. Patient passed away at 2:15pm.

Diarrhea followed by death 24 hrs after vaccination

Patient is a 32 yo G2P1001 with EDD 5/2/2021 by 7w US. She had the first dose of the Pfizer Covid 19 vaccination on 12/17/2020 at the Health Clinic and the second dose on 1/7/2021 at 1115 am. She began having abdominal pain and vaginal bleeding at 315 sm on 1/8/2021 progressing to a previable (22w2d) preterm birth at 739pm on 1/8/2021.

Pt experienced extreme fatigue and sleepiness the day following her second vaccination for Covid 19 and was found by her family after collapsing on 1/6/21 at 05:30. Upon arousal, she experienced headache, vomiting, weakness, difficulty speaking and difficulty walking with lower extremity weakness. She was taken to urgent care and subsequently admitted for evaluation at hospital and found to have a normal chemistry, blood count, normal lumbar puncture and normal imaging of her neck and brain. Discharge summary notes 3/5 strength and hyporeflexia throughout. Pt had televisit consult with psychiatry and neurology. She is subsequently to be discharged to a Facility without explanation for her sudden onset of progressive lower extremity and vocal weakness. She is noted to have a history of shellfish allergy. She experienced mild symptoms after the first vaccination, but no neurologic or vascular symptoms at that time.

I am a physician and I got dose 2 at 1:30pm on Jan 4. Next afternoon, Jan 5, I got severe myalgias, fever up to 100, severe fatigue, went home after work and slept til the next morning, went to work, took ibuprofen, and the myalgias improved and felt better. But around 3 pm, Jan 6, I got mild vertigo. By about 7pm Jan 6, I noticed my L ear didn't hear well. I changed the battery in my hearing aide and cleaned it but It made no difference. I woke up on Jan 7 with severe vertigo and hearing loss. I did Epley's maneuvers with no effect. I have had similar episodes. I went to work, but gave up when I could not hear patients talking to me. I went to the Emergency Dept and got admitted. I was too unsteady on my feet. Audiogram showed profound hearing loss both ears and almost complete loss of discrmination in R ear. I was put on high dose steroids. Also having tinnitus (mostly whooshing sound of my own pulse). MRI negative. Blood work negative. Some mild improvement now, after 1 dose steroids.

Fever up to 102.9, chills, headache, hypertension, tachycardia, dyspnea.

"Myocardial Infarction: patient began to complain of severe chest pain 3 hours after the vaccine was given .. Vaccine NDC # 59267-1000-1. 0.3 ml given by RN. Patient called his PCP: ""... I had very bad chest and shoulder pains, neck pains and slight fever from 9 pm until early this morning (Jan 8). My blood pressure was 155/95 mmHg. Should I see you today? Still feel sore all upper body. Above message

received at 0720 am (Jan 8) and the patient was called back at 0757 am (Jan 8): patient was told that many of the side effects above were related to the vaccine but the chest pain was worrisome and the provider requested the patient go to the emergency room. Patient understood the importance to seek medical attention..... Emergency Room notes: seen by MD on Jan 9. Note at 0749: patient complained of chest pain on/off since received COVID vaccine on Jan 7. Pain was substernal and radiated to the left shoulder, assoc with some SOB. EKG obtained and revealed ST segment elevation and a ""cardiac alert"" was called."

At around 11:45pm tingling started in my left eyebrow. I thought there was something in my eyebrow and after time of wiping it a few times I went to look into the mirror and realized that nothing was there. about and hour later I got a drink and a snack to eat and I realized I had a numb sensation in the left corner of my lip. As a nurse I went though the signs of a stroke with 2 other nurses I called. Everything was normal other than that sensation. Thinking I was just overly tired I went to bed. When I woke up the next day I felt okay until I went to drink some coffee and the numb sensation in my corner lip was still there. Now I was concerned and called employee health and was instructed to go to the ER to role out a stoke. I followed employee health's instructions and went to the ER. I was diagnosed with facial paresthesia and discharged with instructions to come back if symptoms got worse. Symptoms persisted all day and around 7 I called my mom on video chat to show a visual facial twitch on the left side of my face. right after I got off the phone with her the left side of my face drooped and my fiance immediately drove me to the closest ER. I was seen immediately and they decided to admit me. The did labs and head CT. They admitted me to labor and delivery because there were no other rooms. The next day I was seen by a neurologist and many doctors.

Patient was unresponsive in her room during the night, had gotten the vaccine this morning, 911 called. Had right arm pain and loss of consciousness. EMS got 180/104 BP and blood glucose was 122. Was transported to hospital. Returned to the facility the next day with no complications, was just fatigued.

8 hours after vaccine I experienced stomach pain and nausea. I then became very ill and extremely weak. I was laying on floor. Very difficult to talk and very dizzy. Unable to walk. Called 911 and went to ER. Had chest pressure and cardia work up was done. Dx wi ST elevation.

7 day after site itching, hot swelling. Unsure if related 9 day after suffered CVA and have hyper coagulation

sudden sensorineural hearing loss in the right ear, audiology and ENT assessment, currently being treated with steroid medication

after receiving vaccine patient immediately felt warm, dizzy and started dry heaving. we dosed Zofran 4mg, gave one dose epi-pen, and 50mg Benadryl. patient still complained of chest pain and was dry heaving. she was then transported by ems to the hospital at 4pm.

Received vaccine 12/19/2020 at hospital around lunch time. Severe abd pain started 10 hours after vaccine administration with vomiting. I went to emergency room next morning Emergency appendectomy 12/20/2020. Had bleeding after surgery. Second surgery 12/21/2020

Anaphylaxis

After the vaccine was administered I walked away maybe 50' and I started to feel dizzy I felt light headed and as if I was drunk my legs feel real week they took me outside so I could catch some fridge fresh air and they set me down on a chair I was very dizzy my legs and my knees felt like I couldn't stand up and they were very weak I kept seeing a the rails double vision and I started to have a tightness in the back of my neck I felt they warrant come over my head and my forehead got very very cold And then I felt as I was gonna blackout and pass out and I was gasping for air and suddenly my tongue went into a spasm and it went to the top of my the roof of my Roof of my mouth and I couldn't breathe and I was able to send a message for someone to come and help me as I was sitting there by myself they rushed over by now looking at my text message it was for 02 which was within 15 minutes of the vaccine when I had my 1st episode and then minutes after that 3 more came with the same oh unable to swallow I lost the ability to swallow and my tongue fell like I had no control it was just automatically stuck to the roof of my mouth.. Upon the arrival of Ems I was told there was no treatment and there was nothing they could do told me to wait 24 to 48 hours in the symptoms should subside it's been over 72 hours in the symptoms are still occurring. I continue to feel dizzy light headed and now have high blood pressure which was not present before visit ER prescriptions for steroids with issued, I Told to go home and rest. Followed up with family doctor in the morning and was told it was not an allergic anaphylactic reaction probably more so neurologically ransom blood tests waiting for results continue to have loss of control over tounge spasms unable to eat Accompanied by fatigue dizziness and high blood pressure

On 01/07/2021 I woke up at 0300am with chills, headache, body aches, joint pain, fever of 101.2 and swollen left axillary lymph nodes. I took Tylenol and Benadryl and it relieved the fever/headache/body aches/joint pain, however the lymph nodes in my left axillary remained swollen. I continue to take Tylenol for the fever/body aches/pains without relief for the swollen and painful axillary lymph nodes. Warm compresses do help to relieve the pain temporarily but they remain painfully swollen. On 01/08/21 I called my doctors office to ask if it was normal to experience such painfully swollen axillary lymph nodes to which they stated ?we don?t know, it is too soon for us to tell what?s normal and what isn?t normal right now.? They did not offer any suggestions to relieve the pain or swelling. The morning of 01/09/2021 , I called Employee Health at my hospital (my place of work and also where I received the vaccine) and they also stated they didn?t know if this was a normal reaction due to the newness of the vaccine. A couple hours later, employee health emailed me a link to the VAERS reporting website and asked me to file a report.

I am currently breastfeeding my 5-month-old son. I received my first vaccine on 12/28/2020 and directly breastfed within 4 hours of receiving the vaccine. Two days after my vaccine my son was at daycare and had two large diarrhea blowouts and two large emeses followed by a 1-minute episode where he was limp with entire body cyanosis and in-and-out of consciousness. He also had a maculopapular rash on his torso. EMS was called. He was observed in the emergency department for a few hours then recovered well without intervention and did not require hospitalization. EKG was normal. He has continued to be well and back to baseline since the event.

"Dizziness started within 30 minutes after injection on 01/08/21 and felt ""off"". On 01/09/21 approx. 0800 Patient began feeling body aches, fevers, injection site pain, increased dizziness, and nausea. At approximately 1pm patient began vomiting and having diarrhea. Symptoms worsened over the next couple hours to where patient was unable to walk without stumbling. Wife witnessed patient becoming very pale and almost pass out at approx. 5:30pm. Patient states he feels like he's in slow motion. Patient is unable to maintain balance when walking and reports increasing fatigue and weakness."

Started severe belly pain and went to Emergency room and diagnosed with mesenteric vein thrombosis after the CT scan of the abdomen, treated with heparin drip, antibiotic and discharged with anticoagulant pills(Eliquis). I am not sure that it is because of the vaccine my doctors are also not sure about it, but I am sure that I am a healthy person without any health issues . I am working as registered nurse, our unit is for covid-19 patient's since march 2020 and I had covid -19 on August month and recovered after 3 weeks.

Pfizer-BioNTech COVID-19 Vaccine EUA Miscarriage - (date of vaccination 1/6/21, miscarriage symptoms (cramping) started 1/8/21, confirmed 1/10/21; estimated date of delivery 8/30/21)

Patient came into the emergency department on 1/8/21 with an acute ischemic stroke with complete occlusion of her left MCA. She had acute and complete flaccid paresis of her right face, arm, and leg, complete aphasia, and neglect of the right side of her body. NIHSS of 27. Onset of deficit was between 6:30pm-7:10pm. She recieved her 1st COVID-19 vaccine dose that morning at 10:31am.

I was injected high on my shoulder, significantly higher than I?ve ever been injected in my life. I believe I have SIRVA. The pain has become so severe that I cannot use my left arm. The pain is intolerable. I take four Advil every six hours, ice my arm regularly, and keep my arm in a sling. The pain has gotten significantly worse with time (not better). I?ve never experienced pain like this from a vaccine in my life. No history of bursitis or shoulder injury. Again, the pain gets worse with time. I?m almost 48 hours post injection

1/7-21 - Received second dose of pfizer covid-19 vaccine 1/8/21 - Fever, dizziness, headache 1/10/21 0250 was found not breathing. EMS performed CPR and patient deceased

The patient presented with left eye peripheral visual loss, left upper and lower extremity and facial numbness sensation and weakness. This started 1 hour after receiving COVID-19 vaccine at her place of employment. Pt was brought to CRMC via EMS.

Facial (cheek) numbness and swelling with slight face droop Swelling continued on 1/7/2021 On 1/8/2021, lip swelling and numbness and tongue numbness By 1/9/2021 4pm, swelling and numbness resolved but chills and muscle aches began

Patient received the Moderna Vaccine 1/2/21 at his VA Clinic. He received the vaccine that morning and by the evening he was not feeling well. He developed cough, weakness and fever and now is unable to ambulate. He has since been hospitalized and has tested positive for COVID-19.

Headache, Myalgia, Arthralgia, Fever, CoughWheeze & Syncope

NauseaVomiting History of vasovagal episodes; c/o warm feeling and nausea without vomiting. Recovered Narrative: 10 minutes after vaccine admin. c/o/ warmth and nausea. Triaged by the ER nurse and observed for 45 minutes. Discharged in stable condition 133/84, 104, 18

I am not sure if related on not. This event was 13 days after my COVID-19 1/2 immunization. Otherwise, I am a very healthy physician, normal BMI, I have also been tested 5-6 times negative for COVID. I do get exposed in my job, but wear proper PPE. Viral infection in FEB that was like COVID-19 sx, I did AB test as soon as it was available, and negative. ---The Event: Monday morning (1/4/21), after getting out of shower, I was talking to my husband (who is MD)and started having BROCA's aphasia sx (could not get words out coherently), then fell into bed and started right wrist and right foot posturing. This lasted 10 min. I have non-memory of it, but my MD husband witnessed it. After 10 minutes, I was back to normal, except shaky and some word finding difficulties. After 30 min, totally back to normal.

pt received Moderna vaccine. next day he had high fevers up to 103, confusion. admitted to hospital. infectious work up negative. improved off antibiotics.

Resident appeared to be jaundice with yellow skin and eyes. Resident also complained of not feeling well. Urine was dark yellow. Resident short of breath. Resident was admitted to hospital and diagnosed with post-covid pneumonia.

Throat closing Pruritic throat and tongue Tingling lips and tongue Throat clearing Hoarse voice

Acute ischemic stroke, basilar occlusion

SOB

Nausea/vomiting and diarrhea loss of appetite tachicardia sent to er for hydration.

I immediately felt dizzy, and there was ringing in my ears, I felt faint. I also felt shakey. I have had these symptoms for 12 days, unchanged. I cannot work because of these symptoms. I have been to urgent care and have had lab work and an EKG

RECIEVED VACCINE 1/8/21 EXPIRED UNEXPECTED 1/10/21, NO ADVERSE REACTIONS NOTED

Two days following the first COVID vaccination he developed epigastric pain and was evaluated in the ER and was admitted for gallbladder surgery. He has a 6 year history of gallbladder disease but was not experiencing symptoms until after the COVID vaccination.

The patient had an apparent cardiac arrest on 12/23/20 and was admitted to the ICU. He was taken off of life support on 12/30/20. He had known cardiac disease.

Severe thrombocytopenia (plts 3k/uL), oral mucosal bleeding, bruising

Sudden, severe worst headache of her life, coupled with onset of oral herpetic lesions and inflammation to unrelated body part (belly button piercing) occurred one week after vaccination received. She presented to ED 12/28 noted to have hypokalemia and head CT showed mild occipital encephalitis,

admitted overnight for obs subsequent brain MRI was normal. She was seen in my clinic 2 days later (1/4/21) and was started on 3 day course of Decadron, topical acyclovir for herpetic lesion. As she is a nurse, I kept her off work until resolution of symptoms. Seen again on 1/8/21, headache resolved. She did discuss CT and MRI results with neurologist. He was not convinced this was vaccine related. She is having 2nd dose of vaccine on 1/11/21.

Patient died, I have a copy of his vaccination card

Moderna vaccine dose #1 received in right shoulder on 12/31/20 at 2:15PM. Injection was uneventful other than sensation of pressure. I did notice at the time, but could not fully see, that the injection appeared to be much higher on the shoulder than normal. I immediately came home afterwards and relaxed. Approximately 2hrs later, I began experiencing extreme pain in my right shoulder. As the night progressed, the pain worsened to 10/10 with inability to move my arm. Later that night after requiring assistance to take off my shirt, I noticed that the bandaid overlying the injection site was very high, immediately below and bordering the acromion process. This was concerning but I was hopeful the pain would go away over the next few days. I took tylenol that night. I woke up multiple times during the night because the pain was so severe. When I woke up, the pain and inability to move my arm were still present. I began taking 800mg ibuprofen and 1000mg tylenol alternating Q4 throughout the next few days. The pain and disability remained so severe that I required assistance performing ADLs for the next 4 days. On day four, with the pain not resolved and still severe despite consistent advil and tylenol use, I began having concern for shoulder injury related to vaccine administration. The next day I decided to seek an evaluation by an orthopedist. I am a physician and was unable to perform basic tasks and ADLs. I happened to have a few days off after the injection but would not have been able to work had I not. After an evaluation by the an orthopedic PA, I obtained an MRI of my right shoulder with results shown below - as I expected evidence of rotator cuff tendinopathy and subdeltoid bursitis consistent with SIRVA. As of now, I still have limited range of motion and shoulder pain on the right which has improved slightly but is far from resolved. I still have difficulty with certain ADLs including putting clothes on and off, lifting items, and tasks that require raising my right arm above my head. I am concerned with the possibility of long term and/or permanent damage after reviewing the literature. I am also concerned about how many other healthcare workers the person who gave me my vaccine may be injuring and/or causing permanent harm to.

Pain at site of injection, eyes, throat, face swelling. Unclear thinking, hoarse speech, headache, hives, swelling. Intervention taken immediately. Ongoing 11 days: SOB, headaches, nose bleeds, coughing, blood sugars triple, hair falling out, major swelling, dizziness.

feeling flushed elevated HR dizzy nausea evaluated by EMS, VSS and wnl except HR 100 bpm lungs cta at 5:36 patient reported to be feeling better - drank water - declined transport to ER - felt able/safe to drive home

Headache, Muscle aches and chills

"Chills; Fever; Loss of consciousness x 2; GI upset; Diarrhea; Difficulty sleeping; Pallor; Stomach flu; A spontaneous report was received from a nurse concerning a 31-year-old, male patient, who received

Moderna's COVID-19 vaccine (mRNA-1273) and experienced loss of consciousness (LOC) x 2, gastrointestinal (GI) upset, diarrhea, difficulty sleeping, pallor, stomach flu, chills and fever. The patient's medical history, as provided by the reporter, included allergy to cefaclor and hereditary hemorrhagic telangiectasia. Concomitant medications reported included desvenlafaxine succinate, gabapentin and dexlansoprazole. On 23 Dec 2020 at 11:30 am, approximately six hours prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 025J20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On the morning of 23 Dec 2020, prior to receiving mRNA-1273, the patient felt ""achy"". At 5:30 pm, the patient experienced chills, fever to 102, GI upset and diarrhea. At 11:00 pm, the patient reported difficulty sleeping, GI upset, LOC x 2 and pallor. The patient was transported to the emergency room via ambulance. A COVID-19 polymerase chain reaction test and routine labs were collected; however, results were not provided. Treatment for the events included paracetamol, unspecified intravenous (IV) medications, ondansetron and ketorolac tromethamine. The emergency room discharge diagnosis was stomach flu. Action taken with mRNA-1273 in response to the events was not reported. The events, loss of consciousness (LOC) x 2, GI upset, diarrhea, difficulty sleeping, pallor, stomach flu, chills and fever, were considered resolved on 24 Dec 2020.; Reporter's Comments: This case concerns a 31-year-old, male subject with a medical history of hereditary hemorrhagic telangiectasia, who experienced the unexpected events of loss of consciousness (LOC) x 2, gastrointestinal (GI) upset, diarrhea, difficulty sleeping, pallor, and stomach flu, and the expected events of chills and fever. The events of chills, fever occurred approximately 6 hrs. and the events of GI upset, loss of consciousness, difficulty sleeping occurred after 12 hrs. after the first dose of Moderna COVID-19 Vaccine. The time to onset for the events of GI upset and diarrhea were unknown. The reporter did not provide the causality assessment for the events. Due to the temporal association between the LOC and the administration of the vaccine, a causal relationship cannot be excluded, however, the subject's medical history of hereditary hemorrhagic telangiectasia and other concurrent conditions of GI upset, diarrhea, and stomach flu remain as confounders."

Sharp shooting pain up my arm, upper chest, the shoulder, above my brest; Trouble swallowing, slurred speech, red across the chest and hoarse/raspy voice; A report was received from a consumer concerning a patient who was participating in the mRNA-1273 Emergency Use Program and who experienced sharp shooting pain up my arm, upper chest, the shoulder, above my brest, trouble swallowing - could not swallow my saliva, slurry speech, red across my chest, and hoarse/raspy voice. The patient's medical history included diphenhydramine hydrochloride allergy, shellfish allergy, and latex allergy. Concomitant medications included salbutamol sulfate. The patient received their first dose of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection in their right arm on 26 Dec 2020. Five minutes following administration of the vaccine, the patient felt sharp shooting pains up her arm, upper chest, the shoulder, above the breast. Five to 10 minutes after, the patient had trouble swallowing and began to have slurred speech. The patient was administered epinephrine in her right thigh. Following this, she began to experience redness across the chest and was administered another dose of epinephrine. She also experienced hoarse/raspy voice. The patient was then transported to the emergency room in an ambulance, where she received intravenous fluids and solumedrol after which she began feeling better. The patient was observed in the hospital for several hours and discharged on the same day. Action taken with mRNA-1273 in response to the event was not reported. The outcome of the event, sharp shooting

pain up my arm, upper chest, the shoulder, above my brest, was unknown. The event, trouble swallowing - could not swallow my saliva, was considered resolved on 26 Dec 2020. The outcome of the event, slurry speech, was unknown. The outcome of the event, red across my chest, was unknown. The outcome of the event, hoarse/raspy voice, was unknown. The reporter did not provide an assessment for the events, sharp shooting pain up my arm, upper chest, the shoulder, above my brest, trouble swallowing - could not swallow my saliva, slurry speech, red across my chest, or hoarse/raspy voice.; Reporter's Comments: This case concerns a female patient with a medical history of diphenhydramine hydrochloride allergy, shellfish allergy, and latex allergy who experienced the events of pains up her arm, upper chest, the shoulder, hypersensitivity reaction with symptoms of trouble swallowing, slurred speech, erythema of the chest and hoarse/raspy voice, occurring between five and ten minutes following administration of the first dose of mRNA-1273 vaccine. The patient was treated with 2 shots of epinephrine, was transported to the hospital and received and IV solumedrol, after which symptoms improved. Based on the information provided and temporal association, the event is assessed as possibly related to mRNA-1273. The patient's medical history of multiple allergies could have contributed to the event. Further information has been requested.

generalized itchiness; woke up with headache; feeling fatigued; anaphylactic reaction; right arm started going numb; right arm was tingling; A spontaneous report was received from a 26-year-old, female consumer who received Moderna's COVID-19 vaccine and experienced anaphylactic reaction, right arm numbness and tingling, headache, fatigue, and generalized itchiness. The patient's medical history was not provided. No relevant concomitant medications were reported. On 23 Dec 2020 prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: OU520A/011520A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 23 Dec 2020, within minutes of receiving the vaccine, the patient experienced an anaphylactic reaction and was rushed to the emergency room (ER). When transported to the ER she began to experience throat swelling, redness of arms and chest, trouble breathing with lower chest pain shooting into lungs, and numbness with tingling in her right arm. Treatment for the event included epinephrine, steroids, and diphenhydramine. She was released from the ER on 23 Dec 2020. On 24 Dec 2020 patient awoke with a headache, fatigue, and generalized itchiness. Treatment for the event included ibuprofen and diphenhydramine. Action taken with the second dose of mRNA-1273 in response to the event was not reported. The outcome for the events, anaphylactic reaction, right arm numbness and tingling, were reported as resolved on 23 December 2020. The events of headache, fatigue, and generalized itchiness were considered resolving.; Reporter's Comments: This case concerns a 26-year-old female patient who received their first of two planned doses of mRNA-1273 (Lot OU520A/011520A), and who experienced the unlisted events of anaphylactic reaction, right arm numbness and tingling, and generalized itchiness, and the listed events of headache and fatigue. The events were considered to be possibly related to the vaccine due to the temporal relationship with onset on the day of vaccination.

Anaphylactic reaction; Chest pressure; Rash (on neck,belly and arm); Metallic taste in mouth; Hot flashes; Headaches; A spontaneous report was received from a 49-year-old female nurse, who was also a patient, who received Moderna's COVID-19 vaccine and experienced anaphylactic reaction, chest pressure, rash (on neck, belly and arm), metallic taste in mouth, hot flashes and headaches. The

patient's medical history was not provided. No relevant concomitant medications were reported. On 22 Dec 2020, at 7:00 pm, approximately 15 minutes prior to the onset of the events, the patient received her first of two planned doses of mRNA-1273 intramuscularly, for prophylaxis of COVID-19 infection. On 22 Dec 2020, approximately 15 minutes after the mRNA-1273 vaccination, the patient experienced anaphylactic reaction, chest pressure, rash (on neck, belly and arm), metallic taste in mouth, hot flashes and headaches. She was taken immediately to the emergency room. Laboratory values included a negative troponin level and low potassium at 3.3. All other laboratory results were normal. Treatment included prednisone for five days, diphenhydramine hydrochloride, famotidine and paracetamol. Action taken with mRNA-1273 in response to the events was not reported. The outcome for the events, anaphylactic reaction, chest pressure, rash (on neck, belly and arm), metallic taste in mouth, hot flashes and headaches was not reported The causality assessment for the events, anaphylactic reaction, chest pressure, rash (on neck, belly and arm), metallic taste in mouth, hot flashes and headache was not reported.; Reporter's Comments: This case concerns a 49-year-old, female patient who received their first of two planned doses of mRNA-1273 (Lot-# and expiration date -unknown), reporting an unexpected event of anaphylactic reaction, chest pressure, rash, metallic taste in mouth, hot flush and an expected event of headache. The events occurred the same day, 15 minutes after vaccine administration. The reporter did not provide the causality assessment for the events. Due to the temporal association between the events and administration of the vaccine, a causal relationship cannot be excluded, and the events are assessed as possibly related to vaccine.

Anaphylactic type of reaction; A spontaneous report was received from a female consumer who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced an anaphylactic type of reaction. The patient's medical history was not provided. Concomitant product use was not provided by the reporter. On an unknown date, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On an unknown date, after receiving the Moderna vaccine, patient reported that she had some adverse side effects and believed she needed an Epi-pen before getting a second dose due to the anaphylactic type of reaction she had. Treatment information was not provided. Action taken with mRNA-1273 in response to the event was not provided. The outcome of the event, anaphylactic type of reaction, was not reported.; Reporter's Comments: This case concerns a female patient of unreported age. The patient's medical history is not provided. The patient experienced an unexpected event of anaphylactic type of reaction. The event occurred on an unknown date and unknown duration after receiving the first dose of mRNA-1273. Very limited information regarding this event has been provided at this time. Based on temporal association between the use of the product and the event, a causal relationship cannot be excluded. Additional information about the event details are required for further assessment.

"I developed symptoms on 29Dec2020 and test obtained on 30Dec2020. My results are back today and I'm positive.; I developed symptoms on 29Dec2020 and test obtained on 30Dec2020. My results are back today and I'm positive.; This is a spontaneous report from a contactable other HCP (healthcare professional) who reported for himself. A male patient of unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) via an unspecified route of administration on 16Dec2020 (at an unspecified age) as a single dose for COVID-19 immunization. Medical history and

concomitant medications were not reported. The patient tested positive for coronavirus on 30Dec2020. It was reported that the patient obtained his first Pfizer vaccine dose on 16Dec2020. The patient reported that he was a physician assistant and worked in a dedicated COVID patient care area. The patient developed symptoms on 29Dec2020, and a test was obtained on 30Dec2020. The patient's results were back ""today"" and he was positive. The patient was scheduled for his second dose of the vaccine on 06Jan2021. He reported that he would cancel that because he would still be in his 10-day isolation period. Given those circumstances, the patient inquired as to ""when would be the most ideal time to obtain my second dose of the vaccine? When should I take my second dose of the vaccine if I contracted COVID after receiving the first dose?"" The clinical outcome of the event ""I developed symptoms on 29Dec2020, and test obtained on 30Dec2020. My results are back today and I'm positive"" was unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender's Comments: Based on a compatible temporal asociation, a causal relationship between event ""patient developed symptoms on 29Dec2020 and test obtained on 30Dec2020. was positive"" (coded to Drug ineffective / COVID-19) and BNT162B2 vaccine cannot be completely excluded."

person then became symptomatic and tested positive within 7 days of receiving the vaccine; person then became symptomatic and tested positive within 7 days of receiving the vaccine; This is a spontaneous report from a contactable pharmacist. A patient of unspecified age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE lot number and expiration date unknown) via an unspecified route of administration on an unspecified date (at an unknown age) at an unknown dose for COVID-19 vaccination. The patient's medical history was not reported. The patient's concomitant medications were not reported. The patient became symptomatic and tested positive within seven (7) days of receiving the COVID-19 vaccine. The patient underwent lab tests and procedures which included sars-cov-2 test: positive on an unspecified date. The clinical outcome was unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

Complete loss of smell and taste; Complete loss of smell and taste; This is a spontaneous report from a contactable physician reported for herself. A 37-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; brand: PfizerbioNtech, lot number: EH9888) intramuscularly at left arm on 17Dec2020 at 03:00 PM at a single dose (dose number: 1) for COVID-19 immunization. Medical history was reported as none. No known allergies (no allergies to medications, food, or other products). The patient was not pregnant. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No other medications the patient received within 2 weeks of vaccination. Facility where the most recent COVID-19 vaccine was administered was at hospital. The patient experienced adverse event complete loss of smell and taste on 19Dec2020 at 07:00 AM. The event was considered as serious due to resulted in disability or permanent damage. No treatment received for the event. The outcome of

event was not resolved. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events complete loss of smell and taste cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

ball palsy, facial dropping; painful shingles; This is spontaneous report from a contactable consumer reported for herself. A 47-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; batch/lot number: EK5730; dosage form: injection) via an unspecified route of administration as injection to left arm on 24Dec2020 at 7:30 am at a single dose for COVID-19 immunization. Relevant medical history and concurrent conditions included slight hypertension from Jul2020 and ongoing. Concomitant medications included lisinopril from Jul2020 and ongoing for slight hypertension. The patient developed ball palsy, facial dropping which did not lasted long but she still had the painful shingles on 27Dec2020, after the first dose. She wanted to know the recommendations for taking the second dose which is due in 10 days. The patient wanted to know if she should receive the shingles vaccine. This caller was a lab tech who works in the healthcare industry and manages a medical office; but clarified she did not call on behalf of a healthcare professional. She was the patient who received her first dose of Pfizer SARS-CoV-2 Vaccine on 24Dec2020. She reported onset of what the Urgent Care Physician believed was Shingles on 27Dec2020. She called to ask if she should or should not receive the second dose of Pfizer SARS-CoV-2 Vaccine on 14Jan2021 as scheduled due to the Shingles. The Urgent Care Physician advised her to still get the second dose, as there was about a 1:10,000 chance of developing shingles with the vaccine. She reported shingles as a reaction subsequent to the Pfizer SARS-CoV-2 Vaccine. Initially on 27Dec2020 she developed sites of what she thought were canker sores or fever blisters in her mouth which had gotten pretty large and stopped her from being able to eat on 29Dec2020. Then on 30Dec2020 she developed sites on her face which have gotten scarily large; and was causing some deep nerve pain going to her eye and down her chin; the sites felt like lesions on her face with roots. The sites in her mouth were now completely gone; but the sites on her face are ongoing. Now it has kind of taken over her face. She saw the Urgent Care Physician regarding this who believed the sites to be shingles. She had never had fever blisters or shingles before this event. She was still kind of reeling. The report was reported as non-serious. The outcome of event ball palsy/facial dropping was resolved and of shingles was unknown.

received the Covid 19 vaccine/then tested positive for the virus/symptomatic; received the Covid 19 vaccine/then tested positive for the virus/symptomatic; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 17Dec2020 at a single dose as Covid 19 vaccine. Medical history and concomitant medications were not reported. It was reported that the patient received the Covid 19 vaccine on 17Dec2020 and then tested positive for the virus on an

unspecified date. She was scheduled to have the second vaccine on 07Jan2021, but she was not able to go to work because she's still symptomatic. She would like to know if there's an extension to the 21 days since she has the virus now. The outcome of the events was unknown. Information about Lot/Batch number is requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available.

developed UTI very quickly; Puffy face and eyes; Puffy face and eyes; Burning inside digestive tract; Diarrhea; Dehydrated; arm pain; Headache; At bedtime neck stiffness began and worsened; This is a spontaneous report from a contactable healthcare professional. A 39-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EL3246/expiration date unknown), dose number 1, via an unspecified route of administration on 02Jan2021 10:30 at a single dose on the left arm for COVID-19 immunization. The patient had no relevant medical history. Concomitant medications included alprazolam (XANAX). The patient experienced arm pain and headache 4 hours post injection requiring Excedrin. At bedtime, neck stiffness began and worsened. She was treated with lidocaine patches and Aleve. She developed diarrhea 33 hours post injection. She went ER because she was dehydrated. She developed UTI very quickly by hour 35 post injection. She had puffy face and eyes, and burning inside her digestive tract. She was treated with Benedryl at home for allergic reaction, Toradol for pain, IV fluids for dehydration and Keflex for infection. The patient was not diagnosed with COVID-19 prior vaccination and was not tested for COVID-19 since vaccination. The outcome of the events was recovering.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of event Dehydration cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"vomited; diarrhea; a severe headache; severe muscle pain; severe fatigue like being ""beat up in a bar""; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot and expiry not reported), via an unspecified route of administration on 28Dec2020 at single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. On 29Dec2020, patient experienced a severe headache, severe muscle pain and severe fatigue; further reported as like being ""beat up in a bar"" for over 1 week. It was also reported that the patient vomited and experienced diarrhea on an unspecified date. The patient was also inquiring if there is difference between the symptoms in dose 1 and 2. Outcome of events was unknown. Information of lot and batch number has been requested.; Sender's Comments: Based on the available information and known BNT162B2 vaccine safety profile, a causal relationship between events severe headache, severe muscle pain and severe fatigue and BNT162B2 vaccine cannot be excluded. The impact of this report on the benefit/risk profile

of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

Bell's Palsy; This is a spontaneous report from a contactable physician (patient). A 62-years-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular on left arm on 19Dec2020 19:00 at single dose for COVID-19 immunisation. Known allergies: No. Other medical history: None. No other vaccine in four weeks. No other medications in two weeks. The patient experienced bell's palsy on 03Jan2021 21:00 and required visit to physician office. Covid test type post vaccination: Nasal Swab (PCR) on 29Dec202: Negative. Therapeutic measures were taken as a result of bell's palsy included Prednisone, Valtrex. Outcome of event was not recovered. Information on the lot/batch number has been requested.; Sender's Comments: Based on a compatible association, causality between event Bell's palsy and BNT162B2 vaccine cannot be completely excluded. The case will be reevaluated should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"Tested positive with covid 19 with symptoms; Tested positive with covid 19 with symptoms; This is a spontaneous report from a contactable healthcare professional. A male patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date were not reported), via an unspecified route of administration on 22Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient stated, ""I received the covid 19 vaccine on 22Dec; was supposed to have 2nd dose on 12Jan2021. Tested positive with covid 19 on 01Jan2021 with symptoms. I want to know how long I need to wait to get the second dose"".The outcome of the events was unknown. Information on the lot number has been requested.; Sender's Comments: Although, BNT162B2 vaccine immunogenicity is not in full effect after short time (10 days in this case) of first dose administration, a causal relationship between event ""Tested positive with covid 19 with symptoms"" (coded to Drug ineffective / COVID-19) and BNT162B2 vaccine cannot be completely excluded."

"received covid vaccine then contracted covid-19, 9 days after getting the vaccine; received covid vaccine then contracted covid-19, 9 days after getting the vaccine; This is a spontaneous report from a contactable physician. A male patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date were not reported), via an unspecified route of administration on Dec2021 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. It was stated, ""received covid vaccine then contracted covid-19, 9 days after getting the vaccine, should he get his 2nd dose which is on Friday? Tested positive on the 30th, received monoclonal antibody infusion on the 31st. Any information regarding this?"". The outcome of the event was unknown. Information on the lot number has been requested.; Sender's Comments: Although, BNT162B2 vaccine immunogenicity is not in full effect after

short time (9 days in this case) after first dose administration, a causal relationship between event ""received covid vaccine then contracted covid-19"" (coded to Drug ineffective / SARS-CoV-2 test positive) and BNT162B2 vaccine cannot be completely excluded."

"Bell's palsy/Face was turning side ways; This is a spontaneous report from a contactable nurse. A female patient of unspecified age received BNT162B2 (reported as ""Covid-19 Vaccine, manufacturer: Unspecified"", Batch/lot number: not provided) via unspecified route of administration on unspecified date at single dose for COVID-19 immunization. Medical history and concomitant medication were not reported. A woman received a Covid vaccine. She did not know which one. The woman experienced Bell's Palsy. The woman was crying and her face was turning sideways. Outcome of the event was unknown. Pfizer is a marketing authorization holder of Covid-19 Vaccine in the country of incident or the country where the product was purchased (if different). This may be a duplicate report if another marketing authorization holder of Covid-19 Vaccine has submitted the same report to the regulatory authorities. Information on the Batch/Lot number has been requested.; Sender's Comments: Based on a compatible temporal relationship, causality between reported event Bell's Palsy and BNT162B2 vaccine cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

memory care patients received Pfizer-BioNTech covid vaccine, and then were diagnosed with COVID, all three had COVID symptoms; memory care patients received Pfizer-BioNTech covid vaccine, and then were diagnosed; This is a spontaneous report from a contactable other health professional. This reporter reported same events for three patients. This is first of three reports. A patient of unspecified age and gender received BNT162B2 (Pfizer BioNTech COVID vaccine), via an unspecified route of administration on an unspecified date at single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The memory care patient received Pfizer-Biontech Covid vaccine, and then was diagnosed with Covid and had Covid symptoms on an unspecified date, the patient was scheduled to receive monoclonal antibody. Event took place after use of product. The outcome of events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to possibly short number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information,Linked Report(s) : US-PFIZER INC-2021004747 same reporter/product/event, different patient;US-PFIZER INC-2021004748 same reporter/product/event, different patient

Diagnosed with COVID; Diagnosed with COVID; This is a spontaneous report from a contactable other health professional. This reporter reported same events for three patients. This is second of three reports. A patient of unspecified age and gender received BNT162B2 (Pfizer BioNTech COVID vaccine),

via an unspecified route of administration on an unspecified date at single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The memory care patient received Pfizer-Biontech Covid vaccine, and then was diagnosed with Covid and had Covid symptoms on an unspecified date, the patient was scheduled to receive monoclonal antibody. Event took place after use of product. The outcome of events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. had a positive test for COVID; had a positive test for COVID; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect from a contactable physician who reported for himself. A male patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 19Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. Patient had a PCR COVID-19 swab performed on 23Dec2020 which returned positive on 26Dec2020. The action taken in response to the event for bnt162b2 was not applicable. Outcome of the event was unknown. Information for lot number has been requested in follow up activity.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for

the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

positive COVID-19 test with symptoms; positive COVID-19 test with symptoms; This is a spontaneous report from a non-contactable pharmacist via Pfizer Sales Representative. A 25-year-old male patient (nurse) received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiration date unknown as did not have this information), via an unspecified route of administration in Dec2020 (reported as received either 17Dec2020 or 18Dec2020) at single dose for COVID-19 immunization in hospital. The patient's medical history and concomitant medications were not reported. One of the reporter's employees (patient) got the COVID-19 Vaccine. Ended up testing positive for COVID probably due to patient care. Patient was taking care of two to three people who were not positive for COVID while in the hospital, but tests came up as positive. Patient developed symptoms in Dec2020 and tested positive for COVID on 24Dec2020. Patient received COVID-19 Vaccine either 17Dec2020 or 18Dec2020. Began coughing three to four days after vaccination in Dec2020. Rapid test was negative in Dec2020. On 24Dec2020, the M20 test came back as positive for COVID. Only other symptom patient experienced was loss of taste and smell in Dec2020. Had been a stressful situation for the patient. The outcome of the events was unknown. Information on the Lot/ Batch number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

encephalitis; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender received BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE) , via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient was allergic to UTI(urinary tract infection) infection medication (i.e. sulfamethoxazole, trimethoprim etc.). Concomitant medications were not reported. The patient got encephalitis and was put in the ICU(intensive care unit) after getting vaccinated, led to hospitalization. Outcome of event was unknown. Information about lot/batch number has been requested.

Anaphylactic reaction

Pronounced dead 1/9/2021 at 12:42. Received first dose of vaccine 1/8/2021

"Staff member checked on her at 3am and patient stated that she felt like she couldn't breathe. 911 was called and taken to the hospital. While in the ambulance, patient coded. Patient was given CPR and ""brought back"". Once at the hospital, patient was placed on a ventilator and efforts were made to contact the guardian for end of life decisions. Two EEGs were given to determine that patient had no brain activity. Guardian, made the decision to end all life saving measures. Patient was taken off the ventilator on 1/9/2021 and passed away at 1:30am on 1/10/2021. The initial indication from the ICU doctor was the patient had a mucus plug that she couldn't clear."

Aprox 5 minutes after vaccine was given, patient stated he was not feeling well, asked for water and stated he was having trouble breathing. Was then assisted to clinic treatment room, vitals were taken: 08:45 B/P 171/110, HR 84, R 28 O2 97. EMS was activated. At 0900 158/94 HR 84 R 24 O2 97. Patient then voice he was having tightness in his throat. Epi Pen 0.3mg administered at 0900. At 0904 EMS arrived and patient taken to the nearest hospital.

Numbness and tingling bil upper extremities, seizure, temporary paralysis R arm. Started day after vaccine given, was observed overnight in hospital.

"Manager was notified that the employee had suffered a stoke-like ""serious medical event"" hours after the end of her shift, while at home."

Patient had vaccine in Left arm. That same night patient had temp of 100.1 and the right neck at base of head to shoulder began to hurt patient was unable to swallow without pain in the next few days. Patient went to ER and was hospitalized for 2 days treated with IV steroids and 2 antibiotics (clindamycin and acyclovir). Patients symptoms resolved and patient was discharged without additional issues. The admitting physician was unable to identify the cause of these symptoms, but the vaccine could not be ruled out.

"1-2-2021 10:30 PM Complained Right arm/back hurt - took Tylenol 1-3-2021 Complained Right arm hurt, dizzy 1-4-2021 Felt better - did laundry, daughter found her deceased at 3:30 pm. Dr. at hospital said it was ""cardiac event"" according to death certificate."

Upon assessment resident noted to have increased respirations, lungs CTA. Resident c/o increased fatigue and muscle aches. VS 202/180, 118, 22, 97.1, 96%.

Sever thrombocytopenia (platelet count 2,000) 8 days following Moderna COVID vaccine. Clinically suspicious for ITP.

Received vaccine on 1/5, began having swelling in bilateral hands and lower extremities on 1/7, along with fatigue. On 1/8 she reports new swelling started in her face (eyes and cheeks). Swelling has not improved today and fatigue has worsened.

Found on floor by CNA at 6 am. On assessment by charge nurse, VS: 99.6-94-16 212/105 manual. Noted increased confusion. Temp. 99.6 FBS 114. Resident had been provided tylenol just prior in shift for general discomfort (sore muscles) and low grade temp. On call for Dr notified of all and received order to send to ER.

Staff reported that patient was found Friday morning (Jan 8) sitting at a table with his head tilted forward and unresponsive to verbal or physical stimuli. Staff lowered patient to floor and started CPR. EMS was called and continued CPR at scene, however they were not able to revive patient. Patient was pronounced dead at the scene. Staff written statements following the death of patient show that he had a fall about 1 hr. prior. It is unknown if this fall contributed to patient's death. An autopsy has been requested.

Acute anterior MI with death

Approximately 15 minutes after receiving the vaccine, client started c/o itching to face and lips. Transported to triage area. Where she started c/o burning lips also. vital signs monitored, Benadryl 50mg po given. In a few minutes she reported chest tightness, labored breathing. 1:44pm Epinephrine was given IM. client was on 02 increased to 15 Liters. She admits to decreased chest tightness and itching of face improving. She was taken by ambulance to hospital, where she was admitted overnight for observation. She was given Benadryl and epi X2 more time, once in ambulance and once at the hospital. She denies any problems since then. She did say that approx 3 weeks ago she was a contact to a case of covi

Patient is a 41 y.o. female who presented to the ED with complaints of a reaction after she took the COVID vaccine. Patient is an RN here and had earlier received COVID-19 vaccination (Moderna) around 0130 this afternoon. Soon after she experienced rash which was burning and itchy on her arms thighs and back. She reported to Occ health and was directed to the ED. While in the ED she experienced throat tightness and nausea. She had one episode of diarrhea. No tongue, lip swelling, SOB or difficulty swallowing. Denies any chest pain, palpitations, pre-syncope/syncope. No vomiting abdominal pain. H/o of allergy to fish mix and dust mite.

01/06/21 at 6 pm, body aches, and chills 01/07/21 at 12am T102.2, SPO2 62% on room air. Was sent to ER and returned. 01/08/21 at SPO@ less then 60% on room air, non responsive to verbal tactile stimuli. Responsive to sternal rub only. Was sent to ER and admitted to ICU.

The resident resides in an independent living facility/apartment. The reporter at the center was informed by his daughter he was not feeling well on 1/1/2021 (specific symptoms could not be ascertained). He reportedly went to be COVID tested on 1/1/2020 and observed to be deceased in his apartment on 1/2/2020. I do not have confirmation of his COVID results, although the reporter indicates his daughter reports his test was positive.

Patient went to bed around 11pm on Saturday PM and sometime between then and 1:30am on Sunday morning got up and went into the living room without waking up her husband (which is normal). At 1:30am, the husband got up to use the restroom and she was out of bed then, but the husband did not know if she was having any problems at this time. When he got up at 7:45am, she was in the recliner and did not move or anything, which is normal for her. At 8:45am, the husband went back into the living room and tried to wake his wife and that is when he noticed there was no pulse and he called 9-1-1 at this time. EMS got on scene and did CPR for 30 mins and she was pronounced dead at 9:21am.

Approximately 10 minutes after receiving the vaccine she started experiencing numbness and inability to move all 4 extremities. No difficulty breathing or swallowing. Benedryl 25 mg was administered with no relief. EMS was called, she was transported to the ED and admitted to the hospital for evaluation. She was given Ativan 0.5 mg IV with some mild improvement in symptoms. She has had gradual improvement in her symptoms, now able to move her arms normally. She has persistent weakness and discomfort in both lower extremities and is unable to ambulate without assistance.

1/8/2021 tachycardia Pulse 140, Fever T99.4 then 100.2 Lethargy, Somewhat Altered Mental status

"Her voice became raspy, she could hardly talk, she could barely talk; her hand and whole arm swelled up; her hand and whole arm swelled up; Trouble breathing; This is a spontaneous report from a contactable healthcare professional (patient). A 57-year-old female patient received the 1st dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech) (lot# EK9231, exp date Apr2021), via an unspecified route of administration in the right arm, on 29Dec2020, at single dose, for COVID-19 immunization and diphenhydramine hydrochloride (BENADRYL), via an unspecified route of administration, at unknown posology, on 29Dec2020 (20 minutes prior to taking bnt162b2), for anaphylactic reaction. Medical history included ongoing thyroid disorder. Concomitant medications included apixaban (ELIQUIS), diltiazem (unknown trade name), losartan (unknown manufacturer), rosuvastatin calcium (CRESTOR), levothyroxine (unknown trade name), ongoing levothyroxine sodium (SYNTHROID) for thyroid disorder and metformin (unknown trade name). Previously the patient received unspecified influenza vaccine (reported as flu shot) for immunisation, on unspecified date, and experienced anaphylactic reaction treated with Benadryl. On 29Dec2020, an hour after getting the vaccine, the patient experienced her voice became raspy, she could hardly talk, she could barely talk with outcome of unknown, her hand and whole arm swelled up with outcome of unknown, trouble breathing with outcome of unknown. The reporter stated that her voice and everything reacted and made her go to the emergency room on 29Dec2020. She reported that had adverse effect more than normal. The event ""Her voice became raspy, she could hardly talk, she could barely talk"" caused patient's hospitalization on unknown date. The action taken as a result of the events with diphenhydramine hydrochloride was post-therapy. Therapeutic measures were taken at the emergency room as a result of the events and included treatment with Topcid and Benadryl every 6 hours, 2x 40 mg of steroid. The information on the lot/batch number has been requested. Follow-up (02Jan2021): New information received from the same contactable healthcare professional reporting for herself includes: patient's details, medical history, events updated, vaccine lot# and exp date, concomitant, seriousness of event ""Her voice became raspy, she could hardly talk, she could barely talk"" added as hospitalization, historical vaccine, suspect Benadryl details, therapeutic measures updated.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate."

Resident died suddenly and expectantly on 01/05/2021

Patient received COVID-19 (Moderna) vaccine from the Health Department on afternoon of January 8, 2021 and went to sleep approximately 2300 that night. Was found unresponsive in bed the following morning and pronounced dead at 1336 on January 9, 2021

Chills Hip pain

Resident had seizure like activity followed by a vagel response with large bowel movement. Resident then began to show signs of blood clot to left lower extremity. No pedal pulse, area on leg warm to touch. Left lower leg now cold to touch, stiff, purple and white in color. No other signs of modeling, body warm to touch, no fever noted. Respirations and pulse increased with low oxygen levels. Resident not responding to stimuli.

38-year-old female who is healthcare worker and received first dose of COVID vaccine (Pfizer). Immediately after receiving the vaccine, patient developed lightheadedness, flushing, hives, wheezing and throat swelling. Patient was treated in an emergency department with epinephrine, gradually improved and was able to be sent home with an EpiPen, prednisone, hydroxyzine, and famotidine. The next day, patient again developed shortness of breath and her husband administered the EpiPen. EMS arrived and gave another dose of IM epinephrine and IV diphenhydramine. On arrival to the emergency department, the patient was altered, diaphoretic, tachypneic, tachycardic, and stridulous. Patient was given multiple doses of IM epinephrine and started on epinephrine drip. Stridor continued and was unresponsive to nebulized albuterol. Patient was then intubated and placed on mechanical ventilation. Other treatments included solumedrol, pepcid, magnesium sulfate, nebulized epinephrine, and IV fluids. admitted to the intensive care unit, weaned off epinephrine drip, and extubated the next day. Patient was monitored on hospital floor for one additional day and was then discharged with no residual symptoms.

Patient had a rash prior to COVID vaccine. Prednisone 10mg started on 1/5/21 (only one dose administered) 1/6/21, 1am - Rash worsened with increase redness, warmth and extending of body surface, Temp 100.4, 1/6/21, 1:20am Benadryl 25mg administered, (Keflex was ordered at this time, however never administered). 1/6/21, 3am rash improved, temp 99.1 1/6/21, 6:50am Right facial droop and right sided weakness, sent to ER 1/6/21 transferred to hospital, continues to be hospitalized 1/11/2021

Patient expressed: Pain in the left side of the face and migraine on 25Dec2020, and came to emergency room where apparently they diagnosed facial paralysis; Patient expressed: Pain in the left side of the face and migraine on 25Dec2020, and came to emergency room where apparently they diagnosed facial paralysis; This is a spontaneous report from a contactable nurse. A 42-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number EK5730) intramuscular, on 17Dec2020 04:15, single dose arm left for COVID-19 immunization. Relevant medical history included hypothyroidism, hypertension, hyperlipidemia, obesity, and penicillin allergy. Concomitant medications included levothyroxine sodium (SYNTHROID), butalbital, caffeine, paracetamol (FIORICET 50-40- 325mg), dexamethasone 4mg Inj., diclofenac (VOLTAREN 1% Gel), Magnesium, valsartan (VASOFLEX) (pending confirmation), cyanocobalamin (VITAMIN B12), losartan potassium. The patient was not pregnant and did not received any vaccine in four weeks. The patient previously took cephalosporin and experienced allergy. On 24Dec2020, the patient experienced pain left side of the face and migraine, and came to emergency room where apparently they diagnosed facial paralysis. The events resulted in emergency room visit/ urgent care where the patient was administered dexamethasone 4mg Inj, Medrol dose pack, Vit B12 500mcg, and Fioricet 50-325-40. Facility where the most recent COVID-19 vaccine was administered was in the doctor's office/urgent care. It was unknown if the patient was diagnosed with

COVID-19 prior or since the vaccination. The events were assessed by the nurse as non-serious. Outcome of the events was recovering at the time of the report.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

HPI narrative: Patient was fine until 2 days ago. Patient does have chronic dementia but got Covid vaccine 11:00 2 days ago and that night seem to be confused and not able to walk since then. Patient poor appetite since yesterday. Patient had diarrhea 3 x 2 days ago. No vomiting no fever no cough does not appear to be short of breath. Patient also with left hip pain for few days with no injury.All history obtained from caretaker at bedside.

Started as a red raised rash under my arms and my waistline; rash turned to hot to touch; raised red large hives all over my body including my face/head; numbness to my hands/feet/chest area; the SOB started; This is a spontaneous report from a contactable nurse, the patient. A 53-year-old non-pregnant female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EU9231), via an unspecified route of administration in the left arm on 30Dec2020 at 08:30 as a single dose for COVID-19 immunization. Medical history included hypothyroidism and chronic low back pain. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included levothyroxine (MANUFACTURER UNKNOWN), baclofen (MANUFACTURER UNKNOWN), and etodolac (MANUFACTURER UNKNOWN). The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient previously took miconazole nitrate (MONISTAT) on unknown dates for an unknown indication and experienced drug allergy. On 31Dec2020 at 10:00, the patient started with a red raised rash under her arms and waistline and as the day progressed the rash turned hot to touch with raised red large hives all over her body including her face/head. By 23:00 on 31Dec2020, the patient had already taken 3 doses of diphenhydramine (BENADRYL) which was not effective. Then, later on 31Dec2020, shortness of breath started with numbness in the hands/feet/chest area. Her daughter took her to the emergency room. She was started on intravenous diphenhydramine, dexamethasone, and famotidine (PEPCID). The medications took time to work but they did resolve her shortness of breath and the hives subsided to mild redness. She was sent home and given the following medications to take: diphenhydramine 50 mg every 4 hours, methylprednisolone (MEDROL DOSE PAK), cetirizine (ZYRTEC) daily, and famotidine (PEPCID) daily. Since the vaccination, the patient had not been tested for COVID-19. The clinical outcomes of the red rash, rash was hot to touch, shortness of breath, and numbness, were reported as recovered with lasting effects; while that of the hives was recovering as they still flared up if she did not take the medications every 4 hours. The reporter assessed all the events as non-serious.; Sender's Comments: The reported shortness of breath together with red rash was probably related to the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE together with rash was probably related to the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), due to temporal relationship and clinical course. The impact of this report on the

benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory authorities, Ethics committees and Investigators, as appropriate.

Rectal bleeding; Stomach ache; Diarrhea; sick; This is a spontaneous report from a contactable consumer (patient) from a Pfizer sponsored program Pfizer First Connect. A 41-year-old female patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: EK5730 and Expiration Date: 31Mar2021), via an unspecified route of administration in the right arm on 20Dec2020 at a single dose for COVID-19 immunization. The patient's medical history was reported as none. There were no concomitant medications. On 01Jan2021, the patient experienced: rectal bleeding, stomachache, diarrhea, sick; all assessed as medically significant. The clinical course was reported as follows: The patient received the first dose of the COVID-19 vaccine on 20Dec2020; as she was at high risk due to working with COVID patients in the hospital. The patient became sick on 01Jan2021. The patient experienced a stomach-ache, diarrhea, and rectal bleeding. When these events occurred, the patient went to the emergency room (ER). A doctor there prescribed the patient the antibiotics metronidazole 500 mg and cefdinir 300 mg. The patient was also scheduled to follow up with a gastrointestinal (GI) doctor. The patient called asking if she should get the second dose since she was taking antibiotics. The patient was scheduled for the second dose on 08Jan2020.The patient reported she had improved. The symptoms, at the time of the report, were not that bad. Therapeutic measures were taken as a result of rectal bleeding, stomachache, diarrhea, and sick. The clinical outcome of the events was recovering.

Numbness lips,mouth; Was feeling bad; leg numbness/numbness in head, face; pain in head; increased BP; blood pressure was up and down; This is a spontaneous report from a contactable consumer (patient). A 55-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL0140) via an unspecified route of administration in left arm on 29Dec2020 6 am at single dose for covid-19 immunisation. Co-suspected drug amoxicillin;clavulanic acid (AUGMENTIN, Batch/lot number: KN4291, Expiry Date: Mar2022) by mouth from Dec2020 to 28Dec2020 at 875mg, 1 tablet twice daily for pain or infection; MOXIFLOXACIN HYDROCHLORIDE (AVELOX, strength:400mg) by mouth from 29Dec2020 and ongoing at 400mg, 1 tablet once daily for infection; fluconazole (DIFLUCAN, strength:200mg) orally (by mouth) from unknown date and ongoing at 200mg, 1 tablet once daily for Infection.The patient's medical history was reported as ongoing high blood pressure, ongoing pains in her fingers and toes and they thought she had an infection from 02Dec2020, white count went down on 09Dec2020, ongoing pain was up and down. No other vaccines given at that time and none given 4 weeks prior. Had a Flu shot back in Oct2020, but no problems. None diagnosed allergies and family medical history relevant to adverse event. The concomitant medications included unspecified blood pressure medication by mouth daily for high blood pressure. She had also started 2 antibiotics around the same time that she received the vaccine. No further details provided Was on antibiotics at the time she was given the Pfizer COVID-19 vaccine. Patient experienced increased BP/ high blood pressure, pain in head, and leg numbness; all started 2 days (on 31Dec2020) after receiving the vaccine and persisted for 48 hours. First her blood pressure was up and they had to get it

stable and had numbness in her head, face, and mouth for 48 hours. Her blood pressure was up and down and she has history of blood pressure and takes medicine. Was taken off work for a few hours and went to the emergency department on Fri night about 2am. Her blood pressure was 170/92 on 01Jan2021. Not sure if this was related to the vaccine, but the numbness in her head started from her upper neck to face to the right side of her check and she also had leg numbness. Wanting to know if this was related because she was worried about getting the second dose. Had a hard time for 48 hours. Weight was between 150-155 pounds. Stated everything improved after 48 hours. Her lip was also just a little bit numb, but it is feeling better. Patient was feeling bad from 01Jan2021, all Fri and Sat and much better by Sun. Events of increased BP/ blood pressure up and down, leg numbness, numbness in lips, head, face, mouth with emergency room visiting. Wanted to know if she should have the second dose. The action taken in response to Augmentin was permanently discontinued on 28Dec2020, for Avelox and Diflucan was dose not changed. The outcome of events was recovering.

eventually inability to move arm; pain; joint pain; tenderness at injection site; loss of strength; This is a spontaneous report from a contactable nurse. A 36-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Batch/lot number: EJ1685) intramuscular at arm left, on 19Dec2020 06:45 at single dose for covid-19 immunisation. Medical history included ongoing acne. Patient had no known allergies. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Concomitant medication included isotretinoin (ACCUTANE). On 19Dec2020 11:30, approximate 5 hours after vaccine, the patient experienced pain, joint pain and tenderness at injection site, progressively loss of strength and eventually inability to move arm. Since the vaccination, the patient hasn't been tested for COVID-19. The outcome of events was recovered.; Sender's Comments: Based on the compatible temporal association, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the reported events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

she is positive for blood in her stool; left hip/back/kidney pain; left hip/back/kidney pain; left hip/back/kidney pain; This is a spontaneous report from a contactable consumer reporting for herself. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number and expiration date unknown) via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the vaccine on 28Dec2020 (reported on 05Jan2021 as 'a week ago Monday'). After getting the vaccine (2-3 days after getting the vaccine) she started to have some events happen that she was not sure were side effects from the vaccine. She mentioned she started to experience blood in her stool - following a test at her doctor's she was positive for blood in her stool. Also, the left side of her lower back and hip started hurting. She was experiencing left hip/back/kidney pain, as reported. She took hydrochlorothiazide. The outcome of the events was unknown. She wanted to know if this had anything to do with the vaccine and if this could be a side effect. These events did

not start happening until after she got the vaccine. Information on the lot/Batch number has been requested.

difficulty of breathing; chest pain; nearly passing out/fainting; This is a spontaneous report from a contactable consumer. A 50-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiry date unknown) via unspecified route of administration on unspecified date at single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter called in behalf of her friend that has been experiencing serious adverse event. The patient experienced difficulty of breathing, chest pain, nearly passing out/fainting on unspecified date. They felt that the vaccination provider did not provide enough support about the adverse event that happened. Follow-up activities are possible, information on the batch number has been requested.

believed it was injected incorrectly because she didn't have pain in her deltoid but she did have all the pain inside her shoulder, like in the bursa; received the first dose 17DEC2020 / received the second dose 4JAN2021; anterior medial shoulder joint/shoulder pain/pain in shoulder after second dose of COVID 19 vaccine; can't actively use shoulder / can't move her arm; weakness in her hand; bone pain; This is a spontaneous report from a contactable healthcare professional (HCP) reporting for herself. A 40-year-old female patient received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EJ1685, expiry date not provided) via an unspecified route of administration in the left arm on 17Dec2020 13:30, and the second dose (lot number EK9231, expiry date not provided)via an unspecified route of administration in the left arm on 04Jan2021 13:30, for COVID-19 immunization. There was no relevant medical history. The patient's concomitant medications were not reported. The patient experienced anterior medial shoulder joint/shoulder pain/pain in shoulder after second dose of the vaccine on 04Jan2021, and couldn't actively use shoulder. She believed it was injected incorrectly because she didn't have pain in her deltoid but she did have all the pain inside her shoulder, like in the bursa, and she couldn't move her arm and felt weakness in her hand. She noticed the pain and all other symptoms immediately when they were injecting it. She told the nurse who said she was tensing up. The events were considered medically significant by the patient. She also reported experiencing bone pain, unable to put in sutures at work. She was taking 600mg Ibuprofen and 1000mg paracetamol (TYLENOL) every 6-8 hours. The events were not resolved. The pain had gotten worse. The other symptoms were persisting.; Sender's Comments: Based on the compatible temporal association, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

SEVERE ABDOMINAL PAIN

"tongue not swollen but felt sluggish/tongue felt strange, it was sluggish to swallow; tongue felt strange like hard to swallow/tongue felt strange, it was sluggish to swallow/Her tongue felt strange; tongue felt strange like hard to swallow/tongue felt strange, it was sluggish to swallow/felt hard to swallow; hot

flash; flush feeling all over her face/flush all over her face/she felt flush; arm was sore; arm was sore and heavy; drowsiness; pain and redness at injection site; pain and redness at injection site; This is a spontaneous report from a contactable nurse reporting for herself. A 36-year-old female patient received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EL1284, expiry date not provided) on 23Dec2020 09:15 intramuscularly in the left arm for COVID-19 immunisation (reported as preventive). There was no relevant medical history and no concomitant medications. The nurse (patient) received her first dose of the vaccine on 23Dec2020 at the hospital that she worked at. She was kept there for 15 min for monitoring and she felt fine. About 30 minutes post vaccination she got a hot flash, a flush over her face, she does not know if she was red but she felt flush. Her tongue felt strange, nothing swelled that she could tell, it felt hard to swallow, to make the motion to swallow it felt kind of sluggish. She felt weird swallowing which lasted for only a few minutes. She never struggled to breathe. She went back to park in the hospital parking lot since she was not sure if she was experiencing a anaphylactic reaction and then after a few minutes it went away. Her arm was sore and heavy feeling for that day. She had drowsiness for a couple of hours and pain and redness at the injection site for a couple of days that was not bothersome, it was mild. No relevant test. She wanted to know if she should get the second dose of the vaccine due to the symptoms she had after the first dose. The pain and redness at injection site was resolved on an unspecified date in Dec2020, while the other events were resolved on 23Dec2020. The reporting nurse considered the events hot flash, flush all over her face, arm was sore and heavy, drowsiness, pain and redness at injection site were non-serious, while the events ""tongue felt strange, it was sluggish to swallow"" were serious that she drove back to the hospital (no emergency room/phycian office visit). She considered the events were related to the vaccine.; Sender's Comments: A possible contributory effect of suspect BNT162Bw on the reported events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

Sudden and rapid onset of generalized Urticaria accompanied by dyspnea; sudden and rapid onset of generalized uritcaria accompanied by dyspnea; This is a spontaneous report from a contactable nurse (patient). A 34-year-old female patient (non-pregnant) received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899), intramuscular on 30Dec2020 11:00 at single dose at right arm for covid-19 immunization. Medical history included Grave's dse, psoriasis, bronchial asthma. Concomitant medication in two weeks included propranolol, methimazole, fluticasone furoate, vilanterol trifenatate (BREO ELLIPTA), colecalciferol (VITAMIN D). Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient previously took adalimumab and experienced drug allergies. The patient was not diagnosed with COVID-19 prior to vaccination. Since the vaccination, patient has not been tested for COVID-19. 9hrs post-vaccine, patient developed sudden and rapid onset of generalized uritcaria accompanied by dyspnea on 30Dec2020 20:00 with outcome of recovered with sequelae. Adverse events resulted in emergency room/department or urgent care. Patient received intramuscular epinephrine, intravenous solumedrol & benadryl, and oral prednisone x5 for events. This report is considered as non-serious.; Sender's Comments: Based on temporal

association, the causal relationship between bnt162b2 and the events urticaria and dyspnoea cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

Facial paralysis; stress; This is a spontaneous report from a contactable Nurse. A 42-year-old female patient received first dose of BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter felt worried about the patient(partner) that had facial paralysis and asked if they could administer the second dose of the vaccine of covid-19 from Pfizer. The paralysis it was previous from the fist dose of the vaccine, a consequences of the stress, the partner had 42 years. The reporter considered that the event was non-serious. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2and the event facial paralysis cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

"experienced symptoms of TIA; Severe aphasia; blurred vision; confusion; short term memory loss; elevated blood pressure; This is a spontaneous report from a contactable Other-HCP(Patient). A 57-year-old female patient received first dose of BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration at right arm, on 22Dec2020 08:15 at single dose for COVID-19 immunization. The patient was not pregnant. Medical history included herpes simplex on lips, post menopause, elevated cholesterol w/lifestyle changes. Known allergies reported as no. Concomitant medication included varicella zoster vaccine rge (cho) (SHINGRIX) for immunization. On 04Jan2021 08:30, the patient experienced symptoms of transient ischaemic attack(TIA), severe aphasia, blurred vision, confusion, short term memory loss, elevated blood pressure. The patient admitted to (Hospital name) (still here, hospitalization days reported as 2). Symptoms resolved except very mild aphasia. The patient had very few risk factors for TIA but did have family history of cardiovascular(CV) disease at young age, low density lipoprotein(LDL) was 192. The patient did not have diabetes, HTN, or known heart disease. She did not have severe anxiety. She did not smoke or use any substances. She walked about five miles 4x a week. Weigh reported as 157. Events reported as serious due to hospitalization. The patient had no Covid prior vaccination. Covid(nasal swab) was tested post vaccination on 04Jan2021, Covid test result was Negative. The event resulted in emergency room/department or urgent care. Treatment received for the adverse event included clopidogrel bisulfate(PLAVIX),

acetylsalicylic acid (ASPIRIN), statin; potassium, CT, MRI, ""telemet"". The outcome of the events was recovering. Information on the lot/batch number has been requested.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported symptoms of transient ischaemic attack(TIA), severe aphasia, blurred vision, confusion, short term memory loss, elevated blood pressure and the administration of BNT162B2, based on the reasonable temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, Agency, as appropriate."

"two skin procedures performed in his surgeons office the day before- one on his nose and one on his arm; nose was still slightly bleeding; This is a spontaneous report from a contactable consumer(patient). áA 72-year-old male patient received first dose of BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 30Dec2020 at single dose for COVID-19 immunization. Medical history included phlebotomy in Sep2020 because his blood was ""too thick"" and he had no history of a clotting problem until the time of the report. The patient's concomitant medications were not reported. He reported having two skin procedures performed in his surgeons office the day before- one on his nose and one on his arm. The surgeon nicked a vein on his arm and it began bleeding again last night. The arm was addressed in the emergency deportment(ED) and was fine at time of the report. His nose was still slightly bleeding. This morning his blood was drawn for a CT scan and it took a little while to get the bleeding to stop. He had a ""phlebotomy"" in Sep2020 because his blood was ""too thick"" and he had no history of a clotting problem until the time of the report. The patient asked if the Covid vaccine act as an anticoagulant. He had not spoken to this HCP yet. He was not on a blood thinner. The reporter considered that the event was non-serious. The outcome of the event arm bleeding/bleeding was recovered, of event ""nose was still slightly bleeding"" was not recovered. á Information about lot/batch number has been requested."

soreness around the injection site; Had severe arm pain; Had a fever on the night of the 31Dec2020 of 101.3; I have painful lymph nodes/the swollen lymph nodes under her right arm, the armpit area had swollen and painful lymph nodes; I have painful lymph nodes/the swollen lymph nodes under her right arm, the armpit area had swollen and painful lymph nodes; had joint pains/knees and hip joint pain; severe fatigue; muscle pain; This is spontaneous report from a contactable nurse (patient). A 59-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK9231), via an unspecified route of administration in right arm on 30Dec2020 14:15 at first single dose (0.3 cc, but really uncertain of dose) for covid-19 immunization. Medical history included COVID virus from Nov2020 to 2020 (The patient was not hospitalized. It was a mild case and lasted about 10 days. she had any positive antibodies at that time. Was off work for about 12 days and was very lucky to have had a very light case with fever, cough, cold, and super fatigue). The patient's concomitant medications were not reported. The patient did not receive any other vaccines at the same time or 4 weeks prior. No problems with vaccinations in past or events. Caller reported she had the first injection of the Pfizer BioNTech COVID-19 vaccine on the 30Dec2020 and having some side effect symptoms and her supervisor recommended for her to report these things, they are not life threatening, obviously, but things were

still lingering. Side effect of severe fatigue started on the 31Dec2020 and lasted for 72 hours. It was so severe, now it is mild. The patient reported soreness around the injection site. Had a fever on the night of the 31Dec2020 of 101.3 and had that for 6 hours then it dissipated and was gone. Had never had a fever after injections before. Had severe arm pain that usually goes along with an injection. It started also that night of 31Dec2020. She had rolled over in the middle of the night and it hurt. That lasted for about 48 hours, but it has improved. Had some muscle aches since 31Dec2020 but that had improved and had joint pains since 31Dec2020. What was worrisome was the swollen lymph nodes under her right arm, the armpit area had swollen and painful lymph nodes, since 31Dec2020. The patient was still having that and that is why she was so concerned because shouldn't that have gone away after a week. Had knee and hip joint pain, but that had improved. Again, mentioned she had never had that before with an injection. The patient received vaccine at her workplace. Some of her coworkers got it the same day and no one else has this. Mentioned she did have COVID virus back in Nov2020 and wonders if this correlates with her getting the vaccine. Was not hospitalized or notified she had any positive antibodies at that time. Was off work for about 12 days and was very lucky to have had a very light case with fever, cough, cold, and super fatigue. This is the same way she felt back when she had the virus back in November. The patient was concerned about having these side effects would it be okay for her to get the next injection in 3 weeks. AEs did not require a visit to emergency room and physician office. No further details provided. Outcome of the events Fever was recovered, of event swollen and painful lymph nodes was not recovered, of events knees and hip joint pain, fatigue, muscle pain, severe arm pain was recovering, of event soreness around the injection site was unknown. The reporter considered the events severe fatigue, fever, swollen lymph nodes and pain under right arm, knees and hip joint pain as serious (medically significant). The reporter considered the events severe fatigue, fever, severe arm pain, muscle ache, swollen lymph nodes and pain under right arm, knees and hip joint pain as related to BNT162B2.; Sender's Comments: Based on the compatible temporal association, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the reported events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

chest pressure; tightness /pressure in throat; Face red; BP 186/90; within 2 min. of injection had near syncope that would come in waves every 2-3 minutes; Headache; rapid HR; Chills; mild cough; Dizziness; fatigue; This is a spontaneous report from a non-contactable health care professional nurse, the patient. A 53-years-old non-pregnant female patient (nurse) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: EJ1685), in the right arm on 28DEC2020 08:15 as a single dose, for COVID-19 vaccination. Facility where the most recent COVID-19 vaccine was administered was a Hospital. Medical history included asthma and gastroesophageal reflux disease from an unknown date and unknown if ongoing. Known allergies include Tape, Walnuts, and Cat hair. Concomitant medication received within 2 weeks of vaccination included acyclovir [aciclovir] (ACYCLOVIR [ACICLOVIR]), ferrous gluconate, herbal nos, vitamins nos (FLORADIX), lansoprazole (PREVACID), cholecalciferol (VITAMIN D [COLECALCIFEROL]). No other vaccines were given within 4 weeks. Prior to vaccination, the patient was not diagnosed with COVID-19. On 28DEC2020 08:15 within

2 min. of injection had near syncope that would come in waves every 2-3 minutes, face red, chest pressure, tightness /pressure in throat, headache, BP 186/90, rapid HR. The patient Spent 1 hour in ER. Later in day 28Dec2020, continued to have dizziness, chest pressure, chills, headache, fatigue. This continued for 4 days and had mild cough. The adverse events resulted in an emergency room (ER) visit. and Physician Office Visit. Treatment included Xyzal which relieved majority of symptoms. Laboratory test and procedures on 28Dec2020 include Electrocardiogram (EKG) with normal results, Blood Pressure Measurement 186/90 and Heart Rate Rapid. Treatment was given for chest tightness, throat tightness and red face and No treatment was given for chills, cough, dizziness, fatigue, headache, heart rate increase, blood pressure high and near syncope. The clinical outcome of near syncope that would come in waves every 2-3 minutes, face red, chest pressure, tightness /pressure in throat, headache, BP 186/90, rapid HR, dizziness, chest pressure, chills, headache, fatigue, mild cough was recovered. No follow-up attempts are possible. No further information is expected.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported face red, chest pressure, tightness /pressure in throat, blood pressure increased (BP 186/90), near syncope and the administration of BNT162B2, based on the reasonable temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

DVT; have pain in same site where DVT is; This is a spontaneous report from a contactable consumer. A 28-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EK9291), via an unspecified route of administration in left deltoid on 24Dec2020 10:00 at first single dose for COVID-19 immunization. Medical history was none. There were no concomitant medications. Caller was calling to report a possible adverse reaction to the Pfizer Covid-19 vaccine. The patient was currently at hospital, she was admitted for deep vein thrombosis (DVT) of left iliac vein, the patient had no past history as to why this would happen, that she is only 28 years old. Received the vaccine on 24Dec2020, the following day she did have pain in same site where DVT was. Took ibuprofen for the pain. The patient was admitted yesterday 04Jan2020 for the DVT, they were currently treating her with Lovenox injections and prescribing dose for discharge is Eliquis. CT scans and three shots of Lovenox for it, doing a doppler of bilateral legs and echocardiogram (echo) of her heart to make sure there is nothing else. The AEs require a visit to emergency room. The patient was asking if she can still get the 2nd dose based off the adverse event she experienced. Outcome of DVT was not recovered, of pain was unknown.

Chills; Headache; Coughing; Tiredness; Nasal congested; Feels like her sinus were blocked; Body ache; feeling sick; Sneezing; This is a spontaneous report from a contactable nurse (patient, front line health care worker). A 51-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot#: EH9899) via an unspecified route of administration in the left arm on 28Dec2020 (at 10:30 or 11:00 AM) at single dose for COVID-19 immunization. Medical history included hypertension, diabetes, and stroke, all reported as family history (her parent). There were no concomitant medications. There was no history of all previous immunization with the Pfizer vaccine considered as suspect. There was no additional vaccines administered on same date of the Pfizer

suspect. The patient did not have prior vaccinations within 4 weeks. The patient had body ache (reported as medically significant) on 01Jan2021 with outcome of recovering, had been sick for a week/ very ill on 28Dec2020 with outcome of unknown, sneezing on 28Dec2020 with outcome of not recovered, chills on 01Jan2021 with outcome of unknown, headache on 01Jan2021 with outcome of recovering, coughing on 01Jan2021 with outcome of not recovered, tiredness on 01Jan2021 with outcome of unknown, nasal congested on 01Jan2021 with outcome of not recovered, feels like her sinus were blocked on 01Jan2021 with outcome of unknown. Treatment was received for the events. Reported she had a lot of sickness, by evening that day (28Dec2020) she got sneezing and feeling sick. Then the next day was the same, then the third day. She became very ill with chills, body ache, headache, coughing, and tiredness on 01Jan2021 (also reported as 3 days later vaccination). And she had no fever, but stated she had been sick for a week. Added the headache and body ache were a little better but still she felt so congested. Clarified she had nasal congested that feels like her sinus were blocked. She treated herself with acetaminophen, once daily 500 mg by mouth starting 01Jan2021. Added the body ache pain was still on the back of her chest but her legs and arms were better. She used steam inhalation for the congestion. She was not scheduled for the next dose yet, she was just waiting. The patient was wondering if she should do a test for COVID 19. Mentioned she had been healthy all through this year and digging in the COVID 19 all the time but then after the vaccine she got so sick. This was the first day she could get up and did anything. Advised caller to consult her HCP.; Sender's Comments: Based on the information currently provided, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the body ache. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

TB test; This is a spontaneous report from a contactable consumer. This female consumer (patient) reported that received received bnt162b2 (BNT162B2, PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 30Dec2020 at single dose for covid-19 immunisation. Medical history and concomitant medications were unknown. Certified Nursing Assistant got the first dose of the covid vaccine on January 2nd and also she needs to get her TB test. She was told to wait 2weeks between the application and the TB test but the 2 weeks period ends on January 15th and she needs to have the test before that day, so she was wondering if she could get the test done a couple of days early. The outcome of the event was unknown. Information about lot/batch number has been requested.

"miscarriage at 5 weeks of gestation; pregnant patient received the vaccine; pregnant patient received the vaccine; This is a spontaneous report from a contactable physician (patient herself) from a Pfizer Sponsored program. This physician only reported information for the mother (herself). This is the maternal case. A pregnant female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number: EK5730), via an unspecified route of administration, on 17Dec2020 as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The pregnant patient received the vaccine on 17Dec2020

and experienced miscarriage at 5 weeks of gestation on 31Dec2020. The clinical outcome of pregnant patient received the vaccine and miscarriage at 5 weeks of gestation was unknown.; Sender's Comments: The association between the event ""miscarriage"" with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

2 week migraine; headache; flushed/Got flushed; persistent extreme dizziness; This is a spontaneous report from a contactable nurse (patient). A 37-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Batch/lot number: EK5730, Intramuscular at single dose on 17Dec2020 19:00 on right arm for precaution as front line health care worker. Medical history included Hemiplegic migraine. Her mother also had migraines. Concomitant medication included ranitidine hydrochloride (ZANTAC) and H1 and H2 blocker. The patient called to report AE of flushed, persistent extreme dizziness, and a headache that has evolved into a 2 week migraine. She has a history of hemiplegic migraines and was taking and h1 and h2 blocker when she received the vaccine. She was calling on guidance whether or not to receive the second vaccine. She was scheduled for second dose on Thursday, but wanted to speak with someone before she got it to see if it was OK. About 15 minutes after receiving the first dose, she got flushed and extremely dizzy. She had a mild headache when she woke up on 18Dec2020 06:00, which then developed into a severe migraine on 22Dec2020 08:00 that she has had for 2 weeks and dizziness continues. She received it at work and there was no prescriber. She called and left a message with Pfizer but has not heard back from anyone yet about this. She would say the flushed and dizziness would be medically serious because she had allergies and had medication on board. She takes daily allergy medication and Zantac and not sure she would not have had a worse reaction if she hadn't had that on board. She took it every night. She had an H1 and H2 blocker on board. Flushed has improved but the dizziness has stayed constant. She had been treated twice for headache and now they have put her on a Prednisone taper. She got it on her right arm so she could work her arm out. On 22Dec2020, she saw a Neurologist for the Migraine. They gave her Toradol 30 mg and Zofran 4mg injection in office. They were given IM. Then, she had another office visit for urgent care on 02Jan2021, and that was for the exacerbation of the migraine. They prescribed 1 liter of fluids and then another Toradol injection, Zofran injection and Decadron injection. The dose of the Toradol was 30 mg, Decadron was 6 mg, and Zofran was 4mg. These were given IV in urgent care. The patient had no prior vaccinations within 4 weeks. The outcome of flushed/Got flushed was resolving. The outcome of other events was not resolved.; Sender's Comments: Based on the compatible temporal association, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the events flushing, dizziness, headache and migraine. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

syncope; diaphoresis; varying HR; blurred vision; This is a spontaneous report from a contactable physician (patient). A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration on 05Jan2021 as single dose for COVID - 19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced syncope, diaphoresis, varying HR (heart rate) and blurred vision in Jan2021. The patient underwent lab tests and procedures which included heart rate: varying in Jan2021. Details were as follows: Patient received the vaccine in the morning. He reported diaphoresis, syncope, varying HR, and blurred vision within 10 minutes of receiving the vaccine. He was taken to the emergency room and therapeutic measures were taken as a result of the events; he was given fluids. The patient generally tolerated vaccines and has recovered from the episode. The events, syncope, diaphoresis, varying HR (heart rate) and blurred vision recovered in Jan2021. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up .; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event due to temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators as appropriate.

one of those biopsies was bleeding pretty heavy/looked at the incision/The one on his nose is still dripping blood and its coming up on 24 hours now; This is a spontaneous report from a contactable consumer (patient). A 72-year-old male patient received his first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Batch/lot number: E70124), Intramuscular in arm on 30Dec2020 at single dose for COVID-19 vaccination. Medical history included ongoing blood pressure high and he had been treated for that for a number of years, diabetes from 2009 and ongoing, COPD (chronic obstructive pulmonary disease) issues from 2020 and ongoing and his issues began within the last year, ongoing kidney failure and this started occurring within the last 2 or 3 years, had a urostomy done, had bladder cancer and he had had phlebotomy performed around 3-4 months ago in 2020 and he knew his blood was thick at the time. There were no concomitant medications. The patient received the first vaccine on Wednesday, 30Dec2020. He had noticed something. He had a couple of things happen that basically involved a couple of skin biopsies. He had some lab work drawn for a CT scan, and he didn't clot right away on 05Jan2021. Last night 04Jan2021, he went to the emergency room because one of those biopsies was bleeding pretty heavy. He wanted to know if there is any known connection with the COVID vaccine and anti-clogging. He was going to follow up with the surgeon that did the biopsies. He stated its weird. He had had phlebotomy performed around 3-4 months ago in 2020 and he knew his blood was thick at the time. There had been 2 or 3 incidents where he was not clogging up. He clarified they were skin cancer biopsies, which was something diagnosed prior to receiving the vaccine. It was a follow-up because they didn't get it all the first time and they had to go back in. His skin biopsies were done yesterday, 04Jan2021. He verified when he went to the emergency room last night 04Jan2021 he was not admitted into the hospital. It was outpatient and they looked at the incision and put a little clotting tape (or whatever it is) on him and wrapped it up. He hadn't been bleeding. He knew the doctor nicked a vein. There were 2 biopsies done- one was on his nose. The one on his nose was still dripping blood and its

coming up on 24 hours now. The blood drawn for the CT scan was drawn early this morning 05Jan2021 around 7:30 AM. The outcome of the event was not resolved.

Followed by neurological symptoms staring day 4; parasthesias of both upper extremity; progression to muscle weakness of all four extremities/Currently with significant muscle weakness, Left hand weakness leading to dropping of objects and left foot drop; progression to muscle weakness of all four extremities/Currently with significant muscle weakness, Left hand weakness leading to dropping of objects and left foot drop; Flu like symptoms first 3 days; This is a spontaneous report from a contactable physician (patient). A 39-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: ek5730) at left arm, via an unspecified route of administration on 16Dec2020 at single dose for covid-19 immunisation. Medical history included hypertension, diabetes, migraines, Eosinophilic granulomatosis with polyangiitis (EGPA) remission. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient did not have any allergies to medications, food, or other products. The patient's concomitant medications were not reported. On 21Dec2020, the patient experienced flu like symptoms first 3 days. Followed by neurological symptoms staring day 4, parasthesias of both upper extremity with progression to muscle weakness of all four extremities. Leading to 2 ER visits and hospital admission. Evaluation by internal medicine, neurology and rheumatology. Currently with significant muscle weakness, Left hand weakness leading to dropping of objects and left foot drop. The events resulted in Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, Hospitalization, Disability or permanent damage. The treatment for events included High dose steroid. Covid test included Nasal Swab: negative on 19Dec2020. The outcome of events was not recovered.; Sender's Comments: Based on temporal association, the causal relationship between bnt162b2 and the events influenza like illness, neurological symptom, paraesthesia, muscular weakness and peroneal nerve palsy cannot be excluded. The information available in this report is limited. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

tired; no energy; low back pain; her fingers are hurting; passed out on toilet; Nauseated; hit head on wall, head just hurts; hit head on wall, head just hurts; Chills; she was very cold; could not sleep good; site of vaccine was sore; Muscle pain; Joint pain; This is a spontaneous report from a contactable consumer. A 58-year-old female patient started to receive first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Batch/lot number: EK9231) by injection once to left arm, via an unspecified route of administration on 04Jan2021 12:30 at single dose for covid-19 immunisation. Medical history included thyroid disorder. Concomitant medication included levothyroxine sodium (SYNTHROID) for thyroid disorder; patient started it after she had her son, and her son is 18 years old. The patient had her vaccine yesterday (04Jan2021) at 12:30, and at nighttime, around 22:00, she started having chills, she was very cold, so she went to bed, she could not sleep good, she kept waking up, and the site of vaccine was sore, she had muscle pain, joint pain, she didn't have fever, but she got up late

today (05Jan2021), around 11:00, and had breakfast and felt nauseated, so she stopped eating, and she went to the bathroom and passed out on the toilet, when she woke up, she had her nightgown inside the toilet, it was all wet, she felt better, so she stood up and then she woke up again, and was inside the tub, her legs were inside the basin, she was lying down with her back inside the tub, she thinks she hit her head on the wall, and it just hurts, it didn't bleed or nothing. The patient stated she had the paper she was given. Again stated she can not even function. Patient still feels Chills a little bit, not as bad as last night. She is awake now, but she feels very very tired, like she has no energy, she is laying down on couch right now. She kept waking up and noticed this morning, she had low back pain, in the muscles, even her fingers are hurting. Regarding hitting her head on the wall, states she has a terrible headache, not a little pain, she thinks it is because she hurt her head. The patient is supposed to get second vaccination on 25Jan2021. The outcome of events Chills, Joint pain and nauseated was recovering; of events site of vaccine was sore and muscle pain was not recovered; of other events was unknown.

Fainting; This is a spontaneous report from a non-contactable consumer. This consumer reported similar events for 2 patients. This is 2nd of 2 reports. A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunisation. The patient medical history and concomitant medications were not reported. The patient experienced fainting on an unspecified date with outcome of unknown. The action taken in response to the event for bnt162b2 was not applicable. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021006219 same reporter/drug/event, different patient

Auditory & visual hallucinations; Auditory & visual hallucinations; tachycardia; extreme panic; confusion; felt like skin was on fire/pulsating; felt like skin was on fire/pulsating; severe pain especially at knees/hips/base of head and neck; severe pain especially at knees/hips/base of head and neck; severe pain especially at knees/hips/base of head and neck; uncontrollable vomiting; bad chills and fever; bad chills and fever; insomnia; felt as if she had been given drugs; This is Spontaneous report from a contactable Other Healthcare Professional reported for herself. This 40-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number: EK9231), via an unspecified route of administration on 04Jan2021 14:30 at single dose on right arm for COVID-19 immunization. Medical history included COVID prior vaccination and latex allergy. There were no concomitant medications. No other vaccine in four weeks. The patient previously had allergic to diazepam (VALIUM), clonazepam (KLONOPIN), ondansetron (ZOFRAN) and lorazepam (ATIVAN). The patient experienced auditory & visual hallucinations, tachycardia, extreme panic, confusion, felt like skin was on fire/pulsating, severe pain especially at knees/hips/base of head and neck, uncontrollable vomiting, bad chills and fever, insomnia. She felt as if she had been given drugs. All of the events happened on 05Jan2021 01:30 and resulted in Doctor or other healthcare Recovering professional office/clinic visit. No treatment received for the events. No COVID tested post vaccination. The outcome of the events was recovering.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Auditory hallucinations and Visual hallucinations cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of

this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

rash; All over rash with some itching; This is a spontaneous report from a contactable Nurse reported for self. This 34-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 05Jan 2021 12:50 on right arm at single dose (Lot # EK4176, Expiration Date: Mar2021) for covid-19 immunisation. Medical history was not provided. Concomitant medications were none. Past drug history included the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 15Dec2020 16:00 at age of 34 year old at single dose (Lot # EH9899) for covid-19 immunisation. About 30 minutes after being administered (05Jan2021 13:20) that second dose she developed all over rash with some itching. She took Benadryl and Pepcid in response. Today the all over rash with some itching came back at the same persistent level. She wants to know what kind of timeframe she can expect with the continued allergic reaction of all over rash with some itching. She was made to check into the emergency room for observation, but did not have any testing/lab work/investigations done and was not admitted to the hospital. Outcome of the events was not recovered. Reporter seriousness for All over rash with some itching was Medically significant. Drug result was related.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Rash and Itching cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Chills with no fever; Cramping in legs; super tired with no energy; Body aches; tiredness/Feeling super tired with no energy; This is a spontaneous report from a contactable consumer. This consumer (patient) reported for self that the 45-year-old female patient who receive first dose of bnt162b2 (BNT162B2, PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899), via an unspecified route of administration on Saturday (02Jan2021) at single dose (once by injection in the right arm) for covid-19 immunisation. Medical history included ongoing Hypothyroidism from 2008. Concomitant medications included levothyroxine at 75 ug ongoing from 2008 for Hypothyroidism. Medical Professional and told by her work that she could get it because contact with COVID patients. The consumer calls for information about if the side effects she is experiencing after the administration of the COVID-19 vaccine will last for more days. The consumer reported tiredness and other side effects to DSU. A Consumer calls for information about if it would be appropriate the second dose of the COVID-19 vaccine is not administered considering that she had adverse reactions. Consumer calls for information about if the second dose of the COVID-19 vaccine would cause her more side effects than the first one. Received the vaccine on Saturday, 02Jan2021. The day she got it she did not feel anything at all. She was completely fine. She did not even have pain at the injection site. The next day, on Sunday she started

feeling super tired with no energy, had body aches, and cramping in legs from 03Jan2021. She has had these for the past 3 days now. She also had chills with no fever from 03Jan2021 to 05Jan2021. She took Tylenol for the first 2 days, but it did not help her at all. She is feeling a little better today, but not much. Her question is, how long will these side effects last? Tylenol: She says it did help a little bit. She think she would just sleep because she was uncomfortable. The Tylenol just did not make her symptoms go away completely. LOT/Batch: AA46487, EXP: Apr2022 UPC: The consumer says the number under the barcode is: 5187536. Feeling super tired and body aches: Has improved about 20%. She says these are all medically significant as she is not able to do what she was able to do before getting the vaccine. She is super tired with no energy and she is confined to her bed most of the time. The consumer confirms this is her first dose of the COVID Vaccine. She thinks she got the standard dose. Vaccine card does not have the expiration date or NDC written on it. Unknown causality. She said that she could be positive for COVID. She is unsure. The outcome of the event Chills with no fever was recovered. The outcome of the event Cramping in legs was not recovered. The outcome of the other events was recovering.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of reported events cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

I was in a low disease state of SLE, 2 days after injection i had a severe flare of lupus requiring steroids; This is a spontaneous report from a contactable other Hcp (patient). This 36-years-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number: EH9899), intramuscularly on 16Dec2020 13:30 at single dose in Arm left for COVID-19 immunisation. Facility where the most recent COVID-19 vaccine was administered was Hospital. Medical history included systemic lupus erythematosus (SLE) and in remission. No Pregnant at the time of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient did not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19.Concomitant medication received within 2 weeks of vaccination included hydroxychloroquine, topiramate (TROKENDI), prucalopride succinate (MOTEGRITY). The patient was in a low disease state of SLE, 2 days after injection and had a severe flare of lupus requiring steroids on 18Dec2020. The adverse event result in Doctor or other healthcare professional office/clinic visit. Steroids received as treatment. The outcome was recovering. The events were assessed as non-serious; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of event Systemic lupus erythematosus syndrome aggravated cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this

review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

experiencing an allergic reaction; Hives all over her face and neck/hives on face and neck; This is a spontaneous report from a contactable Physician (patient). A 30-years-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number: EL0140, Expiry Date: 31Mar2021) via an unspecified route of administration in left upper arm on 31Dec2020 13:25 at single dose for COVID-19 immunisation. Medical history included crohn's disease from Jul2005 and ongoing, ongoing psoriasis, gastrooesophageal reflux disease (GERD), hand tremor. Concomitant medication included ongoing infliximab (REMICADE) for Crohn's, ongoing esomeprazole sodium (NEXIUM) for GERD, ongoing propranolol for hand tremor, copatsol topical steroid for Psoriasis, ongoing Multivitamin, ongoing vitamin B complex (B COMPLEX), ongoing biotin, ongoing iron, ongoing Calcium/Vitamin D, ongoing curcuma longa (TURMERIC). The patient had an allergic reaction after getting the COVID vaccine. She had an allergic reaction after getting the vaccine. She had hives all over her face and neck. She already had a Medrol Dose Pack at home and some Benadryl. She contacted her doctor who prescribed an Epi Pen for her, but she did not have to use the Epi Pen. She stated she used the Benadryl for three days. She started to get hives all over her face and neck the same date she got the vaccine. It started 2 hours after she got the vaccine (31Dec2020 15:25). She confirmed this was the first dose of the COVID Vaccine. She asked that if it is safe to take the second dose after experiencing an allergic reaction to the first dose. Symptoms include hives on face and neck. Patient had no trouble breathing. Took steroids and Benadryl for 3 days or until symptoms have been managed. No any of the events require a visit to emergency room. Reporter seriousness for hives all over her face and neck was reported as medically significant. Events outcome was recovered on 03Jan2021.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Allergic reaction and Hives cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

blasting headaches; chills all night; dry heaving all night; Nausea; no fever but her skin felt hot; sore left arm; This is a spontaneous report from a contactable nurse for herself. This 64-year-old female patient started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), intramuscular on 18Dec2020 at single dose on left upper arm (lot: EKS730), via an unspecified route of administration on 05Jan2021 14:30 at single dose (lot: EL1284 or EKI284) for COVID-19 immunisation. Medical history and concomitant medications were none. The patient did not have anything with the first shot except a sore left arm on 18Dec2020. She stated that if she lays on left side it is sore. The patient had the sore left arm both times that she got the vaccine. She got second dose of vaccine on 05Jan2021 at 2:30pm and had a blasting headache and just had chills that went away about hour ago on 05Jan2021. She did not have a fever but her skin felt hot on 05Jan2021. She stated that she had dry heaves on 05Jan2021. The patient started that she had a blasting headache within a few hours of the vaccine and it gradually got worst by

the time she went to bed. Stated that the chills and dry heaves started then and throughout the night. The chills stopped an hour before she got up. Stated that she went to check her temperature and did not have a fever despite having chills and her skin feeling hot. Stated that nausea started about 10 at night on 05Jan2021. Seriousness for blasting headache, chills and dry heaves was disabling, for nausea was medically significant, for other events was non-serious. The patient took Ibuprofen for the headache. Stated that she was going to try to drink something. The outcome of sore left arm was not recovered; of chills was recovered on 06Jan2021. The outcome of other events was recovering. The causality for blasting headache, chills, dry heaves, nausea and skin felt hot was related (Source of assessment: Primary Source Reporter, Method of assessment: Agency Information on the batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the headache, chills, dry heaves and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

severe muscle pain, diagnosis of polymyalgia rheumatica; This is a spontaneous report from a contactable other HCP (patient). A 53-year-old female patient received the first dose of BNT162b2 (Lot/batch number and Expiration date were not provided), at the age of 53-year-old, via an unspecified route of administration at right arm on 18Dec2020 08:30 at single dose for covid-19 immunization. Medical history included hypertension (htn), allergies: penicillin. Concomitant medication included cefatrizine propyleneglycolate (CEFTIN), lisinopril, levothyroxine sodium (SYNTHROID). The patient experienced severe muscle pain, diagnosis of polymyalgia rheumatica on an unspecified date. The patient was not pregnant at the time of vaccination. The patient underwent lab tests and procedures which included COVID test rapid (Nasal Swab): negative on 06Jan2021. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: A possible contributory effect of suspect drug BNT162B2 on reported event cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

shaking; weak; cough; shortness of breath; very ill/ sick; horrible chills; I had a 103 degree fever for 4 days, horrible chills that were just debilitating; ached everywhere/ severe aches; site soreness; This is a spontaneous report from a contactable nurse (patient). A 62-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899) via an unspecified route of administration at left upper arm on 18Dec2020 at single dose for COVID-19 immunization. Medical history included auto immune problems, diabetes, thyroid condition, all ongoing since age 28;

pemphigusvulgarism since Sep2020 and ongoing. No concomitant medications. Patient is a frontline worker. She received the vaccine on 18Dec2020 at (Name) where she works. 9 days later she got very ill. she didn't know if it's unrelated. She wanted to know if there is anything she need to be watching out for in order to get her second vaccine on Friday. She was so sick and she did have some autoimmune problems. She was really healthy. On 26Dec2020, she had a 103 degree fever for 4 days, horrible chills that were just debilitating. She was just shaking. She ached everywhere, she had severe aches since 26Dec2020. She got tested for Covid and it was negative on 28Dec2020, she had no cough and no vomit. She stayed in bed and drank lots of fluids and toughed it out. By New Year's Day (reported as 30Dec2020) her fever broke but she was so weak and didn't work. She was back at work now. Also, she experienced site soreness from the injection since 19Dec2020. She did have a cough or any shortness of breath. She felt awful. She had recovered. She was just a little nervous because everything she read said the reaction was more severe with second injection. She planned on getting the second shot. She would have a repeat Covid test on 07Jan2020. Reporter seriousness for fever 103: Medically significant. Reporter seriousness for severe aches: Medically significant. Reporter considered the causality of the event site soreness was related with bnt162b2, of the events fever 103 and severe aches was unknown. The outcome of the event fever was recovered on 30Dec2020, of event ache was recovered on 31Dec2020, of event chills was recovering, of event vaccination site pain was recovered on an unspecified date in Dec2020, of events cough and shortness of breath was recovered on an unspecified date.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the fever, pain and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

(doctor) was not sure whether or not he might get a staph infection, a viral infection; (doctor) was not sure whether or not he might get a staph infection, a viral infection; thought he had a mosquito bite; area on the opposite side of his body, on the left hand side, he noticed that there were several small pustules; the area was raised, it was red, it was warm; Pain; extremely uncomfortable; It was very, very itchy and the area felt like it got itself swollen; It was very, very itchy and the area felt like it got itself swollen; irritation; Initially an area under his left arm which was very swollen it appeared to be filled with fluid of some type/thought it was edema/now had it under his right arm, it's probably impacting lymph system; This is a spontaneous report from a contactable consumer (patient wife). A male patient of an unspecified age started to receive bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EH9899, expiration date not reported), via an unspecified route of administration on 03Jan2020 16:00, at a single dose for Covid-19 immunization. Medical history included heart bypass 15 years ago and some orthopedic problems. The patient's concomitant medications were not reported. The patient previously took codeine and epinephrine experienced sensitivity. On 03Jan2020, the patient

had an injection the Pfizer vaccine in county (not clarified further) (place name withheld) which is the (place name withheld) area on Sunday at approximately 4:00 PM EST. He has no significant medical problems other than the prior history of, he had heart bypass 15 years ago and some orthopedic problems, but nothing else other than that. She had never had any adverse reactions to any medications although he has, he shouldn't say, he does have a sensitivity to Codeine which he reported and Epinephrine which he had a sensitivity to also. He got the vaccine after waiting three and half hours in line and they went off, last night that would be Sunday night, several hours later he noticed an odd sensation and did not really take a look at it, he thought he had a mosquito bite perhaps as they live in (place name withheld) and they live in the land that has lots of mosquito, so he didn't pay too much attention to it. Approximately four hours after the injection, he was going to go to bed and removed his shirt and found that the area on the opposite side of his body, on the left hand side he noticed that there were several small pustules, the area was raised it was red it was warm, it was on the opposite side under his arm on his chest he was extremely uncomfortable. It was very, very itchy and the area felt like it got itself swollen and he shared with his wife, the wife suggested that he contact the physician of course he didn't contact, his primary physician said he can see a dermatologist and sent images and yesterday he went to see a dermatologist, so prophylactically he took the 25 mg of diphenhydramine hydrochloride (BENADRYL) and also 2 acetaminophen (EXTRA STRENGTH TYLENOL) and he treated the pain and itching with ice. He slept with an ice bag and woke up just in morning and in New Year they were able to see a dermatologist, he thought it was dermatological. He was concerned but not overly concerned with the area pretty swollen. He saw a dermatologist yesterday, and gave him a topical treatment, the dermatologist gave him three different, naproxene (NAPROSYN), the other one is Triamcinolone Acetonide cream now the irritation he got the MUPIROCIN ointment now as the dermatoligist told him to do, continue what he was doing as he was comfortable, The dermatologist took some specimens from the pustules and send them to lab and she (doctor) is not sure whether or not he might get a staph infection, a viral infection he was not sure. Initially there was an area under his left arm which is very swollen it appeared to be filled with fluid of some type, he was not sure what was it. He thought it was edema but when he popped it, it felt very much like fluid not like blood but it is some type of fluid filled area most likely his wife said the size are greater and less that it was yesterday and that seems to go down over the last night but not all the way it's decreased by what 20%, 30%, 40% he can't tell, alright 50% but now he has it under under right arm, it's probably impacting his lymph system and he put a call into his cardiologist. So he was asking now what does he do. The outcome of the events were unknown.

Her arm is a little sore; the tissue paper is red after wiping her anal area/ reddish looking poop/ there are pieces of blood or something is different; This is a spontaneous report from a contactable other Health Professional (patient). A 75-year-old female patient receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL0142), via an unspecified route of administration on 05Jan2021 at single dose for covid-19 immunization, also reported as for work. Medical history included ulcer (15 to 20 years before 06Jan2021). Concomitant medication included prasugrel from Apr2020 and ongoing as blood thinner, acetylsalicylic acid, ascorbic acid (ASPIRIN) from Apr2020 and ongoing as blood thinner. The patient went to the bathroom in the morning 06Jan2021, she had to poop. When she wiped, it was reddish looking. The patient stated her stool color was normal, but the tissue paper is red after wiping

her anal area. At first she thought hm oh well. Then she had been to the bathroom a couple of times 06Jan2021, and that the same thing happened. She had never experienced that before. It seems to her that there were pieces of blood or something was different. She wasn't hurting or anything. She was not weak or anything at this time. Her arm was a little sore, but she expected that. She was concerned about the color. She worked in the mammography department. She didn't have a prescribing doctor. She got it at work. She had noticed a difference of color in her poop. It had been the same all day. The outcome of the reddish poop was not recovered, of sore arm was unknown. The patient asked would the vaccine cause rectal blood upon wiping after defecation?; Sender's Comments: Reported blood in stool is considered intercurrent and unrelated to BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

The subject experienced acute pericarditis on 27Dec2020; Other vaccine same date vaccine date= 23Dec2020; This is a spontaneous report from a contactable consumer. A 50-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 23Dec2020 at single dose for covid-19 immunization. The facility type vaccine was hospital. None medical history. The patient's concomitant medications were not reported. Other vaccine same date vaccine date on 23Dec2020. The patient experienced acute pericarditis on 27dec2020 with outcome of recovered. The adverse event resulted in Doctor or other healthcare professional office/clinic visit. It's unknown if treatment was received for the adverse event. The event was reported as non-serious. Pfizer is a marketing authorization holder of [BNT162B2] in the country of incidence or the country where the product was purchased (if different). This may be a duplicate report if another marketing authorization holder of [BNT162B2] has submitted the same report to the regulatory authorities. Information on the lot/batch number has been requested.

Joint pain /felt like it was worsening joint pain; just severe pain to where she couldn't walk; This is a spontaneous report from a contactable Other HCP. A 70-year-old female patient received BNT162B2(Lot Number: ET1685), via an unspecified route of administration at Deltoid Left on 23Dec2020 08:00 at the 70 years old at single dose for COVID-19 immunization. The medical history included rheumatoid arthritis. The concomitant medications were none. The patient received the shot on 23Dec2020 and experienced Joint pain afterward on 02Jan2021. The patient did have rheumatoid arthritis so there was that. The patient felt like it was worsening joint pain on 02Jan2021. She has had no fever, just severe pain to where she couldn't walk on 02Jan2021. The joint pain has gotten worse and it has gotten to where she is going to advise her not to take the second shot. The Reporter assessed the seriousness for the events was Disabling. The events did not require a visit to Emergency Room but required a Physician Office visit on 06Jan2021. The patient received a steroid injection on 06Jan2021. There was none History of all previous immunization with the Pfizer vaccine considered as suspect. There was none Additional Vaccines Administered on Same Date of the Pfizer Suspect. There was no Prior Vaccinations within 4 weeks. The patient underwent lab tests and procedures, which included x-rays on 06Jan2021: unknown results (they were awaiting the X-rays). The outcome of the events was not recovered. The information

on the batch number has been requested.; Sender's Comments: Based on the available information the events worsening joint pain and walking difficulty are attributed to underlying Rheumatoid arthritis; however, based on a compatible temporal association, contributory role of BNT162B2 vaccine to events occurrence cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

it was debilitating for her at work; It even hurts to move the right eye in one direction and hurts to speak, the pain was so bad.; pain in right leg and bottom sole of right foot; hurts to speak; numbness right upper side of lip; pins and needle feeling right upper quadrant of face; pain and dull aching right upper side of face; right hand numbness, wasn't able to feel anything; generalized headache; generalized muscle weakness and pain; generalized muscle weakness and pain; This is a spontaneous report from a contactable other hcp (patient). A 31-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 03Jan2021 at single dose in deltoid right for covid-19 immunization. There were no medical history or concomitant medications. The patient received the vaccine on 03Jan2021 and within 15 minutes had a generalized headache. Later that night she had generalized muscle weakness and pain, but really didn't think too much about it. The next day at work (04Jan2021), she had numbness on the right upper side of her lip and a pins and needle feeling in the right upper quadrant of the face. Had a lot of pain in the area as well on the right upper side of the face as well as a dull aching pain that lasted for hours. Later that day when using the computer and she was trying to reach for her mouse she noticed her right hand wasn't able to feel anything and that lasted about 20-25 minutes. Kept slapping the mouse with her hand, but could not feel anything, her hand went numb. Yesterday (05Jan2021), she had the same pins and needle feeling in the same area of the face and that dull achy feeling and it occurred for hours and it was very kind of debilitating for her at work. Later that night she had pain in her right leg and felt the same way, that very severe achiness, which was the pins and needles feeling up and down the leg and underneath the right foot. All these symptoms tend to be on her right side and it definitely lasted for hours. It started about 1 and didn't end until 6-7pm. It even hurts to move the right eye in one direction and hurts to speak, the pain was so bad. This morning (06Jan2021) she had to call out of work because at 3am the generalized headache, pain was unbearable. She was still experiencing the pain in right leg and bottom sole of right foot. She did not receive any vaccines the same day or 4 weeks prior. No problems with vaccines in past. She had made an appointment with a neurologist and will have a MRI done on Friday, 08Jan2021. No further details provided. All events required a visit to physician office. All events were reported as serious per medically significant. The outcome of all events was not resolved. The reporter considered all events were related to the vaccine. Information about Lot/Batch number has been requested.; Sender's Comments: Based on a compatible temporal relationship, causality between reported events and BNT162B2 vaccine cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as

well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

soreness/The pain radiates down to her left elbow and also goes up the neck; The pain radiates down to her left elbow and also goes up the neck; The pain radiates down to her left elbow and also goes up the neck; This is a spontaneous report from contactable other HCP (patient' husband). A 43-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EK9231), via an unspecified route of administration on 31Dec2020 at single dose for COVID-19 immunization. Medical history reported as none. No concomitant medications. The patient had a whole lot of soreness on 01Jan2021 and it was not getting any better. His wife had called her health care provider. She had an appointment in several days. The pain radiates down to her left elbow and also goes up the neck in Jan2021. The reporter seriousness for soreness: Medically significant. The outcome of event pain was not recovered. The outcome of rest events was unknown.; Sender's Comments: Based on a compatible temporal relationship, causality between event pain and BNT162B2 vaccine cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

She is having an allergic reaction; Itching was reported as worsened/Swelling was reported as worsened/loss of appetite was reported as worsened; From the time she got the vaccine to now, she has lost 20 lbs; shake/shaking; swelling in the lips, throat, and eye lids; swelling in the lips, throat, and eye lids; swelling in the lips, throat, and eye lids; She has been sick since Wednesday; itching all over from head to toe; loss of appetite; This is a spontaneous report from a contactable consumer (patient). A 59-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration at left arm on 30Dec2020 at single dose for COVID-19 immunization. Medical history included hypertension and allergic to ace inhibitors. There were no concomitant medications. Patient was calling about the Covid Vaccine. She was having an allergic reaction. She did not know what to do to stop it. She went to the ER yesterday (04Jan2021). She had been sick since Wednesday (30Dec2020), she was itching all over from head to toe since 30Dec2020, she got a prescription for Prednisone, she took 2 doses yesterday, 1 dose today, and would take another this evening. She took Benadryl, an hour ago and had an episode, and so she had to jump in the shower and let the cold water run to stop itching, the itching did not stop but it has minimized. She put Benadryl gel and she was still itching, she had taken enough Benadryl. Patient asked what is the best way and if she needed an IV of something, she went to ER on Sunday, she was not seen by doctor, it was a nurse practitioner, she didn't do anything but just listen to her and she only looked at ankles to check for swelling. Patient stated that she had been drinking water and urinating, she had no appetite and lost 20 lbs. Patient confirmed that she got her first dose of the Covid vaccine on 30Dec2020 at 1 o clock, the itching started the same day at 5 o clock, the itching was from head to toe. She experienced swelling in the lips, throat, and eye lids, which started 02Jan2021. She began losing her appetite on 30Dec2020. From the time she got the vaccine to now (05Jan2021), she has lost 20 lbs. An hour ago (05Jan2020) she had an episode, which made her shake, and she did not have the shakes before, this was the first date

she started shaking. Itching was reported as worsened/Swelling was reported as worsened/loss of appetite was reported as worsened. Her 2nd dose was scheduled in 21 Days. However, she may not get the second dose, patient stated that she could not get through this no more. She had no positive test for Covid prior to vaccine. She had no antibody test prior to the vaccine. She had not any issues with vaccines in the past. Patient stated that if she was still feeling this way, she would go to a different hospital. When she went to the ER, she was not hospitalized, they sent her back home the same day. Patient would like to know if there was anything that can remove the vaccine from the body. The outcome of the events itching all over from head to toe, loss of appetite, swelling in the lips, throat, and eye lids was not recovered, of the other events was unknown. Information about lot/batch number has been requested.

Acute demyelinating encephalomyelitis; Slurring his speech; Stroke; This is a spontaneous report from a contactable physician. A 35-year-old male patient received first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular in deltoid (unknown if right or left) on 17Dec2020 at 30 ug, single for 'Preventative'. Medical history included hypertension. There were no concomitant medications.(Physician) He is calling about the Pfizer Covid 19 vaccine. States what is going on with the patient may be associated as a side effect. The patient got the vaccine two to three weeks ago, he clarifies the patient received the vaccine on 17Dec2020 and the patient ended up acutely developing (states it is a presumptive diagnosis) Acute demyelinating encephalomyelitis, states it looks like a radiologic diagnosis. The patient is an employee at hospital. When querying seriousness states it is medically significant but could be disabling but he thinks the patient will recover. Reporter seriousness for acute demyelinating encephalomyelitis: Medically significant, Hospitalization. Patient was hospitalized on Sunday and he is still admitted at this time. Dates when patient was in hospital for acute demyelinating encephalomyelitis was from 03Jan2021 to ongoing. Caller thinks the patient was flown to (Place) yesterday. The patient's mother asked the caller if the caller thought the acute demyelinating encephalomyelitis was from the vaccine and the caller responded that he did not think it was from the vaccine. He confirms the patient is still admitted in the hospital and the patient's attending neurologist is doctor. The caller heard about the patient from doctor. When querying covid vaccine dose, the caller states the standard dose is 30 mcg. This was clarified and documented as provided. The patient has not received his second dose yet. He asks if the patient should receive the second dose. He asks a general question if a pregnant patient can be given the Pfizer covid vaccine. He heard the patient had a stroke then the CFO tried to talk to him and the patient was slurring his speech. Caller spoke to the patient's mother this morning and caller told the mother that he would try to find out what is going on with the patient. He asked that the patient get an HIV test even though he does not think the patient is at risk. Vaccination facility type was Hospital. Vaccine administered at military facility was No. None additional vaccines administered on same date of the PFIZER suspect. AE acute demyelinating encephalomyelitis require a visit to Emergency Room, not visit to physician office. Prior Vaccinations (within 4 weeks) was none. He has heard of acute demyelinating encephalomyelitis being associated with vaccines in the past and states that it is rare and usually in kids. States he saw patients that may have had acute demyelinating encephalomyelitis back in the 80s and 90s. Therapeutic measures were taken as a result of acute demyelinating encephalomyelitis (Patient will get steroids tonight pending the review of the x-ray). The outcome of the events was unknown. Information on the lot/batch number has been

requested.; Sender's Comments: The reported stroke with speech slurred, and the presumptive diagnosis of acute demyelinating encephalomyelitis (looks like a radiologic diagnosis by the reporting physician), was most likely an intercurrent disease, and unlikely causally related to the first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE). The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"her nerve was bad; Getting all sick, cold, sick and experiencing terrible side effects; Getting all sick, cold, sick and experiencing terrible side effects; Fatigue; Muscle ache; Nauseous; Felt awful; Can't eat all the day, no appetite; phobic something to drinking water; This is a spontaneous report from a contactable consumer (patient). A 49-year-old female patient received bnt162b2 (lot/batch number and expiration date not provided), via an unspecified route of administration, on an unspecified date, at single dose, for COVID-19 immunization. No relevant medical history. The patient's concomitant medications were not reported. The patient experienced getting all sick, cold, sick and experiencing terrible side effects, fatigue, muscle ache, nauseous, cannot do anything, felt awful, cannot eat all the day, no appetite, phobic something to drinking water. The patient has been sick for three days now. The patient was a ""senior"" (not clarified) care giver at the nursing home. Everybody at nursing home at the nursing home got the shot and now everybody has cold and sick. She has only one day of work and she has to come into her job to take care of elderly people. As since current everybody is experiencing the terrible adverse, terrible side effects, everything. Fatigue, muscle ache everything. The bosses at her nursing home cannot give them three days or even seven days off of work after receiving a contract to give them shot. It was confirmed that the patient received the COVID vaccine. The patient also stated that they are off of that side effects. They are not interrupted not just the ""arm"" (not clarified) been there. The patient said she getting everything. She was getting all the side effects. So when they had this Pfizer drug shot ""they didn't get seven days off of"" (not clarified) work. If a person gets a shot, they are feeling fatigue, nauseous (incomprehensible voice). They can't do anything. They should be allowed to stay home from work. Right now everybody in the nursing home is feeling the adverse effect. The entire building. So, she was telling Pfizer to report the report is that all of sudden that the nursing home ""seniors"" (not clarified) and nurses they got the shot, they can't even get to work. The effects are so bad that they can't do anything. The patient also stated that fatigue, she had fatigue all day. The first day she got the shot her nerve was bad but the second day was everything fatigue. She felt awful, she could not eat, she had no appetite. She was phobic something to drinking water, she cannot eat all the day. ""Fruit or something 5 I can eat"" (incomprehensible voice)."" When probed for the LOT#, the reporter stated, ""No they did not give me anything. All they did is I think 037 I think it looks like a 'K' 20A. (further not clarified) like it says (further not clarified) 037K20A that's (further not clarified)."" The outcome of the events was unknown. Information on lot number/batch number was requested."

aware of 6 cases of Bell's Palsy by the companies making these vaccines; This is a spontaneous report from contactable Other HCP. This Other HCP reported same events for 6 patients. This report is for 2nd

of 6 patients. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. The other HCP was aware of 6 cases of Bell's Palsy by the companies making these vaccines since an unknown date. The event was reported as non-serious. The event outcome was unknown. Information about lot/batch number has been requested.; Sender's Comments: Based on a compatible temporal relationship, causality between event Bell's Palsy and BNT162B2 vaccine cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. The outcome of the event was unknown. Information about batch/lot number has been requested.; Sender's Comments: Based on temporal association, the causal relationship between bnt162b2 and the event facial paralysis cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2021007605 Different patient, same drug/event.

"Looked like an encephalopathy; Face was all swollen; Head swelled; Glands swelled; Fatigue; Headache/ So much pain in my head; Couldn't talk; Complete brain fog; nausea; This is a spontaneous report from a contactable nurse. This 60-year-old female nurse (Patient) reported that received bnt162b2 (BNT162B2, Pfizer COVID-19 vaccine), via an unspecified route of administration on 30Dec2020 at single dose for covid-19 immunisation. Medical history included Atrial fibrillation, Chronic Lyme, Lupus and Autoimmune. Concomitant medications included Metoprolol at 12.5 mg for Atrial fibrillation and acetylsalicylic acid (BABY ASPIRIN). No diabetes, no hypertension. None of the usual common diseases. Registered Nurse stated, ""I received vaccine this past Wednesday. I was just talking to a couple of my colleagues and honestly I received the vac. at work. I did not really read through the paperwork and was 'weird' sharing reactions to the vaccine which for me was pretty bad reaction and thought like I need to go through your paperwork and report it. So I thought I should call and just give some information. The usual fatigue which I go to after being normal, my arm was not sore. However, as the week progressed into Friday I had a constant headache but it was manageable and then by Friday night my glands swelled, my nerves behind my ears, my neck and I was extremely fatigued, bad headache and went to bed and I had not gone out and finally I got out today I spoke with my Physician yesterday. What happened it looked like an encephalopathy but my head swelled, my face was all swollen, complete brain fog, fatigue and I couldn't talk. I was in so much pain in my head resulting in (incomplete sentence)."" Lab work included the only thing is the PCR swabbing. No blood test. Registered Nurse further stated, ""I don't know if that is important. But I will tell you and if it is you can send me the questions. I do have a history of Autoimmune. So my Physician thought that this was just like an enhancement of like my bodies reaction I have Chronic Lyme and I have lupus like my ANA has

always been stressful. But we think that it is a family thing. No treatment for the Lyme. I did a lot of antibiotic and a lot of naturopathic stuff but that is in the past. But anyhow for anything else what I did was when I got the injection they said try and just take Tylenol not Ibuprofen but there was no way I was going to make it through with just that . So I took Ibuprofen. I called my Physician yesterday morning because I was not sure about what was is happening and I thought it might be secondary sinus infection or something else going on and it reassured me that it is definitely due to the vaccine. He said it is just your body's reaction, take the Ibuprofen, hydrate. Had me take what I had in my house Tigan for nausea. So I was extremely nauseous from the severity of the headache."" Registered Nurse stated, ""I just wanted to let you know what happened and the intensity of what it was because normally I would expect a headache. But this was a 'go dated'. Registered Nurse stated, ""I guess the only question that I have is so do my work has this question and I was going to call my doctor tomorrow may be might know it better. I know that I have to take the second dose. But I understand the second round can be worse than the first. Is there anything that they are recommending that I can do may be prior to ease the reaction?"" The outcome of the events was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: The reported clinical manifestations including swelling face and head swelled, which was suspected as encephalopathy by the reporting nurse, was probably related to the bnt162b2 (BNT162B2, Pfizer COVID-19 vaccine), due to temporal relationship. The subject's underlying Chronic Lyme, Lupus and Autoimmune were likely the risk factors to the onset of the events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory authorities, Ethics committees and Investigators, as appropriate."

"Swollen lymph nodes; blood pressure was 90/50; Chills; body aches; Fatigue; Joint pain; Bone pain; Headache; Swelling, pain, redness and soreness at the injection site; Swelling, pain, redness and soreness at the injection site; Swelling, pain, redness and soreness at the injection site; Tachycardia / heart rate was 144-152; painful to breath and she was grunting; also said that the injection site itched a little bit.; Fever; First dose on 17Dec2020, second does on 04Jan2021; This is a spontaneous report from a contactable nurse reporting for herself. A 35-year-old female patient received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) ((lot number was unknown) intramuscularly on 17Dec2020 at 0.3ml, and the second single dose (lot number EJ1685) intramuscularly on 04Jan2021 07:45 at 0.3ml, for COVID-19 prophylaxis. Medical history included ongoing diabetes. Her diabetes was diagnosed about 6 months ago (reported on 06Jan2021) and was well controlled. Her glucose was at 140 at the ER (emergency room) even after drinking a drink that had sugar in it. The patient's concomitant medications were not reported. The patient received the second dose on 04Jan2021 at 07:45 and experienced a severe reaction hours after she received it, and she ended up having to go the ER and that they were baffled about what happened. She reported her symptoms were: fatigue, joint pain mainly in her knees, bone pain that did not feel like muscle pain, headache, swollen lymph nodes in the left axilla, and swelling, redness, pain, and soreness in the left arm at the injection site and also said that the injection site itched a little bit. Her symptoms started about 9-10 at night on 04Jan2021. She said that she felt like with the second dose she noticed the soreness and pain and redness at injection site after about 2 hours after receiving the second dose, which was sooner than with the first injection.

The fever started with the chills and body aches. The chills and body aches started at 22:00 on 04Jan2021. She took acetaminophen and melatonin to try and sleep it off. Fever was after that at around midnight 04Jan2021 and she was burning in fever and her temperature was 104. She stated she started taking layers off and got out from under her covers. She had a sweater on when she took her temperature and her axillary temperature was 105. She said that she got into a hot shower because that was the only thing that provided comfort to her chills. She had not had any chills in about the last 12 hours though (as reported on 06Jan2021). She said that the body aches were so severe that she just sat in her bed and cried. She had tachycardia and she was grunting in pain. She was rotating ibuprofen and acetaminophen and then her fever was not as high. She stated that if her fever came back it was lower each time, and if she did not take the medications though, the bone pain was excruciating. She said that with the bone pain it was like no-one can hold her hand or hug her. Fatigue started at around midnight 04Jan2021. Her headache was at midnight. She felt like she had a headband on and was radiating down the back of her neck. She noticed the lymph nodes were swollen after she went to the ER at around 07:00-08:00 05Jan2021. She was walking with pillow under her arm, and if she moved or lifted her arm it hurt. She went to the ER at 01:00 05Jan2021. Her blood pressure was 90/50, her heart rate was 144-152 at rest, temperature was 102.8, O2 saturation was 95-96. She said that it was painful to breath and she was grunting, but did not have any breathing issues. The nurse thought she was septic and notified the doctor. The nurse and the doctor did not think it was the vaccine and thought that she was COVID-19 positive. But after they tested her, she was negative for flu and COVID and they were baffled. They were unclear on what happened and did not think it was from the vaccine. They bolused her 1 liter of Normal Saline and gave her a dose of Fentanyl that minimally helped with the bone pain. She was also given 30mg of ketorolac (TORADOL) IV (intravenous) and that significantly improved her pain. She was there a total of 3 hours. She was admitted to the back area of the ER. She said that they drew labs and everything was within normal limits. Her CRP (C-reactive protein) was 30 and her lactate was at 1.5. She said that they told her that she was most likely having an immune response to the vaccine. Her heart rate and blood pressure came to a more normal range and everything returned to baseline. Her heart rate was 109. She was told to rotate paracetamol (TYLENOL) and ibuprofen for at least the next 24 hours and hydrate. The events fever, chills, fatigue, joint pain, bone pain, headache, swollen lymph nodes, and swelling, pain, redness and soreness at the injection site were serious due to hospitalization from 05Jan2021 to 05Jan2021. The patient was recovering from fever, chills, joint pain, headache, heart rate and blood pressure, not recovered from fatigue, bone pain, swollen lymph nodes and swelling, pain, redness and soreness at the injection site. The event swollen lymph nodes worsened. The outcome of ""injection site itched a little bit"" was unknown. The reporter considered the events fever, chills, fatigue, joint pain, bone pain, headache, swollen lymph nodes, and swelling, pain, redness and soreness at the injection site were all related to the vaccine; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events pyrexia, chills, fatigue, pain, arthralgia, bone pain, headache, lymphadenopathy, vaccination site erythema, vaccination site swelling, vaccination site pain, blood pressure decreased, tachycardia, grunting and vaccination site pruritus cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern

identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate."

Death; This is a spontaneous report from a contactable Physician. An elderly male patient received BNT162B2 (COVID vaccine), via an unspecified route of administration on an unspecified date in Dec2020 at single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient experienced death in Jan2021. It was unknown if an autopsy was performed. It was unknown if any treatment was received for the event. It was unknown if the patient was diagnosed with COVID prior vaccination or if the patient had been tested for COVID post vaccination. Seriousness criteria for the event was reported as death and hospitalization. Pfizer is a marketing authorization holder of [COVID vaccine] in the country of incidence or the country where the product was purchased (if different). This may be a duplicate report if another marketing authorization holder of [COVID vaccine] has submitted the same report to the regulatory authorities. Information about lot/batch number has been requested.; Sender's Comments: Current information is very limited for full assessment. Further information such medical history, concomitant medications, concurrent illness and event term details especially death cause and autopsy results are needed for meaningful evaluation. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Death

"The lip starting ripping and the face started itching; The lip starting ripping and the face started itching; It started spreading from the ear to the neck, it started itching bad and getting hive in that area; having trouble in breathing because it was swelling up; having trouble in breathing because it was swelling up; The lip was swelled to red and then it started to going up the jaw; The lip was swelled to red and then it started to going up the jaw; This is a spontaneous report from a contactable consumer (patient). A 64-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot#: EJ1686, expiration date: Mar2021) via an unspecified route of administration on the arm right in Dec2020 at single dose for COVID-19 immunisation. Medical history included ongoing blood pressure high. Concomitant medication included lisinopril taken for blood pressure high. The patient had the BNT162B2 on Thursday morning (Dec2020) and Thursday evening the patient had a reaction to that, the lip was swelled to red and then it started to going up the jaw. So the next day it was in the jaw and in the lip and then the lip starting ripping and the face started itching and that's didn't go away and then yesterday it started spreading from the ear to the neck, it started itching bad and getting hive in that area. The patient went to the emergency room, consumer stated that she had nurse practitioner that called her on a steroid (treatment). The consumer stated, ""the thing she called her also in an Epi Pen in case she has started having trouble in breathing because it was swelling up. The patient didn't have to end up using that but she just has to use in case she has"". Treatment was received for the events. The outcome of the events was unknown."

COVID-19; COVID-19; Pneumonia; respiratory failure; This is a spontaneous report from a contactable consumer. An 80-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19

VACCINE) via an unspecified route of administration on 02Jan2021 for COVID-19 immunization. Medical history included Alzheimer's and others. No known allergies. Concomitant medications included unspecified medications. The reporter's mother in law was tested for COVID-19 at a nursing facility on 25Dec2020 and she was negative. On 02Jan2021, she received the first dose of Pfizer vaccine. On 04Jan2020, she developed a high fever, needed oxygen and was positive for COVID-19. Date of death was 04Jan2021. The cause of her death was listed as pneumonia, respiratory failure and COVID-19. No autopsy performed. No treatment received. No one knew if the vaccination contributed to her death. It was hard to know if her death was due to the administration of the vaccine or it exacerbated the COVID19 symptoms which led to her death. Since this was unknown, it could have been a possibility. The reporter wanted to give us this information because we might want to consider having high risk population, patients with underlying conditions, older population tested for COVID-19 prior to the vaccination, as this is not currently a recommendation or a requirement. All is very new and they are all learning so the reporter wanted to share this information with us. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. There are medications the patient received within 2 weeks of vaccination. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has been tested for COVID-19. The outcome of the events was fatal. Information about Lot/Batch has been requested.; Sender's Comments: The association between the fatal event lack of effect (pneumonia, respiratory failure and COVID-19) with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.; Reported Cause(s) of Death: Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19

he passed away; not responsive; mind just seemed like it was racing; body was hyper dried; Restless; not feeling well; ate a bit but not much; kind of pale; Agitated; Vomiting; trouble in breathing; This is a spontaneous report from a contactable consumer (brother of the patient). A 54-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 04Jan2021 (at the age of 54-years-old) as a single dose for COVID-19 immunization. Medical history included diabetes and high blood pressure. Concomitant medications included metformin (MANUFACTURER UNKNOWN) taken for diabetes, glimepiride (MANUFACTURER UNKNOWN) taken for diabetes, lisinopril (MANUFACTURER UNKNOWN), and amlodipine (MANUFACTURER UNKNOWN). The patient experienced not feeling well, ate a bit but not much, kind of pale, vomiting, trouble in breathing, and agitated on 04Jan2021; body was hyper dried and restless on 05Jan2021; mind just seemed like it was racing on 06Jan2021; and not responsive and he passed away on 06Jan2021 at 10:15 (reported as: around 10:15 AM). The clinical course was reported as follows: The patient received the vaccine on 04Jan2021, after which he started not feeling well. He went right home and went to bed. He woke up and ate a bit but not much and then was kind of pale. The patient then started to vomit, which continued throughout the night. He was having trouble in breathing. Emergency services were called, and they took his vitals and said that everything was okay, but he was very agitated; reported as not like

this prior to the vaccine. The patient was taken to urgent care where they gave him an unspecified steroid shot and unspecified medication for vomiting. The patient was told he was probably having a reaction to the vaccine, but he was just dried up. The patient continued to vomit throughout the day and then he was very agitated again and would fall asleep for may be 15-20 minutes. When the patient woke up, he was very restless (reported as: his body was just amped up and could not calm down). The patient calmed down just a little bit in the evening. When the patient was awoken at 6:00 AM in the morning, he was still agitated. The patient stated that he couldn't breathe, and his mind was racing. The patient's other brother went to him and he was not responsive, and he passed away on 06Jan2021 around 10:15 AM. It was reported that none of the symptoms occurred until the patient received the vaccine. Therapeutic measures were taken as a result of vomiting as aforementioned. The clinical outcome of all of the events was unknown; not responsive was not recovered, the patient died on 06Jan2021. The cause of death was unknown (reported as: not known by reporter). An autopsy was not performed. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Reported Cause(s) of Death: not responsive and he passed away

Acute appendicitis; Severe acute abdominal pain; Chills; Fever; This is a spontaneous report from a contactable Nurse (patient). A 42-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (expiration date Mar2021, incomplete lot number L0140, not sure the first letter it is C or E), via an unspecified route of administration on 23Dec2020 at single dose for covid-19 immunization. None medical history. Concomitant medication included escitalopram oxalate (LEXAPRO). The patient experienced a little bit chills and fever she felt coming exactly on the 26th but she expected that and that was all fine but patient ended up in (Incomplete sentence). She went to work on 30th December and had some onset of severe acute abdominal pain and she ended up in an emergency appendectomy by 6 O'clock that evening. So she had an acute appendicitis and she did some research and it says that she can be listed in to the severe complications that the number in the vaccinated group was double back to the procedural group. The 26th it resided and patient felt better until the 30th when she have acute severe abdominal pain onset. She left work went for emergency room and she was in surgery within four hours. The outcome of events chills and fever was recovering, the other events was unknown. Because of the research that is on the website patient cannot help and think that it is related. Patient believed the relatedness of drug to events was related. Information about lot/batch number has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate

26-year-old lady came in after she noticed she had bruises on her left hand after a CPR procedure at hospital. Patient was apparently in well health, she had received COVID-19 mRNA vaccine on January 7 at 3 PM, she has taken 2 pills with ibuprofen and tylenol for pain in right deltoid following vaccination. She was doing the CPR at 1:00 this afternoon, and she noticed that her left dorsum had some bruises. She took day off and went home and noticed that she also had bruises in both medial thighs, above the

knee and some bruises in scalp. Patient presented to the Emergency Room 1/9/2021 ~6PM and platelet count was found to be 2x10^3/uL. Patient required transfusion of 7 units of platelets, steroids, and IVIG.

SOB, Sleeplessness,

Scratchy throat, dizziness and eventually feeling like her throat is closing in

Patient was reported to be deceased at home by law enforcement on 1/7/21

"Patient presents with abdominal pain that started in the middle of the night. Had first COVID vaccine the previous day. Patient states the pain is intermittent ""comes and goes"" ""cramping"" ""pressure and bloating"" feeling. Patient states her normal bowel movements are 12 times per day. The last time she went was this morning. She is concerned about an ""obstruction"" Patient states she has ""some nausea"" She states she has ate and drank normally today. Patient has a history of ulcerative colitis and a complete colectomy with a ileal rectal pouch. She has had abdominal pain since this morning which is crampy, associated with nausea and recurrent vomiting. She normally has 6-12 bowel movements a day, but none since this morning. She does feel her abdomen is distended as well. The last time she had anything like this was when she developed pouch itis last spring, but that was much less painful than this. Her appendix is gone, but she believes she still has her gallbladder."

Went into the ED for bilateral hand and feet tingling. Worked up for possible Guillain Barre.

"Patient reported stroke-like symptoms as he was driving to work: started ""feeling funny"" with dizziness; progressed to feeling weakness in left side of face with facial drooping; tingling in left hand progressed to numbness and weakness in left arm and leg; difficultly coordinating motor movement in right arm; difficulty/ diminished speech ""tongue felt fat."" Symptoms resolved within appx 1+ hour from onset. Per patient, he was given an injection at the hospital (unsure for what?) and was discharged with a prescription for chlorthalidone 25mg daily, blood pressure was elevated."

There were no adverse reactions. Resident Died, she had a history of issues with her health prior to the vaccine.

Patient was found unresponsive at home with SpO2 20% 1/2/2021

1/6/21 8pm started with Nasuea, vomiting, diarrhea and fever. 1/7/21 started having intermittent chest pain in the morning. Then in the evening it became constant. Went to ER that evening due to chest pain. EKG showed t wave abnormality. 1st Trop was negative went from 0.08 to 2.3 Had 2 Echo's done and they were normal. Platelets were 85. Was discharged without chest pain. Troponin on discharge was 0.67 and platelets 61. Was admitted due to Chest pain and troponin. Attending provider diagnosed as myocarditis and thrombocytopenia R/T vaccine.

right after vaccine was given i got a head to toe hot flush. i thought it was just anxiety. within 2 minutes i had expolsive diarrhea, felt dizzy. looked in the mirror and saw my neck and chest covered in red rash and hives. felt hot flush again. dr came in noticed hives all over both my arms as well. felt sob and if someone was holding my neck with their hand. given benadryl and epi taken to local er.

Patient received the 1st dose of Moderna and was found deceased in her home the next day.

In the first 2 days (probably a couple of hours after the shot) I felt achiness, and it got worse body pains, joint pains and fatigue. Almost a week after I started getting sick, aches, shore throat, headache and fever (101.5F) that is when I went to the ED and it lasted about 2 days and then it went away. At the ED they did COVID and strep tests both negative. This was with my first dose and my second one the same thing happened.

Pfizer COVID-19 Vaccine A couple hours after the vaccination the patient experienced pain in the vaccine arm, headache, and feeling ache. Day 1 post vaccination patient experienced sore arm, headache, low grade fever, feeling ache, and GI symptoms with diarrhea. Day 2 post vaccination patient experienced sore arm, Migraine, and diarrhea. Day 3 post vaccine patient woke up with chest pain that radiated into her left arm and some weakness. Patient's blood sugar was >500 and was admitted to hospital for DKA.

My mother was given Pfizer vaccine on Thursday and she died 3 days later yesterday on Sunday!!!

Extremely tired went to bed at 8:30. At 11:00, tossed and turned until 12:16 a.m. Did not think she could stand up. Walked in the bathroom had pain in stomach, was very hot and freezing at the same time, was shaking. Head hurt was hurting so bad. Tried standing up from toilet, was passed out. Eye, half of face is bruised and swollen , eye shut for two days. More than forty minutes passed before she could call her husband. Does not remember anything because she was passed out. Husband came in and grabbed her, to get her back into bed. she could not stand. Went to ER at Hospital. Had CT scan, blood work , EKG, chest xray. Was still kind of out of it but was able to communicate with nurses. Face is still black and blue. Last night got up at 4:00 a.m. something was wrong with her throat. Felt like a walnut was in her throat. Went to doctor this morning. They said it was a reaction from the shot. Got an EpiPen, prednisone. Call them in 2 days to let them know how she's doing and also wear a heart monitor because they do not know how to take care of her, Has had vision blurriness in both eyes. Has not felt well at all.

Difficulty breathing, death.

Noted left lymph nodes left neck. On January 7, 10 days post injection had acute appendicitis requiring emergency appendectomy.

Metallic taste in the back of throat between 15-20 minutes post vaccination, noticeable swallowing and throat irritation at 20-25 minutes post vaccination, tongue and lip numbness and throat tightness at 25-30 minutes, dry hacking cough at 30 minutes. Treated in the ED approximately 1 hour post vaccination, at time of arrival in respiratory distress with subcostal retractions, coughing, speaking 1-2 word sentences, with tachycardia and tachypnea. Treated with IM epinephrine, IV solumedrol and IV Benadryl and IV Benadryl with marked improvement in symptoms.

Woke up 1/4/21 with right sided facial weakness consistent with Bell's Palsy. Started high dose Prednisone and Valtex. Received IVIG infusion on 1/6/21 and 1/7/21. Mild improvement 1/11/21.

About 15 minutes after vaccine, hr 155, fever 102, covered in hives, sick to her stomach and a pounding headache. Has had headache since then and been extremely fatigue.

Anaphylaxis within 5 minutes of dose given. Tachycardia 130-140s, hot body temperature, trouble swallowing, lightheaded/dizzy, ekg changes, feeling like I was going to pass out even when in bed. IV fluids, benedryl, soul-medrol, famotadine and IM epi given.

Trouble swallowing, tingling around the mouth within 5 minutes of vaccine administration. IV started with 25mg Benadryl within 5 minutes of symptom onset. Transfer to ER at 1430. Symptoms unresolved, hr - 120, bp 140/100, O2 sats 100, resp: 21 Additional 25mg Benadryl, 125mg solumedrol, 1ml Ativan given IV at 1435. Symptoms began to resolve, patient discharged at 1600 to home with instructions to return if needed. Patient returned to ER Sunday January 10 at 1300 complaining of throat tightness. Patient was seen by doctor, no acute distress and airway issues seen. Patient elected to stay for 50mg benadryl and 40mg prednisone PO. Patient was discharged to home with script for 40mg prednisone q day for 3 days. Patient feels any remaining allergic symptoms have resolved.

RESIDENT 1ST DOSE OF MODERNA VACCINE ADMINISTERED ON 01/04/2021 AT 8:30PM, RESIDENT FOUND UNRESPONSIVE ON 01/05/2021.

Herpatic infection left eye causing a herpatic dendrite

One week after administration, I had sudden onset inability to move left arm. I was transported to ER immediately. Treated, scanned with CT of brain, MRI of brain, c-spine and brachioplexus. In hospital for 2 days and no answers. Still no answers to left arm paresthesia and proprioreceptor deficits. Spreading into left leg and mild systemic symptoms. I have been to the ER, seen by primary physician, Physiatrist and Neurology and Occupational Therapy. I am scheduled for many more appointments and trying to find and answer.

COVID-19/Caller received the first dose of the vaccine and she tested positive with Covid; COVID-19/Caller received the first dose of the vaccine and she tested positive with Covid; arm pain; she felt like crap the night; chills; This is a spontaneous report from a contactable pharmacist (patient). A 51-year-old female patient received her first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EH9899, expiration date Mar2021), intramuscular on left arm, on 18Dec2020 at 0.3 mL, a single dose for vaccination. The patient medical history and concomitant medications were not reported. The patient received the first dose of the vaccine and she tested positive with Covid. She received the Pfizer Covid vaccine on 18Dec2020. She was exposed to the virus through close personal contact right around this same time-frame and did develop the virus herself. She wanted to know if there were any recommendations regarding her needing to get the second dose in series. She stated that her husband, who was not vaccinated, had the virus and developed more serious symptoms than she did. She is concerned about worsening side effects with the second dose and stated that she felt like crap the night after her first dose with chills and arm pain. The patient tested positive for COVID-19 on 26Dec2020. Specific test name was unknown, but she knows it was not a rapid test. She is scheduled to get the second dose of the Pfizer COVID-19 Vaccine on 08Jan2021. She called to ask if she should or should not get the second dose relative to the COVID-19 diagnosis. She has not been able to find the

information she is asking about. The outcome of the event of Covid-19 was recovering while other events was unknown. The Covid-19 was assessed as unrelated to the suspect drug.; Sender's Comments: No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the positive COVID represents the pre-existing infection prior to vaccine use. Further information like confirmative COVID 19 Nucleic acid/ PCR test together with any associated symptoms are needed for full medical assessment. COVID-19 antigen test positive.

tested positive for Covid-19 after receiving 1st dose; COVID-19 PCR test: positive on 31Dec2020, Covid-19 rapid test: positive on 31Dec2020; smell was gone/no sense of smell; no sense of taste; This is a spontaneous report from a contactable nurse (patient). A 59-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EH9899, expiry date unknown) via unspecified route of administration in the left arm on 26Dec2020 at single dose for Covid-19 immunization. Medical history included cholesterol, blood pressure (controlled blood pressure), hypothyroidism. Concomitant medications included TELMISARTAN (MICARDIS) for blood pressure and ATORVASTATIN (LIPITOR) for cholesterol; both on unspecified date. The patient was asking if she was able to get the 2nd dose of vaccine, since she was tested positive for Covid-19 (31Dec2020) after receiving 1st dose. The patient was asking information about missing 2nd dose and when can she get it and wanted to know if it was still okay to get the second dose. The patient asked if she needed to have a test negative for covid-19 prior to receiving 2nd dose. The patient experienced no sense of taste and actually realized it on 29Dec2020 that her food was not tasting good. The patient didn't notice her smell was gone until she was cooking the chicken curry, she even tested it out by spraying some perfume, she has no sense of smell on 30Dec2020. The patient informed that both her taste and smell returned 02Jan2021 but was not recovered completely. The patient underwent lab tests and procedures which included A1C: 6.4 on 12Dec2020, COVID-19 PCR test: positive on 31Dec2020, Covid-19 rapid test: positive on 31Dec2020. The patient informed that she had no positive test before the Covid-19 vaccine, she took Covid-19 antibody test in Apr2020 and it was negative. The outcome of the events tested positive for Covid-19 after receiving 1st dose was unknown, no sense of taste and smell was gone/no sense of smell was recovered with sequel on 02Jan2021.; Sender's Comments: No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the positive COVID represents the pre-existing infection prior to vaccine use.

congestion; positive for Covid-19; positive for Covid-19; This is a spontaneous report from a contactable healthcare professional (patient). A 61-years-old female patient received her first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EH9899, expiration date not reported), via an unspecified route of administration on left arm on 31Dec2020 at 08:15 at a single dose for Covid-19 immunization/precaution because she works with hospice patients. Medical history included blood pressure (abnormal), diabetes, cholesterol (abnormal), and acid reflux, all are ongoing. The patient has no family medical history. Concomitant medications included amlodipine besilate, benazepril hydrochloride for blood pressure taking about 4-5 years, metformin for diabetes taking about 5 years, rosuvastatin for cholesterol Taking about 5 years, pantoprazole for acid reflux taking 5 years, and vitamin D as supplement taking for 3 years. No previous immunization nor vaccines administered on

same date of the suspect drug. The patient was calling about the COVID vaccination, which she received on Thursday, 31Dec2020. Her husband tested positive on Thursday, so she took the test on Thursday after she took the vaccination and they just told her today, 04Jan2021, that she is positive for Covid-19. She wanted to know if that was going to mess up her vaccination in any way and if there are recommendations for second dose. She is a CNA. There was no prescriber. She received it because she works with hospice patients. Test was administered on 31Dec2020. COVID Test resulted on 10:00 04Jan2020 as positive. ER or physician's office required: She just went to get a COVID test when her husband tested and they gave her a azithromycin (Z-PACK) 250 mg because she had congestion. Take two tabs first day and then one daily for 4 more days. She is taking last one today (04Jan2021). Outcome of the events was unknown.; Sender's Comments: A causal association between reported events and BNT162B2 cannot be excluded.

slight sore arm; slight chest congestion; positive COVID-19 test after first dose of vaccine; positive COVID-19 test after first dose of vaccine; Fever; cold like symptoms; stuffy head; horrible headache; Cough; This is a spontaneous report from a contactable healthcare professional (patient) from a Pfizer-sponsored program, Pfizer First Connect. A 44-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 16Dec2020 as a single dose (reported as 0.3 mL) (at the age of 44-years-old) for COVID-19 immunization. Medical history included ongoing hypothyroidism, one thyroid gland removed due to a nodule on an unspecified date (years ago), ongoing acid reflux, ongoing hypercholesteremia, ongoing fluid retention, and ongoing history of headaches. Concomitant medications included levothyroxine sodium (SYNTHROID) taken for hypothyroidism and for one thyroid gland removed due to a nodule from an unspecified date and ongoing, dexlansoprazole (DEXILANT) taken for acid reflux from an unspecified date and ongoing, atorvastatin (LIPITOR) taken for hypercholesterolemia from an unspecified date to an unspecified date, and hydrochlorothiazide (MANUFACTURER UNKNOWN) taken for fluid retention from an unspecified date and ongoing. Additional concomitant medications included unspecified vitamins. The patient had a positive COVID-19 test after first dose of vaccine on 01Jan2021; cold like symptoms, stuffy head, horrible headache, cough, and fever on 31Dec2020; slight chest congestion on 02Jan2021; and slight sore arm on an unspecified date. The events, stuffy head and horrible headache, were reported as medically significant. The events, cough, fever, and slight chest congestion, were reported as non-serious. The clinical course was reported as follows: It was reported that the patient was vaccinated on 16Dec2020, became symptomatic on 31Dec2020, and tested positive for COVID-19 on 01Jan2021. The patient stated that she became symptomatic one day prior to testing positive for COVID-19, on 31Dec2020. She initially had cold-like symptoms with a stuffy head, cough and a horrible headache; the worst headache she had ever had. These symptoms occurred earlier in the day on the 31Dec2020. Then later that night about 10:00 PM, she had a fever with a body temperature of 102 degrees Fahrenheit. Her body temperature had been normal at 98 degrees all day that day until that night. She also had slight chest congestion and then was fever free for over 48 hours. The patient stated that she had a history of headaches and can tolerate a headache. The headache started 31Dec2020 and was significant. It was reported that after the vaccine, she had no other symptoms other than a slight sore arm, which lasted a day; maybe 24 hours after she received the vaccine. The patient stated that she does not think any of the other symptoms, other than the sore arm, have anything to do with the

vaccine. The clinical outcome of positive COVID-19 test after first dose of vaccine and slight sore arm was unknown; cold like symptoms, horrible headache, and cough was recovering; fever was recovered on 02Jan2021; and stuffy head and slight chest congestion was not recovered. The reporter assessed the causality assessment between the events, positive COVID-19 test after first dose of vaccine, cold symptoms, stuffy head, cough, horrible headache, fever, and slight chest congestion, as unrelated. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Sender's Comments: The efficacy of a drug varies from one patient to another and can be affected by different factors; however, a contributory role of the suspect drug BNT162B2 to the reported events cannot be ruled out. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

suspected COVID-19; suspected COVID-19; Fatigue; Body aches; Headache; chills; The initial case was missing the following minimum criteria: no adverse event. Upon receipt of follow-up information on 04Jan2021, this case now contains all required information to be considered valid. This is a spontaneous report from a contactable healthcare professional, the patient, from a Pfizer sponsored program IBCC (Inbound Call Center for HCPs). A 32-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EK5730), intramuscular in the left deltoid on 15Dec2020 at 21:00 (at the age of 32-years-old) as a single dose for COVID-19 immunization. Medical history included ongoing hypertension from 2009 and COVID-19 from 10Jun2020 to an unknown date in 2020. Ongoing concomitant medications included fosinopril (MANUFACTURER UNKNOWN) taken for hypertension from 2017. The patient did not receive any other vaccines on the same day as the BNT162B2 vaccine. On 19Dec2020, shy of about 96 hours of getting the vaccine, the patient experienced fatigue, body aches, headache and chills. He did not have any fever. The patient stated that he recovered from the fatigue, body aches, headache and chills by 19Dec2020. The patient was fine from 19Dec2020 until 01Jan2021. On 28Dec2020, the patient had a COVID-19 PCR test that came back negative. On 01Jan2021, the patient suspected that he had COVID-19. He had a fever of 103.1 degrees Fahrenheit, body aches, chills like he was freezing to death, fatigue, diarrhea; however, he did not have nausea or loss of taste or smell. He had swollen lymph nodes, but no sore throat and his oxygen saturation was okay in Jan2021. He was also having chest pain but it was more like intercoastal pain. He stated that these current symptoms were significantly worse than the ones he had just after getting the vaccine and felt more like the symptoms he had when he had COVID-19 before on 10Jun2020 (positive IgG for COVID-19-tested in 2020). The patient had a COVID nasal swab (PCR) done at an urgent care (physician's office) on 02Jan2020 or 03Jan2020 and was awaiting the results. The clinical outcome of the suspected COVID-19 was not recovered.; Sender's Comments: A causal association between reported suspected COVID-19 cannot be excluded.

Patient complained of itching starting on her legs, which went upwards; Redness on her arms, neck, face; Redness on her arms, neck, face; Redness on her arms, neck, face; Itching up to her scalp; Dry cough; Rash; This is a spontaneous report from a contactable nurse (patient). A 44-year-old non-

pregnant female patient received the first dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine) at single dose, in the left arm, on 26Dec2020, at 09:00 AM, for COVID-19 immunisation. COVID-19 vaccine was administered at hospital. The patient had not received any other vaccines within 4 weeks prior to the BNT162B2 vaccine. Relevant medical history included asthma, hypertension, hypothyroidism, penicillin allergy, food allergy (melon and pineapple) and latex allergy. Concomitant medications, received within 2 weeks of vaccination, included omalizumab (XOLAIR), levothyroxine sodium (LEVOXYL), levocetirizine dihydrochloride (XYZAL), losartan and formoterol fumarate, mometasone furoate (DULERA). After covid vaccination, the patient was advised to stay 30 minutes for observation. On 26Dec2020 at 09:15, less than 15 minutes later, the patient complained of itching starting on her legs, which went upwards. The patient took 25 mg oral diphenhydramine hydrochloride (BENADRYL). She noted to have redness on her arms, neck, face, itching up to her scalp. By then she started to have a dry cough, removed her mask, nurse who was with her called for a rapid response team. Patient's epi pen was used, they then started IV and pushed emergency meds and transported to ED. Emergency room/department or urgent care was required. Another dose of epinephrine IM and additional meds were given. Placed on oxygen via non-rebreather with albuterol. Epinephrine drip started. Stabilized after 3 hours, stayed in observation for 12 hours then discharged to home. Around the clock 50 mg diphenhydramine hydrochloride (BENADRYL) at home x 2 days, then levocetirizine (ZYXAL) thrice daily x 7 days to control itching and redness/rash. Other treatment included steroids, pepcid. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient has been tested for COVID-19 (PCR, Nasal Swab) on 26Dec2020 and the result was negative. Clinical outcome of the adverse events was recovering at time of this report. Information on the lot/batch number has been requested.; Sender's Comments: Based on a close temporal association, a causal relationship between reported events and BNT162B2 vaccine cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

anaphylaxis; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), on an unspecified date as single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced anaphylaxis on an unspecified date. The outcome of anaphylaxis was unknown.

tested positive for COVID-19; tested positive for COVID-19; loss of taste and smell; loss of taste and smell; excruciating headache; runny nose; congestion; shortness of breath when she started talking; having aches and pains; lightheaded, experienced dizziness; tied; This is a spontaneous report from a contactable consumer(patient). The 58-year-old female patient received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EJ1685, intramuscular injection), intramuscularly in left arm on 23Dec2020 at single dose for COVID-19 vaccination in nursing home. Medical history included she had a right knee injury so she had some inflammation, She had stomach issues in the past-Barrett's syndrome, H. pylori(Helicobacter infection), GERD(Gastrooesophageal reflux disease), so,

Pantoprazole is just a maintenance medicine, she was stable right now. She had a Vitamin D deficiency at one point. Ongoing concomitant medication included meloxicam for inflammation, thyroid for thyroid(Thyroid disorder), pantoprazole for stomach issues, colecalciferol (VITAMIN D 3) for supplementation therapy. There was no vaccination within 4 weeks. She received her first vaccine on 23Dec2020. There no other vaccine received in the same day. By 26Dec2020, she started with symptoms and then she tested positive for COVID-19 on 29Dec2020. She felt horrible with an excruciating headache and was wondering if she was going to die now. She can really feel for the residents she works with who get it. Right now, she was hopefully going back to work next week, but she was wondering about the second vaccine. People are saying she got COVID-19 because of receiving the first vaccine and she was hoping it was not the case. Is it going to be an issue getting the second vaccine after testing positive? The caller declines to include her healthcare professional for this report, stating she has been talking with her doctors over the week. Her symptoms included runny nose, congestion, and what seemed like shortness of breath when she started talking. She started having aches and pains over the weekend. By Monday, 28Dec2020, there was loss of taste and smell, it was totally gone. She also was lightheaded, experienced dizziness, was tied. She went through a lot of symptoms which was shocking to her. She clarified these symptoms first began the morning of the 26Dec2020. Christmas she was fine, and then she to go out to get snow off of her car and do some running around on 26Dec2020 and she noticed she started having symptoms. When probed for outcome, the caller state she was most definitely feeling better. She was having some excruciating headaches and she has worked with her doctor on what they needed to do. She is still working with the doctor on her lightheadedness. She has set up a follow-up appointment, but she was feeling better. There was no emergency room nor physician office. Relevant test was none. It was also reported lot number was either EJ1685 or EJ1085, she can't tell. Outcome of loss of taste and smell was recovered, of dizziness was not recovered, of other events was recovering.

tested positive for COVID virus; tested positive for COVID virus; cold all day; tiny cough; chills; sweating/ woke up sweating wet; arm pain/Very sore arms; body aches; fever; some muscle aches; This is a spontaneous report from a contactable consumer(Patient's Wife). A 67-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in left arm on 02Jan2021 13:30 at single dose for COVID-19 vaccination. There were no concomitant medications nor medical history. He did not receive any other vaccines that day or 4 weeks prior. No history of any other vaccines or events. He got his vaccine on Saturday(02Jan2021) at 1:30pm(13:30) and by 5:30pm(17:30) had very sore arms/arm pain, at 7:30pm(19:30) he had chills off and on and was sweating. He woke up soaking wet and did that on Sunday, but was feeling a little better today. He also experienced body aches and fever in Jan2021. Today is testing day at his work and he tested positive for COVID virus on 05Jan2021. Not sure if it's a coincidence. Again, he got the shot and then started having all these symptoms at 5:30 and 7:30. Now they are both on quarantine for the 10-14 days. He wanted to see if it's possible to test positive for the virus after getting the shot or is it just a coincidence. He also had some muscle aches in Jan2021. Last night (04Jan2021), he woke up again sweating, but not like on Saturday, but he got really warm and started to sweat a little, and on Sunday(03Jan2021) he was cold all day and had a tiny cough, but it wasn't significant. Ever so often she would hear him cough. All of a sudden patient would wake up sweating. Again, Saturday he soaked everything. There was no

Emergency Room nor Physician Office. Outcome of Very sore arms, sweating was recovering, of pain and fever was unknown, of other events was not recovered. Information on Lot/Batch has been requested.

a little bit of a cough.; headache; runny nose; Aside from her taste and smell still being gone; Aside from her taste and smell still being gone/loss of taste; fogginess; Patient had since tested positive; Patient had since tested positive; patient likely had exposure on 22Dec2020; This is a spontaneous report from a contactable physician. A female patient of an unspecified age received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 21Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient likely had exposure on 22Dec2020. She showed the first covid symptoms on 31Dec2020. Patient experienced loss of taste, headache, fogginess, runny nose, and a little bit of a cough on unspecified date. Patient received her first covid dose on 21Dec2020. The first dose likely helped her, she has rapidly gotten better and was feeling much better today. Aside from her taste and smell still being gone. The patient was scheduled to receive her second dose on 11Jan2021. Patient had since tested positive. Caller clarified that the patient didn't get a test until 03Jan2021. Outcome of events taste and smell still being gone was not recovered, and outcome of other events was unknown. Information on batch/lot number was requested.; Sender's Comments: No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the positive COVID likely represents the pre-existing infection prior to vaccine use. Further information like confirmative COVID 19 Nucleic acid/ PCR test together with any associated symptoms are needed for full medical assessment.

tested positive; tested positive; runny nose; headache; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A contactable consumer reported that a 51-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced tested positive, runny nose, headache after getting the vaccine on an unspecified date with outcome of unknown. This report is considered as non-serious.

"tested positive for COVID-19; tested positive for COVID-19; This is a spontaneous report from a contactable nurse (patient) from a Pfizer-sponsored program Pfizer First Connect. A 55-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK5730), via an unspecified route of administration in the right arm on 18Dec2020 at single dose for covid 19 immunisation as healthcare professional and husband was high risk. Medical history included hypertension from 2019 and ongoing. Concomitant medication included amlodipine besilate (NORVASC, 5 mg) from 2019 and ongoing for high blood pressure. The patient experienced tested positive for covid-19 on 03Jan2021 with outcome of not recovered, congestion and headache in Jan2021 with outcome of unknown. The patient underwent lab tests and procedures which included COVID test on 03Jan2021 and the results came back positive on 04Jan2021. The patient was scheduled to receive her second injection on 08Jan2021. Since her first injection she had tested positive for COVID-19. The second dose had to be given a certain amount of days after the first. She would be outside that window. She would like to

know if there is any guidance regarding the if/when she should get the second dose. The reporter would like to know if she waits longer than the recommended 21 days to receive her second dose of the COVID-19 vaccine would she need to restart the vaccination series. The reporter said this was not serious as she only had congestion and headache with treatment: using over the counter stuff. Event relatedness with COVID vaccine was unknown.; Sender's Comments: Based on available information, a possible contributory role of suspect BNT162B2 vaccine cannot be completely excluded for reported ""tested positive for COVID-19""."

it was like having Covid again; it was like having Covid again; body aches; dry mouth; generalized weakness; temp was 38.1 Celsius; head feels weird; can't sleep; decreased appetite; pain at the injection site; This is a spontaneous report from a contactable Nurse (patient). A 36-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 04Jan2021 at single dose for COVID-19 immunization. Medical history included COVID-19 from Mar2020 to an unknown date. The patient's concomitant medications were not reported. The patient experienced body aches, dry mouth, can't sleep, generalized weakness, decreased appetite, and pain at the injection site, temp was 38.1 Celsius, head feels weird in Jan2021. The patient got her first dose and was looking online to see the symptoms. She said that she saw that during the trials, people were experiencing the symptoms she was experiencing after the second dose and she was concerned. She said that she wanted to make sure her symptoms are ok and to make sure that the symptoms are not just caused from the booster, but also from the first dose. The caller said that her mom told her that someone died from the Pfizer vaccine. No further details provided. The patient was having body aches, could not sleep, her mouth is really dry, her temp was 38.1 Celsius, her head feels weird, she has generalized weakness, pain at the injection site, and decreased appetite. She said that it was like having Covid again. She said that she had Covid back in Mar2020. The patient underwent lab tests and procedures which included body temperature: 38.1 centigrade. The outcome of all the events was unknown. The events were reported as non-serious. Information on the lot/batch number has been requested.; Sender's Comments: No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the suspected COVID likely represents a pre-existing infection prior to vaccine use. Further information like confirmative COVID 19 Nucleic acid/ PCR test is needed for full medical assessment.

she is pregnant as well; she reported to be diagnosed positive for COVID last 01Jan2021 after showing symptoms on 31Dec2020; she reported to be diagnosed positive for COVID last 01Jan2021 after showing symptoms on 31Dec2020/tested positive for COVID-19; This is spontaneous report from a contactable Other Health Professional (patient) via a Pfizer Sponsored Program. A 29-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EJ1685), intramuscularly in right deltoid on 23Dec2020 14:30 at single dose for COVID-19 vaccination while pregnant. Medical history was none. Concomitant medication included ongoing ascorbic acid, betacarotene, calcium carbonate, colecalciferol, docosahexaenoic acid, ferrous fumarate, folic acid, nicotinamide, pyridoxine hydrochloride, riboflavin, thiamine mononitrate, tocopheryl acetate, vitamin b12 nos, zinc oxide (PRENATAL MULTIVITAMIN + DHA, Prenatal Multi + DHA), one soft gel, every morning as prenatal medication. The reporter was asking for recommendations for her in taking the second dose as she

reported to be diagnosed positive for COVID last 01Jan2021 after showing symptoms on 31Dec2020. She received the first dose of the vaccine last 23Dec2020. She is asking if she should wait 90 days before taking the 2nd dose. Agent has a physical therapist on the phone. She had her first dose of the COVID vaccine on 23Dec2020. She started to show symptoms of COVID on 31Dec2020. She tested positive on 01Jan2020. Caller wants to know does she need to wait 90 days for the second dose. Caller wanted to add she is pregnant as well. She declined to include a healthcare professional for the report. The caller states she started to feel symptoms towards the end of the day on 31Dec2020. She clarifies she felt like she was having a cold coming on. She had some congestion. When probed for outcome, caller stated it had improved quite a bit. She had been improved but today, its kind of like she had a cold again, but that had improved. Vaccination Facility Type: Hospital. Vaccine Administered at Military Facility: No. Prior Vaccinations (within 4 weeks): None within 4 weeks. Additional Vaccines Administered on Same Date of the Pfizer Suspect: None. Relevant Tests: None. Investigation Assessment: Yes. Is a sample of the product available to be returned, if requested (Y/N): Vaccine was administered in hospital. No AE required a visit to emergency room and physician office. The reporter stated her symptoms have been pretty mild. The patient underwent lab tests and procedures which included COVID Fast-acting (rapid) test: positive on 01Jan2021. Outcome of events was recovering.; Sender's Comments: Based on available information, a possible contributory role of suspect BNT162B2 cannot be completely excluded

She did a rapid antigen test and was positive; She did a rapid antigen test and was positive; her arm hurt after vaccination; she lost taste; This is a spontaneous report from a contactable Consumer. An adult female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 04Jan2021 at single dose for COVID-19 immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. Friend shared that the patient's arm hurt after vaccination and the following day she lost taste. She did a rapid antigen test and was positive. Adverse event start date was 04Jan2021. No treatment was received for the adverse event. AE resulted in doctor or other healthcare professional office/clinic visit. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had been tested for COVID-19. Test name: antigen (positive). Outcome of the events was not recovered. Information on the lot/batch number has been requested.

"Received the Pfizer COVID-19 on 21Dec2020. I got Covid from a family member, sore throat, felt like a flu or bad cold,headache, body aches and sinus issue. She now has congestion and cough; Received the Pfizer COVID-19 on 21Dec2020. I got Covid from a family member, sore throat, felt like a flu or bad cold,headache, body aches and sinus issue. She now has congestion and cough; This is a spontaneous report from a contactable health care professional nurse, the patient. A female patient (nurse) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 21Dec2020 as a single dose for COVID-19 vaccination. The patient had no known medical history. The patients concomitant medications were not reported. On an unspecified date the patient experienced I got Covid from a family member. She reported being symptomatic on 1Jan2021 started with a sore throat, felt like a flu or bad cold. She reported sore throat, headache, body aches and sinus issue. She now has congestion and cough. She had no issue when she got the vaccine. The patient will be getting the second dose 11Jan2021 and she would like to know if she is eligible to receive the second dose Pfizer Covid-19

Vaccine. The clinical outcome of the event was unknown . Information on the Lot number has been requested.; Sender's Comments: The reported ""got COVID from a family member"" after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration."

received the vaccine on December 17th and tested positive for Covid on December 27th/COVID PCR (polymerase chain reaction) test: positive on 28Dec2020; received the vaccine on December 17th and tested positive for Covid on December 27th/COVID PCR (polymerase chain reaction) test: positive on 28Dec2020; This is a spontaneous report from a Pfizer sponsored program Pfizer First Connect. A contactable nurse (patient) reported that a 65-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK5730), via an unspecified route of administration on 17Dec2020 11:00 in left deltoid at single dose for covid-19 immunization. Medical history included thyroid cancer from an unknown date and unknown if ongoing, bilateral thyroidectomy in 2014. Family Medical History: Father died of lung cancer. Mother died of cardiac arrest in 1972. Concomitant medication included levothyroxine sodium (SYNTHROID) for bilateral thyroidectomy. The patient received the vaccine on 17Dec2020 and tested positive for covid on 27Dec2020. The adverse events resulted in emergency room visit. The patient underwent lab tests and procedures which included tested positive for COVID on 27Dec2020, COVID PCR (polymerase chain reaction) test: positive on 28Dec2020. Vaccination facility type was hospital. No additional vaccines administered on same date of Pfizer suspect. Received COVID Vaccine on 17Dec2020. Tested positive for COVID in emergency room on 27Dec2020. Tested positive on a COVID PCR test on 28Dec2020. Prior vaccinations within 4 weeks was none. Caller received the first dose of the COVID Vaccine. Tested positive for COVID on 27Dec2020. Is about to get the second dose of COVID Vaccine and would like to know if she should proceed or wait. Since quarantine, she has had no fever. Is slightly short of breath and has a headache. Works in COVID units in a hospital. Wants to make sure she can receive the second dose. Stated she had no adverse reaction to the COVID Vaccine unless an adverse reaction can occur two weeks after. Is attributing the shortness of breath and headache to testing positive for COVID. Shortness of breath and headache only occurred after testing positive for COVID. Reason she went to the hospital is because she lost her sense of smell. She got tested and was positive for COVID. Lost sense of smell, went to Emergency Room, and notified doctor of positive test the following day, 28Dec2020. Clarified she just went to the emergency department to get tested for COVID and then went home. Was called with positive results in an hour. Caller wanted to know when she should proceed with getting her second dose of Covid vaccine. She is supposed to receive her second dose tomorrow. She thought she was going to take second dose when I completely recovered. Caller asked if she waited until the 13th to receive second dose of Covid vaccine, would it be effective. She would feel more comfortable doing that. The outcome of events was unknown.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported COVID-19 based on the known safety profile. However the short duration of 9 days since the vaccine first dose is given it is unlikely patient would have fully developed immunity.

"Felt like he couldn't breath; He still has his sense of taste, but it is dulled; Recently got the vaccine and also came down with covid; Recently got the vaccine and also came down with covid; Exhaustion/feeling

tired; Loss of smell; Mild congestion/The congestion went into full nasal drainage; This is a spontaneous report from a contactable pharmacist (patient). A 30-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL0140, Expiry Date: 31Mar2021), via an unspecified route of administration on 31Dec2020 13:00 at single dose for Covid-19 immunization. The patient had no relevant medical history and concomitant drug. The patient experienced recently got the vaccine and also came down with covid on 04Jan2021 00:30, mild congestion/the congestion went into full nasal drainage on 31Dec2020, loss of smell on 02Jan2021, exhaustion/feeling tired on 03Jan2021, felt like he couldn't breathe, he still has his sense of taste, but it is dulled on an unspecified date. He was a pharmacist. He received his first dose of the COVID vaccine on Thursday 31Dec2020 1pm. Shortly thereafter, he got the typical side effects of the vaccine that are posted. Then 2.5 days letter he no longer had a sense of smell. Everything he read said that he probably came in contact with COVID prior to administration. His questions was since he test positive for COVID, should he still get the second shot. He got it at a clinic. He did experience mild congestion which started by 6 o'clock. He started to notice slight congestion that kind of went away. Then, on Friday, about 24 hours later, he really noticed he had congestion. He took pseudoephedrine hydrochloride (SUDAFED) and paracetamol (TYLENOL). Then his sense of smell diminished with the congestion and felt like he couldn't breathe. On Saturday, he decided to not take medication. That was when he noticed he could not smell anything. He had full blown congestion. It probably took two days when he started to lose his sense of smell. He received the shot on Thursday. On Saturday, he lost his sense of smell. He still has his sense of taste, but it was dulled. Sunday, he was just exhausted and feeling tired. These were all listed as typical side effects except for the loss of smell. Saturday was the worst. The congestion went into full nasal drainage. On Sunday he had no sinus issues. He still hasn't gained his sense of smell back. The exhaustion set in Sunday 03Jan2020. He doesn't feel like any of the side effects are serious. The exhaustion has started to let up some so it is improving. He was pretty much back to normal. He just couldn't figure out why he had a loss of smell. He had a COVID rapid test on 04Jan2021 at 8:30 am (as reported). He received an alert and hour later that it was positive. He was wondering whether the loss of smell could be from the vaccine. The patient underwent lab tests and procedures which included COVID-19 rapid POC test: positive on 04Jan2021. The outcome of events for mild congestion/the congestion went into full nasal drainage was resolved on 03Jan2021, for loss of smell was not resolved, for exhaustion/feeling tired was resolving, for other events was unknown. The events were reported as non-serious.; Sender's Comments: Reported event ""recently got the vaccine and also came down with covid"" is considered possibly related to suspect BNT162B2 based on temporal association and known drug safety profile."

"Doctor had the 1st dose last 16Dec2020 then tested positive for COVID 17Dec2020; Doctor had the 1st dose last 16Dec2020 then tested positive for COVID 17Dec2020; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect, received from a contactable physician (patient). A male patient of an unspecified age started to the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), unspecified route of administration on 16Dec2020 as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The physician inquired ""is it recommended to receive the 2nd dose despite having antibodies and recovered from COVID?"" The doctor had the 1st dose on 16Dec2020 then tested positive for COVID

17Dec2020. He will receive the 2nd dose tomorrow 06Jan2021 and he was recovering. The patient underwent lab tests and procedures which included COVID test: result positive on 17Dec2020. Outcome of the event doctor had the 1st dose last 16Dec2020 then tested positive for COVID 17Dec2020 was recovering. Information on the lot/batch number has been requested.; Sender's Comments: The reported tested positive for COVID after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration."

"he received his first dose of the vaccine on 22Dec2020 and tested positive for Covid yesterday (04Jan2021).; he received his first dose of the vaccine on 22Dec2020 and tested positive for Covid yesterday (04Jan2021).; This is a spontaneous report from a contactable other healthcare professional (patient). A male patient of an unspecified age started to the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), unspecified route of administration on 22Dec2020 as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. He received his first dose of the vaccine on 22Dec2020 and tested positive for COVID yesterday (04Jan2021). He stated his ""symptoms were general at first, then weakness after 10 days, chilly and muscle strain"". The other HCP reported ""do I need to take the second dose on 11Jan2021?"" The patient underwent lab tests and procedures which included COVID test: result positive on 04Jan2021. Outcome of the event he received his first dose of the vaccine on 22Dec2020 and tested positive for COVID yesterday (04Jan2021) was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The reported positive test for Covid after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration."

she had COVID symptoms; she had COVID symptoms; chills; low grade fever; muscle joint pain; muscle joint pain; exhausted with a headache/ She doesn't want to get up she is tired; exhausted with a headache/slight headache; muscle joint pain which is a stabbing pain all over her body; feeling unwell; This is a spontaneous report from a contactable nurse (patient). A 47-year-old female patient receive first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899, manufacturer: Pfizer), via an unspecified route of administration on 04Jan2021 14:00 at single dose for Covid-19 immunization. Medical history included ongoing childhood asthma, COVID 19 positive from 07Dec2020 to an unknown date. There were no concomitant medications. The patient felt like she had covid symptoms, chills, low grade fever, muscle joint pain, exhausted with a headache/ she doesn't want to get up she was tired, muscle joint pain, which was a stabbing pain all over her body, feeling unwell, all on 05Jan2021 05:00. The events were reported as non-serious. Caller had Sars-COV-2 infection diagnosed 07Dec2020. Received first dose of vaccine 04Jan2021 at 14:00. She was experiencing chills, low grade fever, muscle joint pain, exhausted with a headache. Asking for information on efficacy of second dose. She didn't have any side effects or anything initially. Then, 12 hours later at 5- 6 am she felt like she had COVID symptoms. She already had COVID so she known what it feels like. She was wondering how long would last. It was almost like having real COVID. She didn't have a prescribing doctor. She had COVID 07Dec2020. She was currently experiencing Chills, fever low grade, muscle joint pain which was a stabbing pain all over her body, and she was feeling unwell. She didn't want to get up

she was tired. She has a slight headache. This all started at 5 am on 05Jan2021. Even with medication. She has been taking paracetamol (TYLENOL) and excedrin. She cannot work if she wanted to, but these effects are not serious. Her fever has went down. The chills have stayed the same. She was diagnosed with childhood asthma. Caller asked about interval information between the SARS-COV-2 infection diagnosed 07Dec2020 and her first dose of vaccine 04Jan2021 at 14:00. The outcome of events for felt like she had covid symptoms was unknown, for low grade fever was resolving, for other events was not resolved.; Sender's Comments: There is not a reasonable possibility that event suspected COVID-19 is related to BNT162B2. There is no test done to confirm whether patient got COVID-19 or not. And symptoms that were suspected by reporter as due to COVID-19 occurred one after the vaccination, when vaccine was not expected to achieve the effect.

he tested positive for COVID; he tested positive for COVID; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs) from a contactable physician (patient). A 73-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on the right deltoid on 28Dec2020 09:30 at single dose for COVID-19 immunization. Medical history included diabetic (he is a diabetic, but he is not on medication for it) from Nov2018 and ongoing, hepatitis (not ongoing) (He had hepatitis virus for 15 to 20 years. It resolved 5 or 6 years ago. It corrected on it's own), supplement, hypertension and carcinoma of the lung. Everyone in his family has hypertension. His sister had carcinoma of the lung. There was no history of all previous immunization with the Pfizer vaccine considered as suspect. The patient did not have additional vaccines administered on same date of the Pfizer suspect. There were no prior vaccinations within 4 weeks. There were no adverse events following prior vaccinations. Concomitant medication included doxazosin mesilate (CARDURA), bisoprolol fumarate, hydrochlorothiazide (ZIAC), nystatin (STATIN) taken for lipids, colecalciferol (VITAMIN D) taken for supplement, fish oil, acetylsalicylic acid (BABY ASPIRIN), vitamin C [ascorbic acid]. The patient also received multivitamin. He has been on all concomitant medications for at least three to four years. The patient was scheduled for the next dose on 18Jan2021. On 05Jan2021 he tested positive for COVID. The event was reported as serious as medically significant. The patient was given the antibody infusion and steroid injection. It was outpatient. He was not admitted. Treatment was received for the events. The outcome of the events was unknown. Information on lot number/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. However individuals may not be protected until at least 7 days after their second dose of the vaccine.

she previously had a SARS-Cov-2 infection; she previously had a SARS-Cov-2 infection; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunisation. Caller just had wisdom teeth extracted and was currently on antibiotics. She stated she previously had a SARS-Cov-2 infection on an unspecified date. Outcome of SARS-Cov-2 infection were unknown. Information on the lot/batch number has been requested.

following the receipt of the first dose of the COVID-19 vaccine; testing positive to COVID; This is a spontaneous report from a non-contactable other Healthcare Professional reported for herself. A female

patient of an unspecified age (Age: 47, Unit: Unknown) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 20Dec2020 at single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient explained testing positive to COVID on the 29Dec2020, following the receipt of the first dose of the COVID-19 vaccine on the 20Dec2020. She stated that minor symptoms remain, and asked if she could receive the second dose of the vaccine due on the 10Jan2021. The outcome of the events was not reported. No follow-up attempts are possible; information about lot/ batch number cannot be obtained.; Sender's Comments: The reported testing positive to COVID after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

"Flu-like symptoms; Cold symptoms; tested positive for SARS-COV-2 infection; tested positive for SARS-COV-2 infection; muscle and body aches; muscle and body aches; loss sense of taste; Congestion nasal; Sore throat; Loss of smell; Sinus pressure; Headache; general fatigue; This is a spontaneous report from a contactable consumer (patient). A 28-year-old female patient received BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE) Batch/lot number: EJ1685, via an unspecified route of administration on 17Dec2020 16:00 at single dose for COVID-19 immunisation. Medical history was none. There were no concomitant medications. The patient got the COVID Vaccine and the day after, was exposed to the virus, got sick right away and tested positive for the virus. The patient stated that she got vaccinated around 4pm, 17Dec2020. She was exposed to the virus by the same coworker twice on 18Dec2020 and then the next week, she believed, on 22Dec2020, the coworker tested positive for COVID. Patient stated that her symptoms started 24Dec2020. She did not think she had a fever as she did not feel feverish. She had flu like symptoms from an unspecified date with muscle and body aches from 25Dec2020. She lost her sense of taste and smell from 25Dec2020. She had cold-like symptoms from an unspecified date with congestion nasal and sore throat from 25Dec2020, sinus pressure and headaches from 24Dec2020. She had general fatigue from 24Dec2020 for a while. Patient had not had another COVID test since the one she had 28Dec2020, when she tested positive for COVID. She became symptoms-free on 03Jan2021. Patient was asking should she still get the 2nd dose of the COVID Vaccine. She was also concerned about the reaction her body was going to have to the vaccine after being sick. The patient had recovered from Flu-like symptoms and Cold symptoms on an unspecified date, recovered from muscle and body aches on 29Dec2020, recovered from loss sense of taste and loss of smell on 31Dec2020, recovered from congestion nasal, sinus pressure and headache on 03Jan2021, recovered from Sore throat on 01Jan2021, recovered from general fatigue on 02Jan2021. And outcome of ""tested positive for COVID after receiving the COVID Vaccine"" was unknown."

He received the 1st dose of the vaccine on Friday 18DEC2020. He developed COVID the following Thursday.; He received the 1st dose of the vaccine on Friday 18DEC2020. He developed COVID the following Thursday.; This is a spontaneous report from a contactable Physician (patient's wife). A 55-year-old male patient received the 1st dose of bnt162b2 (BNT162B2) on 18Dec2020 at single dose for Covid-19 immunisation. The patient medical history and concomitant medications were not reported. The patient experienced developed Covid on 24Dec2020 (reported as the following Thursday). The patient underwent lab tests and procedures which included Sars-Cov-2 test: developed Covid. He was

fairly symptomatic for 7 days but he was doing well now. The outcome of events was recovering. The reporter quereide whether he should receive the 2nd dose, which is due on 08Jan2021 or should it be deferred. Information on Lot/Batch number requested.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported positive Sars-Cov-2 test, which is considered ineffective of BNT162B2, and the administration of BNT162B2.

began having Covid symptoms on 24Dec and tested positive for Covid on Christmas; began having Covid symptoms on 24Dec and tested positive for Covid on Christmas; Arm was sore; This is a spontaneous report from a contactable physician reported for herself. A 55-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730), via an unspecified route of administration on 17Dec2020 at single dose for COVID-19 vaccination. Medical history was not reported. There were no concomitant medications. Patient had arm sore on 18Dec2020. She started having COVID symptoms on 24Dec2020. She tested positive on Christmas, 25Dec2020. She was asking if she should get the second vaccine. When she got the vaccine she didn't pay attention to the paperwork. She was busy. Her arm was a little sore for a day that was the only reaction she had. She was hoping when she developed COVID symptoms that she was not sick. She was not hospitalized, and she is wondering if maybe the vaccine helped her not get as sick, and not end up in the hospital. It was the first dose she received. She has no other medical conditions. All the previous agent did was read off information to her. It sounds to her like she should go ahead and get the second dose. Outcome of event Arm was sore was recovered in 19Dec2020, of others was unknown.; Sender's Comments: Based on available information, a possible contributory role of BNT162B2 vaccine cannot be completely excluded for reported events.

developed covid like symptoms a few days later/ tested positive on the 26th; developed covid like symptoms a few days later/tested positive on the 26th; This is a spontaneous report from a contactable physician. A patient of unspecified age and gender received the first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 18Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the vaccine on 18Dec2020 and developed covid like symptoms a few days later in Dec2020 and believed the patient was likely exposed. The patient was tested positive on 26Dec2020. The outcome of the events was unknown. Information about Lot/Batch number has been requested.; Sender's Comments: The reported covid like symptoms a few days with tested positive after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

tested positive for the COVID-19 virus; tested positive for the COVID-19 virus; This is a spontaneous report from a contactable nurse. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient was tested positive for the COVID-19 virus on an unspecified date after being administered with the vaccine. The outcome of the event was unknown. Information on Lot/Batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further

information like confirmative virus genome /nucleic acid detection is needed for meaningful medical assessment. ,Linked Report(s) : US-PFIZER INC-2021005630 same reporter and drug, different patient and event

"was tested and diagnosed positive for the SARS-CoV-2 infection; was tested and diagnosed positive for the SARS-CoV-2 infection; developed symptoms after being exposed at work on 27Dec2020; This is a spontaneous report from a contactable nurse. A male patient (reporter's husband) of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) as the first dose via an unspecified route of administration on 22Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient got exposed as a first line nurse working in the emergency room. The nurse reports that her husband developed symptoms after being exposed at work on 27Dec2020 five days after being administered with the first dose of BNT162B2 and he was tested and diagnosed positive for the SARS-CoV-2 infection on 27Dec2020. The outcome of the events was unknown. Information about Lot/batch number has been requested.; Sender's Comments: There is not a reasonable possibility that reported ""tested and diagnosed positive for the SARS-CoV-2 infection"" is related to BNT162B2. Event occurred only 5 days after receiving first vaccine and patient was exposed to virus at work."

positive COVID test result; positive COVID test result; cough; This is a spontaneous report from a contactable consumer reporting for herself. A 49-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) (lot number/expiration date: not provided), via an unspecified route of administration, on 16Dec2020 (at the age of 49 years old) as a single dose for COVID-19 vaccination. Relevant medical history and concomitant medication were not provided. On 21Dec2020, the patient experienced a strange cough. The patient reported that she received the first dose of COVID vaccine on 16Dec2020 and that she was then exposed to her husband who tested positive on 17Dec2020. Due to a strange cough, she was tested on 21Dec2020, which resulted in a positive COVID test result. The outcome of the events strange cough and positive COVID test was unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.

Developed covid symptoms 21Dec, tested positive 26Dec; Developed covid symptoms 21Dec, tested positive 26Dec; This is a spontaneous report from a contactable physician reporting for a patient. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 18Dec2020 as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient developed COVID symptoms 21Dec2020, tested positive 26Dec2020. The outcome of the event was unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. However individuals may not be protected until at least 7 days after their second dose of the vaccine.

received the first dose of the Pfizer COVID vaccine on 28Dec2020 and tested positive for COVID 03Jan2021 (nasal swab) & symptomatic; received the first dose of the Pfizer COVID vaccine on

28Dec2020 and tested positive for COVID 03Jan2021 (nasal swab) & symptomatic; This is a spontaneous report from a contactable Nurse (patient). A female patient of unspecified age received BNT162B2 (Pfizer, lot number: EL0140) first dose on 28Dec2020 at single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. Patient was tested positive for COVID 03Jan2021 (nasal swab) & symptomatic, her second dose of the vaccine is scheduled 18Jan2021. She was wondering if she still get the second dose. The outcome of the events was unknown.; Sender's Comments: The reported tested positive for COVID (nasal swab) & symptomatic after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

within 6 hours experienced severe chills and covid-like symptoms, she also tested positive for COVID-19; within 6 hours experienced severe chills and covid-like symptoms, she also tested positive for COVID-19; This is a spontaneous report from a contactable nurse. A 30-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were not reported), via an unspecified route of administration in left arm on 04Jan2021 11:30 at a single dose for COVID-19 vaccination. Medical history included allergies to Sulfa diagnosed in 2008, Allergies to Strawberries diagnosed when she was very young, Diamox allergy diagnosed in 2008, dyslexic, and Obesity but never been treated. Concomitant medication included levothyroxine (LEVOTHYROXINE), ascorbic acid, betacarotene, calcium sulfate, colecalciferol, cyanocobalamin, ferrous fumarate, folic acid, nicotinamide, pyridoxine hydrochloride, retinol acetate, riboflavin, thiamine mononitrate, tocopheryl acetate, zinc oxide (PRENATAL VITAMINS), zinc (ZINC), nd cetirizine hydrochloride (ZYRTEC). The patient previously took diamox [acetazolamide] and experienced drug hypersensitivity. Patient received first dose Monday, 04Jan2021, then she experienced severe chills and Covid like symptoms. Apparently, she tested positive for COVID 19. She ws not sure if it was a false positive or if she actually has COVID, but was concerned because her husband has cancer and was immunocompromised. Literally, she got the vaccine because her OB/GYN told her she needs to get it as soon as possible. She did blood work and she tested negative for pregnancy. There was no prescriber as it was given as part of her work. Fifteen minutes after receiving the vaccine, she had the worst headache she has ever had in her life. Six hours after that, she had such bad chills. That night, it worsened and it got better every hour when she took something. She said her congestion was still present. She stated she took Tylenol and hour later and it subsided. The outcome of the events was not recovered. The patient underwent laboratory date including negative antibodies on an unknown date, blood work on Mar2020 with unknown result, then on 05Jan2020 tested positive to COVID 19 by saliva test at 09:15 and nasal test at 11:30 Information about Lot/batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available

patient got the first dose of the COVID vaccine on 18Dec2020/was positive via COVID PCR test on 26Dec2020; patient got the first dose of the COVID vaccine on 18Dec2020/was positive via COVID PCR test on 26Dec2020; had a COVID exposure on 23Dec2020; This is a spontaneous report from a contactable physician. A patient of unspecified age and gender received the first dose of bnt162b2

(PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiration date not provided), via an unspecified route of administration on 18Dec2020 at single dose for COVID-19 immunization. Patient's medical history was not reported. Concomitant medication included chemotherapy. It was reported that patient got the first dose of the COVID vaccine on 18Dec2020 and then had a COVID exposure on 23Dec2020 and was positive via COVID PCR test on 26Dec2020. It was mentioned that patient is a chemotherapy patient. The patient was given the antibodies for COVID on 28Dec2020 and the patient is currently doing well. Reporter's question was that the patient was scheduled to get the second dose of the vaccine on 08Jan2021 and the reporter is wondering if given this patient's situation, is it safe for the patient to receive the second dose or if there are any recommendations on when the patient should receive the second dose. Outcome of the events was recovering. Information on the lot/batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and SARS-CoV-2 test positive cannot be totally excluded. The case will be reassessed if additional information becomes available.

tested positive for covid; tested positive for covid; This is a spontaneous report from a contactable consumer. A 35-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration at the left upper arm on 18Dec2020 15:30 at a single dose for COVID-19 immunisation. Medical history included high blood pressure and had electrocardiogram (EKG) unknown result a week before vaccination in Dec2020. Concomitant medication included acetylsalicylic acid (ASPIRIN), lisinopril, and guaifenesin (MUCINEX). It was reported that patient tested positive for COVID on 31Dec2020. She has not gotten her second dose but it was scheduled for 08Jan2021 for which will still be in quarantine then and requested guidance on when/if she should get the second dose. Patient explained her parents have COVID and that the rapid test for the COVID test was how she found out she had COVID. The patient has not recovered from the events.

Developing symptoms of covid/ symptoms of Covid after having the vaccine; Developing symptoms of covid/ symptoms of Covid after having the vaccine; This is a spontaneous report from a contactable consumer (patient) via a Pfizer-sponsored program. A 31-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection) lot number: EJ1688, via an unspecified route of administration in the left arm, on 21Dec2020 at a single dose for covid-19 immunisation as she works with disabled people and for general community health. Patient's medical history was none. Family history included her kids/children had covid (unknown if ongoing). There were no concomitant medications. It was reported that the patient had symptoms of covid after having the vaccine with outcome of recovering. The patient received the first dose of covid vaccine on 21Dec2020 and on the 02Jan2021 she started developing symptoms of covid. She mentioned that her children have virus and she had the covid test done. She wanted to know if she can get the second dose of the vaccine. She queried for her co-worker who has the Covid and was told to not take the vaccine yet and how long they need to wait. She was tested this morning. She has not gotten the results. Her kids had Covid and she felt certain she had it because she has symptoms. It comes and goes. It was better during the day and worse at night. She received the vaccine because she works with disabled people where

there are extremely high numbers of the virus. She also got it for general community health. The Covid test was done on 06Jan2021 with unknown result.

had a positive Covid test after receiving the vaccine; had a positive Covid test after receiving the vaccine; This is a spontaneous report from a contactable nurse (patient) via a Pfizer Sponsored program, Pfizer First Connect. A 30-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection) lot number: EH9899, intramuscular in the left arm, on 18Dec2020 at 0.3 mL, single dose for COVID-19 immunization. Medical history included was none. There were no concomitant medications. The patient had a positive Covid test after receiving the vaccine with outcome of unknown. It was reported that the patient got the first dose of the vaccine on 18Dec2020, and tested positive on 28Dec2020 due to some exposure. She asked for any recommendations on the second dose whether or not she could get it. She is scheduled to get it this weekend. The reporter considered the event as non-serious and unrelated to the use of the vaccine.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 virus test positive cannot be totally excluded. The case will be reassessed if additional information becomes available.

He tested positive last Tuesday for SARS-Cov-2; He tested positive last Tuesday for SARS-Cov-2; This is a spontaneous report from a Pfizer Sponsored Program, Pfizer First Connect via a contactable other health professional (HCP) (patient). A male patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 18Dec2020 at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. The patient tested positive last Tuesday (05Jan2021) for SARS-Cov-2 and the patient wanted to know if he could receive his second dose of vaccine. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further information like confirmative virus genome /nucleic acid detection is needed for meaningful medical assessment.

she received the COVID-19 vaccine and the next day she tested positive for the viral infection; she received the COVID-19 vaccine and the next day she tested positive for the viral infection; This is a spontaneous report from a contactable consumer (patient) from a Pfizer sponsored program Pfizer First Connect. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 05Jan2021 at single dose for COVID-19 immunisation. The patient medical history and the concomitant medications were not reported. The patient was tested on 02Jan2021, and did not get the results till 06Jan2021 and tested positive. The patient wanted to know if she could have any side effects if she received the COVID-19 vaccine and the next day she tested positive for the viral infection. She is unsure of when she contracted the infection. The outcome was unknown. Information on the lot/batch number has been requested.

chest tightness; palpitations; elevated heart rate; fatigue; This is a spontaneous report from a contactable Other HCP. A 37-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19

VACCINE), via an unspecified route of administration on 31Dec2020 at single dose for covid-19 immunisation. Medical history included Dermatographia. The patient is allergic to Penicillin, lactose, Cephalosporins and Beepen-VK. There were no concomitant medications. Seventy two hours after the vaccine was given the patient had an elevated heart rate, chest tightness and fatigue. Are this consistent with the vaccine. She does not have a history of elevated heart rate or palpitations. She checked her heart rate with her Apple watch and sent in a strip to the doctor. The doctor is concerned and is asking if this is related. She went to the ER to make sure she was ok but was not admitted. Outcome of event heart rate increased as recovered on 05Jan2021, of fatigue was not recovered, of others was recovering. Information about Lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of elevated heart rate, chest tightness, palpitations and fatigue due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including 12-lead EKG , counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

if a patient experienced an allergic reaction to the first dose is there anything prophylactically needing to be done when administering the second dose of the Covid vaccine; delayed hyper sensitive reaction; Angioedema; Urticarial rash; This is a spontaneous report from a contactable other hcp. A 47-years-old male patient received first dose of bnt162b2 (BNT162B2), unknown on 18Dec2020 (lot number: EK5730) at SINGLE DOSE for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. Caller is a Physician Assistant. Caller states that she is calling about the Covid Vaccine. She had a patient received his first dose of the vaccine on Friday 18Dec2020, 3 days later on 21Dec2020 he had an urticarial rash that persisted, The urticarial rash was treated with prednisone and resolved by 27Dec2020, it has not reoccurred. The allergist said it was a delayed hyper sensitive reaction that was Prompted by the immune simulation from the vaccine. The Patient was treated for the urticaria. Caller would like to know if a patient experienced an allergic reaction to the first dose is there anything prophylactically needing to be done when administering the second dose of the Covid vaccine? Caller is very upset and frustrated and stating she wants to speak to someone that is a clinician with the clinical trial team who can give her recommendations for a specific patient. Caller asks if they should do Prophylaxis with antihistamines for the second dose. He did not have anaphylaxis but he had angioedema. Caller states that she did a Vaers report on 22Dec2020, but no one contacted her. He started taking Zyrtec and Vistaril. The Allergist said it was fine and he will still need the 2nd Booster Dose. The Angioedema started on 22Dec2020, it was also treated with prednisone, in addition to being administered Benadryl IM, and Vistaril. The outcome of the event urticarial rash was recovered on 27Dec2020 and Angioedema was recovered on 22Dec2020. No follow-up attempts are needed; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the angioedema and the other reported events due to

temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including serum tryptase level and complement panel, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Angioedema; Tongue numb observer notified about 10 minutes after vaccine, then tongue and Lower lips numb; tachycardia with throat tightness; tachycardia with throat tightness.; This is a spontaneous report from a contactable nurse (patient). The 37-years-old female patient received first dose of bnt162b2 (BNT162B2, Lot number: EK9231), unknown on 05Jan2021 07:45 at SINGLE DOSE on left arm for COVID-19 immunisation. The patient is not pregnant. No covid tested post vaccination. Medical history included Idiopathic angioedema, HTN, PCOS, Allergies to medications, food, or other products: Latex, penicillin, coconut. Prior to vaccination, the patient was diagnosed with COVID-19. Concomitant medication included spironolactone (ALDACTONE), fexofenadine hydrochloride (ALLEGRA), hydrochlorothiazide, amlodipine besilate (NORVASC). The patient did not take other vaccine in four weeks. The patient experienced Angioedema event occurred approximately 18 hrs later with repeat of treatment in ER on 06Jan2021, tongue numb observer notified about 10 minutes after vaccine, then tongue and lower lips numb on 05Jan2021 08:00, taken to ER became tachycardia with throat tightness on 05Jan2021 08:00. EPIPEN administered, benadryl and prednisone (steroids), and famotidine administered along with a saline bolus. The outcome of the events was recovered. No follow-up attempts are needed.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the angioedema and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including complement levels, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"extremely bad dry mouth; lips were going numb; facial numbness; rash from his neck to his nipple line; BP was 180/110 / BP stayed around 160/100; felt an ""amped"" feeling; felt flush; uncomfortable; This is a spontaneous report from a contactable healthcare professional. A 44-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number/expiration date unknown), dose number 1, intramuscularly on 21Dec2020 14:00 at a single dose on the right arm for COVID-19 immunization. Medical history included gluten allergy with causes dermatitis herpetiformis, osteoporosis, and fibromyalgia. The patient previously took Benadryl and experienced allergies. Concomitant medications were not reported. The patient reported that immediately after receiving

vaccine on 21Dec2020, he felt an ""amped"" feeling and felt flush. It was uncomfortable but not alarming at first. About ten minutes after shot, he started to have extremely bad dry mouth. He went back to work, but he went back downstairs after feeling like he was getting seriously ill and his lips were going numb. His BP was 180/110. The facial numbness went away but his BP stayed around 160/100. He was asked to go to ER, but he refused because he would have to pay for it and he was feeling better. He also noticed after going back upstairs that he had a rash from his neck to his nipple line. The doctor asked for Benadryl, but he was not given due to possible Benadryl allergy. He went home and his BP returned to normal 2 hours later. The patient was not diagnosed with COVID-19 prior to vaccination, and was not tested for COVID-19 since the vaccination. The outcome of the events was recovered in 21Dec2020 for blood pressure increased and facial numbness, and recovered on an unspecified date for the other events. Information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the BP increased and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including EKG and chemistry panel, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

crystals in her urine; muscle pain; joint pain; flu like symptoms/feeling like she has the flu; having no energy; feeling tired/Tiredness; kidney stone; pain in her back; did not feel good; This is a spontaneous report from a contactable consumer (patient). A 54-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot EL0140) intramuscular on 31Dec2020 16:00 at a single dose on left arm for Covid-19 prophylaxis. Medical history included rheumatoid arthritis. There were no concomitant medications. The patient wanted to know if she could receive the second dose of the COVID-19 vaccine if she presented the following side effects with the first shot: feeling tired/tiredness on 02Jan2021; having no energy on 03Jan2021; muscle pain, joint pain, and flu like symptoms/feeling like she has the flu, on 04Jan2021. She went to work on Monday and has taken the last couple of days off because she did not feel good on Jan2021. She did have rheumatoid arthritis, but it was different and has not been like this. She went to the doctor on Monday after she got off of work and thought at first maybe she had a UTI; treated herself with AZO, but had a urinalysis that was negative on an unspecified date. She was told some of the pain in her back might have been a kidney stone on Jan2021 because they found crystals in her urine on 04Jan2021, but she did not know about that. She noticed having no energy on Sunday. She wanted to know if it was recommended that she get the second vaccine since she was having side effects. The events required a visit to physician office and did not require a visit to Emergency Room. Prior vaccinations within 4 weeks was noted as none. Family medical history relevant to the events (AE) was noted as none.The outcome of the events of feeling tired/tiredness was not recovered; of having no energy, muscle pain, joint pain, flu like symptoms/feeling like she has the flu was recovering; of the rest of events was unknown.

Left Bell's palsy/left side of face, inability to raise left eyebrow; numbness and paresthesia of tongue; numbness and paresthesia of tongue; pain in left upper arm between elbow and shoulder; tachycardia; elevated blood pressure; This is a spontaneous report from a contactable physician. A 35-year-old female patient (not pregnant at the time of vaccination) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899), intramuscular at arm left on 31Dec2020 at single dose for covid-19 immunization. The vaccine was administered at other (as reported). Medical history included asthma (Allergy induced asthma). Concomitant medication within 2 weeks of vaccination included cetirizine hydrochloride (ZYRTEC) from Dec2020 at 10mg daily. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 31Dec2020, the patient experienced Left Bell's palsy, numbness and paresthesia of tongue, left side of face, inability to raise left eyebrow, pain in left upper arm between elbow and shoulder, tachycardia, elevated blood pressure. The adverse events result in emergency room/department or urgent care. The patient received treatment for the adverse events which included Prednisone 20mg daily, Valacyclovir 1000mg twice a day. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient was not been tested for COVID-19. The outcome of events was not recovered.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the Bell's palsy and other reported events due to temporal relationship. However, the Bell's palsy may possibly represent a concurrent medical condition. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including viral serologies, and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Shortness of breath, stridor, migraine for 5 days and 10 days later cellulitis at injection site.; Shortness of breath, stridor, migraine for 5 days and 10 days later cellulitis at injection site.; Shortness of breath, stridor, migraine for 5 days and 10 days later cellulitis at injection site.; Shortness of breath, stridor, migraine for 5 days and 10 days later cellulitis at injection site.; This is a spontaneous report from a contactable Nurse (patient). A 51-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EH9899), intramuscularly on 28Dec2020 14:30 at single dose for covid-19 immunization. Vaccine location was left arm and it was the first dose. The facility type vaccine was hospital. Medical history included migraine from an unknown date. Concomitant medication included erenumab aooe (AIMOVIG), estradiol, diphenhydramine hydrochloride (BENADRYL), trazodone hydrochloride (TRAZODON). No known allergies. Patient was not diagnosed with COVID-19 prior to vaccination nor tested for COVID-19 since the vaccination. The patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced shortness of breath, stridor, migraine for 5 days and 10 days later cellulitis at injection site on 28Dec2020 15:00. Patient received Antibiotics, steroids epi as treatment for the adverse events. The adverse events resulted in Doctor or other healthcare professional office/clinic visit. The outcome of event migraine was recovered in Jan2021, other events was recovered on an unknown date. The events were reported as non-serious.;

Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of Vaccination site cellulitis, shortness of breath, stridor and migraine, due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

to get Botox injection for her Dystonia; got her 1st dose of Covid vaccine last 04Jan and was scheduled to have her 2nd dose on 22Jan; This is a spontaneous report from a Pfizer-sponsored program. A contactable consumer(patient) reported that a 62-year-old female received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 04Jan2021 at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. The patient got her 1st dose of Covid vaccine last 04Jan2021 and was scheduled to have her 2nd dose on 22Jan2021, but she had an appointment 2 days prior this to get botulinum toxin type a (BOTOX) injection for her Dystonia. The patient wanted to know if it's ok for her to get 2nd dose of Covid vaccine after getting botulinum toxin type A. Outcome of the events was unknown.

she tested positive 5 days after taking the first COVID19 Vaccine dose; she tested positive 5 days after taking the first COVID19 Vaccine dose; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiration date were not reported), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. On an unspecified date, the patient tested positive 5 days after taking the first COVID-19 vaccine dose. Outcome of the events was unknown. Information about lot/batch number has been requested.

received first dose of covid vaccine on 19Dec2020 tested positive on 31Dec2020; received first dose of covid vaccine on 19Dec2020 tested positive on 31Dec2020; This is a spontaneous report from a contactable other HCP (patient). A male patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) , via an unspecified route of administration on 19Dec2020 at the first single dose for covid-19 immunisation. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient received first dose of covid vaccine on 19Dec2020 tested positive on 31Dec2020. The outcome of events was unknown. Information about Lot/Batch has been requested.; Sender's Comments: A causal association between reported event and BNT162B2 cannot be excluded.

tested positive for covid19; tested positive for covid19; This is a spontaneous report from a contactable nurse (patient). A 22-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 21Dec2020 at single dose for COVID-19

immunization. The patient medical history and concomitant medications were not reported. The patient received vaccine 1st dose on 21Dec2020 and on 29Dec2020 she tested positive for covid19. She is coming up on 2nd dose on Friday (will be out of quarantine on the same day), she asked if she should get the vaccine. Her primary care physician advised her not to receive, within 30 days because there had been reports of people having reactions (ie: high fevers) to the vaccine. If she has a high fever she can't go to school. She asked if waiting 90 days make the vaccine not as effective and if she need to restart the series. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Test positive for covid19 found 7 day following the vaccination, no adequate effect of the suspect vaccine thus could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag

collapse/rapid progression of symptoms; hypotension/rapid progression of symptoms; respiratory distress with stridor; respiratory distress with stridor; dizziness/rapid progression of symptoms; not limited to abdominal pain/rapid progression of symptoms; blood pressure abnormality/rapid progression of symptoms; chest pain/rapid progression of symptoms; drooling/rapid progression of symptoms; increased swelling/rapid progression of symptoms; wheezing; dyspnea and increased work of breathing; skin changes; tongue swelling and vomiting; tongue swelling and vomiting; This is a spontaneous report from a non-contactable other health professional. A 35-year-old female patient (Age at vaccination: 35) received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK9231), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. During her 15 minute waiting period after the injection, the patient began to experience dizziness. Monitored patient for severe reaction symptoms, including but not limited to abdominal pain, blood pressure abnormality, chest pain, collapse, drooling, hypotension, increased swelling, rapid progression of symptoms, respiratory distress with stridor, wheezing, dyspnea and increased work of breathing, skin changes, tongue swelling and vomiting. Treatment included: no therapy. The outcome of the events was unknown. No follow up attempts are possible. No further information is expected.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the collapse, hypotension, respiratory distress and other reported events due to temporal relationship. There is very limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including BP measurements, chest x-ray, EKG and chemistry panel, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Escherichia Coli infection; This is a spontaneous report from a non-contactable consumer (daughter) from a Pfizer sponsored program Pfizer First Connect. A female patient of unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. Medical history and

concomitant medications were not reported. The reporter's mother has Escherichia Coli infection and is taking Nitrofurantoin antibiotic (Macrodantin). Asked if it is safe to take the second dose of the vaccine while on antibiotic. Caller asking if we could update info regarding antibiotic as even her doctor does not have info on this. Saying that even her doctor is unsure as Pfizer should know information regarding this more than her doctor. Treatment for event was Nitrofurantoin antibiotic (Macrodantin). Outcome of event was unknown. No follow up attempts are possible; Information about lot/batch number cannot be obtained.

"tested positive for Covid; tested positive for Covid; This is a spontaneous report from a contactable physician (patient). A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 20Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient tested positive for Covid on 22Dec2020. She wanted to know if there is any more information on receiving the second dose after testing positive. The outcome of the event was unknown. Information on the Lot/batch number has been requested.; Sender's Comments: Based on the mechanism of action of BNT162B2 vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine was given (in this case 2 days). However, a causal relationship between event ""tested positive with Covid "" (coded to Drug ineffective / SARS-CoV-2 test positive) and BNT162B2 vaccine cannot be completely excluded."

she received the Pfizer-BioNTech Covid-19 Vaccine .She said she tested positive for Covid-19 after being exposed to someone infected with the virus last Christmas; she received the Pfizer-BioNTech Covid-19 Vaccine .She said she tested positive for Covid-19 after being exposed to someone infected with the virus last Christmas; after being exposed to someone infected with the virus; This is a spontaneous report from a contactable Physician (patient). A female patient of an unspecified age receive the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) , via an unspecified route of administration on 18Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient she received the Pfizer-BioNTech Covid-19 Vaccine on 18Dec2020. She said she tested positive for Covid-19 after being exposed to someone infected with the virus last Christmas (25Dec2020). Now, she wanted to know if she can still take the 2nd dose. The outcome of the events was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: A causal association between reported event and BNT162B2 cannot be excluded.

tested positive for covid; tested positive for covid; This is a spontaneous report from a contactable consumer received from a Pfizer-sponsored program Pfizer First Connect. A 64-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EH9899, expiry date Mar2021, NDC 59267-1000-1), intramuscular in right arm on 18Dec2020 11:45 at a single dose as prevention. The vaccine was administered in the hospital. Medical history included ongoing cardiomyopathy diagnosed about 32 years ago and had pacemaker defibrillator Placed about 12 years ago. There were no concomitant medications. She was supposed to get the second dose of the Covid vaccine but she was positive for Covid. She found out she was positive for covid on Monday 04Jan2021 after she had a nasal swab test on 02Jan2020. The outcome of the event was unknown.

Bell's Palsy; developed flu like symptoms; This is a spontaneous report from a contactable pharmacist. A female patient of an unspecified age (reported as 32-40) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date in 2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient developed side effects side effects from first vaccine, Bell's palsy 4 days after vaccination (Dec2020) which lasted for 2 weeks and flu like symptoms (Dec2020) which also lasted 2 weeks. The events outcome was unknown. The patient was receiving 2nd dose on 06Jan2021, the reporter asked any information regarding this? Information on the lot/batch number has been requested.; Sender's Comments: Based on a compatible temporal relationship, causality between event Bell's palsy and BNT162B2 vaccine cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Fatigue; tested positive after receiving Covid-19 vaccine; tested positive after receiving Covid-19 vaccine; severely congested; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A contactable consumer (patient) reported that a 47-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EJ1685, Expiry Date: Mar2021) via an unspecified route of administration at right deltoid on 20Dec2020 at single dose for COVID-19 immunization. Medical history included ongoing severe asthmatic diagnosed as a child. There were no concomitant medications. Patient (a front line worker) is Grief Counselor. She tested positive after receiving BNT162B2 on 29Dec2020. She was supposed to get the second dose on 10Jan2021. She was having fatigue since 01Jan2021 and was severely congested since 26Dec2020. She was asking if she should get the second dose. The outcome of the events severely congested and fatigue was recovering, of the other events was unknown.

recently got vaccinated unwillingly knowing she had Covid; recently got vaccinated unwillingly knowing she had Covid; This is a spontaneous report from a contactable Other healthcare professional (HCP) reporting for herself. A female patient of an unspecified age received her first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient recently got vaccinated unwillingly knowing she had covid on an unspecified date. The patient wanted to known if she should get her second dose still and in the same timely manner. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of suspect BNT162B2 cannot be completely excluded for reported event.

she received the first dose of the vaccine on the 22nd of December and tested positive on the 28th; she received the first dose of the vaccine on the 22nd of December and tested positive on the 28th; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A contactable consumer(patient) reported that a female patient of an unspecified age received first dose BNT162B2, via an unspecified route of administration on 22Dec2020 at single dose for COVID-19 immunization. The

medical history and concomitant medications were not reported. The patient received the first dose of the vaccine on the 22nd of December and tested positive on the 28Dec2020, she was scheduled to get the 2nd dose on Jan 12th. The reporter wanted to know if it was safe for her to take the 2nd dose. The outcome of the events was unknown. Information about lot/batch number has been requested.

testing positive for COVID on nasal swab after first dose of COVID vaccine; testing positive for COVID on nasal swab after first dose of COVID vaccine; This is a spontaneous report from a non-contactable pharmacist. A patient of unspecified age and gender received 1st dose of BNT162B2 (reported as COVID vaccine), via an unspecified route of administration on an unspecified date at single dose for Covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient experienced testing positive for Covid on nasal swab after first dose of Covid vaccine on an unspecified date with outcome of unknown. No follow-up attempts are possible. Information about lot/batch number cannot be obtained. Pfizer is a marketing authorization holder of COVID vaccine in the country of incidence or the country where the product was purchased (if different). This may be a duplicate report if another marketing authorization holder of COVID vaccine has submitted the same report to the regulatory authorities.; Sender's Comments: The reported testing positive for Covid on nasal swab after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

She thinks there has been more anaphylactic reactions than usual and said that a physician female friend had experienced one; This is a spontaneous report from a non-contactable Other Health Professional via Pfizer sales representative. A female patient of unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. During a conference call, (Name) mentioned that she thinks there has been more anaphylactic reactions than usual and said that a physician female friend had experienced one. It was unclear whether it was after a Pfizer or Moderna vaccine. She did mention that her friend recovered without any issues. Outcome of event was recovered on an unspecified date. No follow-up attempts are possible. Information about lot/batch number cannot be obtained.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of anaphylaxis cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Tested positive for COVID; Tested positive for COVID; This is a spontaneous report from a Pfizer-sponsored program from a contactable consumer (patient). A 68-year-old female patient received first dose of bnt162b2 (Pfizer BioNTech COVID vaccine), via an unspecified route of administration on an unspecified date at a single dose in left arm for COVID-19 immunization. Medical history included ongoing rheumatoid arthritis, open heart surgery had this done a year ago, knee replacement, and hip

replacement. Concomitant medications included patient took a lot of different medications, but no additional details provided. The test done on Saturday 02Jan2021 and on Sunday 03Jan2021, she got the results that she was positive for COVID. Clinical details: She received the first dose of her COVID vaccine, and she will be due for her second dose on Saturday. However, she tested positive for COVID after getting her first dose. The doctor informed her she should have a COVID infusion. She took the COVID infusion and now after getting the infusion she is told she is not able to get her second dose of the COVID vaccine for 60-90 days. She is not sure what to do. She cannot remember the date she got the COVID vaccine, she knew she is due for her second one on Saturday. She received the COVID infusion this morning, originally she was told she would be able to have a second shot even after getting the COVID infusion. Now they are saying she cannot have the next dose on Saturday. She was told later she would have to wait two weeks. Then she was told she would have to possibly wait 90 days. She was thankful for the vaccine because even though she tested positive it probably kept her from dropping dead. Information on the lot/batch number has been requested.

"got Covid/She tested positive for SARS-Cov-2 04JAN2021; got Covid; This is a spontaneous report from a contactable other healthcare professional (patient). A female patient of an unspecified age received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 21Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient indicated she received her first dose of vaccine 21Dec2020. She tested positive for SARS-Cov-2 04Jan2021. She was asking how she ""got Covid"" and if she should receive the second dose. The outcome of the event was unknown. Information on Lot/Batch number has been requested.; Sender's Comments: The reported tested positive for SARS-Cov-2 after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration."

The day after vaccine administration, pt was still experiencing vertigo, spinning and headache.; The day after vaccine administration, pt was still experiencing vertigo, spinning and headache.; This is a spontaneous report from a non-contactable other healthcare professional (hcp). A 27-year-old female patient receive first dose of bnt162b2 (Pfizer BioNTech COVID vaccine, lot number: EL0140), intramuscularly on 30Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. There is unknown if any other vaccine received in four weeks. The patient experienced the day after vaccine administration, patient was still experiencing vertigo, spinning and headache, all on 31Dec2020 the day after vaccine administration. The outcome of events was unknown. This is a non-serious report. It's unknown if patient was diagnosed with COVID-19 or tested for COVID-19 since the vaccination. The adverse did not result in 'doctor or other HCP visit or emergency room or urgent care, hospitalization or prolongation, life threatening illness, disability or death or congential anomaly'. No follow-up attempts are possible. Information about Lot/Batch cannot be obtained.

anaphylaxis; throat tightening; throat tightening/tingling; throat tightening/tingling/soreness; dry wheezy cough a little dizziness; dizziness; tachycardia; Itching; chills; numb R foot; Low grade temp; h/a today; This is a spontaneous report from a contactable Nurse (patient). A 51-years-old female patient (no pregnant) started to receive bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number el3248),

via an unspecified route of administration on 06Jan2021 11:00 at the first single dose at left arm for covid-19 immunisation. Medical history included supraventricular tachycardia, adrenal insufficiency, hypothyroidism, attention deficit hyperactivity disorder, hypermobility syndrome, developmental hip. Concomitant medication included hydrocortisone, trazodone, levothyroxine sodium (LEVOTHROID), bupropion hydrochloride (WELLBUTRIN). The patient previously took erythromycin, morphine and experienced drug hypersensitivity. The patient experienced anaphylaxis, throat tightening/tingling/soreness, dry wheezy cough a little dizziness and tachycardia. Itching, numb R foot, Low grade temp and chills and headache on 06Jan2021 11:15. Seriousness criteria reported as life threatening. Taken to ER had IV benadryl, solumedrol, pepcid for anaphylaxis. Placed on O2 and given albuterol nebulizer. Had IV fluid bolus. Now on benadryl and 5 days of prednisone. The patient felt completely fine prior to vaccine. The patient underwent lab tests and procedures which included sars-cov-2 test: negative on 06Jan2021. The outcome of events was recovering. No other vaccine in four weeks; No covid prior vaccination.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of anaphylaxis presented as throat tightening/tingling/soreness, dry wheezy cough a little dizziness and tachycardia. Itching, numb R foot, Low grade temp and chills and headache cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The underlying predisposing condition of drug allergies may put the patient at high risk of anaphylactic reactions. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Soreness at injection site started at 1600 Body aches, headache, and low grade fever woke me up around 0100

Patient with Covid between their first and second doses of the Covid vaccine; Patient with Covid between their first and second doses of the Covid vaccine; This is a spontaneous report from a Pfizer-sponsored program from a contactable Pharmacist reported similar events for 2 patients. This is the 2nd of 2 reports. A patient of an unspecified age and gender received the first dose of BNT162B2 (Pfizer/BioNTech Covid-19 vaccine) on an unspecified date for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. On an unspecified date, the patient got Covid between first and second doses of the Covid vaccine. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The association between the event lack of effect (got COVID between first and second doses) with BNT162b2 can not be fully excluded.,Linked Report(s) : US-PFIZER INC-2021011515 same reporter/drug/AE, different patient

patient with covid between their first and second doses of the covid vaccine; patient with covid between their first and second doses of the covid vaccine; This is a spontaneous report from a Pfizer sponsored program IBCC (Inbound Call Center for HCPs). A contactable pharmacist reported similar events for two patients. This is the first case out of 2 cases. A patient of unspecified age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK9231, expiration date: Apr2021, NDC#59267-1000-1), via an unspecified route of administration on an unspecified date at

single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient with Covid between the first and second doses of the Covid vaccine on an unspecified date. The reporting pharmacist wanted to know if the patients with covid between their first and second doses of the covid vaccine what their risk would be, Reportedly 2 different patient. The outcome of the events was unknown.; Sender's Comments: The association between the event lack of effect (COVID between first and second dose) with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2021011471 same reporter/drug/event, different patient..

tested positive and also received the vaccine from COVID-19; tested positive and also received the vaccine from COVID-19; This is a spontaneous report from a Pfizer sponsored program. This contactable physician reported similar events for the physician herself and a patient. This is the second report, the patient report of 2 reports. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. The physician reported there was another person in her clinic that tested positive and also received the COVID vaccine on an unspecified date with outcome of unknown. The information on the batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further information like confirmative virus genome /nucleic acid detection needed for meaningful medical assessment.,Linked Report(s) : US-PFIZER INC-2021000799 Same reporter, same drug, different patients

"did develop COVID that week probably symptoms in general by 25Dec/probably infected whenever got the vaccine; did develop COVID that week probably symptoms in general by 25Dec/probably infected whenever got the vaccine/I don't feel very well right now; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EJ1685), via an unspecified route of administration on 21Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received 1st vaccine on 21Dec2020. The patient did develop COVID that week probably symptoms in general by 25Dec2020. She was probably infected whenever she got the vaccine and the patient was scheduled to have second vaccine on 11Jan2021 which was next Monday and the patient was still sick, should the patient delayed that. The patient also did not feel very well on an unknown date (""right now""). The outcome of the events was not recovered."

"had covid after his first dose; had covid after his first dose; headaches; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect from a contactable Physician. A male patient of an unspecified age received his first single dose of BNT162B2 (Pfizer/ BioNTech Covid-19 vaccine) on an unspecified date in Dec2020 for Covid-19 immunization. The patient previously had Covid in Apr2020.

Concomitant medications were not reported. After his first dose of vaccine, in Dec2020, the patient had Covid and headaches. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The reported ""had Covid"" after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration."

Got the first dose of the vaccine on 23Dec2020, this week the patient was tested positive for COVID; Got the first dose of the vaccine on 23Dec2020, this week the patient was tested positive for COVID; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect from a contactable other healthcare professional (HCP) (patient). A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 23Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient got the first dose of the vaccine on 23Dec2020, this week the patient was tested positive for COVID in Jan2021. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The reported tested positive for COVID after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

she tested positive in the middle; she tested positive in the middle; This is a spontaneous report from a contactable female consumer (patient) via a Pfizer-sponsored program . A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 16Dec2020 at first single dose for COVID-19 immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. Caller was asking if it was safe for her to get the second dose, she had the 1st dose on the 16Dec2020 and scheduled for the second dose today (reported on 06Jan2021), however she tested positive in the middle. Outcome of the event was unknown. information on the lot/batch number has been requested.

tested positive for Covid-19; tested positive for Covid-19; This is a spontaneous report from a contactable healthcare professional (HCP) reporting for himself via a Pfizer-sponsored program Pfizer First Connect. A male patient of an unspecified age received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number and expiry date not reported) via an unspecified route of administration on 21Dec2020 for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient was tested positive for COVID-19 on 28Dec2020 and he was wondering if he was still able to receive the second dose of the vaccine. The outcome of the event was unknown. Information on the lot/ batch number has been requested.; Sender's Comments: The reported tested positive for COVID-19 after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

Anaphylactic reaction; Flushed; Diaphoretic; redness and rash; hives on chest; Tachycardia; shortness of breath; Chest tightness; Dizziness; Headache; This is a spontaneous report from a contactable nurse, the patient. A 47-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-

19 mRNA VACCINE; Lot Number: EL1283), via an unspecified route of administration on 08Jan2021 at 08:49 (at the age of 47-years-old) as a single dose for COVID-19 immunization. There were no known medical history or concomitant medications. The patient previously received the first dose of BNT162B2 on 18Dec2020 (Lot Number: EK5730) for COVID-19 immunization and experienced nausea, headache, and fatigue. On 08Jan2021, about 5-10 minutes after the second dose, the patient experienced anaphylactic reaction, flushed, diaphoretic, redness and rash, hives on chest, tachycardia, shortness of breath, and chest tightness, reported as life-threatening. She reported that these events occurred within less than 10 minutes of receiving the vaccine. She went to the emergency room and was treated with methylprednisolone (SOLUMEDROL), diphenhydramine hydrochloride (BENADRYL), famotidine (PEPCID), and epinephrine (MANUFACTURER UNKNOWN). She was sent home and prescribed methylprednisolone and epinephrine (EPI-PEN). Later on 08Jan2021, she experienced dizziness and headache, which were consistent. She stated she would most likely take ibuprofen (MOTRIN) as treatment (not specified if taken). The clinical outcomes of the flushed, diaphoretic, redness and rash, hives on chest, tachycardia, shortness of breath, and chest tightness were recovered on 08Jan2021; while the outcomes of the dizziness and headache were not recovered and that of the anaphylaxis was reported as recovering.; Sender's Comments: The reported information is limited. Based on the close temporal relationship and the description of the events, there is a reasonable possibility that the events are related to BNT162 vaccine. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Approx 10-15 post vaccine, employee said she felt lightheaded and like her heart was racing. Within 10 minutes she said she felt difficulty breathing, She then vomited. The observation nurse at the clinic administered Epi Pen and called a Code. The employee was transported to the Emergency Dep't and then to intensive care. She was placed on an Epi drip.

loss of consciousness Narrative: Patient received COVID-19 vaccine dose #1 on 1/6/21 w/o complications. Per 1/6/21- 1/9/21 nursing notes, patient did not experience any injection site reactions, denied pain or tenderness at injection site, no dizziness, no n/v, remained afebrile. Around 1/9/21 @1810, patient became acutely nonresponsive after being helped to the edge of bed. Per nurses, he was previously awake/alert, talking and asymptomatic. Patient is DNR/DNI but facility rapid response emergency team called d/t patient's sudden change of condition. Emergency team helped patient into lying position. Per 1/9/21 ICU emergency team note, patient appeared comfortable w/ no palpable radial pulse and had minimal shallow agonal breathing. Pulse ox 94%, HR in 60s per machine. BP unmeasurably low by BP cuffx3. Resident passed at 18:20 pm.

Approximately 1 - 2 hours after receiving I had numbess and soreness to my neck. A few days later started experiencing tingling, buzzing, weakness and heaviness to my right arm and leg. I reported this to my MS doctor who ordered an MRI of the brain and told me to report to you

Patient received the vaccine on 12/22/20 without complication. It was reported today that the patient was found unresponsive and subsequently expired at home on 1/11/21.

Increased weakness leading to a fall and fever of 101.3

Patient began experiencing fevers, body aches, back pain, fatigue, chills the night she received the vaccine. Symptoms progressed for the following four days when she was ultimately seen in PCP office. Laboratory evaluation demonstrated atypical pneumonia and elevated WBC count. Patient was diagnosed with Acute Myeloid Leukemia via bone marrow biopsy and is receiving treatment at the hospital.

LEFT FACIAL AND TONGUE NUMBNESS - WORK UP CVA NEG Narrative: Developed left facial and tongue numbness 4 hours after vaccine - went to ER and admitted for 2 days, negative workup for CVA or other acute etiology. Symptoms resolved prior to discharge from hospital

Reported feeling faint and nauseated during observation period. Placed on cart in trendelenberg

Within 24 hrs, developed headaches, burning sensation down spine and neck. fullness in head intensified next day. balance was off, numbness and tingling throughout body. Went to ER. Diagnosed Paresthesia

The facility had positive cases of COVID when we were able to begin vaccinating residents. Within about a week of vaccination, patient was tested positive for COVID. He was 91 years old and his immune system did not have the time to allow the vaccine to begin working before exposure. His age was a major contributing factor to his death.

The facility had positive cases for COVID 19 when the vaccine was received and administered to patient. With her advanced age and chronic conditions, she did not have time to build immunity between the time of vaccination and her testing positive.

The facility had a number of positive COVID 19 cases prior to patients vaccination. Due to her advanced age, chronic condition, and exposure, patient did not have the time to build immunity after exposure before becoming positive.

Within approximately 30 minutes after vaccine (Thursday), patient presented with red rash to upper chest, severe headache, dizziness and nausea. Was treated with Benadryl and Tylenol per anesthesia onsite. Symptoms remained throughout the day with minimal improvement. The following morning (Friday) only headache remained. patient began having abdominal pain, and was admitted to hospital the next day (Saturday). It is now Tuesday and patient is still hospitalized. Unclear if this entire event is vaccine related.

Pt expired due to possible cardiac arrest. Unsure if this was vaccine related.

Resident was found deceased at approximately 6pm in her apartment

Pt experienced the following morning: fever (100 F) chills, malaise, nausea, and numbness in hands at 0624 and 0836. Pt went to hospital at 1000, tx with IV fluids.

"In the early morning of Monday, January 11th the patient developed a significant headache with neck pain. She also reported parathesia and tingling in bilateral upper extremities with weakness of the right upper extremity. She reported feeling very anxious and ""wound up"". Patient presented to the Emergency Department 3 hours later. CT of the head/brain, EKG, CBC,CMP, Magnesium and Cardiac profile were performed with no significant findings. Ativan 0.5mg was administered orally. Patient was admitted to the facility for observation. Symptoms gradually resolved with no additional treatment."

Large red area surrounding injection site.

unsure if related to vaccine, but was notified by her next of kin that she died on 1/4/2021. No reports of side effects or hospitalization were reported to the facility prior to the notification of death.

patient reported expired 1/7/2021

On 12/31/2020, at approximately 00:15, pt developed a fever of 102.9 F and tachycardia with rate of 120. He was treated with acetaminophen. Later in the morning, he complained of nausea, generalized muscle aches, intermittent increase in confusion. At approximately 14:00, he had a fall out of bed and at that time noted to be short of breath, tachypneic. He was taken via ambulance to Emergency Department. From there he was transferred to Hospital for admission with acute respiratory distress, suspected sepsis with lactic acid 7.4 and Bilateral Pulmonary Emboli. He was started on heparin and broad spectrum antibiotics and transitioned to ELIQUIS on 1/3/2021. Infectious etiology of sepsis was unclear. He continued broad spectrum antibiotics with clinical improvement. Abdominal CT scan was obtained due to intermittent nausea, vomiting, abdominal pain, loose stools. His heart rhythm flipped to Atrial Fibrillation with RVR on 1/2 and his rate improved with titration of metoprolol. He was also treated with prednisone for suspected underlying undiagnosed COPD. It is noted in his hospital summary that PEs presumed provoked in the setting of his recent COVID 19 infection. He was discharged from the hospital on 1/8/2021 and readmitted to the Veterans Home. He has been stable.

Received Moderna vaccine on 1/5. Had a single episode of vomiting approximately 1 hour after vaccine. Hx of Asthma, started to develop SOB approximately 2 days later. She reached out to PCP and used inhaler with little relief. SOB worsened and she was admitted to the hospital on 1/8/21. Eval was negative for COVID (3 tests completed), flu and pneumonia. She has elevated WBCs and was given steroids and supplemental oxygen. She is improving but remains inpatient.

Patient was sent to the ED due to significant hematuria. He was afebrile.

Patient presented with myalgias, fevers, and chest pain on 1/10/21 and was found to have diffuse ST elevation and elevation troponin. He was evaluated by cardiology and diagnosed with acute myopericarditis. He was treated with NSAIDs and colchicine. He improved with this treatment and was discharged on 1/12/21 with ibuprofen and colchicine and outpatient cardiology follow up.

Rash on neck; gall bladder attack; This is a spontaneous report from a contactable nurse (patient). A 34-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730), via an unspecified route of administration at the left arm on 18Dec2020 10:30 at a single dose for COVID-19 immunization in the hospital, and morphine sulfate (manufacturer unknown), via an unspecified route of administration from an unspecified date at unspecified dose and frequency for an unspecified indication. Medical history included S/P rouxen-y gastric bypass, sleep apnea, cholelithiasis, HSV-2, obesity, and Hashimoto hypothyroid disease. The patient was not pregnant at the time of vaccination. Concomitant medications included ursodiol, valacyclovir, levothyroxine sodium (LEVOTH) and vitamins. The patient previously took morphine and experienced allergies. The patient did not receive any other vaccine within 4 weeks prior to the vaccine. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient experienced Rash on neck, morphine reaction and May or may not be related - gall bladder attack on 18Dec2020 14:30. The events resulted in Doctor or other healthcare professional office/clinic visit and Emergency room/department or urgent care. The patient was administered with NS bolus, diphenhydramine (BENADRYL) and also morphine in response to the events. Since the vaccination, the patient had been tested for COVID-19 via Nasal Swab/COVID-19 rapid ABBT which was negative on 18Dec2020. The action taken in response to the events for morphine sulfate was unknown. The outcome of the events was recovered with sequel. The patient assessed the events as non-serious. Pfizer is a marketing authorization holder of morphine sulfate in the country of incidence or the country where the product was purchased (if different). This may be a duplicate report if another marketing authorization holder of morphine sulfate has submitted the same report to the regulatory authorities.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

mild elevation of his sed rate and leukocytosis; mild elevation of his sed rate and leukocytosis; myalgia (was reported as worsened); Arthralgia; Ten days later and still having pain/started in neck and migrated to his back, the buttocks and gluteal and quadriceps area; Ten days later and still having pain/started in neck and migrated to his back, the buttocks and gluteal and quadriceps area; Ten days later and still having pain/started in neck and migrated to his back, the buttocks and gluteal and quadriceps area; Ten days later and still having pain/started in neck and migrated to his back, the buttocks and gluteal and quadriceps area; This is a spontaneous report from a contactable physician (patient). A 76-years-old male patient received bnt162b2 (Pfizer-Biontech Covid-19 Vaccine), via an unspecified route of administration on 23Dec2020 at single dose on deltoid Right for covid-19 immunisation. Medical history included ongoing type 2 diabetes mellitus (diagnosed about 8 years ago). There were no concomitant medications. Patient developed myalgia on 27Dec2020 and arthralgia on 28Dec2020. Patient also experience ten days later and still having pain/ started in neck and migrated to his back, the buttocks and gluteal and quadriceps area in Dec2020. He had labs a few days ago. He had a mild elevation of his sed rate and leukocytosis. Events myalgia and arthralgia considered serious due to medically significant.

Outcome of events myalgia (was reported as worsened) and arthralgia was not recovered. Information about batch/lot number has been requested.; Sender's Comments: Based on the time association, the events myalgia and arthralgia are possibly related to suspect bnt162b2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

blood pressure increased and her pulse; blood pressure increased and her pulse; Chest pain; Numb fingers and later numb face; Mind fog; This is a spontaneous report from a contactable other HCP. This 37-year-old female other HCP (patient) reported that she received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: 1685), via intramuscular at left arm on 02Jan2021 08:15 AM at single dose for COVID-19 immunization. Facility type of vaccine was pharmacy or drug store. Medical history included panic disorder (last attack 2 years prior) and known allergies: latex, Iodine dye. Concomitant medications were not reported. No other vaccine in four weeks. No covid prior vaccination. No covid tested post vaccination. On 02Jan2021 08:15 AM, within a few minutes while still under observation at pharmacy, her blood pressure increased and her pulse. Numb fingers and later numb face. Chest pain presented. She went to ER (emergency room) 3hours later with ongoing symptoms that never resolved until 6 or 7 that evening while still in ER waiting room. Mind fog (02Jan2021 08:15 AM) was currently ongoing. The treatment for events included lorazepam (ADIVAN), diphenhydramine (BENADRYL), ibuprofen. Outcome of event mind fog was not recovered, and the rest of events was recovered/resolved with sequel.; Sender's Comments: Based on the compatible temporal association, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the reported events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

lost the sense of smell and taste; lost the sense of smell and taste; nasal congestion/stuffy nose; runny nose; tiredness/felt tired; eye pain; pain in the muscles; chills; sore pain in the arm; This is a spontaneous report from a contactable Other HCP (Dentist) reporting for herself. A 43-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) at single dose on 31Dec2020 at 10:00AM in the left arm for COVID-19 immunization. Lot number was EJ1685. Medical history and concomitant medications were none. On 01Jan2021 in the morning, she had a sore pain in her arm, and by nighttime she had chills. On 02Jan2021 and on 03Jan2021, Saturday and Sunday she had pain in her muscles, felt tired, and had some pain around her eye every time she moved her eyes. On 04Jan2021, Monday everything went away but she had stuffy nose and runny nose. Her stuffy and runny nose was better but she still had some congestion, but she could not blow anything out of her nose. On 05Jan2021, Tuesday she noticed she could not smell and she still could not smell. On 06Jan2021, she had no smell and no taste either. Stated everything was good at the time of report but she still could not smell or taste anything. She treated herself with Tylenol for the muscle aches. She

took one 500mg Tylenol by mouth on 02Jan2021 at bedtime and then one Tylenol 500mg by mouth again on 03Jan2021. She was scheduled for the next dose 19Jan2021. Mention she was planning to get a COVID 19 test to see if she had the disease. The patient recovered from fatigue, eye pain, pain in muscles on 03Jan2021, the patient recovered from chills on 02Jan2021, the patient recovered from sore pain in the arm on 01Jan2021, the patient was recovering from nasal congestion/stuffy nose, the patient did not recover from runny nose and loss the sense of smell and taste. Information on the lot/batch number has been requested.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported pain in her muscles, felt tired,had some pain around her eye every time she moved her eyes, had no smell and no taste, and the administration of the COVID-19 vaccine, BNT162B2, based on the reasonable temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

aware of 6 cases of Bell's Palsy by the companies making these vaccines; This is a spontaneous report from a contactable Other HCP. This Other HCP reported similar events for 6 patients. This is 1st of 6 reports. A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunisation. The patient medical history was not reported. The patient's concomitant medications were not reported. The reporter reported since the use of modified RNA in covid vaccines,he/she had aware of 6 cases of Bell's Palsy by the companies making these vaccines since an unknown date. The event outcome was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Bell's Palsy is not uncommon in general population. The information provided in this case is limited and does not allow a full medically meaningful assessment. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics committees and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2021009409 Different patient, same drug/event.;US-PFIZER INC-2021009412 Different patient, same drug/event.;US-PFIZER INC-2021009410 Different patient, same drug/event.;US-PFIZER INC-2021009411 Different patient, same drug/event.;US-PFIZER INC-2021009408 Different patient, same drug/event.

joint pain and muscle; joint pain and muscle; Vertigo; an itchy rash bilaterally on her arms; developing swollen, tender, and hard lymph nodes under the Left subclavian area/ swollen left subclavian lymph nodes; developing swollen, tender, and hard lymph nodes under the Left subclavian area; extreme fatigue; Runny nose; Headache; This is a spontaneous report from a contactable nurse (RN) reporting for herself. A 42-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) first dose on 23Dec2020 h 09:00 intramuscularly in left deltoid (left arm) lot number: EK5730 at single dose for COVID-19 immunization. Concomitant medications were not provided. Patient stated that she has had double mastectomy, and missing a lot of lymph nodes, states she got the first dose of Pfizer Covid

vaccine on 23Dec2020, states it made her left subclavian lymph nodes swollen and hard. States that when she gets the flu vaccine at her hospital every year, she gets swollen lymph nodes ever since she had a double mastectomy and chemotherapy. She originally was wondering if she could get the vaccine in another large muscle group. States she even went as far as to cross reference flu shot ingredients with the Pfizer Covid ingredients to see if something in the vaccines were causing the swollen lymph nodes but was unable to come to any conclusion, the only think in common is the Sodium Chloride and she does not feel like that would cause any issue. States the swollen lymph nodes occurred after the Sanofi brand flu vaccine (no other information known or provided). Patient is on day 15 post vaccination and they are still swollen and hard, she is wondering if there is any data on how long this side effect can last. She made an appointment with her oncologist, she knows that the swollen lymph had the first dose, lymph nodes are still swollen and hard, knows it can cause swollen lymph nodes but wants to know what is the typically length of the event. Patient also experienced other side effects, on 30Dec2020 (last week), she developed vertigo that lasted through the weekend intermittently, states she at first thought she was having a stroke. States it seems to have subsided as of 05Jan2021 (yesterday). Patient also reported she had an itchy rash twice as part of her side effects reported from the COVID 19 vaccine. She noticed an itchy rash and it went away but she is unsure exactly the day or time. Stated she definitely remembered the rash on 28Dec2020 as she took pictures. It was gone in about three hours on the same day. She did not treat the rash because it was gone and not itching. The rash came and went and had not come back. It was mostly on the bends of the arms, bilateral arms. Patient reported developing swollen, tender, and hard lymph nodes under the Left subclavian area the day after the injection, on 24Dec2020. They were not as tender at the time of the report but were continuing and this was 15 days from her vaccination. Patient also experienced an itchy rash bilaterally on her arms that occurred twice and only lasted a few hours each time, onset date reported as 25Dec2020. She was advised to take diphenhydramine hydrochloride (BENADRYL) for it however she did not take it. On 23Dec2020 patient experienced headache. On 24Dec2020 patient experienced extreme fatigue, swollen left subclavian lymph nodes and runny nose. On 30Dec2020 patient experienced joint pain and muscle and vertigo. The events headache, experienced extreme fatigue, swollen left subclavian lymph nodes, runny nose, joint pain and muscle and an itchy rash bilaterally on her arms were considered serious as medically significant events. Patient had not recovered from swollen left subclavian lymph nodes, joint pain and muscle, extreme fatigue and swollen, tender, and hard lymph nodes under the Left subclavian area, she was recovering from headache, runny nose and vertigo and recovered completely from an itchy rash bilaterally on her arms on 28Dec2020.; Sender's Comments: The Causality between the events, headache, experienced extreme fatigue, swollen left subclavian lymph nodes, runny nose, joint pain and muscle and an itchy rash bilaterally on her arms, and the administration of the COVID 19 vaccine cannot be denied based on the reasonable temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

Seizure; This is a spontaneous report from a contactable physician (patient). A female patient of an unspecified age received BNT162B2 (Pfizer-Biontech Covid-19 Vaccine) on an unspecified date, at single

dose, for COVID-19 immunisation. Relevant medical history and concomitant medications were unknown. On an unspecified date, after the vaccination, the patient had a seizure. Clinical outcome of the adverse event was unknown at time of this report. The information on the lot number has been requested.; Sender's Comments: A possible causal relationship between seizure and BNT162B2 cannot be completely ruled out considering the temporal relationship. However, more information would allow for a full medically meaningful assessment, especially medical history, concomitant medications, concurrent illness and event details description including time lag between the onset of the event and vaccination date of BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"Her INR was 5.8 (normal range 1 to 2)/increasing INR; Scratched arm; Scratched arm and bled through 3 shirts, it kept bleeding; This is a spontaneous report from a contactable nurse (patient). A 64-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EC1284), via an unspecified route of administration administered to left arm/deltoid on 29Dec2020 13:15 at single dose for COVID-19 immunization at a research medical facility; and received warfarin sodium (COUMADIN, strength 2 mg), oral (by mouth) from an unspecified date in 2017 and ongoing at ""3 1/2 tablets once daily in the evening at 5:30pm (total 7mg)"" for metal heart valve. The patient's medical history included had the surgery (for her metal heart valve), about 01Mar in 2017 (about 4 years ago) and so she thought she had been on Coumadin for about 4 years, had been on the 7mg dose for over a year; and has a history of metal heart valve and takes Coumadin for the metal heart valve. Denied illness. Denied family medical history relevant to event. There were no concomitant medications. The patient previously received Shingrix vaccine in past and remenbered she had the usual side effects from it, had mild symptoms. History of all previous immunization with the Pfizer vaccine considered as suspect was none. The patient did not receive any other vaccines the same date of the Pfizer Suspect or 4 weeks prior. On Jan2021, the patient experienced scratched arm and bled through 3 shirts, it kept bleeding. On 04Jan2021, her international normalised ratio (INR) was 5.8 (normal range 1 to 2). The events did not lead to emergency room visit, however led to physician office visit. The events were reported as serious medically significant. The nurse got the first Pfizer COVID-19 shot on 29Dec2020 because she is a healthcare provider. She wanted information on increasing INR. The nurse has a history of metal heart valve and takes Coumadin. Her INR was typically 1.7 to 2.3. She reported her last INR, before the covid-19 vaccine was given, was ""some time ago"" but it had not varied much over the years. Normally she got her INR run and it was about 2. She had to be scheduled for her INR on the 04Jan2021 and it was 5.8 (normal range 1 to 2) and they asked about anything that may have changed and the only thing was that she got her first shot. The nurse reported not having any changes in her medications, food, or life style to account for the change, other than receiving the COVID-19 vaccine. The patient stated that it could be a serious problem if she had an accident or fell and started bleeding. A normal person's lab result is between 1 and 2, but they like to keep people with the metal heart valves between 2 and 3. She had been bleeding. She had barely scratched her arm the other day and went through 3 shirts because she kept bleeding. This is more than unusual for her, it's kind of unusual.

Getting the vaccine is the only variant she has had since getting her last INR. The patient underwent lab tests and procedures which included INR (normal range 1 to 2): typically 1.7 to 2.3 on an unspecified date; it's about 2 on an unspecified date: and 5.8 on 04Jan2021. The action taken in response to the events for warfarin sodium was dose not changed. The outcome of the event INR was 5.8 was not recovered, for the other events was unknown. The nurse (patient) assessed the event ""INR was 5.8; it's normally about 2"" as related to the COVID-19 vaccine.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of International normalised ratio increased and wound hemorrhage due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics coagulation panel, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

Dizziness; palpitations; resting tachycardia that persisted for 3 days; muscles aches; Chills; Restlessness; feeling unwell; arm pain; This is a spontaneous report from a contactable physician reported for herself. This 37-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: Ek5730) via intramuscular on 23Dec2020 09:30 AM on left arm at single dose for COVID-19 immunisation. Medical history included chronic kidney disease, HTN (hypertension), persistent proteinuria. No known allergies. Concomitant medication included losartan. The patient did not have other vaccine in four weeks and did not diagnosed with COVID-19 prior to vaccination. The patient was not pregnant at the time of vaccination. On 24Dec2020, the patient experienced dizziness, palpitations, resting tachycardia that persisted for 3 days, muscles aches, chills, restlessness, feeling unwell and arm pain, and resulted in Emergency room/department or urgent care. Treatment included paracetamol (TYLENOL). The patient had COVID tested on 28Dec2020 post vaccination, covid test type post vaccination=Nasal Swab, covid test name post vaccination=PCR, covid test result=Negative. Outcome of events was recovered.; Sender's Comments: The reported events dizziness, palpitations, resting tachycardia that persisted for 3 days, muscles aches, chills, restlessness, feeling unwell and arm pain, were likely related to the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) due to temporal relationship and clinical course. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics committees and Investigators, as appropriate.

Hellucinogenic visions of monsters and violent events; This is a spontaneous report from a contactable consumer (patient). A 68-year-old female patient (not pregnant) received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK5730), via an unspecified route of

administration on 05Jan2021 at 14:30 on Right arm at single dose for COVID-19 immunization in hospital. The patient medical history included Hypertension, Hypothyroid. Prior to vaccination, patient was not diagnosed with COVID-19. Concomitant medications included levothyroxine sodium (LEVOXYL); Olmesartan; aluminium hydroxide gel, dried, magnesium carbonate (PEPCID); bifidobacterium bifidum, bifidobacterium lactis, bifidobacterium longum, lactobacillus acidophilus, lactobacillus rhamnosus (PROBIOTIC); ascorbic acid, biotin, folic acid, iodine, pantothenic acid, pyridoxine hydrochloride, retinol, vitamin b12 nos, vitamin d nos, vitamin e nos, zinc (CENTRUM MULTIGUMMIES). Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient previously took and had known allergies with bacitracin zinc;neomycin sulfate;polymyxin b sulfate (NEOSPORIN) and bacitracin zinc;neomycin sulfate;polymyxin b sulfate (POLYSPORIN). The patient experienced hellucinogenic visions of monsters and violent events on 06Jan2021 at 02:00 AM. Since the vaccination, patient had not been tested for COVID-19. No treatment was received for the event. The outcome of the event was recovering. The report was reported as non-serious, with seriousness criteria-Results in death: No; Life threatening: No; Caused/prolonged hospitalization: No; Disabling/Incapacitating: No; Congenital anomaly/birth defect: No.

severe ITP; This is a spontaneous report from a contactable physician. A 22-years-old male patient received his first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 17Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient developed severe ITP (Idiopathic thrombocytopenic purpura) on 20Dec2020, 3 days after first dose of the vaccine on 17Dec2020. He was hospitalized for 3 days and now the patient was healthy with a normal platelet count on an unspecified date. The physician wanted to know if this patient can get the second dose. The outcome of the event was recovered on an unspecified date. Information on the lot/batch number has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported ITP cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

"immune deficiencies; She said the joint pain felt like ""flu"" joint pain; She said she was really sweaty, so much so, that she had sweat under her eyes; thyroid problems; feels shaky inside; Numbness facial; Exhaustion; Foggy feeling in head/feeling rundown; felt exasperated; sweating like crazy and then gets chills; felt yucky/she didn't feel good at all; Joint pain; Nausea; Chills; after receiving the COVID-19 Vaccine on (Dated), she had left upper shoulder pain.; She clarified she had some injection site pain; and the injection site was a little itchy; This is a spontaneous report from a contactable consumer (patient). A 58-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot EL3246), via an unspecified route of administration on 02Jan2021 14:30 at single dose in the left upper arm for COVID-19 immunization. Medical history included Pernicious anaemia from 2006 and ongoing, Hashimoto's disease ongoing, stated she was diagnosed with Hashimoto's disease in either 1994 or 1995. Psoriatic arthritis from Nov2020 and ongoing. Potassium low ongoing, reported she has

had low potassium off and on for years. She said she can't remember when she didn't have low potassium. She said she normally finds out her potassium is low when she has blood work done. She stated she has had low potassium most of her adult life. IgA deficiency from Feb2019 and ongoing, Psoriasis ongoing, paralysis in her left trapezius muscle. Concomitant medication included B-12 for pernicious anemia. She said she had the typical reactions that one might get with a vaccine. She clarified she had some injection site pain and the injection site was a little itchy on 02Jan2021. She stated on the second day (03Jan2021) she had joint pain, felt yucky, had nausea, and chills. She said the next day (04Jan2021) she felt a little better, but still had chills. She said yesterday (05Jan2021) she thought she was feeling better, but by yesterday, clarified as late afternoon and evening, she crashed. She said she has a lot of autoimmune issues and immune deficiencies, saying she has pernicious anemia and Hashimoto's disease. She said yesterday evening she experienced extreme body temperature issues. She said she was really sweaty, so much so, that she had sweat under her eyes. She said she would get really hot and had chills. She said she was feeling really bad and was feeling shaky inside. She said she thought it was important that she report what she was experiencing to Pfizer. She stated she has psoriatic arthritis, too. Reported after receiving the COVID-19 Vaccine on 02Jan2021, she had left upper shoulder pain. She clarified that she had a previous history of paralysis in her left trapezius muscle and had surgery in 1998 on her left shoulder. She said she had a weird feeling that went around where her scar was from the surgery on the back of her left shoulder. She said maybe the left shoulder pain had to do with how she held her left shoulder. She said on Monday, 04Jan2021, she had a little bit of pain in her left shoulder and by yesterday night, 05Jan2021, there was not much pain at all. Clarified her joint pain was in her ankles, wrists, hips, neck, back, and knees. She said the joint pain felt like ""flu"" joint pain. She stated she normally has joint pain with the other issues she has, but this joint pain felt different. She said the joint pain she experienced after taking the COVID-19 Vaccine was all over her body. She said yesterday (05Jan2021) her joint pain felt so much better, but later in the afternoon she didn't feel right. She said she has pernicious anemia, and thought maybe she needs her B-12 shot. She said yesterday (05Jan2021) she experienced a lot more symptoms. She said she had numbness in her face, felt extremely exhausted, had a foggy feeling, and felt exasperated. She said the symptoms didn't start until late in the afternoon into the evening of 05Jan2021. She said she did not feel well and went to bed at 8:45PM, which is early for her. She said she did give herself a B-12 1mcg/ml shot intramuscularly yesterday. She provided the B-12 1mcg/ml NDC Number: 7006900510, Lot Number: C0495, and Expiration Date: Aug2022. She said the name (company name) was listed on the B-12 1mcg/ml packaging. She said she gives herself a B-12 shot every 10 days. She said she still has some joint pain, but the joint pain is not like it was on 03Jan2021. She said she still has a tiny bit of heaviness in her joints with a constant throbbing pain, which is a different joint pain from her normal. Reported last night (05Jan2021) she didn't feel good at all. She said she felt horrible, and had to go to bed. She said she felt shaky inside all night, and still feels that way now. She said she was sweating like crazy, and then would get chills. She clarified she is used to being hot and cold in her normal life because of her thyroid problems, but stated what she experienced last night was beyond that. She said her hot and cold issue was bumped up several levels last night. She said she was chilled or sweating all the time last night, but did not have a temperature. She clarified her normal body temperature is 96.7, and when she checked her temperature at one point, her temperature was 98 degrees. Reported the hot and cold with sweating and chills, and nausea come and go. She said if she has nausea, it is a mild feeling of nausea.

Clarified if Sunday, 03Jan2021. was a work day, she would have called out sick. She said Monday (04Jan2021) and Tuesday (05Jan2021) she did go to work. Reported she has low potassium and made herself an electrolyte cocktail. Reported if her system feels off, she said her electrolytes maybe off. She said her heart felt like it may be shaky, so she ate a banana to get potassium in her system. She said she does her little routine before she would call her doctor to get blood work done. She said she had her blood work done not too long ago. She said she wasn't feeling this way before she had the COVID-19 Vaccine, and is feeling rundown now. She said she was feeling good before she had the COVID-19 Vaccine. She said she feels like something is going on with her body now. Reported her last blood work was done on 04Dec2020 and everything was kind of normal. She clarified her thyroid was a little off, and her doctor adjusted her medication. She said her potassium was a little down. Reported she was told when she got the COVID-19 Vaccine shot she has to be a little more careful, and she might not be as protected as some people. She said she was told there have not been enough studies on the COVID-19 Vaccine. She clarified she was told that information by a person at the site where she received the COVID-19 Vaccination, saying the person was helping her with the COVID-19 Vaccination authorization form. Reported she thought she was doing OK after she received the COVID-19 Vaccine, until after last night and yesterday afternoon. She said if she continues feeling the way she is, she will see her doctor. She said her system seems off. She said she normally tries everything she knows first, like drinking a lot of water, and drinking electrolytes, and will take potassium to see if that is the issue. She said those are her own things that she does before she calls her doctor. Clarified sometimes she has numbness in her face due to not having her B-12. She said she still has a little numbness in face. She said on 05Jan2021, the numbness went across her face from the bridge of her nose down through to her mouth. She said the numbness was nothing like paralysis in her face, but her face was really hot at the same time she had the numbness. Reported she took Tylenol (clarified as (company) brand Tylenol, stating she doesn't have the UPC, Lot and Expiration Date). She said the Tylenol wasn't kicking in, so she took Ibuprofen (clarified as (company)brand Ibuprofen, and she doesn't have the Ibuprofen NDC, Lot and Expiration date). She said she took her normal medications. Outcome of events ""She clarified she had some injection site pain"" ""and the injection site was a little itchy"" and Shoulder pain were recovered on an unspecified date, ""Chills"" and ""feels shaky inside"" were not recovered, ""Joint pain"" ""Nausea"" ""Numbness facial"" were recovering, while outcome of other events was unknown."

Bell's Palsy; This is spontaneous report from a contactable Other Health Professional. This reporter reported similar events for 6 patients. This is a 6th of 6 reports. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced bell's palsy on an unspecified date with outcome of unknown. Since the use of modified RNA in COVID vaccines, the reporter aware of 6 cases of Bell's Palsy by the companies making these vaccines. Information about lot/batch number has been requested.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the event facial paralysis cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and

analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2021007605 Different patient, same drug/event.

The numbness began to intensify and I could not feel myself blinking or smiling on the left side of my face; pain and numbness to my left ear and left jaw that began to spread down my left jaw and upward across my left cheek, left eye, and left temple, and above my left eyebrow; pain and numbness to my left ear and left jaw that began to spread down my left jaw and upward across my left cheek, left eye, and left temple, and above my left eyebrow; pain and numbness to my left ear and left jaw that began to spread down my left jaw and upward across my left cheek, left eye, and left temple, and above my left eyebrow; pain and numbness to my left ear and left jaw that began to spread down my left jaw and upward across my left cheek, left eye, and left temple, and above my left eyebrow; pain and numbness to my left ear and left jaw that began to spread down my left jaw and upward across my left cheek, left eye, and left temple, and above my left eyebrow; This is a spontaneous report from a contactable nurse reported for herself. A 39-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EL0142) via an unspecified route of administration on 07Jan2021 07:00 at single dose for covid-19 immunization. Vaccine location was left deltoid. The facility type vaccine was Workplace Clinic. Medical history included food allergy at shrimp. Concomitant medications were not reported. The patient did not received any other vaccines within 4 weeks prior to the COVID vaccine. On 07Jan2021 at 07:15 AM the patient notice pain and numbness to her left ear and left jaw that began to spread down left jaw and upward across left cheek, left eye, and left temple, and above left eyebrow. The numbness began to intensify and patient could not feel herself blinking or smiling on the left side of my face. The numbness slowly began improving over the next hour in the same order that it began, but she still have mild left ear and jaw pain and mild numbness. Events outcome are recovering. No treatment was received. The action taken was not applicable.; Sender's Comments: Based on the compatible time association, the facial palsy is possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Burst blood vessel in left eye 24 hours after vaccine was given.; This is a spontaneous report from a contactable other-HCP. A 45-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) lot number not available, via an unspecified route of administration on 21Dec2020 07:45 AM at single dose for covid-19 immunization. Vaccine location was left deltoid. The patient did not received any other vaccines within 4 weeks prior to the COVID vaccine. Medical history included morbid obesity and blood pressure high. No known allergies. Patient didn't do relevant test. Concomitant medication included amlodipine (AMLODIPINE) at 5mg daily. The patient experienced burst blood vessel in left eye 24 hours after vaccine was given (eye haemorrhage) on 22Dec2020 08:30 with outcome of recovered. No treatment received. The action taken in response to the event for BNT162B2 was not applicable. Information on the lot/batch number has been requested.; Sender's Comments: Based on the available

information, the company considers that a causal relationship between the eye haemorrhage and vaccination with BNT162B2 cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer drug is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Had ruptured blood vessels x 2 spontaneously in eyes; This is a spontaneous report from a contactable nurse reported for herself. A 54-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EK5730), via an unspecified route of administration on 17Dec2020 03:00 P.M at single dose for covid-19 immunization. The facility type vaccine was: workplace clinic. Medical history included manifesting carrier BMD (Becker's muscular dystrophy). Allergies to medication: allergies rash on Sulfa. The patient did not received any other vaccines within 4 weeks prior to the COVID vaccine. Concomitant medication included pregabalin (LYRICA), duloxetine hydrochloride (DULOXETINE [DULOXETINE HYDROCHLORIDE]). The patient experienced ruptured blood vessels x 2 spontaneously in eyes (eye haemorrhage) on 18Dec2020 with outcome of recovered. No treatment received. The action taken in response to the event for BNT162B2 was not applicable.; Sender's Comments: Based on the available information, the company considers that a causal relationship between the eye haemorrhage and vaccination with BNT162B2 cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer drug is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

some congestion that just came on; her arm was really aching after the injection; she started coughing; voice was hoarse; light wheeze; soles of her feet were hurting; pressure in bilateral groin; aching all over; very tired; balance issues; This is a spontaneous report from a contactable nurse (patient). A 62-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK9231) intramuscularly in left upper arm on 05Jan2021 at single dose for covid-19 immunisation. The patient got her Covid vaccine yesterday (05Jan2021) around 11 or 11:30 am in her left upper arm. She had bilateral breast cancer and had lymph nodes removed in each arm but more removed from her Right, so she got the vaccine in the left arm. She also had some skin cancers removed, one would not heal properly on her left arm and formed a blister, and her dermatologist popped it and put a band aid on it. The vaccine was given 3 inches above it. The patient's concomitant medications were not reported. The patient experienced pressure in bilateral groin, aching all over, very tired and balance issues on 05Jan2021; light wheeze on 06Jan2021. Seriousness for these events was medically significant. The patient stated she had some congestion that just came on. She felt fine yesterday (05Jan2021) right after getting the vaccine, that at work she did notice that there was something different feeling in the left side of her groin. She was not in direct patient care. She noticed on her left side in the groin, something felt different, then yesterday evening (05Jan2021) after work she was really tired in the evening, aching all over last night, even the soles of her feet were hurting, woke up like her balance was off, she would walk one way and go another, states it is not like an orthostatic issue, that

she knows what that feels like. She stated that in her inguinal area she could feel pressure, bilaterally. Her arm was really aching after the injection. Her breathing, heard a light wheezing, was clearing her voice, and then she started coughing, voice was hoarse. The outcome of events pressure in bilateral groin, very tired and light wheeze was not recovered; of events aching all over and balance issues was recovering; of other events was unknown.; Sender's Comments: The reported events bilateral groin, aching all over, very tired, balance issues and light wheeze were possibly related to the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), due to temporal relationship. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics committees and Investigators, as appropriate.

Severe respiratory distress; This is a spontaneous report from a contactable pharmacist. A 51-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection),Lot# lot number: EL1284, intramuscular at right arm on 07Jan2021 12:00 PM, at SINGLE DOSE for COVID-19 immunization. No known allergy , no other medical history.No COVID prior vaccination. Facility where the most recent COVID-19 vaccine was administered was Nursing Home/Senior Living Facility .No any other vaccines within 4 weeks prior to the COVID vaccine. No Concomitant medications (received within 2 weeks of vaccination) . On 07Jan2021 the patient experienced Severe respiratory distress that resulted in Emergency room/department or urgent care.It was unknown if treatment was received for the event. The patient had not been tested for COVID post vaccination. The outcome of the event was unknown.; Sender's Comments: A possible causal relationship between Severe respiratory distress and BNT162B2 cannot be completely ruled out considering the temporal relationship. However, more information would allow for a full medically meaningful assessment, especially medical history, concomitant medications, concurrent illness and event details. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

she was transferred to the hospital with tachycardia, congestion, shortness of breath, and is now unresponsive; she was transferred to the hospital with tachycardia, congestion, shortness of breath, and is now unresponsive; she was transferred to the hospital with tachycardia, congestion, shortness of breath, and is now unresponsive; she was transferred to the hospital with tachycardia, congestion, shortness of breath, and is now unresponsive; This is a spontaneous report from a contactable nurse. A 95-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), Lot# EH9899 Exipration on 06Jan2021 at 15:00 at SINGLE DOSE at deltoid for COVID-19 immunization. The patient received first dose of the same vaccine BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), Lot# EH9899 Exipration date : 31Mar20221, on 16Dec2020. Medical history included : cardiac failure congestive, hypertension, cardiac murmur .There were no concomitant medications. The patient previously took cymbalta , vasotec and

zocor and experienced drug hypersensitivity. The patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine.This nurse,worker at a skilled nursing facility, reported that this patient with a history of heart failure, received her second dose of the Pfizer-BioNTech Covid-19 vaccine yesterday, 06Jan2021, at 3pm. At 7am on 07Jan2021 she was transferred to the hospital with tachycardia, congestion, shortness of breath, and is now unresponsive. Patient was stable prior to vaccination, but will now be transferred to hospice care. The nurse added the patient had the second COVID vaccine on 06Jan2021 yesterday and has now been transport to hospital due to a drastic decline after the shot. It was explained that this morning around 7 am she was transferred to the hospital. She was experiencing tachycardia, shortness of breath, and congestion. The events started this morning around 6-6:30am. The patient was admitted to the hospital. The shot was given at the facility. She received it at 3pm on 06Jan2021, First dose was on 16Dec2020.The caller relays she didn't know how aggressive the hospital will be for the patient. She was a full code when left and now a DNR and is unresponsive. The patient will be going on hospice care. The causality was reported as related. The outcome of the events was not recovered.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported tachycardia, shortness of breath, congestion, unresponsive, and the administration of the COVID 19 vaccine, BNT162B2, based on the reasonable temporal association. The patient's pre-existing medical condition of cardiac failure congestive, hypertension, cardiac murmur are confounding factors. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

patient developed acute onset of right-sided facial palsy and pain; patient developed acute onset of right-sided facial palsy and pain; Brain MRI done showing T2 hyperintensity in the brainstem and basal ganglia, suspicious for inflammation; This is a spontaneous report from a contactable physician. A 46-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), on 18Dec2020 at SINGLE DOSE for COVID-19 immunization. Medical history included psoriasis. No COVID prior vaccination. It was unknown if the patient received any other vaccines within 4 weeks prior to the COVID vaccine.No known allergies. Concomitant medications (received within 2 weeks of vaccination) included fluoxetine. days following vaccination,on 23Dec2020,the patient developed acute onset of right-sided facial palsy and pain. Brain MRI done showing T2 hyperintensity in the brainstem and basal ganglia, suspicious for inflammation. Work-up is ongoing. AE Resulted in: Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, Disability or permanent damage].It was unknown if the event was treated. The event was assessed as serious for Disabling/Incapacitating. The patient had been tested for COVID post vaccination (covid test result-Negative). The outcome of the events werenot recovered Information about lot/batch number has been requested.; Sender's Comments: A possible causal relationship between acute onset of right-sided facial palsy and pain with MRI findings suspicious for brain inflammation and BNT162B2 cannot be completely ruled out considering the temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as

well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

myositis; This is a spontaneous report from a contactable physician. A 43-year-old male patient received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number/expiration date unknown) on an unspecified date in Dec2020 reported as around the end of December, at single dose for COVID-19 immunization. Relevant medical history and concomitant medications were not reported. On an unspecified date after he received the vaccine he had right arm pain and swelling (states it was in his bicep brachial radialis in the muscle) which is the opposite arm of the injection site. He had an MRI done on an unknown date that showed myositis. He thinks could be due to the vaccine since it started two days after he received the vaccine. His pain peaked at about a week and a half and now the pain was improving and the swelling was down. He still had function in the right arm but when he strained it would hurt. His concern was that the reaction may be an autoimmune reaction and the first response was muted. He was worried the second dose may elicit a larger response. At the time of the reporting the patient was recovering from the events. Information on Lot/Batch number has been requested.; Sender's Comments: Based on the available information, the company considers that a causal relationship between the myositis and vaccination with BNT162B2 cannot be excluded. Additional information regarding onset latency, relevant medical history, concomitant medications and detailed clinical course around the event onset will aid in comprehensive assessment of the case. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics committees and Investigators, as appropriate.

Atrial fibrillation; Was not feeling well; Warm sensation in chest; This is a spontaneous report from a contactable nurse (patient). This 62-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot EJ 1685), intramuscular, on 21Dec2020 at 09:30 PM at single dose for COVID-19 immunisation. Vaccine location was left arm. The patient was vaccinated at hospital, age at vaccination was 62-years-old. The patient received also varicella zoster vaccine RGE (CHO) (SHINGRIX) on 19Nov2020. Medical history included gastrooesophageal reflux disease (GERD) and high cholesterol. Concomitant medications included omeprazole, colestyramine (QUESTRAN), and vitamins. On 22Dec2020, the patient was not feeling well intermittently starting the day after the injection with warm sensation in chest that would go away until 31Dec2020 when the warm sensation of chest would not go away. The patient was sent for EKG that showed atrial fibrillation that she is now being treated for. The events resulted in doctor or other healthcare professional office/clinic visit. The events were reported as non-serious. Outcome of the events was unknown.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported atrial fibrillation and the administration of COVID 19 vaccine, BNT162B2. More information regarding the clinical course, the patient's underlying concurrent medical condition are required for the Company to make a more meaningful causality assessment. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for

adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, Agency, as appropriate.

blood in the stool; fevers; night sweats; chills; aches; This is a spontaneous report from a contactable Physician reporting for herself. A 30-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 30Dec2020 at single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. She experienced chills and aches after 24 hours (on 31Dec2020) and experienced significant fevers that wouldn't break and cycles of chills and fevers that would last for 2 hours each cycle over the next 24 hours. She also experienced night sweats and blood in the stool and mentioned it was the first time that happened to a healthy 30 year old like her. She is asking for reports of these side effects, especially blood in the stool and for recommendations regarding taking the 2nd dose as she is still not sure on whether to take it due to hearing that the 2nd dose side effects were worse. The outcome of the events was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: Based on the information currently provided, the vaccination with BNT162B2 might play a contributory role in triggering the onset of blood in the stool. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Tested positive for COVID-19; CT showed increased infiltrates 10-15%; Dehydration/Dehydrated; Chills; Tested positive for COVID-19; Hypotensive; Achy; Severe achy cramps/Severe cramps all over body; This is a spontaneous report from a contactable nephrologist (patient himself). This 78-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EK5730), via an unknown route, on 17Dec2020 at single dose for COVID-19 immunisation. Age at vaccination was 78-year-old. The patient was diabetic and hypertensive. Additional medical history included hyperlipidaemia. No relevant concomitant medications were provided. On 18Dec2020, the patient developed severe achy cramps/severe cramps all over body. On 19Dec2020, the patient developed achy. On 20Dec2020, the patient was dehydrated and hypotensive, he had also chills. On unknown date, blood pressure was down to 76/50. His symptoms for COVID were severe achy cramps, hypotension, and dehydration. On 20Dec2020, COVID-19 test was positive. On 21Dec2020, the patient was given monoclonal antibodies. A computerized tomogram (CT) of the lungs was performed on 21Dec2020 and it was ok. A week later (Dec2020), he had a repeat CT which showed increased infiltrates of 10 to 15%. He then started on dexamethasone, apixaban (ELIQUIS) and the rest of the things. He had a repeat CT on 05Jan2021 which showed resolution of the infiltrates; most of the lesions went gone. CT results had improved significantly. The patient underwent a second COVID test a week ago which was still positive. He had a third COVID on 06Jan2021, but results were not available yet. The patient queried if he can proceed with second dose planned on 07Jan2021 or if he should wait. The clinical outcome was recovered for the event 'severe achy cramps/severe cramps all over body' on 19Dec2020, for 'dehydration/dehydrated' on 20Dec2020, for 'chills' on unknown date in Dec2020, for 'achy' on 30Dec2020, for 'hypotensive' on 20Dec2020; the outcome of the event 'CT showed increased infiltrates

10-15%' was recovering; the outcome for 'Tested positive for COVID-19' was unknown. The reporter considered the events 'achy' and 'severe achy cramps/severe cramps all over body' serious because causing disability; the events 'tested positive for COVID-19', 'dehydration/dehydrated', 'chills' and 'hypotensive' were considered medically significant. The reporter considered the events 'Tested positive for COVID-19', 'CT showed increased infiltrates 10-15%' and 'dehydrated/dehydration' unrelated to BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE).; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded. Case will be reassessed when new information is received. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Possible cellulitis; slight redness in left upper within 24 hours; severe redness and swelling and warmth of entire upper left arm and half of lower arm; severe redness and swelling and warmth of entire upper left arm and half of lower arm; Some pain; This is a spontaneous report from a contactable Physician. A 94-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EL0140) on 30Dec2020 at 12.00 pm at single dose Intramuscular on left arm for COVID-19 immunization. Relevant medical history included COVID 19 infection, on 19Jul2020, post COVID left femoral DVT oral anticoagulation, Alzheimer dementia, Osteoarthritis, Spinal Stenosis, Gait Dysfunction and Constipation. Known allergies included acetazolamide, penicillin and sulfa. Concomitant medications included apixban (ELIQUIS) 5 mg twice a day, colecalciferol (VIT D3) 1000u once a day. On 31Dec2020 at 12:00 pm patient experienced slight redness in left upper within 24 hours. The patient also experienced possible cellulitis, severe redness and swelling and warmth of entire upper left arm and half of lower arm. Some pain. No fever. It was also informed that patient underwent nasal Swab test for Coronavirus (Abbott BinaxNOW) on 05Jan2021 and on 07Jan2021 and resulted negative, for both. Treatment received for cellulitis included Cefuroxime. Outcome for the event possible cellulitis was unknown. Outcome of other reported events was recovering.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported events due to temporal association. However patient old age and other underlying conditions cannot be excluded for a contributory role The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators as appropriate.

Facial paralysis; This is a spontaneous report from a contactable Pharmacist. A 70-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EH9899, Expiration Date 30Mar2021), via intramuscular, on 17Dec2020 (at 15:35), at single dose of 0.3 mL for COVID-19 immunisation. The patient was vaccinated at hospital, age at vaccination was 70-year-old. Vaccine location was deltoid but unsure which deltoid. The patient did not have a relevant medical history and concomitant medications. Pharmacist said that after vaccination, she waited to be

monitored the standard 15 minutes at hospital and then when she got in the car and was on the way home like 20 minutes later she had brief episode of what the patient described as facial paralysis. It was like the side of her face in one area felt funny, it felt numb and it was not anywhere else on her face. It lasted the 20 minutes and then went away. The patient had recovered from the events on 17Dec2020. The pharmacist queried if the patient can proceed with the 2nd dose of the vaccine. The reporting pharmacist considered the event 'facial paralysis' as non-serious.; Sender's Comments: A possible causal relationship between acute onset of facial paralysis and BNT162B2 cannot be completely ruled out considering the temporal relationship and the known adverse event profile of the suspect vaccine. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

got home from the shot at 1145a. Fell asleep until 930pm. During sleep was told by family that i was angry, cursing and yelling in my sleep. I don't remember any of it , i felt delirious and out of co; got home from the shot at 1145a. Fell asleep until 930pm. During sleep was told by family that i was angry, cursing and yelling in my sleep. I don't remember any of it , i felt delirious and out of co; got home from the shot at 1145a. Fell asleep until 930pm. During sleep was told by family that i was angry, cursing and yelling in my sleep. I don't remember any of it , i felt delirious and out of co; got home from the shot at 1145a. Fell asleep until 930pm. During sleep was told by family that i was angry, cursing and yelling in my sleep. I don't remember any of it , i felt delirious and out of co; Left arm was extremely painful; This is a spontaneous report from a contactable Other-HCP. A 51-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number # EL1284) on 02Jan2021 at 10:00 AM at single dose via intramuscular on left arm for COVID-19 immunization. Medical history included allergy to codeine hypertension and asymptomatic HIV infection. Concomitant medications were not reported. Patient got home from the shot on 02Jan2021 at 11: 45 am. Fell asleep until 930p:m. During sleep was told by family that He was angry, cursing and yelling in his sleep. He didn't remember any of it, He felt delirious and out of control. Left arm was extremely painful. At the time of the reporting had recovered from the events without any treatment.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported event delirious cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

"lymph node swelling and lymphedema in the right forearm side and the right upper arm; lymph node swelling and lymphedema in the right forearm side and the right upper arm; cold blister on lip; significant swelling on the right side of the base of her neck near her clavicles; slightly itchy scalp; redness, swelling, tenderness at injection site; redness, swelling, tenderness at injection site; redness, swelling, tenderness at injection site; This is a spontaneous report from a contactable Registered nurse reporting for herself. A 58-years-old female patient received the first dose of BNT162B2 Pfizer-BioNTech COVID-19 Vaccine (Batch/lot number: EL0140), in Hospital, by intramuscular route in right upper arm on

23Dec2020 at 08:30, at 58-year-old of age, at single dose for COVID-19 immunization. The patient had no relevant medical history. She didn't receive any prior vaccinations within 4 weeks. There were no concomitant medications. The patient reported that it has been 2 weeks since she received the COVID-19 Vaccine now and she still has a considerable amount of lymph node swelling and lymphedema in the right forearm side and the right upper arm. The nodes on the right side of her neck around the clavicle have been quite swollen for about 2 weeks. She has the list of side effects so she was not concerned, as this was listed but now she's not sure. When she got the vaccine she had the expected redness, swelling and tenderness at injection site (onset reported as 23Dec2020). On the evening of the 24Dec2020 she had an itchy scalp but she didn't see any rash and that only lasted a short time. On 29Dec2020 the patient had a significant swelling on the right side of the base of her neck near her clavicles that wrapped around to the posterior of her neck and was assessed as medically significant. She treated it by putting ice on it in the evening. On 30Dec2020 the swelling seemed to be slightly decreased but it is still a visible lump, the nodes are firm and there is swelling around those and it has not improved since the 30Dec2020. On 30Dec2020 she noticed a little cold blister or hive on the center of her lower lip and that was resolved by 03Jan2021, she did not have fever and did not feel sick, but her main problem is the swollen lymph nodes around base of neck around clavicle and it is considerably swollen there. The patient reported that last night (06Jan2021) it looked like her right arm was swollen, she thinks she is having lymphedema on the right arm, her right forearm is half an inch circumference larger than her left arm and was measured at her work. The patient reported she is seeing her new primary care doctor on 26Jan2021 and will follow up with the doctor. The patient wanted to know if she should get the second dose scheduled for the next week or should wait until the swelling resolves. Moreover the patient asked how long do the side effects usually last (specifically systemic side effects). The events ""redness, swelling and tenderness at injection site"" and ""slightly itchy scalp"" resolved on 25Dec2020, the event ""Cold blister on lip"" resolved on 03Jan2021. The event ""Swelling on the right side of the base of her neck near her clavicles"" had not resolved yet at the time of the report. All the reported events were assessed as related to the COVID-19 Vaccine by the Primary Source Reporter (Method of assessment:Agency).; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events swelling and lymphadenopathy cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate."

kidney infection; urine turning a different color/urine was an orange color/urine was a tea color; This is a spontaneous report from a contactable Nurse reporting for herself. A 24-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 06Jan2021 at single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient stated earlier this afternoon (07Jan2021) urine turning a different color, her urine was an orange color, and this afternoon her urine was a tea color. She had no other symptoms as if she had a kidney infection. The outcome of the events was

unknown. Information on the lot/ batch number has been requested.; Sender's Comments: The causal relationship between BNT162B2 and the event kidney infection cannot be excluded as the information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

Nausea; Diarrhea; Jitteriness; foggy head or brain; she can't concentrate /she didn't pay it any attention; sleeping a lot; sick; Headache; body aches; This is a spontaneous report from a contactable nurse. A 62-years-old female patient started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EK5730), via an unspecified route of administration on 05Jan2021 08:15 at single dose for COVID-19 immunisation. Anatomical location of administration of vaccine was right deltoid. Medical history was not reported. The patient previously took omeprazole (PRILOSEC) and experienced drug hypersensitivity and lip swelling. Concomitant medication included atorvastatin (LIPITOR). The patient experienced headache on Jan2021, body aches on Jan2021, nausea on 06Jan2021, diarrhea on Jan2021, jitteriness on Jan2021, foggy head or brain on Jan2021, sleeping a lot on Jan2021, sick on Jan2021, she can't concentrate /she didn't pay it any attention on Jan2021. The outcome of headache and she can't concentrate /she didn't pay it any attention was recovering, of pain, jitteriness, foggy head or brain was not recovered, of sleeping a lot and sick was unknown. Nausea, and diarrhea recovered on 07Jan2021.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events headache, pain, nausea, diarrhea, feeling jittery, feeling abnormal, disturbance in attention and hypersomnia cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

High fever; Vomiting; Severe fatigue; Weakness; This is a spontaneous report from a contactable physician (patient himself). This 61-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EL1442), via intramuscular, on 05Jan2021 at single dose for COVID-19 immunisation. Age at vaccination was 61-year-old. Vaccine location was deltoid left. The subject did not have a relevant medical history and concomitant medications. On 06Jan2021, the patient developed high fever, vomiting, severe fatigue and weakness. He did not experience anaphylaxis. The events were considered serious as medically significant. The patient stated that side effects mentioned lasted 3 hours and he felt much better now. However, the final clinical outcome was unknown. The patient is not sure if he should get the shot again in 3 weeks since he was really sick. The reporting physician considered the events 'high fever', 'vomiting', 'severe fatigue' and 'weakness' related to BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE).; Sender's Comments: Based on temporal association, the causal

relationship between BNT162B2 and the events pyrexia, vomiting, fatigue and asthenia cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

feeling of fullness in her ear; it felt like fluid in her right ear; Hearing loss in right ear; Soreness in the left arm; This is a spontaneous report from a contactable Other-HCP. A 34-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number # EH9899) 16Dec2020 at 07:40AM in the left arm at single dose via intramuscular for COVID-19 immunization. Medical history included seasonal allergy. Concomitant medications included fluticasone propionate for seasonal allergy. The day after vaccination she noticed soreness of the left arm. Then two days later she noticed hearing loss secondary to a feeling of fullness in her ear; it felt like fluid in her right ear which has improved and she states it was not serious after the first dose. Patient received the second dose of vaccine on 04Jan2021 at 08:00AM in the left arm. That night she experienced myalgia, fever, chills, back pain, and started with a constant ringing in her right ear and the hearing loss that worsened from before (reported under AER 2021012152. All of these effects have resolved except the hearing loss and ringing in her ear. Additionally she went to see an ENT doctor and get a hearing test. The Hearing test showed moderate hearing loss and speech clarity of 96% in her left ear compared to 52% in the right ear. They don't know if it is permanent. She was currently being treated with 80mg of Prednisone daily by mouth and getting Dexamethasone injections to her middle eardrum. Patient informed that on 17Dec2020 she was tested for COVID 19 with the PCR test due to an exposure at work. The result was negative. The patient recovered from soreness in the left arm on 19Dec2020. The patient had not yet recovered from deafness.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events ear congestion and hearing loss unilateral cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

constant ringing in right ear; Myalgia; Fever; Chills; back pain; Inappropriate schedule of vaccine administered; hearing loss that worsened from before; hearing loss that worsened from before; This is a spontaneous report from a contactable physician (patient). This 34-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot EH9899), via an unspecified route of administration, on 04Jan2021 at 08:00AM at single dose for COVID-19 immunisation. The first dose was received on 16Dec2020 at 7:40 AM at single dose. Vaccine location was in the left arm. The patient was vaccinated at hospital, age at vaccination was 34-years-old. No other vaccine was received in four weeks. Medical history was none. Concomitant medications included ongoing fluticasone proprionate

(FLONASE) for seasonal allergy taking for two years. On 17Dec2020, COVID-19 PCR test was negative. On 04Jan2021 at night, she experienced myalgia, fever, chills, back pain and started with a constant ringing in her right ear and the hearing loss that worsened from before (started on 18Dec2020 after first dose, see AER # 2021012126). Start date of constant ringing in right ear was 05Jan2021. The events resulted in Physician Office visit. Hearing loss in right ear worsened and constant ringing in right ear were reported serious as medically significant while the other events were reported as non-serious. She went to see an ENT doctor and get a hearing test. The hearing test showed moderate hearing loss and speech clarity of 96% in her left ear compared to 52% in the right ear. They don't know if it is permanent. She is currently being treated with 80mg of Prednisone daily by mouth and getting dexamethasone injections to her middle eardrum. All of these effects have resolved except the hearing loss and ringing in her ear. All the events were considered related to the vaccine per reporter.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

fever of 103.7; Cough; body aches; Joint pain; chills; This is a spontaneous report from a contactable Nurse reporting for herself. A 54-year-old female patient received first dose of intramuscular BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 06Jan2021 at single dose in left deltoid for COVID-19 immunisation at the age of 54-year-old. Lot number was EL1284. Medical history included Asthma since 1991 and ongoing, high blood pressure since 2020 (6 months before the report) and ongoing. Concomitant medications were unknown. On 07Jan2021, the patient experienced fever of 103.7 at 1:30PM, chills at 9:00AM, body aches at 11:00AM, Joint pain at 09:00AM, cough at 1:00PM; the events were considered medically significant. The patient was not treated for the events. On 13Nov2020, test showed she had COVID-19. On 07Jan2021, body temperature was 103.7 Fahrenheit. The patient did not recover from the events. The nurse considered the events were related to suspect vaccine.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

"Hypokalemia; Hypomagnesemia; Hypocalcemia; Hemoglobin dropped little bit; Tetany; Muscle cramps; This is a spontaneous report from a contactable healthcare professional, a physician assistant. A 50-year-old female patient received the first dose of the BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: UNKNOWN), via an unspecified route of administration on 18Dec2020 (at the age of 50-years-old) as a single dose for COVID-19 immunization. Medical history included tachycardia, tension headache, and glucose tolerance impaired. Concomitant medications included rosuvastatin calcium (CRESTOR), gabapentin (MANUFACTURER UNKNOWN), and metoprolol (MANUFACTURER

UNKNOWN). On 18Dec2020, the patient experienced hypokalemia, hypomagnesemia, hypocalcemia, tetany, muscle cramps, and hemoglobin dropped little bit. The clinical course was as follows: The patient received the vaccine and about 30 minutes later she started to ""feel bad"". She went to the urgent care and about an hour after they took her to the emergency room (also reported as hospital). She had a complete blood count, complete metabolic panel, and magnesium level done on the 18th, 21th, 23rd, 26th, 28th, 30th of Dec2020 and then again on 04Jan2021. On 18Dec2020, her initial lab test showed potassium: 2.6, hemoglobin: 10.2, magnesium: 1.2, and calcium: 5.7. The physician assistant reported that a potassium of 2.6 was critically low and a hemoglobin was 10.2 was about normal for the patient. She received oral medications of potassium 20 mEq twice a day and calcium and magnesium supplements once a day. On 04Jan2021, lab data showed: potassium: 4.2, magnesium: 2.1, calcium: 9.5 and hemoglobin: 14.5. Per the reporting physician assistant, the above levels went back to normal but stated she had to be supplemented to get back to that point. The clinical outcomes of the hypokalemia, hypomagnesemia, hypocalcemia, and hemoglobin dropped little bit were recovered on 04Jan2021; while that of the tetany and muscle cramps, were unknown. The physician assistant assessed the events as related to the suspect vaccine. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

patient felt tingling in their neck, arms and hand and then few days later it went to their feet; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number and Expiration Date: unknown), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. On an unspecified date, the patient felt tingling in their neck, arms and hand and then few days later it went to their feet (medically significant). The clinical outcome of the event was unknown. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 MRNA VACCINE, were not provided and will be requested during follow up.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

Bell's palsy; Flu like symptoms; This is a spontaneous report from a non-contactable consumer reported that a female patient of an unspecified age received bnt162b2, via an unspecified route of administration on an unspecified date at a single dose for COVID-19 vaccination. The patient's medical history and concomitant medications were not reported. It was reported that the patient got Bell's palsy four days after the vaccine and had flu-like symptoms for two weeks. Added that patient is completely

symptom free at the time of report. The outcome of the events was recovered. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

"Got very hot and clammy but at the same time had the goosebumps; Got very hot and clammy but at the same time had the goosebumps; Got very hot and clammy but at the same time had the goosebumps; My whole body was as if I was sun burnt; My heart started to race; This is a spontaneous report from a contactable consumer (patient). A 45-year-old female patient received BNT162B2, (Pfizer COVID Vaccine, lot number: EK9231, expiry date: Apr2021) intramuscular on an unspecified date at single dose on right arm for COVID-19 immunisation. Medical history included migraine from an unknown date and unknown if ongoing. Concomitant medication included nortriptyline for migraine, botulinum toxin type a (BOTOX) for migraine and birth control medication. The patient stated that, ""I was wondering if this was a reaction to the vaccination I had today. So I ended up 3 hours after I received the vaccine, I got very hot and clammy but at the same time had the goosebumps and then my whole body was as if I was sun burnt and my heart started to race. And then my whole body was red as if I had a sunburn. Actually I went to the ER today and they just did lab work because of the way I was feeling. All they gave me in the emergency room is IV fluids."" Therapeutic measures taken as a result of the events included IV fluids. The outcome of the events was unknown."

died; This is a spontaneous report from a non-contactable consumer via a Pfizer-sponsored program. A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, via an unspecified route of administration on an unspecified date at single dose for covid-19 immunisation. The patient medical history and concomitant medications were not reported. It was reported the patient was a doctor, died after the vaccine with no apparent disease. It was not reported if an autopsy was performed. No follow-up attempts are possible. Information about lot/batch number cannot be obtained.; Reported Cause(s) of Death: Unknown cause of death

COVID-19 positive and admitted to hospital 6 days post-vaccination

Received first dose Moderna COVID vaccine on 12/28/2020; on that same day 12/28 he noticed a dry cough; on 1/1/2021 he reported fever, chills, body aches, Headache, sinus congestion. On 1/1/2021 he tested positive for COVID-19, he reported being with a family member on Christmas who had COVID symptoms. On 1/11/2021 he required hospitalization for COVID-19 pneumonia

on 1/8/2021 17:30 patient taken to ER, cerebellar hemorrhage, stroke, aneurysm

Following the first COVID vaccine dose on Dec/18/2020, I had headaches that started on the third day and ended on the tenth day. The headaches were usually light, unilateral, and alternating from one side to the other. I was usually functional except on the fourth and seventh days where the headaches were moderate to severe, and I took naps to help with the headaches for those two days. I have never had an issue with headaches before, and these symptoms were a new experience for me. I did not take any medications as treatment for the headaches. Following the second COVID vaccine dose on January/7/2021, I felt fatigue and generalized muscle aches within six to twelve hours, and these symptoms lasted for two days. On January/10/2021, when I woke up that morning I again felt light, unilateral, and alternating headaches. In addition, I noticed that I was unable to move the left side of my

face. I felt moderate tingling sensations associated with the distribution of the paralysis. When I looked in the mirror, I could quite noticeably see asymmetry in my face. I immediately went to the emergency department at the hospital where my primary care doctor is located. I was kept in the hospital into the next day for observation. After evaluation by a neurology team and an MRI, I was provided with the diagnosis of Bells Palsy. I have never previously been diagnosed with Bells Palsy, and I have never previously had a hospital stay before. The doctors prescribed medications which I am currently taking. As of today January/12/2021, the symptoms have had some improvement, but the symptoms still continue.

Beginning at 6:30 am on 1/8, two days following vaccination, the individual was driving to work and began to experience nausea while at a traffic light. He pulled over and threw up. Once he got to work he vomited again. He drove to another facility for work and then threw up 3 or 4 more times. He began experiencing hot flashes at this time. He went to the hospital and was seen in the emergency room. He threw up several more times in the ER and stated that his heart was racing and that he had diarrhea. The emergency room gave him medications for the nausea and he stayed there for 2 or 3 hours. He began to feel better and was discharged to home.

Immediately developed intense burning that progressed over the next 30 minutes and continued to burn for 3 days. The next day progressive extreme fatigue last 4 days. felt like it was going to pass out. full on body pain, dizzy and lightheaded. need assistance to get to the walk, intense headache.

Very large, reddened, tender area at injection site (like the size of an angry red egg), and fever of 103.2.

GIVEN ON 12/23. SORENESS FELT ON LEFT ARM SITE THE NEXT DAY, WITH DECREASED MOBILITY AND STRENGTH DUE TO SEVERE SORENESS AND PAIN. PAIN PROGRESSIVELY LESSENED BUT THE SORENESS STILL VERY APPARENT. ON 1/5, SPOKE TO PRIMARY MD, XRAY ON LEFT SHOULDER DONE ON 1/6. ON 1/7, STIFFNESS WITH SEVERE PAIN UPON MOVEMENT NOTED ESP IN THE MORNING. ULTRASOUND WAS DONE ON 1/8, NOTED BICEPS TENOSYNOVITIS. ORTHOPEDIC SURGEON SEEN ON 1/11, W DX OF ADHESIVE CAPSULITIS, SUGGESTED FOR PT FOR NOW, AND OFF WORK, AND TO BE FOLLOWED UP ON 2/1 BY SAME ORTHO SURGEON. WILL NOT OFFER CORTISONE SHOT FOR NOW AS IT MAY COMPROMISED OR WEAKEN IMMUNE RESPONSE, IN WHICH MY SECOND COVID SHOT DUE ON THE 15TH OF JANUARY. FIRST APPT FOR PT ON 1/15

Sudden hearing loss right ear accompanied by tinnitus

Sudden hearing loss right arm accompanied by tinnitus

Patient presented on the morning of 1/10/2021 with swollen lips and hives. Vaccination took place on Wednesday January 6th, 2021.

Patient had mild bilateral knee and hip pain 1 month ago, then she received her 1st dose of COVID vaccine on 12/14/20. Her joint pain worsened then on 1/4/21 she received her 2nd dose of COIVD vaccine on 1/4/21 and then her pain increased in spread up to her shoulders. She was seen at immediate care on 1/11/21 because her joint pain had worsened throughout and her shoulder pain was

making it difficult to raise her arms above the level of her shoulders. Her pain was made worse w/ movement.

Woke up on 1/6/2021 with hot flashes, palpitations, dizziness and heart racing. Went to urgent care and they did an EKG which showed A-Fib, so I was sent to the ER and from there, I was transferred to an ICU at a different facility . I stayed until 1/8/2021. No cause was found and no history of A-Fib or family history.

immediate tingling of lips, followed by fullness of posterior oropharynx, hoarseness and pruritus

"Fever (103-104 oF) and 4""x1"" red, swelling area around site of injection. Pt states she received an IV."

Acute approximate respiratory failure secondary to acute COPD

first day after shot, nausea, body aches, 2nd day Sunday headache, Monday 5 am woke up itching, then 9 am hives everywhere, trouble breathing, anaphylaxis, went to ER, got epi X 2, solumedrol, benadryl, pepcid, then still with hives, tachycardia, dyspnea, iv fluids were influsing and epi drip started, went to ICU

Back pain, bilateral PE and DVT

"Patient states that she received her second vaccination and in the hours after she had flu-like symptoms. Then over the next few days, she started to notice tingling and a ""prickly"" sensation in various areas. This progressed to symmetric BLE weakness which started in her feet and had reached to just above her knees bilaterally time and she arrived. The weakness had progressed to her hips. She also noticed weakness in her arms and they are easily fatigued. She is able to walk but it takes much effort."

coughing, flushing, cyanosis, diaphoresis

Within 3 minutes of receiving vaccine felt flush and throat swelling, responded to Epi Pen and Benadryl p.o. EMS took him to ED where he remained several hours receiving 1 liter NS 125 mg solumedrol IV, discharge with 4 days of prednisone 40 mg daily and a prescription for an Epi Pen. As of 1.12 he is totally okay with no after effects.

First Day after the injection I had a headache and nausea the entire day into the next day. The second day I still had the headache and the nausea. I work overnights. When I awoke in the afternoon, my throat was closing up. It was hard to swallow and I struggled to breath. I immediately drank liquid Benadryl and called my doctor in the morning.

Patient presents to the Emergency Department who was doing well up until she received COVID-19 vaccine at 1150. 15 minutes later patient started to experience throat tightening and tongue swelling. She was administered Epipen at 1217 by staff at vaccination clinic. EMS was called and prior to arrival at ER tongue swelling had subsided.

-0715 vaccine administered. -0735 started to feel dizzy/off and right side of tongue felt like it was mildly swelling and itchy. -0735 asked to have blood pressure taken as know when I am having anaphylaxis my

blood pressure escalates. -0740 took blood pressure and it was 141/86 in right arm. Normal is 110s/60s-70s. No anxiety feelings. -0740 throat started to have increased mucous production. Had the tickle and tightness in throat. Asked and received 25mg Benadryl with cup of water. -0742 started clearing throat frequently and slight cough. Knew it was anaphylaxis and told the team I need to go to the ER. Asked for additional 25mg Benadryl. Also took 20mg Famotidine and 2 puffs Albuterol inhaler--this is my prescribed anaphylaxis routine. Had Epipens on standby. -0743 put on O2 saturation monitor and watched O2 drop into 90-92 range. Asked for epipen on standby as I know when I need to start it. Didn't want to take that when I knew I was about to get it in the ER and knowing self hadn't progressed that far. Felt chest tightness and shortness of breath. Voice started becoming hoarse. -0800 EMS arrived (delay as team didn't know if they were supposed to call 911 or a Code--they chose EMS even though in hospital). Then staff at COVID vaccine clinic kept emphasizing need to go in ambulance while EMS and self fought to go through hospital (much quicker route). Finally cleared to go through hospital to ER. To get some air via breathing in had to sit up leaning forward. Voice completely hoarse by this time. -About 0817 arrived to ER bay. At this time, frequently coughing and cough started to sound stridorous. Difficulty getting breaths in. Had chest pain near heart. Greeted by MD, 2 RNS, and technician. -0819 received IM epinephrine. Attached to 5 lead EKG monitoring and O2 monitoring. Blood pressure done again. Higher than previous. -About 0821 had working IV (previous two attempts failed as veins were constricting). Given IV Solumderol. Started bolus of 1L Normal Saline. -Not sure how long after by cough subsided, increased mucous production subsided, as well as hoarseness decreased. -Held for observation for 2hours (would be longer if not resolved). - Discharged around 1015. At this time, hoarseness almost all gone. Minimal throat clearing. Cough resolved. -Prescribed epipen inhalers (mine expired) and Prednisone. Prednisone is PRN for mild breathing difficulties if it starts again tomorrow 1/13/21. -At 1400 took 50mg Benadryl and 20mg Famotidine as previously prescribed for anaphylaxis maintenance. Will continue this as previously prescribed every 6hours until symptoms stay resolved. - Made follow up appointment with Primary Care Physician per protocol

Immediately after she felt faint, heart rate 121, felt faint again bp 62/33. Was taken to the ER, within a half hour, she fully recovered. Vitals went back to normal.

Hospice Resident received first Covid 19 vaccine dose on 1/6/21. 1/7/21 resident had decreased appetite noted in am but ate 100% of meal at dinner. 1/9/21 resident had decreased appetite with emesis x 2, loose BM x 2. Call placed to hospice. 1/10/21 5:44 am resident able to take HS meds, ingest 2 cups of shake. No emesis or loose stool noted. 12PM nurse noted resident not eating meals but ingesting milkshake and medications without any problems. Hospice contacted for change in condition. 1:00 pm hospice ordered Phenergan 12.5 mg Q 6 hrs PRN. Labs to be drawn 1/11/21. Hospice notified POA. 1/11/21 12:24am Resident had blood in stool. Resident denies any pain, on 2L of O2 for comfort.

Severely dizzy, left hand totally numb but painful, cold to touch. Felt better before she got to ER.

Patient vaccinated on 12/28. Approximately one day later, develops cough and on azithromycin x 1 week. On 1/3, patient develops left-sided weakness and aphasia. Taken to the hospital, tested COVID+, required intubation -- acute hypoxic respiratory failure secondary to COVID - on H&P. Patient died on 1/4/21 at 7:20am.

Attempting to confirm which COVID 19 vaccine was given (Moderna or Pfizer). They did not send the record when they sent the patient to General ER the next am. Did not answer the phone.

Started to feel lightheaded, weak, faint like I was going to pass out, heart rate increased, confusion, trouble speaking, brought to the ED, throat started to swell and started having thick spit and clearing my throat excessively. Diagnosed as anaphylaxis.

within 1 hr post-vaccine on 1/7 I had a mild headache that resolved with Tylenol. At about 12 hours post-vaccine I developed nausea, fever (100.4) and chills and secondary to this had poor sleep. The next day I took scheduled alternating Tylenol & ibuprofen during the day and then overnight 1 episode of chills that woke me up. no events Saturday or Sunday. Then Monday 1/11 in the early morning I started to develop a rash on my b/l elbow and right foot 3rd toe. I applied mometasone topical cream to these locations. while at work the rash extended down both forearms then by 5pm it was on both hips and extending along both legs. I applied Benadryl cream to the most irritated sites and took PO Benadryl 50mg at bedtime and again at 1am when the itching woke me up. I repeated Benadryl 25mg at 8am. The rash seems to be getting better on the arms but then by noon I had a new breakout on my neck and face. I took Benadryl 50mg at 1pm. The rash continued to have a rapid progression over the next hour and resulted in angioedema with my throat swelling, lips puffed and numb and eye swelling. I was injected with an epi pen and sent to the ED where I received PO prednisone, famotidine, and Benadryl. The face/neck rash then greatly improved and I was sent home on prednisone 40mg daily for 3 days.

Blurred vision, difficulty breathing (pale skin/blue lips), profuse sweating, muscle fatigue, headache. This lasted about 15 minutes. Until severity went down. Followed by 20 minutes of profuse sweating and headache. I thought I was going to die

Sudden cardiac death

"COVID-19 PCR test/he was positive per the PCR test; COVID-19 PCR test/he was positive per the PCR test; Sweating; Fever; running to bathroom with urination every 15 minutes with a large amount of urine; running to bathroom with urination every 15 minutes with a large amount of urine; Heart pounding; tired and fatigue; Weight loss; Chills; pain all over the body; Sluggishness; This is a spontaneous report from a contactable consumer. A 63-years-old male patient received his first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EH9899, expiry date was unknown), via an unspecified route of administration on the left arm on 21Dec2020 14:40, at a single dose for Covid 19. The patient's medical history and concomitant medications were not reported. The patient has no prior vaccinations -within 4 weeks. The patient is an EEG technician. On 22Dec2020, the patient reported the next day he started to feel sluggish, chills, tired/fatigue, pain all over his body, patient mentioned he has lost weight everyday since he got the shot from 153 pounds to 142 pounds; then on Wednesday evening 23Dec2020, it was a nightmare, he got sweating; fever with a high of 101.4 Fahrenheit; he was running to bathroom with urination every 15 minutes with a large amount of urine; and he was so tired and fatigued. Added when he was getting up all that night he was having night sweats up to five times a night and chills; and his heart was pounding. The urination, heart pounding resolved the next day. All of these events have improved at the time of report (now) or gone away but

he is still sweating once at night for the last two days and he is tired and fatigued. He stated that he is scheduled for the second dose on 11Jan2021 and he is concerned if he should take the vaccine. He mentioned that he was tested for COVID 19 on 18Dec2020 and the result was inconclusive. He went again 23Dec2020 they called him on 25Dec2020 and informed he was positive per the PCR test. He treated himself with 500mg acetaminophen (UPC 0904672059; lot OBE2896 and expiration Oct2021) and azithromycin Z-Pack (NDC 65862-641-69; Lot ZYSA20012-A; and expiration date Mar2022). The sample of the product is not available to be returned. Predisposing factor was that the patient's wife was at home and was sick too at the same time. She was tested Sunday with no results yet. The outcome of the events of fever recovered on 28Dec2020, sluggishness recovered on 29Dec2020, pain all over the body was recovered on 02Jan2021; running to the bathroom with urination every 15 minutes with a large amount of urine and heart pounding were recovered on 24Dec2020, weight loss was not recovered, and for other events was recovering.; Sender's Comments: Based on the mechanism of action of BNT162B2 vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine was given (4 days in this case). However, a causal relationship between event ""COVID-19 PCR test/he was positive per the PCR test"" (coded to Drug ineffective / SARS-CoV-2 test positive) and BNT162B2 vaccine cannot be completely excluded"

Tested positive to COVID; Tested positive to COVID; This is a spontaneous report from a contactable nurse, the patient. A 41-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 23Dec2020 as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. On 02Jan2021, the patient tested positive to Covid. The outcome of the event, tested positive to Covid, was unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.

neuropathy; pain; nausea; fatigue; bone, muscle, stomach pain; bone, muscle, stomach pain; bone, muscle, stomach pain; flare; increase in joint pain from his baseline; This is a spontaneous report from a Pfizer sponsored program Accredo Xeljanz Program. A contactable nurse and contactable consumer (patient) reported that a 56-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 18Dec2020 at a single dose for COVID-19 immunization and tofacitinib citrate (XELJANZ XR), orally from 02Oct2020 at 11 mg, daily for rheumatoid arthritis. The patient's medical history and concomitant medications were not reported. On 19Dec2020, the patient experienced neuropathy, pain, nausea, fatigue, bone, muscle, stomach pain and flare. In Dec2020, the patient experienced increase in joint pain from his baseline. The physician was aware. The patient was placed on unspecified steroids for the events, neuropathy, pain, nausea, fatigue, bone, muscle, stomach pain and flare which minimized symptoms. While weaning off steroids, the severity of symptoms returned. The patient was instructed by the doctor to stop taking tofacitinib citrate which was stopped on 29Dec2020. The action taken in response to the events for BNT162B2 was not applicable and for tofacitinib citrate was permanently withdrawn on 29Dec2020. The patient reported slight improvement after stopping tofacitinib citrate. The outcome of neuropathy, pain, nausea, fatigue, bone, muscle, stomach pain and flare was recovering and of increase in joint pain from his baseline was

unknown. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.; Sender's Comments: Based on the information available, the reported events are most likely due to patient underlying contributory factors and unlikely that it is related to the suspect product. However due to temporal association with the vaccine, a possible contributory role of vaccine cannot be ruled out. Case will be reevaluated based on additional information during the follow-up. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators as appropriate.

I developed Covid -19 (positive PCR) on 02Jan2021 after respecting quarantine, mask wearing, and was not onsite at work; I developed Covid -19 (positive PCR) on 02Jan2021 after respecting quarantine, mask wearing, and was not onsite at work; This is a spontaneous report from a contactable pharmacist. A 25-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) lot number: EK5130, via an unspecified route of administration at left arm from 23Dec2020 16:30 to 23Dec2020 16:30 at a single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. The patient developed Covid-19 (positive polymerase chain reaction (PRC)) on 02Jan2021, after respecting quarantine, mask wearing, and was not onsite at work. The patient did not received treatment for the adverse events. The outcome of the events was recovering.; Sender's Comments: A causal association between reported event and suspect BNT162B2 cannot be excluded.

she received her first dose of COVID vaccine on 18Dec and a week later contracted COVID; she received her first dose of COVID vaccine on 18Dec and a week later contracted COVID; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs) from a contactable registered nurse (patient). This 67-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) at single dose on 18Dec2020 for COVID-19 immunization. Medical history and concomitant medication were not reported. Patient stated she received her first dose of COVID vaccine on 18Dec and a week later contracted COVID (in Dec2020) after receiving COVID vaccine. She just wanted to find out the answer to some medical questions. She had questions about antibodies and whether or not she should take the second dose. She stated her second dose was scheduled in two days, on Friday. She said after being positive on 28Dec2020 for COVID-19 virus test, she received the medication Bamlanivumab 700 mg intravenous passive antibodies therapy to lessen the COVID symptoms and to keep her out of the hospital, which it did. The outcome of events was unknown. Information about lot and batch number was requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 cannot be completely excluded. However, it is unlikely that the patient would have fully developed immunity due to the very short time lag between the first vaccine dose and the event onset.

COVID Rapid Test and COVID-19 PCR test positive/ symptomatic/ fever/ not feeling well; COVID Rapid Test and COVID-19 PCR test positive/ symptomatic/ fever/ not feeling well; This is a spontaneous report from a Pfizer-sponsored Program Pfizer First Connect. A contactable nurse reported for a male patient (husband) with unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730) via IM injection left deltoid on 19Dec2020 at single dose for COVID Prevention.

Medical history and concomitant medications were none. The patient did not receive any other vaccines on the same day as the COVID vaccine. The patient was a healthcare professional. The vaccine was not specifically prescribed to the patient, but rather was given to him via his workplace policy, although it was not mandatory. The patient received 1st dose on 19Dec2020, and he had exposure to the virus at work, and on 01Jan2021 he woke up with a fever and was not feeling well and tested positive for COVID-19. Currently he is still symptomatic. The reporter is inquiring about how to follow up with the second dose for the patient, as the patient is due for his second dose on 09Jan2021. It was reported that it had mostly been a low grade fever. The patient had both COVID Rapid Test and COVID-19 PCR test performed on 01Jan2021, and both were positive. The outcome of event was unknown. The reporter was unsure of seriousness for the patient's positive COVID tests, so far it had not been terrible, but he was still symptomatic, so it was hard to say seriousness at this time. Relatedness of vaccine to event fever and positive COVID test both rapid and PCR from the reporter was unrelated.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 cannot be completely excluded. However, it is unlikely that the patient would have fully developed immunity due to the very short time lag between the first vaccine dose and the event onset.

"got the covid 19 vaccine on 29Dec2020 and tested positive for covid on 05Jan2021; got the covid 19 vaccine on 29Dec2020 and tested positive for covid on 05Jan2021; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age (reported as ""Age-48, Unit-Unknown"") received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 29Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient stated she got the covid 19 vaccine on 29Dec2020 and tested positive for covid on 05Jan2021. She wanted to know what to do about the second dose of the vaccine. Information about Lot/batch number has been requested."

"I ended up testing positive on Monday 04Jan2021; I ended up testing positive on Monday 04Jan2021; This is a spontaneous report from a contactable Other Health Professional (patient). A male patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection) lot number was not reported, via an unspecified route of administration on 30Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Family history included patient was ""99.9% sure that his daughter at day care had direct contact (COVID-19)"". It was reported that the patient received first dose on 30Dec2020, and that same Wednesday morning 99.9% sure that his daughter at day care had direct contact (COVID-19). He ended up testing positive on Monday 04Jan2021 with outcome of unknown, and was scheduled for second dose on 04Jan2021. He asked for specific recommendation for his weird situation. Information on Lot/Batch has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of suspected LOE and SARS-CoV-2 test positive due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available."

anaphylactic reaction; arm was really sore; tiredness; dizzy; This is a spontaneous report from a contactable other health professional (patient). A 53-year-old female patient received bnt162b2 (Pfizer-biontech covid-19 vaccine), via an unspecified route of administration on 31Dec2020 at single dose for covid-19 immunization. Medical history included shellfish allergy. The patient's concomitant medications were not reported. The patient experienced anaphylactic reaction on an unspecified date, dizzy on 31Dec2020, arm was really sore on an unspecified date, tiredness on an unspecified date. Event details: She was dizzy that day especially with changing positions, she didn't need to go to the doctor or anything. It wasn't severe. She was just a little dizzy. It's probably just the vaccine and it did go away. Her arm was really sore and went away after a few days. the tiredness, it wasn't a big deal. She did feel better about. it wasn't a serious anaphylactic reaction. It didn't happen right away. She had arm soreness. it wasn't immediate. She usually didn't have. It was really weird. She thought she was well hydrated. The outcome of event was really sore was resolved, outcome of other events was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the anaphylactic reaction and other reported events due to temporal relationship. There is very limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

she tested positive for COVID-19 after receiving the first dose of the Pfizer-Biontech COVID-19 vaccine.; she tested positive for COVID-19 after receiving the first dose of the Pfizer-Biontech COVID-19 vaccine.; This is a spontaneous report from a contactable physician. A 41-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EH9899) intramuscular in left arm on 26Dec2020 14:30 at a single dose for COVID-19 immunization.The patient's medical history and concomitant medications were not reported. The physician received her first dose of the COVID vaccine on 26Dec2020 and on 02Jan2021, tested positive for COVID. She actually tested negative 2 days before testing positive (26Dec2020). The outcome of the event was recovered on an unknown date. According to the physician, the event was unrelated to the vaccine as her nanny and her son was also tested positive.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported tested positive for COVID, which is considered ineffective of BNT162B2, and the administration of BNT162B2.

Tested positive for COVID; Tested positive for COVID; This is a spontaneous report received from a contactable Registered Nurse (patient) via a Pfizer sponsored program IBCC (Inbound Call Center for HCPs). A female patient of an unspecified age received BNT162B2, via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient experienced tested positive for COVID on an unspecified date with outcome of unknown. The patient just received the COVID vaccine,

and also tested positive for COVID. The patient underwent lab tests and procedures which included COVID test: positive. Information on the lot/batch number has been requested.

has COVID now and was pretty ill and in their ICU, positive COVID-19 test; has COVID now and was pretty ill and in their ICU, positive COVID-19 test; This is a spontaneous report from a contactable pharmacist. A 55-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), on unspecified date in Dec2020 at SINGLE DOSE for COVID-19 immunization. The patient developed positive COVID-19 test with symptoms on unknown date. The clinical course was as follows: the patient received the first dose of the vaccine 2 weeks ago and has COVID now and was pretty ill and in their ICU. Laboratory data included: SARS-CoV-2 test (unknown date): positive. The pharmacist was wondering if the participants in the trials received their second dose if they tested positive before the second dose and if there is any data on when to give the second dose of the vaccine for patients that test positive before the second dose. The outcome of the events was unknown. Information on lot/batch number has been requested.; Sender's Comments: No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the positive COVID likely represents a pre-existing infection prior to vaccine use. Further information is needed for full medical assessment.

"Anaphylactic reaction; Tongue was swelling; Difficulty breathing; This is a spontaneous report from a contactable Pharmacist. A 55-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), at SINGLE DOSE for COVID-19 immunization. The patient experienced ""Tongue was swelling, Difficulty breathing, and an Anaphylactic reaction"".No other details provided. The outcome of the events was unknown Information on lot/batch number has been requested.; Sender's Comments: A possible causal relationship between acute onset of Anaphylactic reactions presented as Tongue swelling/Difficulty breathing and BNT162B2 cannot be completely ruled out considering the temporal relationship and the known adverse event profile of the suspect vaccine. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

Positive COVID-19 rapid test; Positive COVID-19 rapid test; Positive COVID-19 rapid test; Patient got sick; 2 weeks of on and off fever and unproductive cough; Patient got sick; 2 weeks of on and off fever and unproductive cough; Patient got sick; 2 weeks of on and off fever and unproductive cough; Lost sense of taste and smell; Lost sense of taste and smell; sore throat; This is a spontaneous report from a contactable nurse (patient). A 50-year-old male patient received the 1st dose of bnt162b2 (BNT162B2), via an unspecified route of administration, on 16Dec2020, at single dose, for COVID-19 immunisation. Medical history and concomitant medications were none. On 17Dec2020 patient got sick; 2 weeks of on and off fever and unproductive cough. In Dec2020 the patient also experienced lost sense of taste and smell. On 20Dec2020 the patient underwent COVID-19 rapid POC test and was found positive. The events required emergency room visit. Therapeutic measures were taken as a result of the events and included treatment with Tylenol 650 every 4 hours. The events recovered on unspecified date except unproductive cough and sore throat that were recovering. The information on the lot/batch number has

been requested.; Sender's Comments: The association between the event lack of effect (COVID-19 rapid POC test) with BNT162b2 can not be completely excluded.

Covid; Covid; This is a spontaneous report from a contactable Other Healthcare Professional (HCP). A female patient of unknown age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on an unknown date at single dose for COVID-19 immunisation. Medical history and concomitant medications were unknown. The patient was scheduled for her second dose of vaccine tomorrow (08Jan2021) but she was diagnosed with Covid on 07Jan2021. Outcome was unknown. Information on the lot/ batch number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

Drug ineffective; tested positive for COVID-19; This is a spontaneous report from a contactable pharmacist reporting for his/her mother-in-law. A 99-years-old female patient in good health received the first dose of BNT162B2 Pfizer-BioNTech COVID-19 Vaccine, via an unspecified route of administration on an unspecified date (presumably on 02Jan2021 - to be confirmed) at single dose for COVID-19 immunization. The patient's medical history was not reported. Concomitant medication included monoclonal antibody bamlanivimab on an unknown date. On 06Jan2021 the patient experienced tested positive for COVID-19. It was reported that the patient is scheduled to have her 2nd dose on 23Jan2021. The reporter asked if the patient should wait 90 days before taking the second dose. Information on the lot/batch number has been requested.; Sender's Comments: A causal association between event and suspect BNT162B2 cannot be excluded

"positive with covid; positive with covid; sinus strainagned at the back of the throat.; sinus strainagned at the back of the throat.; This is a spontaneous report from a contactable nurse. A female patient of an unspecified age started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# unknown), via an unspecified route of administration on an unspecified date single dose for COVID-19 immunisation. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient experienced positive with COVID on an unspecified date, sinus strainagned at the back of the throat on an unspecified date. The outcome of the events was unknown. Information on the Batch/Lot number has been requested.; Sender's Comments: A causal association between reported ""positive with covid"" and suspect BNT162B2 cannot be excluded."

received her 1st COVID vaccine shot 22Dec2020, however she got diagnosed with COVID; received her 1st COVID vaccine shot 22Dec2020, however she got diagnosed with COVID / pneumonia; rash; This is a spontaneous report from a contactable consumer (patient). This 77-years-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 22Dec2020 at single dose for COVID-19 immunisation. Medical history and concomitant medications were unknown. After the first dose, the patient got diagnosed with COVID. She does not want to waste a second dose if it will not be useful. Everyone on her department has had

COVID, and have been told to wait 3 months before getting their second dose. Caller had a 'rash' after her 1st dose of the COVID vaccine. The patient is now recuperating from the pneumonia. Outcome of pneumonia was recovering while outcome of the other events was unknown. Information on the Lot/Batch Number has been requested.

headaches on both sides of his head; This is a spontaneous report from a contactable Physician reporting for himself. A 53-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) at 0.3ml single dose on 30Dec2020 in the left deltoid for COVID-19 immunisation at the age of 53-year-old. Lot number was EK9231, expiration date 30Apr2021. Medical history and concomitant medications were unknown. On 31Dec2020, headaches on both sides of his head; the event was considered medically significant. The patient received TYLENOL for the event. The patient did not recover from the event. The physician considered the event was related to suspect vaccine. Information on the lot/batch number has been requested.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

Received the first dose of Pfizer COVID Vaccine and then tested positive after receiving it; Received the first dose of Pfizer COVID Vaccine and then tested positive after receiving it; This is a spontaneous report from a Pfizer-sponsored program. A contactable consumer (patient) reported that a male patient of an unspecified age received the first dose of bnt162b2 (lot no. and expiry date were unknown), via an unspecified route of administration on an unspecified date at single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the first dose of Pfizer COVID Vaccine and then tested positive after receiving it. He says it has been 14 days after he tested positive and he is wondering about getting his second dose. The outcome of the event was unknown. Information on the Lot/batch number has been requested.

increased respiratory infection; Allergic reaction; Yeast infection; Non-diagnosed allergic conjunctivitis; seasonal allergies; This is a spontaneous report from a Pfizer-sponsored program, IBCC (Inbound Call Center for HCPs), from a contactable nurse (patient) reported for herself. A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 22Dec2020 at a single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. The patient was having an allergic reaction and had a yeast infection. She was supposed to get the next dose soon (on 12Jan2021) but she was worried about getting the second dose. The patient stated so she had some increased (incomplete sentence).The patient stated she had a non-diagnosed allergic conjunctivitis followed by a yeast infection, followed by increased respiratory infection and she did make a report of the seasonal allergies that I did not used to get at this time of year. So, she did not report the conjunctivitis because it was not diagnosed and did not report the yeast infection because she handled it herself. The outcome of events was unknown. Information about Lot/Batch number is requested.; Sender's Comments: Based solely on a compatible

temporal association causality between reported events and BNT162B2 vaccine cannot be excluded. The case will be reevaluated should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

On 1/5/2020, I, the patient woke up at 3:30 with sharp boring epigastric pain. Progressed to include nausea. On evaluation in the ED was diagnosed with acute pancreatitis. Prior hx includes 2 episodes with hospitalization for gallstone pancreatitis in 2016. Subsequently had laparoscopic cholecystectomy in 2016. Last alcoholic beverage prior to 2020 ED presentation was 3 weeks prior. No tobacco or drug use.

The patient presented to hospital on 1/6/2021 with a primary complaint of Fatigue (pt had covid vaccine yesterday. Now displaying increased weakness, blood in urine, increased confusion and urinated on herself today. Fever of 101.9) 79-year-old female presents to the emergency room with fatigue. The patient states yesterday she had the Moderna COVID-19 The patient states today she had a temperature 101.8¦ prior to arrival. Her son noted that she was having episodes of urinary frequency and also that she was profoundly weak and fatigued. They denied falling or hitting her head. The patient also states she been having nausea vomiting with diarrhea.

Vaccine was given on 12/23/20 on 01/07.21 went to get a routine physical and received an emergency call that my pallet blood count was around 10K instead of 150k. Was instructed to go to the ER asap. However didn't received the message until the next morning at 6:30am. Was checked into the E.R. , given sterioids, pallets, hemogolibin. Stayed overnight in the hospital was able to leaved the next day around 1pm with pallets at 47k.

swelling at the injection site, pain, headache, feeling like numb, change in the taste, fever the 1st day x2, body ache, lower back pain.

Three hours after receiving COVID 19 vaccination, Patient oxygen level decreased to a critical level and went into cardiac arrest. Staff performed full code but was unable to bring back patient from cardiac arrest.

2230 feeling of unease, body aches, site arm tingling, general mild aches 0220 awoke from sleep choking, having difficulty breathing, felt very SOB, worse with exertion or trying to speak, great difficulty swallowing and speaking even in brief words. Took 50mg of Benadryl PO and went to the ED, about a 15 minute car ride. Had tingling and numbness of the tongue and back of throat by arrival but still able to breath with focus. Exertion of just walking into the ED greatly increased the SOB. Was triaged, Benadryl starting to help, was able to speak a little better, 3-4 words without too much SOB caused. Was walked to a room, SOB milder with that exertion. Seen by Dr. Given IV Sol-u-Medrol and 50mg Benadryl. Was observed on cardiac monitor/Q15VS for a few hours and discharged home around 5:30. Given Rx of Prednisone 20mg -3tabs x2 days, 2tabs x5 days all once a days and told to take 50mg of Benadryl Q4H for the next 24 hours at least and to return prn. I did need to stay on Benadryl, as the Sol-u-Medrol wore off some of the swelling in thr throat did return but not severe, Benadryl did help, along with taking my

Asthmnex I already had. I also continued my normal HS antihistamines. I had SOB on exertion, progressively better from the 6th-10th with it mostly resolved to yesterday. Body aches have continued but also progressively better. Yeasterday1/12/21 the Rx of prednisone was completed and I did have some mild swelling /tingling in the throat/face/mouth return in the evening, took Benadryl 50mg again and inhaler used. I have an appointment today to seek further care at my primary doctor's office. Asthmnax used again this morning as well, only mild tightness in the throat currently with mild body aches this whole time.

Systemic: Fever-Severe, Systemic: hypotension, dyspnea-Severe; symptoms lasted 1 day

Patient day after vaccination had fever, chills, headache and malaise but recovered the next day. starting four days after vaccination started to have left neck swelling . Of note day prior vaccination had left wisdom teeth removal and maxillary root canal. 1 week after vaccination and 8 days after oral procedures worsening left neck swelling, trouble swallowing's and change voice found resulting left neck 3x2cm necrotic neck abscess and significant neck inflammation. Patient was seen by ENT and started on IV Unysan and admitted for airway monitoring due to swelling with improvement over next 48 hours.

12/23/2020-RECEIVED VACCINE AT 9:52 AM. REPORTS NOT FEELING WELL IN THE AFTERNOON, LIGHTHEADED AND DIZZY, THROBBING HEADACHE. CRAMPING/ACHING IN BACK OF CALVES. 12/24/2020 CONTINUED WITH DIZZINESS, THROBBING HEADACHE, BLOOD PRESSURE ELEVATED, CHEST PRESSURE 8:00 PM REPORTED FEELING THAT SHE WAS GOING TO DIE, WENT TO LAKE CITY MEDICAL CENTER- BLOOD PRESSURE ON ARRIVAL 184/101 HR. 117. GIVEN NITRO AND MEDICATIONS. ADMITTED, DISCHARGED 48 HOURS LATER ON 12/26/2020. DISCHARGED ON BLOOD PRESSURE MEDICATION 12/27/2020-LESS THAN 24 HOURS AFTER BEING DISCHARGED SHE WAS READMITTED TO MEDICAL CENTER WITH SAME SYMPTOMS. 36 HOURS AFTER ADMISSION, TRANSFERRED TO MEDICAL CENTER. FOR CARDIC WORKUP AND HIGHER LEVEL OF CARE.

Became dizzy, headache, felt like she was going to faint, rigors and a temperature of 101.5. Next morning she had upset stomach, feeling dizzy, thought she was going to faint and a headache.

Had Covid Vaccine AM of 1.8.2021. Woke up with Nausea, Vomiting X 4, Chills the following AM. Presented to ED. Found to be hypotensive during ER. Nausea Vomiting resolved. Tx with fluid replacement and dismissed home instructed to monitor BP. B/P dropped again at home returned and admitted to hospital.

Site: Pain at Injection Site-Medium, Systemic: Generalized Body Aches -Severe, Systemic: Headache-Severe, Systemic: Severe drop in blood pressure, pulse, and o-sat-Severe

Patient reported symptoms started ~15 mins s/p dose. Symptoms reported LUE and LLE numbness/tingling, and notable tachycardia

NauseaVomiting, HYPERtension, Tachycardia, throat swelling Narrative: Went home after vaccine and starting vomiting, throat swelling. HR and BP elevated Went to ER was given beta blockers, in hospital for observation.

"Patient received vaccine on 1/8/2021. On 1/9/2021 I checked on patient via phone for symptoms or problems and he reported none but mild soreness at injection site. On 1/10/2021 family friend called me to tell me that patient had expired at about 8:00 pm. Patient reportedly complained of ""pain"" unspecific and collapsed at home. Hospital reportedly told family that it appeared to be a ""heart attack""."

I was being monitored for 15 mins since I was allergic to tree nuts stayed 20 mins. I started feeling dizzy and exp nausea lasted 20 sec. After about 12 hrs later I woke up had difficult swallowing felt like something in my throat. I went to ER received a dose pack, Benadryl and steroid injection.

Jan 1st, patient had a seizure after breakfast. Temperature was 98.5 Pulse 95. B.P. 160/70 Two hours later another seizure at the home, with emesis, Sent to hospital at 2pm. Focal Status elepticus. Seizure activity along with continuous persistent activity with emesis throughout the 12 hour time in the ED. Seizure during the CT scan.

severe stabbing-shooting lower back pain; severe stabbing-shooting lower back pain that radiated to both legs; Pricking, pins and needles sensations in the hands and feet; numbness; weakness to both legs but mostly the right leg; Coordination problems, unsteadiness; Coordination problems, unsteadiness; This is a spontaneous report from a contactable nurse (patient). A 39-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL0140), intramuscular on 20Dec2020 08:00 at single dose at left arm for covid-19 immunization. Medical history included hypertension from an unknown date and unknown if ongoing. The patient's concomitant medications in two weeks included multivitamins. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. No known allergies to medications, food, or other products. On 22Dec2020 at approximately 19:15, the patient experienced sudden onset of severe stabbing-shooting lower back pain that radiated to both legs. Pricking, pins and needles sensations in the hands and feet. Coordination problems, unsteadiness, numbness, and weakness to both legs but mostly the right leg. The patient underwent lab tests and procedures post-vaccination which included nasal swab for covid test: negative on 30Dec2020 (Antigen Test). Adverse events resulted in doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care, disability or permanent damage. Patient received pain medication, steroid dose pack, MRI (pending), and physical therapy (pending) as treatment. Outcome of all events was not recovered.; Sender's Comments: Based on the compatible temporal association, a contributory role of vaccination with BNT162B2 in the onset of the events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

high blood pressure within 15 min post vaccination. BP 180/94/BP rose to 202/110; This is a spontaneous report from a contactable nurse. An adult female (age:18-64 Years) patient (pregnant: No) received first dose of BNT162B2 (Pfizer), intramuscularly in left arm on 05Jan2021 10:30 at single dose for COVID-19 immunization. The patient's medical history was not reported. The patient was received

other concomitant drugs. The patient experienced high blood pressure within 15 min post vaccination. BP (blood pressure) 180/94 rose to 202/110 on 05Jan2021 10:45. The event resulted in doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. The events were reported as non-serious. Recipient experienced high blood pressure within 15 min post vaccination. Went to hospital where her pressure was 202/110, vaccine given on 05Jan2021 at 10:30 am, by 10:45 am BP was 180/94, recipient refused hospitalization. Sister took her home but made her go to the hospital where her BP rose to 202/110. IV (intravenous) steroids given. The outcome of event was resolved in Jan2021. The patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. The medications the patient received within 2 weeks of vaccination: Protein drink. Unknown whether was the patient diagnosed with COVID-19 prior to vaccination. Unknown whether the patient been tested for COVID-19 Since the vaccination. Unknown allergies to medications, food, or other products. Information on the lot/batch number has been requested.; Sender's Comments: Based on temporal association, a possible contributory role of BNT162B2 cannot be excluded for reported event hypertension. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

First dose on 16Dec2020, second dose on 05Jan2021; Tinnitus; constant ringing in ears; louder this time; This is a spontaneous report from a contactable nurse (patient). A 51-year-old female patient (no pregnancy) received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), with first dose (lot number: EH9899) on 16Dec2020 via intramuscular route, with second dose (lot number: EK4176) on 05Jan2021 via an unspecified route of administration, both at single dose for covid-19 immunization. Medical history included allergies: penicillin. Concomitant medication included famotidine, ibuprofen (DUEXIS), iron (IRON) and multivitamins, all received within two weeks of vaccination. On 17Dec2020, the patient experienced tinnitus, constant ringing in ears that started 24 hours after first vaccine, lasted about 2-3 days and went away. Ringing in ears started again and is louder this time on 06Jan2021. Facility where the most recent COVID-19 vaccine was administered was in hospital. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No treatment received for the adverse event. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The event was identified as serious and resulted in disability or permanent damage. The outcome of event tinnitus was not recovered. The outcome of the other event was unknown.; Sender's Comments: Based on the compatible temporal association with positive rechallenge result, the Company considers the event tinnitus is possibly related to vaccination with BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Injection site was red and a little swollen the next day and has become increasingly larger. Today (3 days later) the injection site is red, warm, swollen, and about the size of a grapefruit.; Injection site was red and a little swollen the next day and has become increasingly larger. Today (3 days later) the injection site is red, warm, swollen, and about the size of a grapefruit.; Injection site was red and a little swollen the next day and has become increasingly larger. Today (3 days later) the injection site is red, warm, swollen, and about the size of a grapefruit.; This is a spontaneous report from a contactable other HCP. A 39-yearsold female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EL1284), intramuscular in left arm on 04Jan2021 14:00 at a single dose for COVID-19 immunization. Medical history included COVID-19 prior to vaccination. Concomitant medication included desvenlafaxine succinate (PRISTIQ), fluoxetine (FLUOXETINE), bupropion hydrochloride, naltrexone hydrochloride (CONTRAVE), hydrochlorothiazide (HYDROCHLOROTHIAZIDE), etonogestrel (NEXPLANON) , ergocalciferol (VITAMIN D [ERGOCALCIFEROL]), cyanocobalamin (VIT B12), and iron. On 05Jan2021, the patient experienced injection site was red and a little swollen and has become increasingly larger. 3 days later, on 08Jan2021, the injection site was red, warm, swollen, and about the size of a grapefruit. The outcome of the event was not recovered. Treatment included over the counter medications and ice. The patient was not tested for COVID-19 post vaccination.; Sender's Comments: Based on the information currently provided, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the reported injection site reactions. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"dizzy; felt like I was going to pass out; shaky; ringing in ears; This is a spontaneous report from a contactable nurse (patient herself). A 63-year-old non-pregnant female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: unknown), via intramuscular route of administration on the left arm on 30Dec2020 17:00 at a single dose for COVID-19 immunization at hospital facility. The patient had no relevant medical history and no known allergies. The patient's concomitant medications were not reported. The patient did not receive any other vaccines within 4 weeks, or any other medications within 2 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient reported ""almost immediately, dizzy, felt like I was going to pass out, shaky, and ringing in ears"" on 30Dec2020 17:00. Events were reported as non-serious but resulted in visit to the Emergency room/department or urgent care. Ondansetron (ZOFRAN) was given as treatment for nausea and meclizine. The outcome of the events was not recovered. Since the vaccination, the patient had not been tested for COVID-19. Information on the lot/batch number has been requested.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported ""dizzy, felt like I was going to pass out, shaky, and ringing in ears"" and the administration of COVID 19 vaccine, BNT162B2, based on the plausible temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate."

felt flushed; BP elevated 226/97; dull occipital headache/dull headache; This is a spontaneous report from a contactable other HCP (patient). A 64-year-old female patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EL1284; expiration date not provided) via an unspecified route of administration (vaccination location: left arm) on 06Jan2021 09:30 at SINGLE DOSE for COVID-19 immunisation. Medical history was reported as 'none'. It was also reported that patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine, and prior to vaccination, the patient was not diagnosed with COVID. The patient has no allergies to medications, food, or other products (no known allergies). The patient's concomitant medications were not reported. The patient previously took bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EH9899; expiration date not provided), via an unspecified route of administration (vaccination location: left arm) on 18Dec2020 18:00 at SINGLE DOSE for COVID-19 immunisation. It was reported that patient received second dose of Pfizer Covid vaccine on 06Jan2021 at 09:30 am. One hour after the 2nd dose (10:30 am), patient experienced dull occipital headache. Patient took paracetamol (TYLENOL). At 10:45 am, patient felt flushed. The nurse took patient's vital signs and noted no fever, normal heart rate and respiratory rate. BP elevated 226/97 (reported at 10:30, no unit provided; normal BP: 130's/80's). At 12:45, patient was taken to ED. CT scan and lab work were reported as all normal. BP continues to be elevated. Amlodipine (NORVASC) 10 mg was given at 17:00. BP slowly came down. Twenty-four hours later, BP was normal at 137/72 (no unit provided). No additional medication taken. It was reported that patient continues to have dull headache. No arm soreness or other symptoms. It was also reported that since the vaccination, the patient has not been tested for COVID-19. Outcome of the events 'BP elevated 226/97' and 'felt flushed' was recovering, outcome of the event 'dull occipital headache/dull headache' was not recovered.; Sender's Comments: Based on the compatible temporal association and in absence of strong confounding factors, the Company considers the reported event blood pressure increased is possibly related to vaccination with BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"rash/getting this rash on my face and everywhere/rash and it is breaking out her face and now it is all over; a lot of muscle pain; could not sleep; This is a spontaneous report from a contactable consumer (patient). A 27-year-old female patient received first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular in left deltoid on 24Dec2020 09:30 at single dose for preventative. Medical history included none. There were no concomitant medications. The patient previously took influenza vaccine (FLU) for immunization and experienced sick (Flu shot if it contains egg she gets really sick). Patient reported experiencing a rash 2 weeks on 06Jan2021 after getting her first dose of the vaccine. Caller stated ''I'm concerned because I'm getting this rash on my face and everywhere and I'm due for my booster on 13Jan2021.'" Caller questioned if others had reported this. She had a lot of muscle pain on 24Dec2020 and could not sleep from the pain in Dec2020. Reports the pain is gone now and lasted till 28Dec2020. She has a rash and it is breaking out her face and now it is all over. States nothing has changed and the vaccine was the only new thing. States the rash started two weeks since she got the vaccine. Vaccination facility type was Hospital. Vaccine administered at military facility was No.

Additional Vaccines Administered on Same Date of the Pfizer Suspect was none. AE not require a visit to emergency room. Therapeutic measures were taken as a result of rash/getting this rash on my face and everywhere/rash and it is breaking out her face and now it is all over (Doctor ordered steroids for her today she is a CNA). The outcome of the event a lot of muscle pain was recovered on 28Dec2020. The outcome of the event rash/getting this rash on my face and everywhere/rash and it is breaking out her face and now it is all over was not recovered. The outcome of the event could not sleep was unknown. Information about lot/batch has been requested."

"passed out; blood pressure was lowered; blood sugar high; weakened; feeling tired and her legs are heavy; feeling tired and her legs are heavy; This is a spontaneous report from a contactable consumer (Patient's Mother). A 23-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 04Jan2021 Monday at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient experienced passed out 12 hours post injection (Jan2021). She specified that her daughter was therefore brought to hospital by ambulance. She continued explaining that her blood pressure was lowered, her blood sugar high and that she was weakened (Jan2021). On 08Jan2021, ""day 4"", she said that her daughter had been feeling tired and her legs are heavy (Jan2021). The event outcome was unknown. She then asked if those side effects were experienced after the vaccine. It was not reported as serious. Information on the batch number has been requested."

left side will blur; Left side of face was sagging/ water leaking out of mouth/Progressive weakness on left side of face/ Swelling on lower left mandible/ diagnosed with Bell's Palsy.; Eye tearing; This is a spontaneous report from a contactable nurse who reported for himself. A 61-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Batch/lot number: EK5780) in left arm on 26Dec2020 at 08:30 at single dose for covid-19 immunisation (worked in surgical ICU and was over 61 years old). Medical history included Pre-diabetic. Family history included: mother died; mother's side had colon cancer and grandparents and uncles had cardiovascular diseases.Concomitant medication included exenatide (BYDUREON), amlodipine besilate (NORVASC), omeprazole (PROTONIX), hydrochlorothiazide, lisinopril and pneumococcal vaccine on 08Dec2020 and tetanus vaccine on 08Dec2020. It was reported that on 31Dec2020 at 07:30, the patient had eye tearing and water leaking out of mouth, left side of face was sagging, swelling on lower left mandible (eye tearing was first, as reported); on 31Dec2020 he also experienced progressive weakness on left side of face; on 02Jan2021 the patient was diagnosed with Bell's Palsy. Then on an unknown date, left side will blur occurred. All events required emergency room visit and physician office visit. Diagnosis of Bell's Palsy and event eye tearing were serious per disability; left side will blur was non serious. Patient described the events as follows: on 31Dec2020 he was brushing teeth and noticed the water was going everywhere. Left side of face was sagging, noticed some swelling and thought it was from a bug bite. He wasn't sure if it was a stroke or not. In the morning of 01Jan2021 noticed it was progressively causing a problem. Days before noticed tearing of left eye (as reported). On 31Dec2020 before midnight, something felt wrong. He saw four cases on clinical trial with similar side effects (he clarified he had no patient information for the four patients mentioned with similar side effects from Pfizer Clinical trial. He saw this information from a article; stated four from Pfizer and Moderna). In the morning of 02Jan202, he went to Emergency Room

(ER) and was diagnosed with Bells Palsy. He was given prednisone 20mg to take 3 times by mouth every day for 5 days, tetracycline 100mg, at 1 capsule by mouth twice a day for 10 days and methylprednisolone (SOLU MEDROL; Lot: 9945776;Exp: Nov2021) 4mg dose pack, started with 6 tablets first day. It was told by doctor it might cause tick problems. He was waiting for results. On 04Jan2021 went to family doctor and more blood work was taken. Because he was taking prednisone, noticed his sugar was up a little bit (date unspecified). It was prescribed Glitizide extended release, 2.5mg one tablet twice a day with breakfast. Patient was checking sugar every 6 hours. It was also prescribed Acyclovir 400mg one tablet orally five times per day for 10 days. 08Jan2021 is last day of prednisone 5 day dose and will follow up with methylprednisolone tablets. Patient had an appointment with a neurologist on 13Jan2021. Patient was still having symptoms. It was really hard for him. Not hard to swallow. Face was still drooping. Eyes were still tearing. Could not work with eyes tearing all of the time. Needed to be alert. When driving, had to focus on the right side because his left side will blur. He had to chew only on the right side because food will be left behind in between his cheeks and gums. If he drank through a straw, he had to cover the left side of his lips so he was able to suck out fluids. He thought symptoms were progressively getting worse, he didn't see much improvement. He clarified swelling was on lower part of mandible on left side. It was slightly bigger than right. When looking at face, the lines on his forehead on the left side were down. If he smiled he cannot raise his left eye brow, when before the COVID-19 vaccine he could. Noticed left side of nose was lower than the right. Cannot raise left side of lips. Outcome of the event Eyes tearing and Bell's Palsy was not recovered; outcome of the other event was unknown. Information on the batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of Bell's palsy, Lacrimation increased and vision blurred due to temporal relationship. However, the Bell's palsy may likely possibly represent concurrent medical condition in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including head CT/MRI and viral serologies, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Bell's Palsy; This is a spontaneous report from a contactable nurse. A 33-year-old male patient received his first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. The reporter reported a patient developed Bell's Palsy after receiving the first dose of the vaccine. This patient was a physician, the reporter stated that the patient was scheduled to receive the second dose on Monday (unspecified date) and questioned if he should or should not get the second dose. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on temporal association, the causal relationship between bnt162b2 and the event facial paralysis cannot be excluded. The information available in this report is limited and does not allow a medically meaningful

assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

hearing loss; ringing and pulsating in her ears; Chills; Headache; This is a spontaneous report from a contactable consumer (patient). A 36-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK9231), via an unspecified route of administration in in the left arm on 04Jan2021 at single dose for covid-19 immunization. Medical history included ongoing acid reflux. The patient had no concomitant medications. The patient previous received the flu shot. The patient experienced hearing loss, ringing and pulsating in her ears on 05Jan2021, headache on 04Jan2021, chills on 05Jan2021. Treatment was none. She had the vaccine on Monday at work and some of the symptoms that she has had have not resolved. She was having ringing in her ears and hearing loss. Went to see them and had her ears looked at. Everything was normal. Got the vaccine on 04Jan2021. Ringing in ears and hearing loss: Had been very consistent with no improvement. If anything, it had worsened. She was going to re-contact her doctor. She was also going to ask, should she go on Prednisone or something. She was worried she was going to lose her hearing. Her doctor said that a hearing test may need to be done. History: Takes one medication that she has been taking for years. She has never had an adverse event to any vaccine before. She got the flu shot every year. She was expecting the chills and headache, but they resolved fast. The next vaccine was 25Jan2021, the patient was asked whether she should get the second dose. The outcome of events for hearing loss, ringing and pulsating in her ears was not resolved, for headache and chills was resolved on 06Jan2021.

she was dying as her blood pressure dropped to 70/40 and to come for a last visit; This is a spontaneous report from a contactable consumer. A 100-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 02Jan2021 at single dose for COVID-19 immunization. Medical history included COVID in Dec2020, urinary tract infection (UTI), dehydration and Covid sickness (vomiting) (was treated earlier in month for UTI and dehydration from the Covid sickness (vomiting)). Known allergies: no. The patient's concomitant medications were not reported. After testing positive in mid December to COVID and being declared Covid free on 30Dec by the nursing staff and in good health, with normal vitals and oxygen levels, the patient was given a vaccination on 02Jan2021. In the early evening the patient's blood pressure dropped to 70/40 and the reporter was told to come for a last visit. The patient was sleeping comfortably. She did not wake up when spoke with her. No one expected her to make it through the night. The next morning she work up, ate breakfast, watched TV, got IVs and oxygen and her vitals improved significantly. Lab tests and procedures included blood pressure: 70/40 on 02Jan2021, oxygen levels: normal, COVID test: positive in Dec2020 (testing positive in mid December to COVID and being declare Covid free on 30Dec), vitals: normal; improved significantly. Facility where the most recent COVID-19 vaccine was administered: Nursing Home/Senior Living Facility. If the patient received any other vaccines within 4 weeks prior to the COVID vaccine: No. Prior to vaccination, was the patient diagnosed with COVID-19: Yes. Since the vaccination, has the patient been tested for COVID-19: No. AE resulted in: Life threatening illness

(immediate risk of death from the event). Serious: Yes. Seriousness criteria-Results in death: No. Seriousness criteria-Life threatening: Yes. Seriousness criteria-Caused/prolonged hospitalization: No. Seriousness criteria-Disabling/Incapacitating: No. Seriousness criteria-Congenital anomaly/birth defect: No. Information about lot/batch number has been requested.

dizzy; itchy throat; coughing; swollen throat; This is a spontaneous report from a contactable pharmacist. A 21-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL0142, NDC number: 59267-1000-1; Expiry Date: Mar2021), via an unspecified route of administration on 07Jan2021 11:20 at 0.3 mL, single at left arm for vaccination. Medical history included Cushing's disease (recovering), bipolar disorder from an unknown date and unknown if ongoing. Concomitant medication included lamotrigine (LAMICTAL) for bipolar disorder. On 07Jan2021, looked like after receiving the vaccine about 30 minutes later patient was standing and felt like dizzy. About 15 or 20 more minutes, or 45-50 minutes after received injection, she felt like itchy throat, then itchy throat triggered coughing, then she felt like swollen throat. For the treatment on scene patient was administered 50mg of diphenhydramine hydrochloride (BENADRYL) and when she complained of swollen throat was administered epinephrine (EPI-PEN) 0.3mg injection to right thigh. Then they called EMS who transported her to the hospital where she was admitted to the hospital. Outcome of events was unknown. This report was considered as serious per caused/prolonged hospitalization. Causality: Cannot jump to that conclusion.; Sender's Comments: Based on temporal association, the causal relationship between bnt162b2 and the events dizziness, throat irritation, cough and pharyngeal swelling cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

horrible body aches; Nausea; head fogginess; felt like a lump and couldn't move; not wanting to eat; This is a spontaneous report from a contactable nurse (patient). A 63-year-old female patient received BNT162B2 (Batch/lot number: E10140) first dose on 28Dec2020 11:15AM in the right arm at single dose since she is front line health care worker. Medical history included pain. Medical history included tramadol for pain. No Prior Vaccinations (within 4 weeks). Family Medical History Relevant to AE was none. She received the vaccine 28Dec2020 and it flattened her for two days. Her primary care provided has advised her not to take the next dose. Within 45 minutes she noticed nausea. She was eating lunch and she felt like everything was coming up and she forced herself not to vomit. The she noticed horrible body aches; head was foggy; she felt like a lump and couldn't move;. The body aches hurt in her arms, legs, hips, and back. Adds she was out of work for two days. She could feel it working as the symptoms would peak and then drop. She did go back to work but shouldn't have as she continued to feel nauseous and not wanting to eat. All of these symptoms have now resolved. Vaccination Facility Type was nursing home. No Vaccine Administered at Military Facility. Facility Name: Nursing Home. History of all previous immunization with the Pfizer vaccine considered as suspect was none. Additional Vaccines

Administered on Same Date of the Pfizer Suspect was none. Event not resulted in Physician office or ER. The outcome of the event nausea was recovered on 02Jan2021. The outcome of event not wanting to eat recovered on 03Jan2021. The outcome of other events was recovered on 01Jan2021. The seriousness criteria for event horrible body aches was reported as medical significant.; Sender's Comments: The patient had medical history included pain. A possible contribution role of the first dose of BNT162B2 to the horrible body aches cannot be excluded. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

patient passed away after receiving the Covid vaccine; This is a spontaneous report from a contactable nurse. An 81-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), intramuscular into the right arm on 07Jan2021 at 0.3 mL, single for covid-19 immunization. There was no medical history and no concomitant medications. On 08Jan2021, the patient passed away after receiving the COVID vaccine. The patient died on 08Jan2021. An autopsy was not performed. Investigations indicate that unspecified labs were done, but nothing two weeks prior; no further details were provided. The patient received the first dose the day prior. The reporting nurse discussed it with the medical director, and he thought that he potentially passed away from the COVID vaccine. The relatedness of the event to the suspect vaccine was reported as related by the reporting nurse per The Agency. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up .; Sender's Comments: Based on the limited information available, it is medically not possible to make meaningful causality assessment, it is unlikely the vaccine could have contributed to the death of the patient based on the known safety profile. However case will be reevaluated when additional information is received during the follow-up The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Stated that the patient passed away after receiving the Covid vaccine

Patient received her vaccination on 1/12/21 administered by pharmacy*+. She expired on 1/12/21 an approximately 7:30pm. Resident did not have any adverse reactions and was a hospice patient.

"Patient was found ""acting abnormal"" on 1/9/2021 at 1215. VS HR 20-30's. EMS activated. EMS arrived and patient was found pulseless in PEA/ asystole, CPR and ACLS initiated and then transported to the MC. Unsuccessful resuscitation and expired on 1/09/2021 at 1348. Clinical impression Cardiopulmonary arrest."

"5 days after administration- heavy uterine bleeding; constipation; severe knee/shoulder joint pain; light sensitivity; dizziness/ light headedness; thigh numbness; pain when prodded on either sides of thighs; harsh headache; This is a spontaneous report from a contactable Other healthcare professional

(patient). A 21-year-old female patient received BNT162B2 first dose on 31Dec2020 03:15 PM intramuscularly on left arm at single dose for COVID-19 immunization. Medical history included Depression, Anxiety, Factor V Leiden, Known allergies to Penicillin and Onion sensitivity. Patient is not pregnant. No other vaccine in four weeks. Concomitant medications in two weeks included unspecified medications. ""5 days after administration"" (also reported as 01Jan2021)- heavy uterine bleeding (resulting with trip to ER), constipation, severe knee/ shoulder joint pain, light sensitivity, dizziness/ light headedness, thigh numbness, pain when prodded on either sides of thighs, harsh headache. No treatment received for the events. Events resulted in ER and physician office visit. No covid prior vaccination. No covid tested post vaccination. The outcome of the events was not recovered. The seriousness was reported as no. Information on the lot/batch number has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported uterine bleeding cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

thrombopenia; pulmonary embolism; neutropenia fever; This is a spontaneous report from a Pfizer-sponsored program . A contactable consumer reported for a patient that received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced thrombopenia, pulmonary embolism and neutropenia fever on an unspecified date. The clinical outcome of thrombopenia, pulmonary embolism and neutropenia fever was fatal. The patient died on an unspecified date. It was unknown if an autopsy was performed. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.; Reported Cause(s) of Death: thrombopenia; pulmonary embolism; neutropenia fever

"Began to start having bulbar reaction with clearing of throat and tightness of chest; Began to start having bulbar reaction with clearing of throat and tightness of chest; Numb bottom lip progressed to both lips with swelling, then tip of tongue and progressed to tongue with numbing /swelling sensation; Numb bottom lip progressed to both lips with swelling, then tip of tongue and progressed to tongue with numbing /swelling sensation; Numb bottom lip progressed to both lips with swelling, then tip of tongue and progressed to tongue with numbing /swelling sensation; This is a spontaneous report from a contactable Other-HCP (patient herself). This 48-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EL0142), via an unknown route, on 07Jan2021 at 14:15 at single dose for COVID-19 immunisation. Vaccine location was left arm. The patient was vaccinated at hospital, age at vaccination was 48-year-old. The patient was not pregnant. No other vaccine was received in four weeks.Relevant medical history included COVID 19 complications (prior to vaccination). The patient has allergy to contrast dye, sulfa and molds. Relevant concomitant medications included nebivolol hydrochloride (BYSTOLIC), topiramate (TOPAMAX), atorvastatin (LIPITOR), ascorbic acid, betacarotene, biotin, calcium, chromium, copper, folic acid, iodine, iron, lycopene, magnesium, manganese, nicotinamide, pantothenic acid, phytomenadione, pyridoxine hydrochloride, retinol,

riboflavin, selenium, vitamin b1 nos, vitamin b12 nos, vitamin d nos, vitamin e nos, xantofyl, zinc (CENTRUM WOMEN), and acetylsalicylic acid (ASA). After vaccination, within 5 min she started with numb bottom lip progressed to both lips with swelling, then tip of tongue and progressed to tongue with numbing /swelling sensation. Began to start having bulbar reaction with clearing of throat and tightness of chest. She was given diphenhydramine hydrochloride (BENADRYL) total 50 mg, famotidine (PEPCID) 20 mg, dexamethasone (DECADRON) 4 mg and racemic epinephrine. The events required visit at emergency room/department and urgent care. However, the events were reported as non-serious by the reporter. Post-vaccination COVID test was not performed. The patient had not recovered from the events.; Sender's Comments: The reported ""numb bottom lip progressed to both lips with swelling, then tip of tongue and progressed to tongue with numbing /swelling sensation"", ""bulbar reaction with clearing of throat and tightness of chest"" developed within 5 min administration of BNT162B2, is likely an allergic reaction to BNT162B2, and considered related. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate."

My b/p shot up as well 180/107; My heart started racing....noted at 133/I had strong heart palpitations; Feeling of lightheadedness; This is a spontaneous report from a contactable nurse reporting for herself. A 50-years-old female patient received the first dose of BNT162B2 Pfizer-BioNTech COVID-19 Vaccine, via an unspecified route of administration in the right arm on 29Dec2020 at 12:15 pm, at 50-years of age, at single dose for COVID-19 immunization. The patient received the vaccine in Hospital and didn't receive any other vaccine in the previous four weeks. Medical history included hypertension from an unknown date (controlled) and no known allergy. Concomitant medication included amlodipine besilate 10 mg (NORVASC). The patient reported that, on 29Dec2020, within 6 minutes after receiving the vaccine dose, her heart started racing, it was noted at 133, her blood pressure shot up as well to 180/107, she had strong heart palpitations with feeling of lightheadedness. Prior to the vaccine the patient was at work, feeling well and taking care of her patients. Emergency Room visit and Physician Office visit were required, moreover fluids and potassium were administered to the patient as a result of the events. She reported she spent 8 hours in the ER. The events were reported as non-serious but they were assessed as important medical events by the Company. At the time of the report the reported events were resolving. Information about Lot/Batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Hypertensive crisis, Palpitations, and Lightheadedness cannot be excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"Heart attack; This is a spontaneous report from a contactable consumer. An 82-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: and Expiration Date: Unknown), via an unspecified route of administration in the left arm on 05Jan2021 at 13:00 at a single dose for COVID-19 immunization; administered in doctor's office/urgent care. The patient's medical history and concomitant medications were not reported. It was unknown if the patient received any other vaccines within four weeks prior to the COVID vaccine. Prior to the vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. On 05Jan2021, the patient experienced heart attack; which resulted in death and was assessed as medically significant. The patient also experienced the associated symptoms of cold sweats, chest pain, shortness of breath. Therapeutic measures were taken as a result of heart attack, which included ""life saving measures"" by the paramedics performed upon arrival with no success. The clinical outcome of the event, heart attack, was fatal. The patient died on 05Jan2021 due to heart attack; as ruled by the paramedics. It was unknown if an autopsy was performed. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 MRNA VACCINE, were not provided and will be requested during follow up.; Reported Cause(s) of Death: Heart attack"

"Cardiac Arrest; Patient was found pulseless and breathless 20 minutes following the vaccine administration.; Patient was found pulseless and breathless 20 minutes following the vaccine administration.; This is a spontaneous report from a contactable other healthcare professional (HCP). A 66-year-old female patient (pregnant at the time of vaccination: no) received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL1284) via intramuscular at left arm on 11Jan2021 12:15 PM at single dose for COVID-19 immunization. Medical history included diastolic CHF, spinal stenosis, morbid obesity, epilepsy, pulmonary hypertension and COVID-19 (Prior to vaccination, the patient was diagnosed with COVID-19). The patient received medication within 2 weeks of vaccination included amiodarone, melatonin, venlafaxine hydrochloride (EFFEXOR), ibuprofen, aripiprazole (ABILIFY), lisinopril, cranberry capsules, diltiazem, paracetamol (TYLENOL), famotidine, furosemide (LASIX [FUROSEMIDE]), ipratropium bromide, salbutamol sulfate (IPRATROPIUM/ALBUTEROL), buspirone, senna alexandrina leaf (SENNA [SENNA ALEXANDRINA LEAF]), polyethylene glycol 3350 and morphine. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Patient used took Penicillin, propranolol, quetiapine, topiramate, Lamictal and had allergy to them. Patient used took the first dose of BNT162B2 (lot number: EJ1685) via intramuscular at right arm on 21Dec2020 12:00 PM at single dose for COVID-19 immunization. Since the vaccination, the patient been tested for COVID-19 (Sars-cov-2 PCR) via nasal swab on 06Jan2021, covid test result was negative. Patient was found pulseless and breathless 20 minutes following the vaccine administration (11Jan2021 12:30 AM). MD found no signs of anaphylaxis. Patient died on 11Jan2021 12:30 AM because of cardiac arrest. No treatment received for the events. Outcome of pulseless and breathless was unknown. the autopsy was performed, and autopsy remarks was unknown. Autopsy-determined cause of death was unknown. It was reported as non-serious, not results in death, Life threatening, caused/prolonged hospitalization, disabling/Incapacitating nor congenital anomaly/birth defect.; Sender's Comments: Based on the available information this patient had multiple underlying medical conditions including morbid obesity, diastolic CHF, epilepsy, pulmonary hypertension and COVID-19 diagnosed prior to vaccination. All these conditions more likely contributed to patients cardiac

arrest resulting in death. However, based on a close temporal association (""Patient was found pulseless and breathless 20 minutes following the second dose of BNT162B2 vaccine administration, contributory role of BNT162B2 vaccine to the onset of reported events cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Cardiac arrest; Autopsy-determined Cause(s) of Death: autopsy remarks was unknown. Autopsy-determined cause of death was unknown"

Patient admitted for a fib; This is a spontaneous report from a contactable consumer. A female patient in her 70s received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection) lot number was unknown, via an unspecified route of administration on 05Jan2021 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that the patient received vaccine on Tuesday, 05Jan2021. On Thursday, 07Jan2021, patient did not feel good-pulse and blood pressure. It was mentioned that the patient admitted for a fib. Two days after receiving Pfizer-BioNTech Covid 19 vaccine, the woman patient in her 70s was admitted for a fib. Information about lot/batch number has been requested.

Vaccine administered at 08:16--08:25 patient c/o feeling unwell and dizzy 87, 143/84, 18, 100%; 08:28: Pt c/o dizzy & chest tightness, appeared pale, monitoring; 08:34: Pt c/o increased chest tightness 130, 144/81, 22, 100% monitoring 08:36: Epinephrine .3mg given IM to R thigh, pt. reported flushing, pounding heart, 911 called; 08:40: Pt flushed.

5 days after Moderna vaccine, developed severe abd pain, mid epigastrium. No Nausea or vomiting. No fever. Mild diarrhea. after 48 hrs with no improvement went to ED

At first I has some injection site pain and soreness nothing too bad. But around 01:30 I awoke with a really high fever. My fever was 102.8 when I first woke up. I was very nauseous and my fever felt worse. My thermometer would not read any more until my temp came down. I can only guess how high it got but at least 103 degrees. I took Advil Liquid Gells and then my fever broke. I was actually scare for my life. In March I actually caught coronavirus and developed anti bodies for Covid. I can only guess my body was fighting for it's life.

positive COVID-19 test with symptoms; positive COVID-19 test with symptoms; After the shot i have headache, sorethroat, cough and cold till this date; After the shot i have headache, sorethroat, cough and cold till this date; After the shot i have headache, sorethroat, cough and cold till this date; After the shot i have headache, sorethroat, cough and cold till this date; A 48-years-old non-pregnant female patient, receivedBNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration, in left arm, on 18Dec2020 (at the age of 41 years-old) as a single dose for COVID-19 immunization. The vaccination was administered at a pharmacy/drug store. Medical history was not reported. Concomitant medication included sertraline hydrochloride (SERTRALINE HYDROCHLORIDE). The patient had not received any other vaccines within four weeks prior to the vaccination nor received

any other medications withing 2 weeks prior. It was reported that the patient had been tested for COVID-19 prior to vaccination and was negative. On 18Dec2020, the patient experienced itchy sore eyes one hour after vaccination, sore and itchy arm for 5 days, headache, swollen sore throat, tiredness all 5 days after. The patient was not hospitalized nor received treatment for the events. The clinical outcome of the events of Itchy, sore eyes 1 hour after, sore and itchy arm for 5 days, headache, swollen sore throat, tiredness all 5 days after, was not recovered., the outcome of the COVID-19 positive was unknown. It was reported that the patient tested positive for COVID-19 via nasal swab, post vaccination on 31Dec2020. No follow-up attempts possible. No further information expected. Lot/batch number was not provided and unable to obtain

tested positive for Covid; tested positive for Covid; This is a spontaneous report from a contactable consumer. A 7-decade-old female patient (in her 60s) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 23Dec2020 at a single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. A pharmacy student received this drug information question in which a female patient in her 60s received the first Covid vaccine on 23Dec2020 and tested positive for Covid on 04Jan2021. Could the patient receive antibody treatment? Could she get the second vaccine and when? The outcome of the events was unknown. Information about Lot/Batch number has been requested.

Caller is a respiratory therapist who reports that he tested positive for covid after receiving the first dose of the vaccine on 17Dec; Caller is a respiratory therapist who reports that he tested positive for covid after receiving the first dose of the vaccine on 17Dec; This is a spontaneous report from a contactable consumer (patient) reported that a 32-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899), via an unspecified route of administration from on 17Dec2020 at single dose (once by injection in the right arm/bicep) for COVID-19 immunization (Healthcare worker). There were no medical history and concomitant medications reported. The patient/caller is a respiratory therapist who reported that he tested positive for covid after receiving the first dose of the vaccine on 17Dec2020. He called to ask if he can get the second dose. He also wanted to ask if people experienced side effects or what side effects people experience after the second dose. He tested positive for Covid-19 on 21Dec2020, after receiving the first dose of the vaccine. He said it had been 14 days since he tested positive for COVID and he is if he can get the second dose. He says he is actually on his way to get the second dose right now, and thought he should call. The outcome of the event was unknown.

hypertension like 190/90; I had tachycardia to 165; Flushing; This is a spontaneous report from a contactable consumer (patient). A 22-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) lot number: EK9231, intramuscular on 06Jan2021 at single dose for COVID-19 immunization. Medical history included migraine. Concomitant medication included cyproheptadine for migraine, unspecified multivitamins; and diphenhydramine (BENADRYL) and famotidine as pre-medications. The patient previously received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 17Dec2020 for COVID-19 immunization, and experienced dizziness, palpitations, tingling in face and legs, myalgia, nausea, headache, fatigue. It was reported that patient got the second dose and had tachycardia to 165 and hypertension like 190/90 and had some flushing

(event onset: 06Jan2021). Patient was no longer tachycardiac or hypertensive; lasted for about 30-40 minutes. Outcome of the events tachycardia and hypertension was recovered on 06Jan2021. Outcome of the event flushing was unknown.

Actual event and cause of death were unknown; This is a spontaneous report from a non-contactable consumer. A 90-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 06Jan2021 at single dose for COVID Prevention. The relevant medical history included aortic valve replacement from Nov2019. Concomitant medications were not reported. The consumer stated that she was taking the reporting responsibilities to report that a friend of hers, informed that the patient passed away on Friday, and had received the COVID vaccine on Wednesday. The consumer stated that it was unknown to her at this time, if the friend had called to complete a report herself, regarding the incident. Their conversation was very brief. The patient was 90 years old, and it was her friend's mother that was the patient. Actual event and cause of death were unknown. The patient had her vaccine on Wednesday 06Jan2021, and then the patient collapsed in front of the reporter at Friday night on 08Jan2021 and passed away that same day. The autopsy was unknown. The outcome of the event was fatal. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Reported Cause(s) of Death: Actual event and cause of death were unknown

episodes of severe dyspnea and lightheadedness over the past couple of weeks; episodes of severe dyspnea and lightheadedness over the past couple of weeks; ventricular tachycardia with a rate of 270; severe right ventricular dilatation and dysfunction with inflammation and fibrosis throughout the RV and septum, but minimal LV involvement.; severe right ventricular dilatation and dysfunction with inflammation and fibrosis throughout the RV and septum, but minimal LV involvement.; severe right ventricular dilatation and dysfunction with inflammation and fibrosis throughout the RV and septum, but minimal LV involvement.; This is a spontaneous report from a contactable physician (patient). A 4-decade-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via unspecified route of administration on 18Dec2020 at single dose for COVID-19 immunization. Patient medical history and concomitant medications were not reported. Patient reported that on 18Dec2020, she received the first dose of Pfizer / BioNTech vaccine. On 30Dec2020 (Wednesday), she was diagnosed of ventricular tachycardia with a rate of 270, severe right ventricular dilatation and dysfunction with inflammation and fibrosis throughout the RV and septum, but minimal LV involvement. On 30Dec2020, EKG showing RBBB with PR 234 (in presence of normal EKG and ECHO from Dec2016), and positive troponin 0.07 that has remained stable in the following week. On unspecified date in Jan2021, the patient had been having episodes of severe dyspnea and lightheadedness over the past couple of weeks, but it had been sporadic - it became significantly worse in the last 2 weeks, which is why patient sought out an electrophysiologist (and purchased at-home EKG monitor on which she saw the VT). Patient do not know the cause at all. She was tested for SARS-CoV-2 antibody yesterday (unspecified date in Jan2021), which was negative. Patient was also trying to determine if she should get the second dose or not. She will have cardiac PET scan next week, which hopefully further elucidate causes. Outcome of the events dyspnea and lightheadedness was not recovered; while outcome of other events was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: Based on the available

information, a causal relationship between reported events and BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

My right leg from the knee down was purple and they thought I have a blood clot; My right leg from the knee down was purple and they thought I have a blood clot; This is a spontaneous report from a non-contactable consumer (patient). A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. Three days after vaccination the patient felt very sick and he/she was so bad that he/she thought he/she might die with outcome of recovered after one week. The patient reported also that on unknown date his/her right leg from the knee down was purple and they thought he/she have a blood clot, due to which the patient was hospitalized for 14 days. The patient ended in the hospital because his/her right leg from the knee down was purple and they thought he/she have a blood clot but they did an ultrasound that was not the case but they put he/she on antibiotic. The patient was still taking them but his/her leg has got better. No follow-up attempts are possible. Information about lot/batch number cannot be obtained. No further information is expected.

Covid symptoms began 2-3 days after shot. Presented to ER day 11 day after positive with extreme dyspnea O2 Sat at 88% Chest xray opacities throughout the bilateral hemithoracies would suggest multifocal infiltrate Admitted on high flow oxygen reduced to 6 liters currently D-dimer is >35.20

Patient is a 99yr old female who got a covid vaccine in the afternoon of 1/10/21 and woke up in the morning of 1/11/21 with altered mental status, weakness, and dysarthria. She was taken from her assisted living facility to the hospital and MRI showed a small stroke in the right medial thalamus. She was also found to have new onset atrial fibrillation. She was treated appropriately for both conditions and discharged to a skilled nursing facility on 1/13/21.

Pt was accompanied by daughter, who drove pt to clinic. Pt was correctly identified, screened, given vaccine, monitored for appropriate time. Pt left clinic as passenger of vehicle and was being driven by daughter. Pt started complainingg of Shortness of breath and not feeling right.. Daughter brought pt to local emergency room, Pt was later transferred to higher care hospital. Information regarding symptoms and further medical care was relayed to clinic by family member.

Patient received vaccine in afternoon of 12/28. She works in ER as housekeeper 7pm-7am. The day she received the vaccine she became ill with fever chills and nausea and left work at 2am. On 12/31 she developed hemianopia. She went to ER and they did CT scan. She was told it was complex migraine. She left and came Home. On 1/1/21 her vision was back to normal. On 1/3 she suffered bilateral cerebellum ischemic stroke. She is currently in medical center. In Trauma.

Patient experienced a syncopal episode post vaccination, accompanied by feeling hot and tachycardic. Prior to the syncope, she reported hyperventilating. She remained unresponsive for about 10 minutes and was brought to the ED. There she became responsive, and reported chest pain and had sinus tachycardia episodes. She also had lower extremity weakness. This has improved per the latest neurology notes. She also had a negative EEG. Unsure if this is an allergic reaction or if the syncope was due to hyperventilation. Patient is currently on day 3 of hospitalization.

Systemic: Headache, Systemic: Eyes dilated and difficulty remembering information; symptoms lasted 2 days

I was short of breath and went to emergency room on 1/5/2021. I was diagnosed with bilateral pulmonary embolisms. I was Covid negative and had no other symptoms.

2 Hours after the injection, my arm hurt so bad I could not raise it laterally. This continued for 3 days. After that I felt tired and achy until Jan 4th, I had chills and whole body aches. I came home from work, took the next day off. Feeling better, I worked 3 more days and developed the worst headache of my life. I consulted my PCP and went to the emergency room. I was diagnosed with viral meningitis and admitted to the hospital for 3 days. .

Staff walked into resident's room around 10:00am and noted resident's left side of his face was flaccid. Nurse was called and upon assessment resident noted to have an unequal hand grasp with left worse. He was able to talk but was mumbled and hard to understand. Physician, hospice, and family were notified. Resident had a stroke at 10:06 am on 1/8/2020. He lost all ability to use his left side. Resident passed away on 1/11/2020.

Patient received COVID-19 Vaccine at 0956 and reported symptoms of itchy face and chest pressure at approximately 1008 during observation period. Pt vital signs were 133/86, HR 130 and oxygen saturation 100% on room air. Pt reported worsening symptoms of chest pressure and itchiness to face. Provider instructed Epi Pen be given and pt to be transported to ED for further evaluation. EKG obtained and showed sinus tachycardia. Nonrebreather oxygen mask applied with 2L/min and oxygen saturation remained at 100%. Pt was transported via ambulance to at 1038 and pt reported feeling improved symptoms prior to leaving the clinic at approximately 1034. Pt stable at time of transfer.

Employee was awaken at 5:30 am on 1/13/2021 by chills and a feverish feeling. She then became nauseous and faint. She passed out and was noted by her mother who is a RN to have a seizure. She remained out for several minutes and then aroused. She has remained groggy the rest of today but has improved. She has a history of non-epileptic seizures since she was 14 and has been on medications for this. Employee stated she has not has any seizure activity in over a year. She did not see medical attention due to recovering quickly from this.

The patient passed away today, 1/13/2021. She was a hospice patient. She showed no adverse effects after receiving the vaccine on 1/12/2021. This morning she woke up as normal and during her morning shower she had a bowel movement, went limp and was non-responsive. The patient passed away at 7:45 am.

The morning following COVID-19 vaccination, patient's right shoulder had swelling, generalized weakness and myalgia. Hospitalized for 2 days, received intravenous fluids and bedrest, and acetaminophen. He was prostrate for 2 days.

numbness to forearm then to lower leg that then took on a dermatomal pattern, brain fog w word finding issues that progressively worsened, LLE weakness. ct brain neg. MRI/MRA head and neck neg. labs neg. MRI of c spine t spine l spine s spine neg. emg and eeg neg. discharged from hospital. symptoms fluctuating. slowly improving.

Presented to MD'S office on 01/05/2021 with cough, HA, fever 101.9, chills, and fatigue. Returned on 01/07/2021 with no improvement. Returned on 01/11/2021 with fatigue, elevated temp 101.2, SOB, 02 Sat at 90%, Rocephin 1G IM administered, CXR revealed pneumonia. MD received call from patients husband stating worsening 02 Sat levels at 81-82%. Was transferred to hospital and admitted with pneumonia..

This person was found to be deceased on routine rounds during the night, 3am. No symptoms of reaction noted post vaccine. No injection site reaction. No reports of any allergic reaction.

Resident began having fever on 1/11/21 @0600. VS= T-102 B/P- 100/57 P- 112 RR- 24 O2 Sat 92% on RA. MD called. Rapid COVID Test was negative. CBC,CMP, U/A were ordered as well as CXR. Resident's condition declined. At 3:00pm resident started having respiratory distress and hypoxia O2 Sat 89%. Supplemental O2/mask @ 5LPM. Neb TX, EKG, and Rocephin 1 GM ordered. Condition worsened. Resident sent to nearest ER for evaluation. Later in the evening the staff AT Medical Center called to inform staff that resident had expired @ 2230 as a result of Respiratory Failure and Sepsis.

about 14 hours after vaccination I experienced what appeared to be a severe case of Cytokine storm. I had a moderate case of COVID in May 2020 and had positive IgG AB in August. The symptoms started with heavy shaking chills, lasting 1 1/2 hours , fever and most concerning sustained tachycardia with heart rate of 180' to 200' over hours, which then destabilized into runs of Vtach and complex ventricular dysrythmia, low BP, profound weaklness, head aches and joint and muscle pains (similar to the experienced COVID symptoms)

"Patient received vaccine at 0939. 30 minute wait period related to history of previous anaphylactic reaction. 10:05 patient walked from observation area to vaccinator and reported that her ""chest was burning"" and ""feels like it is getting tighter to breathe. Pt had change in voice. Patient moved to chair and started on oxygen 1.5 L/m per nasal cannula. MD came to room to assess patient. ED arrived and checked patient B/P. Patient transferred by cart to ED."

Patient began having cramping of her upper extremities and subsequent swelling of her face and neck and also shortness of breath, chest pressure and flushed appearance. She denies any tongue or throat swelling. She is also complaining of bilateral arm pain. The initial reaction treatment was started in the conference room and then the patient was transferred to the emergency room. She continued to has arm and chest pain in the emergency room. She had muscle tension/rigidity in the upper extremity which caused significant pain. She also developed a nonspecific rash on the chest and abdomen that

persisted for through out he hospital stay. Treatment was started with epinephrine 0.5 mg IM x2 and diphenhydramine 50 mg IM x1, prior to transfer to emergency room. In the emergency room treatment was dexamethasone 10mg IV x 1, famotidine 20mg IV x1, Ketorolac 30mg IV x 1, lorazepam, 1mg IV x 2, morphine 4mg IV x 2, 1000ml Saline Solution. As an inpatient the treatment included scheduled acetaminophen 500mg TID, as need morphine for pain after treatment with fentanyl, scheduled diphenhydramine 25mg IV q8 and compazine 5mg IV for nausea, cyclobenzapine 10mg as need for muscle spasms, dexamethasone as a scheduled dose started at 4 mg BID and tapered to 2 mg BID, Naproxen 500mg BID and Norco 7.5/325 as need for pain. with famotidine 20mg BID .

Note: I am currently breastfeeding. Had body aches; chills; fever of 102.6; headache; nausea; cough; shortness of breath - I went to ER and that is where I received COVID positive test and positive tests for COVID Pneumonia and Microplasm Pneumonia as well. Stayed overnight in ER observation - 2 am to 8 am . Went home next morning and was quarantined approximately 8 days. Body aches and a cough had started two days prior to injection. IV antibiotics at the hospital and oral antibiotics at home. Received nebulizer breathing treatments. Pain meds and anti-inflammatory medication.

Onset of tachycardia was 8:30pm on 1/12/21 with a noted HR of 164 and SR. Went to ER and had HR of 171 upon arriving to triage window. EKG said Sinus Tachycardia. Admitted to observation station with telemetry to monitor HR. HR normalized around 100 when up and walking at 10:45am on 1/13/21.

I received my covid vaccine on 12/29/2020 at 4:42pm. In 10 minutes after the shot, I went into anaphylactic shock, I broke out in hives, and my throat was closing

Pt reported chest tightness and throat tightness following vaccination. Time course following vaccination unknown.

little bit of a reaction light headed after 5 minutes. vitals were low, so observed for 30 minutes after being light headed. Patient was found unresponsive and pronounced dead later that day.

Death occurred 3 days after vaccine receipt; attributed to complications of her chronic advanced dementia with aspiration at age 87. No evidence of acute vaccine reaction.

No adverse effects from vaccination seen on 1/2/21. On 1/6/21 resident was seen by Dr and her baclofen pump was refilled with 20 ml Baclofen 4,000mcg/ml. ITB Rate increased by 6% to 455.5 mcg/day simple continuous rate over 3 days. On 1/8/21 at 0615 resident was shaking, lower extremities mottled, Sa02 70%, pulse 45. Oxygen started at 2 L/m per NC. At 0715 her primary physician was notified as well as her daughter. Oxygen increased to 4 L/min, sats at 83%. SOA noted, reported all over pain. At 0850 when they attempted to reposition the resident, she was not responsive. Licensed nurse assessed her and no heartbeat heard or pulse found.

I had a mild headache the evening of the shot, I had a headache the next two days that was relieved by Advil. I had a very sore arm at the injection site Friday and Saturday after the shot was given. The arm pain was gone Sunday morning. I was very tired on Saturday especially and slept through the morning and early afternoon on and off until about 3:00 pm. On Friday during the day, I noticed my right ear

starting to feel unusual and uncomfortable. On Saturday, the ear issue continued, I felt like I had some hearing loss and a constant buzzing and ear fullness feeling. On Sunday, the ear issued continued with the hearing loss, buzzing and fullness and has through today and hasn't stopped. I tried some nasal decongestant on Sunday afternoon, but it didn't have any effect. I made an appointment with the ENT doctor on Monday morning for Tuesday. I had a hearing test on Tuesday and saw the ENT doctor on Wednesday. He prescribed prednisone and ordered an MRI. I will be starting the prednisone later today (Wednesday) when the pharmacy has the prescription ready.

54 y/o M with PMH of HTN, HLD, Alcoholic Cirrhosis, Aortic Valve Stenosis, and angina BIBA as a Medical Alert for cardiac arrest noted PTA. Per EMS, the patient called because he was having constant, diffuse abdominal pain x 1 day that radiated to his chest. On scene, the patient had a witnessed arrest with EMS starting CPR. He was given 3 rounds of epi without ROSC. Pt had no associated shockable rhythm. Of note, pt's wife, had noted pt had received covid vaccine the prior day.

A few minutes after the vaccine, she had mild tongue swelling. It only lasted a few minutes, and then she felt fine. However, her BP went up. I'm not sure how high. she then has a short run of asymptomatic V tach. Taken to hospital observed overnight. No further events or problems.

She got the vaccine on Dec 23, and then on Jan 4 she had a mild stroke with left sided arm and face weakness. She did recover fully. She already has known CAD and risk factors for CVD. It is possible, but by no means certain, that the vaccine was an indirect cause of the event. Since the vaccine provoked an immune response, as it was supposed to, it is possible that this inflammation may have set up a metabolic predisposition that may have contributed to the event, which was 12 days later.

New onset altered mental status after fall. Per son, she was found in bed, unresponsive at around 12:15 AM on 1/10 by her husband. Brought to the emergency room and admitted, Began treatment for UTI w/ CTX. Discharged 1/11/21 with f/u appointments

Resident received 1st dose on 1/4/2021. On 1/6/2021 resident having SOB, increased weakness with O2 sats at 91% RA. On 8th resident sustained a fall, O2 sats 88-92, dizzy, weakness. Rapid COVID test performed with negative results. Evening of 8th resident was lethargic and diaphoretic with fever of 99.9. Resident transferred to ER, on 5lt of oxygen. Resident returned from the ER on 1/9/2021 with new diagnosis of Leukemia and orders for hospice. Continued with fever, crackles and N/V and loss of appetite from the 9th and 10th of January. Resident expired at 820am on 1/11/2021.

I had a headache at the top of my head, and a tingling sensation down my left leg from my buttocks to my calf. The tingling lasted until the next morning then went away. On 1/3/2021 I experienced a strong headache followed by facial numbness and tingling. This lasted for an hour or so and slowly subsided. The headache lingered for 3 days.

Headache; migraine; tenderness at injection site; Ten hours after injection he had shaking, sweats, hot and cold flashes, and augmentation of myalgias; Ten hours after injection he had shaking, sweats, hot and cold flashes, and augmentation of myalgias; Ten hours after injection he had shaking, sweats, hot and cold flashes, and augmentation of myalgias; Ten hours after injection he had shaking, sweats, hot

and cold flashes, and augmentation of myalgias; Ten hours after injection he had shaking, sweats, hot and cold flashes, and augmentation of myalgias; Fatigue; This is a spontaneous report from a contactable physician (patient). A 53-year-old male patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK9231), via an unspecified route of administration on right deltoid on 05Jan2021 07:45 at single dose for covid-19 immunization. Family history included migraine (other family members). Medical history included mild blood pressure and kidney stones, reactive airway disease. Concomitant medication included colecalciferol (VITAMIN D), potassium, allopurinol and hydrochlorothiazide/valsartan for mild blood pressure and kidney stones, fluticasone propionate, salmeterol xinafoate (ADVAIR) for reactive airway disease, atorvastatin, and multivitamins. The patient previously took fluticasone propionate, salmeterol xinafoate (ADVAIR) and experienced dry mouth and lost sense of taste. The patient also previously took Tdap booster on Aug2020, Shingrix on 10Aug2020, and influenza on 12Oct2020; all for immunization; and tetanus injections for immunization and experienced localized tenderness. The patient had the first dose of BNT162B2 (lot number: EH9899) for COVID-19 immunization on 15Dec2020 and experienced localized tenderness at injection point. The received his second dose of COVID vaccine on 05Jan2021. With the first dose he had increased localized tenderness at injection site on 15Dec2020, and he rated it mild to moderate. He would say it was 80% resolved in 24 hours. It had completely resolved in 36 hours. He would say that he has recovered completely form the localized tenderness with the first dose. Then he noted his second dose was yesterday, in the context of not having much sleep the night before. The actual injection was uncommonly eerily painless. The other folks in his department had similar experience. Maybe it was the nurse who gave the injection. Maybe it was because it was the same area and sensitivity was decreased. They had to check the Band-Aid to make sure blood was there. The administration was painless. He was relieved when the arm started getting sore to know he actually received it. He had increased arm tenderness at injection site which he rated as moderate which has now resolved. It got to moderate where lifting the arm up was sore. He definitely knew that he had been vaccinated. He got the vaccine at 7:45AM and now it is 16 to 17 hours later and he would say the pain is mild now. It did persist. The first vaccine hurt a little more. He expects this to go away. Ten hours after injection he had shaking, sweats, hot and cold flashes, and augmentation of myalgias. He had unrelenting headache over night that was moderate to severe. He said it kept him awake. It was exacerbated by lying down. Sitting up helped him. It became a migraine which is something he doesn't often experience. Migraines are pretty rare for him. He took 800mg of Advil at 6AM that helped for headache and migraine. The weight of the patient was 250 to 255 pounds. Shaking, sweats, hot and cold flashes, and augmentation of myalgias have resolved. Everything has resolved except for a little headache. In the background he literally had one or two hours of sleep. He thinks that likely precipitated a migraine was increased. Last night he slept literally an hour. He took 800mg of Advil and fell asleep. He is operating on 2 hours of sleep in 48 hours. Most of the stuff is gone except a little headache and expected fatigue. Headache Seriousness Criteria: he would say that it was relatively disabling. He would not have been able to carry on. He wouldn't have been able to operate last night. It would have interfered. It was dissimilar to others. He gets rare migraines. Everything was amplified with a migraine. He certainly felt that. It was fair to say the vaccine precipitated the migraine that was mild or severe. He doesn't want to falsely attribute these things to the vaccine. Causality Headache: precipitated by the vaccine. In the context that he had not slept the night before. He had a nasopharyngeal COVID test and it was negative. He has been in a COVID study

where they are looking at combination. They developed a saliva test at (Name). There is a combination of saliva oropharyngeal and immunoglobins. He has been negative multiple times. The outcome of the events headache and fatigue was not recovered and recovered for the rest of the events.; Sender's Comments: A causal association between BNT162B2 and the reported event headache cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

A PCR test was done and received results Monday (4th) as positive; A PCR test was done and received results Monday (4th) as positive; Had some scratchy throat late friday night; Saturday called out sick to work as the cough started; Saturday called out sick to work as the cough started.; Lost taste and smell monday; Lost taste and smell monday; Running fever; fatigue; This is a spontaneous report from a contactable Pharmacist (the patient). A 52-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number EJ1686, expiration date unknown) via an unspecified route of administration on 28Dec2020 at 12:00 PM (at the age of 52-years-old) via an unspecified route of administration at an unspecified dose in the right arm for COVID-19 vaccination. Medical history included hypertension, high blood cholesterol from unknown dates. Allergy information was not provided. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient was administered the vaccine at a Nursing Home/Senior Living Facility. Concomitant medication included hydrochlorothiazide, valsartan (VALSARTAN/HYDROCHLOROTHIAZIDE), atorvastatin (LIPITOR), fenofibric acid (FENOFIBRIC ACID), amlodipine besilate (NORVASC). The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient received the vaccine on Monday 28Dec2020. A PCR test for COVID was done on Tuesday and a rapid test on Wednesday both of which were negative. The patient experienced some scratchy throat late Friday night on Saturday, 02Jan2021 the patient called out sick to work as a cough had started. A PCR test was done on 02Jan2021 and he received results Monday (4th) as positive. The patient continued to say that the cough had subsided, as he took Delsym. He lost taste and smell on Monday. He reports running a fever that varies from 99-101.5. He took Tylenol and Motrin to control the fever. In addition he has experienced fatigue. It was also reported, in contradiction of the above reported chronology of events, that the onset date of events was 25Dec2020 (CONFIRMATION PENDING for onset date of events relative to vaccine administration). The patient experiences of COVID 19 positive test, scratchy throat, sickness, cough, loss of test and smell, fever and fatigue resulted in a physician office visit (date not specified). The patient underwent lab tests that includes a PCR test on 29Dec2020 which was negative, a rapid test on 30Dec2020 which was negative and a PCR test on 02Jan2021 which was positive. Treatment for the events was reported as Motrin and Tylenol for fever and Delsym. for cough. The clinical outcome of COVID 19 positive test, scratchy throat, sickness, cough, loss of test and smell, fever and fatigue was reported as not recovered.; Sender's Comments: The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 28Dec2020, and COVID-19 PCR test positive on 02Jan2021. No effect of the suspect vaccine could be reasonably achieved to protect from the targeted

infection/disease due to the very short time lag. Instead, the positive COVID likely represents the pre-existing infection prior to vaccine use. Further information is needed for full medical assessment.

"he tested positive for COVID-19 / (probably infected by a family member); runny nose; dry cough; flu-like symptoms; he tested positive for COVID-19 / (probably infected by a family member); he tested positive for COVID-19 / (probably infected by a family member); This is a spontaneous report from a contactable consumer (patient). A 40-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 17Dec2020 at single dose for COVID-19 immunisation. The relevant medical history and concomitant medications were not reported. The patient stated that the next dose is scheduled for the time of the report, however he tested positive for COVID-19 on 05Jan2021 (probably infected by a family member). Representatives at the administration site are not sure if he should get the second dose. The patient reported minor symptoms ""flu-like symptoms, runny nose, dry cough, no major symptoms"". The outcome of the events was unknown. Information on the lot/batch number has been requested."

diagnosed with covid 30Dec2020; diagnosed with covid 30dec2020; This is a spontaneous report from a contactable nurse (patient). A 27-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number EK5730), via an unspecified route of administration in right deltoid on 21Dec2020 13:45 at single dose for Vaccination. There were no medical history and concomitant medications. The patient was diagnosed with covid on 30Dec2020 with outcome of recovering. The patient underwent lab tests and procedures which included COVID test: positive on 30Dec2020. The patient received the first dose of the covid vaccine on 21Dec2020, and was diagnosed with covid on 30Dec2020. The patient had COVID test on 30Dec2020 and received positive result of COVID test on 31Dec2020. He was scheduled for the second dose between 08Jan2021 and 11Jan2021. He asked if he should continue to get the second dose as scheduled in relation to the diagnosis of COVID. COVID: the patient still had chest congestion, but no fever without medication, no cough anymore. He was having cough, fever, loss of taste and smell, fatigue and malaise. Reporter seriousness for COVID: Not serious. Relatedness of drug to reaction/event: Reaction assessed: COVID, Source of assessment: Primary Source Reporter, Method of assessment: Global Introspection, Drug result: Unrelated. Verbatim event relatedness: Pfizer COVID-19 Vaccine: COVID-Unrelated.; Sender's Comments: The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 21Dec2020, and was diagnosed with COVID-19 on 30Dec2020. No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the diagnosed COVID-19 likely represents the pre-existing infection prior to vaccine use, and unrelated to BNT162B2.

she got Covid; she got Covid; This is a spontaneous report from a contactable physician. A female patient (Patient Age: 18; Unit: Unspecified) received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date t a single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The nurse that her first Pfizer Covid 19 vaccine and a couple of days later developed symptoms of Covid and tested positive. Stated that she recovered and had no symptoms. Information on Lot/Batch number has been requested.; Sender's Comments: The

reported symptoms of Covid with tested positive after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

covid test result=Positive; covid test result=Positive; This is a spontaneous report from a contactable other healthcare professional (other HCP reporting for himself). A 39-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE Solution for injection, batch/lot no. and expiry date unknown), via an unspecified route of administration on 16Dec2020 12:45 (1st dose) at a single dose on his left arm for COVID-19 immunization. The patient medical history was not reported. Concomitant medication included hydrochlorothiazide, losartan potassium (HYZAAR), omeprazole, and ibuprofen; all on unspecified dates for unspecified indications. The patient previously took amoxicillin and experienced allergies. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine, he was also not diagnosed with COVID-19 prior to vaccination. However, since the medication, the patient has been tested positive for COVID-19. Patient had his nasal swab on 22Dec2020, and it turned out positive (COVID test result=positive). Outcome of the event drug ineffective and COVID-19 virus test positive was unknown. Facility where the most recent COVID-19 vaccine was administered at the hospital. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 cannot be completely excluded. However, it is unlikely that the patient would have fully developed immunity due to the very short time lag between the first vaccine dose and the event onset.

covid test result=Positive; covid test result=Positive; nasal congestion; sneezing runny nose; sneezing runny nose; sinus pressure; dry cough; This is a spontaneous report from a contactable Nurse (patient herself). This 37-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EL0140), via an unknown route, on 19Dec2020 at 16:15 at single dose for COVID-19 immunisation. Vaccine location was arm left. The patient was not pregnant. The patient was vaccinated at hospital, age at vaccination was 37-year-old. No other vaccine was received in four weeks. No relevant medical history was provided. Relevant concomitant medications included amoxicillin sodium, clavulanate potassium (AUGMENTIN, formulation: tablet) at dose of 875 mg twice daily from an unknown. Pre-vaccination COVID test was not performed. On 25Dec2020 at 20:00, the patient complained of nasal congestion, sneezing runny nose, sinus pressure, and cough. On 28Dec2020, COVID test Nasal Swab (SOFIA SARS ANTIGEN FIA/QUIDEL) was performed and resulted positive. She was given oral azithromycin 500 mg 1 tab Daily and oral benzonatate (TESSALON PERLES) 1 Capsule three times a day (TID). The symptoms of nasal congestion, sneezing runny nose, sinus pressure, and cough were improving. The outcome of 'COVID test result=Positive' was unknown.; Sender's Comments: The efficacy of a drug varies from patient to patient and can be affected by different factors; however, a contributory role of the suspect product BNT162B2 to the reported drug ineffective and SARS-CoV-2 test positive cannot be ruled out.

two staff members who tested positive for covid after receiving the first dose.; two staff members who tested positive for covid after receiving the first dose.; This is a spontaneous report from a Pfizer-sponsored program from a contactable pharmacist reported similar events for 2 patients. This is a first of two reports. A staff member of unknown age and gender received the first dose of BNT162B2 Pfizer-

BioNTech COVID-19 Vaccine, via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medication were unknown. The reporter stated that have a staff member took the first shot and afterward got a positive COVID test. He is asking about the recommendation regarding taking the second shot. The reporter explained he is the immunizer and 2.5 weeks ago he gave the employ at the facility the first does of the vaccine. He has very little information to provide on this event. He called to go over the procedure for administering the second dose and that is when in was inform. Information on the lot/batch number has been requested.; Sender's Comments: The efficacy of a drug varies from patient to patient and can be affected by different factors; however, a contributory role of the suspect product BNT162B2 to the reported drug ineffective and SARS-CoV-2 test positive cannot be ruled out.,Linked Report(s) : US-PFIZER INC-2021011912 Same reporter/ drug/ event for different patients.

received first dose of the vaccine on 19Dec and tested positive on 30Dec; received first dose of the vaccine on 19Dec and tested positive on 30Dec; This is a spontaneous report from a contactable nurse reported for herself. A female patient on unknown age received the first dose of BNT162B2 Pfizer-BioNTech COVID-19 Vaccine, via an unspecified route of administration on 19Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medication were not provided. On 30Dec2020 the patient experienced tested positive for COVID-19. It was reported that the patient is scheduled to have her 2nd dose on 09Jan2021however she's been getting roundabout information on what to do in her case. Information on the lot/batch number has been requested.; Sender's Comments: The efficacy of a drug varies from patient to patient and can be affected by different factors; however, a contributory role of the suspect product BNT162B2 to the reported drug ineffective and SARS-CoV-2 test positive cannot be ruled out.

She tested positive to COVID on 29DEC2020; She tested positive to COVID on 29DEC2020; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received first dose of bnt162b2 (BNT162B2, lot no. and expiry date were unknown), via an unspecified route of administration on 21Dec2020 at single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient was tested positive to COVID on 29Dec2020. She received the 1st dose of the vaccine on 21Dec2020. She is due for the 2nd dose on 11Jan2020. They asked if she should still receive the 2nd dose. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the positive COVID likely represents the pre-existing infection prior to vaccine use. Further information like confirmative COVID 19 Nucleic acid/ PCR test together with any associated symptoms are needed for full medical assessment.

"got the covid 19 vaccine on 21Dec2020 and tested positive for covid on 24Dec2020; got the covid 19 vaccine on 21Dec2020 and tested positive for covid on 24Dec2020; This is a spontaneous report from a contactable Nurse (patient) from a Pfizer-sponsored program Pfizer First Connect. A 36-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot number: EK5730), via intramuscular in left deltoid on 21Dec2020 10:00 at 0.3 ml, single for precaution as front line healthcare worker in hospital which is not a military facility. Medical history included nonsmoker.

She did not provide causality but stated that she probably already had COVID when she got the vaccine. It was unknown if the patient had SARS-CoV2 antibodies at diagnosis as she had never been tested. Other history was none. The patient did not have a history of hypertension, diabetes, heart disease, lung disease, liver disease, kidney disease, cancer, immunosuppressive disorder, obesity. There was not any pre-existing diseases worsened during the SARS-CoV2 infection. The patient hadn't been treated with immunomodulating or immunosuppressing medications or received any other vaccines around the time of COVID-19 vaccination. Concomitant medication included bupropion hydrochloride (WELLBUTRIN SR), sertraline hydrochloride (ZOLOFT), amfetamine aspartate, amfetamine sulfate, dexamfetamine saccharate, dexamfetamine sulfate (ADDERALL). Prior Vaccinations (within 4 weeks) were none. AE following prior vaccinations were none. There was no additional vaccines administered on Same Date (21Dec2020) of the Pfizer bnt162b2. The patient got the covid 19 vaccine on 21Dec2020 and tested positive for covid on 24Dec2020. The patient wanted guidance on receiving the 2nd dose of the vaccine. The reporter considered event was non-serious. The patient received the first dose of the vaccine on 21Dec2020, and after that on 24Dec2020, she tested positive for COVID . She was supposed to be revaccinated on 07Jan2021. She would like to know if she should she get this or does she need to be revaccinated. There is no prescriber. She received it through her work. She received the first dose on 21Dec2020, and assumed she was positive when she got it. She just had cough and muscle aches and a headache. Her dad was hospitalized. Hers was not that serious. She had not completely recovered yet. Her smell had not come back yet and she was just tired still. She said the headache was prior to getting vaccine. She did not provide causality but stated that she probably already had COVID when she got the vaccine. The cough occurred on 25Dec2020, muscle aches on 22Dec2020 at 08:00. There was no emergency room of or physician's office required for the events. The patient was not hospitalized or admitted to an ICU. Nasal swab test done. Imaging for COVID-Pneumonia, other radiological investigations, hematology, clinical chemistry, inflammatory markers, urinalysis, evidence of hypoxemia, other relevant test were none. The patient did not display clinical signs at rest indicative of severe systemic illness. The patient did not require supplemental oxygen (including high flow or ECMO) or receive mechanical ventilation. The patient did not receive any additional therapies for COVID-19. The event did not require the initiation of new medication or other treatment or procedure. She did start taking extra vitamins on her own. The patient was recovered with some lasting effects such as not being able to smell and is tired still.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported COVID with symptoms and the administration of COVID 19 vaccine, bnt162b2. However, as the reporter claimed ""she probably already had COVID when she got the vaccine"", this may provide an alternative explanation."

had the first dose of the COVID-19 vaccine last 24Dec2020 and the second dose is scheduled on 14Jan2021/tested positive for COVID-19; had the first dose of the COVID-19 vaccine last 24Dec2020 and the second dose is scheduled on 14Jan2021/tested positive for COVID-19; This is a spontaneous report from a contactable Nurse (patient). A male patient of an unspecified age received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date: unknown), via an unspecified route of administration on 24Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient had the first dose of the COVID-19 vaccine last 24Dec2020 and the second dose is scheduled on 14Jan2021. However, last 04Jan2021, the patient

tested positive for COVID-19. The patient was looking for recommendations on when he/she can take the COVID-19 vaccine. The patient underwent lab tests and procedures which included COVID-19 test: positive on 04Jan2021. The outcome of the event was unknown. Information on the Batch/Lot number has been requested.

Received the vaccine on 23Dec2020. She tested positive for COVID on 31Dec2020.; Received the vaccine on 23Dec2020. She tested positive for COVID on 31Dec2020.; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A contactable other healthcare professional (patient herself) reported that a 37-year-old female patient received bnt162b2 (BNT162B2 also reported as PFIZER-BIONTECH COVID-19 VACCINE, lot EH9899), via an unspecified route of administration in the left arm 23Dec2020 at single dose, for Covid-19 immunization. Medical history included migraine (takes a migraine medication). Her height was 168cm, weight of 72.5kg. There were no concomitant medications. Received the vaccine on 23Dec2020. She tested positive for COVID on 31Dec2020. Then she had another test and was negative for COVID on 03Jan2021 and was also negative for another test on 05Jan2021. She was wondering if this was like a super vaccine and knocked it out or if there was an error with the test. She acknowledged that there was a lag time for the second dose of 21 days. She was wondering if there was a grace period for that since she cannot be cleared for work. She was also wondering what to do before her second dose of the vaccine. The outcome of event was unknown.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported positive Sars-Cov-2 test, which is considered ineffective of BNT162B2, and the administration of BNT162B2.

she tested positive for the Covid-19; she tested positive for the Covid-19; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot no. and expiry date were unknown), via an unspecified route of administration on 17Dec2020 at single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the Covid-19 vaccine on 17Dec2020. She said that she tested positive for the Covid-19 after that (unspecified date) and she is due to get her second dose of the vaccine today 07Jan2021. She said that she is wondering if she needs to get the second dose. The outcome of the event was unknown. Information about Batch/Lot number has been requested.; Sender's Comments: Based on available information, a possible contributory role of BNT162B2 cannot be completely excluded for reported event.

tested positive for COVID; tested positive for COVID; This is a spontaneous report from a non-contactable nurse (patient) and a contactable consumer. A 43-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 23Dec2020 at single dose for COVID Prevention because of occupation. The patient's medical history and concomitant medications were not reported. The patient experienced tested positive for COVID on 02Jan2021 with outcome of unknown. The patient underwent lab tests and procedures which included COVID test: positive on 02Jan2021. The patient got the first dose of the COVID vaccine, and then tested positive for COVID afterward. The patient was inquiring about if there are any recommendations for getting the second dose, if the person tested positive for COVID after getting the first dose. The patient

did not provide prescriber information. The patient should come off of quarantine on 15Jan2021. It was unknow if the patient received any other vaccines on the same day as the COVID vaccine and if there were any concomitant medications, history or investigations other than the COVID test. The type of COVID test the patient received was unknown, just that she got the positive result on 02Jan2021. Information on the lot/batch number has been requested.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

He is losing some taste/but reduced by 30-40%; received first dose of vaccine 21DEC2020 and SARS-Cov-2 positive/Nasal swab COVID positive; received first dose of vaccine 21DEC2020 and SARS-Cov-2 positive/Nasal swab COVID positive; Sniffles; This is a spontaneous report received from Pfizer sponsored program Pfizer First Connect via a contactable other HCP (parent) reported for the patient (son). A 22-years-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot: EK5730) intramuscularly in left arm on 21Dec2020 (15:00-16:00) at single dose for COVID-19 immunisation. There was no medical history. There were no concomitant medications. The patient received first dose of vaccine 21Dec2020 and SARS-Cov-2 positive 06Jan2021 13:00. The patient got COVID vaccine 21Dec2020, and was scheduled to get second dose on 11Jan2021. He had a sniffle the other day on 05Jan2021 night time and tested positive for COVID on 06Jan2021, so reporter wanted to know if he should still get second dose. His symptoms are stable. He is quarantining. He is on his way to do a PCR now. Reporter read somewhere people could have false positive in nasal. He is losing some taste from 07Jan2021 (01:00 - 02:00). Most things he can taste. Some he cannot. It is not completely gone but reduced by 30-40%. He did a mouthwash with a sting and is not feeling that sting anymore. He said last night, same thing. He did a mouth wash and did not really taste much. It is not as prevalent as it was before. The patient underwent lab tests and procedures which included SARS-CoV-2 test: positive on 06Jan2021, positive COVID test 06Jan2021, 13:00, Nasal swab COVID. Event outcome of sniffles was recovering, while for other events was unknown.; Sender's Comments: The efficacy of a drug varies from one patient to another and can be affected by different factors; however, a contributory role of the suspect drug BNT162B2 to the reported event ___ cannot be ruled out. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

woke up in the middle of the night; lower legs felt kind of numb and tingly; weak; nausea; anaphylactic reaction; hot flash started on my head, went over my body; dizzy/lightheaded; blurred vision; chest became very tight/chest tightness; throat felt like there was a lump in it; coughing; irritated throat; heart rate was in the 140s; sinus tachycardia; lower legs felt kind of numb and tingly; chills; fever; body aches; diarrhea; This is a spontaneous report from a contactable nurse. A 26-year-old female patient

started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EH9899) via an unspecified route of administration on 29Dec2020 07:30 at single dose for COVID-19 immunisation. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient experienced anaphylactic reaction, hot flash started on my head, went over my body, dizzy, lightheaded, blurred vision, chest became very tight/chest tightness, throat felt like there was a lump in it, coughing, irritated throat, heart rate was in the 140s, sinus tachycardia, fever, chills, body aches, diarrhea, lower legs felt kind of numb and tingly, weak, all on 29Dec2020 and , woke up in the middle of the night on an unspecified date. She reported severe reaction to Pfizer COVID-19 Vaccine onset 8 minutes after being administered that first dose. She asked for information regarding her severe reaction related to the product. This event started with a hot flash that started in her head and went all the way through her body; became really lightheaded; dizzy; her chest became really tight; felt like there was a lump in her throat closing her throat up. They took her to the emergency room where she was treated and kept for a couple of hours, but was not admitted to the hospital in response to this event. While in the hospital she received IV fluids; steroids clarified as Prednisone; Benadryl; Pepcid; and was sent home. On 30Dec2020 afternoon she ended up with the same type of severe reaction: her chest felt tight, she felt her throat closing and itching; she started coughing. She went back to the emergency room in response to the severe reaction. The emergency room thinks it was the same thing again as on 29Dec2020; she again was not admitted to the hospital in response to this event, but was treated and kept for a couple of hours; while in emergency room they again gave her IV fluids; steroids clarified as Prednisone; Benadryl, and because her heart rate was like in the 140s also gave her Ativan to help bring her heart rate down. The anaphylactic aspect of the severe reaction is not ongoing any longer. She then developed fever; body aches; nausea; diarrhea; all the kind of what you would call normal side effects. She reported that on 03Jan2021 morning she woke super dizzy, lightheaded and her vision was blurred. In response to those events she went to her Primary Care Physician on 04Jan2021. The Primary Care Physician told patient to just ride it out for a little bit to see what happens; so that is what the patient has been doing. The dizziness and blurred vision have improved over the last couple of days; but last night she was up all night because she felt a numbness in her lower legs; she can still walk, it is not painful; it's just a weird numbness, tingling kind of feeling. Severe reaction events reported as improved, but ongoing. The patient underwent lab tests and procedures which included electrocardiogram: sinus tachycardia on 30Dec2020, heart rate: was in the 140s on 29Dec2020. The outcome of anaphylactic reaction was recovering, of hot flash started on my head, went over my body, dizzy/lightheaded, blurred vision, chest became very tight/chest tightness, throat felt like there was a lump in it, coughing, irritated throat, heart rate was in the 140s, sinus tachycardia, fever, chills, body aches, diarrhea, woke up in the middle of the night, lower legs felt kind of numb and tingly, weak was unknown. Caller explained she will not receive the second dose.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset anaphylactic reactions cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

an employee who received the first dose of the Covid 19 vaccine, has tested positive for Covid 19 today; an employee who received the first dose of the Covid 19 vaccine, has tested positive for Covid 19 today; This is a spontaneous report from a contactable other HCP and a nurse. A female patient of an unspecified age received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient employee who received the first dose of the COVID 19 vaccine, has tested positive for COVID 19 today, 07Jan2021. The outcome of the event was unknown. The reporter would like to know if the patient can get the second COVID-19 vaccine. Information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of BNT162B2 cannot be completely excluded for reported event.

Tested positive for COVID after receiving the first dose of the vaccine; Tested positive for COVID after receiving the first dose of the vaccine; This is a spontaneous report from a contactable other healthcare professional (patient). A 26-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EJ-685, expiration date: Mar2021), via an unspecified route of administration in the right arm on 21Dec2020 at a single dose for COVID-19 immunization. There were no medical history and concomitant medications. The patient tested positive for COVID on 26Dec2020. Now, she is wanting to know if she should still get the second dose. Outcome of the events was unknown.; Sender's Comments: The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 21Dec2020, and COVID-19 test positive on 26Dec2020. No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the positive COVID likely represents the pre-existing infection prior to vaccine use. Further information is needed for full medical assessment.

tested positive/had the COVID infection/cough; tested positive/had the COVID infection/cough; PFIZER-BIONTECH COVID-19 VACCINE at 1.3 mL; This is a spontaneous report from a contactable nurse (patient). A 39-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiration date were not reported), via an unspecified route of administration on 19Dec2020 at 1.3 mL, single for COVID-19 immunization. There were no medical history and concomitant medications. She received the first COVID-19 vaccine dose on 19Dec2020 then she tested positive on 22Dec2020. She got the first dose of the COVID vaccine and now she had the COVID infection. She was wondering if she should continue to get the second dose. She was also wondering if it will affect whether or not she gets the second dose. She couldn't find information online about what to do. Before she got the vaccine, she did take a test on an unspecified date to make sure she was negative, and she was. She had a cough at the end of the call. Outcome of the events was unknown. Information on lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of COVID-19 and suspected LOE due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this

report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Idiopathic trigeminal neuralgia; This is a spontaneous report from a contactable nurse (patient). A 34-year-old female patient started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EL0140), intramuscular (right deltoid) first dose on 21Dec2020 at single dose for Covid-19 immunization. The patient's medical history included multiple sclerosis from 2015 (Diagnosed 5 year) and ear infection from 03Dec2020 prior to vaccination, she was seen in urgent care with an ear infection, states it was super painful and lasted about 7-10 days treated it with drops.. There were no concomitant medications. The patient requested guidance on whether or not she should get the second dose of the covid vaccine after being diagnosed with Trigeminal Neuralgia following the first dose. The patient stated that she received the first done on 21Dec2020 and on 27Dec2020 was diagnosed with Idiopathic trigeminal neuralgia. The patient was unclear if the vaccine played a part in the diagnosis and wonders if there is any data available about this as an adverse event as she read that Bells Palsy was reported and this was similar. The patient need guidance on whether to get second dose of the Covid vaccine scheduled for on Monday. Wondering if getting the second dose would be risking it flaring up, states she was now on anticonvulsant medication and gabapentin and they have increased the anticonvulsant medication. The patient experienced idiopathic trigeminal neuralgia (trigeminal neuralgia) (non-serious) on 27Dec2020 with outcome of not recovered. The action taken in response to the event(s) for bnt162b2 was not applicable. The outcome of the event was not recovered.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported event of Trigeminal Neuralgia due to temporal relationship. However, the event may possibly represent concurrent medical condition in this patient with medical history of multiple sclerosis. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including head CT/MRI and viral serologies, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

rash developed on 50% of her body; vomiting; nausea; headache; severe muscle aches; This is a spontaneous report from a contactable nurse reported for herself. This 39-year-old female patient received the 1st dose of BNT162B2 (Pfizer-BioNTech COVID-19 vaccine) via Intramuscular at left arm on 16Dec2020 at 01:00 PM at single dose (lot number: EK5730) for COVID-19 immunisation. Medical history was unknown. Concomitant medications included bupropion hydrochloride (WELLBUTRIN), zolpidem tartrate (AMBIEN) and vitamins. The patient previously took dicycloverine hydrochloride (BENTYL), amlodipine and azithromycin (ZITHROMAX), all experiencing allergies. The patient experienced rash developed on 50% of her body, vomiting, nausea, headache, severe muscle aches 24

hours post vaccination on 17Dec2020 10:45 AM. The patient was treated with Benadryl, Tylenol, IM Solumedrol. The patient had Covid test post vaccination by Nasal Swab on 28Dec2020 and on 04Jan2021, both with negative results. The patient was not pregnant at the time of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Outcome of all events was recovered.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the rash and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

COVID-19 virus test positive; COVID-19 virus test positive; Headache; Sinus congestion; This is a spontaneous report from a contactable consumer reported for himself. A 61-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN9899 and expiration date unknown), via intramuscular on left arm on 22Dec2020 at single dose for COVID-19 prophylaxis. The patient medical history reported as none. Concomitant medications reported as none. The patient is a radiology technician that reported that he got the Pfizer vaccine on the 22Dec2020. He said that he got a positive Covid test on 04Jan2021. The patient had the Covid symptoms as of last Monday night on 04Jan2021. He stated that he developed a headaches and sinus congestion on the 04Jan2021. Stated that he has not had a fever. He said that there was no adverse reaction from the vaccine itself. He said that he was due for the second dose on the 11Jan2021 and he is currently quarantined so he will not be getting the second dose. The outcome of the events was unknown.

two staff members who tested positive for covid after receiving the first dose.; two staff members who tested positive for covid after receiving the first dose.; This is a spontaneous report from the Pfizer Sponsored Program called 'Pfizer First Connect' received by a contactable pharmacist. This pharmacist reported similar events for 2 staff members. This is 2nd of 2 reports. A patient (demographics unknown) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unknown route, in Dec2020 at single dose for COVID-19 immunisation. No relevant medical history and concomitant medications were provided. On unknown date, after first shot of vaccine, COVID test resulted positive. The reporting pharmacist is asking about the recommendation regarding taking the second shot. The outcome of the event was unknown. Information about Batch/Lot number has been requested.; Sender's Comments: A causal association between reported event and suspect BNT162B2 cannot be excluded. ,Linked Report(s) : US-PFIZER INC-2021010495 Same reporter/ drug/ event for different patients.

positive COVID-19 test with symptoms; positive COVID-19 test with symptoms; The patient had MS and was immune compromised; The patient had MS and was immune compromised; This is a spontaneous

report from a contactable consumer (patient). This female consumer of unspecified age received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 04Jan2021, for COVID-19 immunization. She had MS and was immune compromised. Concomitant medications were not reported. On 07Jan2021 the patient woke up with headache, runny nose, groggy and muscle aches. She went to pharmacy and got a rapid COVID test that resulted positive. She was asking if the 1st dose could have caused her to be positive on the test. Events outcome was unknown. Information on the batch/lot number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

tested COVID Positive; tested COVID Positive; This is a spontaneous report from a contactable nurse. A female patient of an unspecified age received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 22Dec2020 at single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient experienced tested COVID positive on 01Jan2021. She still has a few symptoms and is scheduled for the 2nd dose on 12Jan2020 or 13Jan2020. She was asking if there were any recommendations on the scheduling of the vaccine for her. The outcome of event was unknown. information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient cannot be completely excluded.

severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath.; severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath.; severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath.; severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath.; severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath.; severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath; severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath; This is a spontaneous report from a contactable nurse (reporting for herself). A 41-year-old non-pregnant female patient received two doses of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), both via an unspecified route of administration in the left arm, the first dose on 16Dec2020 09:00 (lot number: EH9899) and the second dose on 08Jan2021 07:15 (lot number: EL0140), both at a single dose for COVID-19 immunization. Medical history included ongoing anxiety, from an unspecified date. The patient had no known allergies. Concomitant medication included escitalopram oxalate (LEXAPRO), acetaminophen (MANUFACTURER UNKNOWN), naproxen sodium (MANUFACTURER UNKNOWN), ibuprofen (MANUFACTURER UNKNOWN). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, has not been tested for COVID-19. On 09Jan2021 at 01:30 AM, the patient experienced severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath, all of which were reported as being life-threatening. The patient went to the

Emergency room due to the events. Therapeutic measures were taken as a result of the events and included: methylprednisolone sodium succinate (SOLUMEDROL) 125 mg, famotidine (MANUFACTURER UNKNOWN) 20 mg and diphenhydramine hydrochloride (BENADRYL) 50 mg. The clinical outcome of severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath was recovering.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

the person who took the 1st dose of the vaccine and still tested positive; the person who took the 1st dose of the vaccine and still tested positive; This is a spontaneous report from a Pfizer sponsored program Pfizer First Connect. A non-contactable consumer reported that a patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via unspecified route of administration on unspecified date at single dose for COVID-19 immunization. Patient medical history and concomitant medications were not reported. ~The patient took the 1st dose of the vaccine and still tested positive on unspecified date. They would like to know if the patient still needs to take the 2nd dose of the vaccine or not. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

Received 2nd vaccination in series on 11 JAN 21. By next morning started to experience some muscle and joint symptoms. By afternoon of 12 JAN 21 experienced sudden onset loss of bladder control for first time in his life, followed a few hours later by blurry vision, vertigo, motion sickness, emesis and cold sweats that drenched his clothes. Taken to ER by paramedics, and admitted for further observation and evaluation for underlying neurologic vs. cardiogenic problems. Given positional treatments by PT for possible otoliths. Feels much improved on afternoon of 13 JAN 21, but symptoms not fully resolved. Will likely be discharged from hospital on 14 JAN 21 if problems continue to resolve.

Admission Note: ? Weakness - Generalized á á Patient reports feeling weak prior to dialysis, but demanded clinic to perform dialysis. Had full tx done and brought to ER. Reports still feels weak after dialysis. á 84 year old male comes in today after completing dialysis for evaluation of generalized weakness x 5 days. He has also lost his voice. He tells me he received his COVID vaccine yesterday, but he is concerned he may have COVID. He denies any fevers, cough, sore throat, NVD, abd pain. Transfer Note: HOSPITAL COURSE: Patient is a 84 y.o. male who presented with shaking chills and was found to have Gram-negative rods in the blood. The source of infection was unclear. Initially it was thought that it could possibly be cholecystitis but imaging was negative for that. There was concern that it could be UTI but the patient is on dialysis and is an uric and therefore no urinalysis could be got. Early this morning when I saw the patient the patient did have significant pain and tenderness in the right knee and is not able to put weight on that. I.e. Consulted Dr. Today with per lumbar from Orthopedics who said that it would be in the best interest of the patient for him to be transferred to hospital where he could decide on aspiration and or washout of the right knee. á Transfer center has been called and we are trying to

finalize a transfer of the patient hospital at this point of time á Please see problem list listed below. á REASON FOR ADMISSION/ ADMISSION DIAGNOSES á Sepsis cause unclear

History of Present Illness: á Patient is a 80 y.o. male who presents with chest pain. Patient reported that he 1st had the chest pain approximately 2 weeks ago when he woke from sleep. At that time patient pain lasted about 5 minutes or so and resolved when he got out of bed. He did well for the rest of the day up until yesterday. Patient reported that yesterday morning he woke up with the pain at the lasted about 30 minutes or so. Patient also had associated burping felt that it is likely GI in nature. The pain was located mainly in the left side of the chest without any radiation. No diaphoresis. No shortness of breath or palpitation. No radiation for the pain. Since yesterday morning he had another 3 episodes of pain the last after dinner tonight. Patient reported that this pain was located more on the left side of the chest, likely lasted about 10 minutes or so. There was no exertional component to the pain. No known history of heart disease. Due to rather recurrent nature of the pain patient was brought to the hospital by his son who is a cardiologist to be evaluated. No fever or chills. No cough . Patient reported that he got vaccination for COVID 2 days ago-of a concern that this may be a side effect of the vaccine. No dizziness lightheadedness. Patient with history of GI bleed in the past at that time patient was on NSAIDs. Patient with burping associated with the pain

Chief Complaint Patient presents with ? Generalized Body Aches á á Pt presents via EMS c/o DOE, dry non-productive cough, subjective fevers Tmax 101.9, decreased appetite, aches since testing + for COVID on 1/5. á Patient is a 50 year old male with PMH of Crohns/MS on fingolimod presenting to the Hospital for fevers, shortness of breath and weakness. Patient received COVID vaccine on 12/29. Patient had initial left arm discomfort though has had worsening weakness, cough, shortness of breath and fevers since that time. Patient tested positive for COVID19 on Patient has shortness of breath with exertion that is relieved by rest. Patient denies N/V/D. Patient has taken tylenol at home to attempt to alleviate symptoms.

Chief Complaint Patient presents with ? Vomiting á á pt reports dry heaving and nausea that started an hour ago á Patient is an 68 y.o. year old male with PMHx significant for HTN, BPH, who presents to the ED today with nausea and dry heaving for one hour PTA. States that he was at work as a courier when he had onset of sensation of room spinning, nausea, and dry heaving. Also having tinnitus which he thinks is b/l. This happened once about two weeks ago and resolved spontaneously overnight when he was asleep. No preceding illnesses, medication changes, or other associated symptoms. Vertigo has no clear exacerbating or relieving factors. Has not yet taken anything for symptoms. á The patient denies fevers, chills, headaches, syncope, chest pain, shortness of breath, rhinorrhea, sore throat, cough, abdominal pain, changes in usual bowel movements, changes with urination, back pain, pain anywhere else in body. The patient has no sick contacts, recent travel history.

HOSPITAL COURSE: Patient is a 50 y.o. female with a history of anxiety and migraine headaches who presented to hospital with cough and diarrhea. The patient had felt the symptoms on 12/31/2020 and eventually went to have a COVID test on 1/1/2021. She was subsequently positive but due to dehydration and diarrhea she came to the emergency department where she was admitted for

remdesivir and dexamethasone. She was able to be weaned off any supplemental oxygen. Her diarrhea resolved. She is feeling well and will be discharged home in good condition.

None stated.

Peripheral neuropathy

Pt experienced 103.7 fever and muscle spasms. Hospitalized.

Numbness tingling in feet, toes progressed to waist. ER Sunday hosp, pt was admitted inpatient, diagnosis transverse myelitis.

Systemic: Dizzy, hyperventolation-Medium

Began with tingling/itching to tongue and roof of mouth approx 15 minutes after administration, progressed to tingling of lips, was sent to the ED for observation. Within 20-30 minutes developed cough, throat tightness, difficulty swallowing, breathing, vomiting, shortness of breath. Noted to have uvular swelling and wheezing on examination. Given Benadryl, Pepcid, Solumedrol, Zofran, Albuterol MDI, Epi IM. within a few minutes symptoms returned and were worse where I felt like I could not breathe, throat was closing, could not talk. Noted to be pale, HR in 140?s. Given second dose of epi IM and symptoms improved. Was transferred to Obs Unit., within 2 hours (approx 6 hours after administration), developed SOB, throat tightness, cough, vomiting, difficulty breathing. Again noted to have swelling of uvula, wheezing on exam. Given Solumedrol, Benadryl, SQ epi, Albuterol, Racemic Epi nebulizer. Was transferred to ICU, all meds held except Pepcid. Day #2 ~10 am (25 hours from administration) developed throat tightness, diffuse red rash to arms, difficulty breathing, vomiting. Again noted to have uvular swelling and wheezing. Given Solumedrol, Benadryl, Pepcid, Albuterol MDI, Racemic Epi neb. Solumedrol started q12hour dosing. Strange feeling/fullness in throat continued all day, got additional racemic Epi neb that night with improvement of symptoms. Following morning (day#2 after vaccine) noted to have diffuse red rash to chest and face, spread to arms, then began coughing. Given Solumedrol, Pepcid, Benadryl, Advair, Racemic Epi nebulizer. Solumedrol changed to q8 dosing. Approx 4 hrs later nurse noted rash worse on face, associated with itching, throat tightness. Given additional Benadryl, Racemic Epi neb with improvement. Rash continued that night with throat tightness, got additional Benadryl and Racemic Neb that night (total of 3 Racemic nebulizer on Day#2 post vaccine). Transferred to telemetry floor. Day#3 post vaccine rash improved, but still present to chest and face. Throat fullness present, especially after drinking. Am still hospitalized while writing this report

Initial pain in back of head and extreme headache. Some vomiting. At emergency, went into coma and was intubated. Hole drilled in skull to relieve pressure. MRI taken. Lot of bleeding in brain - anuerism lead to death approximately 14 hours after initial symptoms.

Systemic: Anaphylaxis-Medium; symptoms lasted 1 day

Unprovoked seizure (clonic tonic) 13 days later, requiring hospitalization and testing

Pt collapsed at home approx 5:30 pm and died

On day due for 2nd dose, Patient was found unresponsive at work in the hospital. Patient pupils were fixed and dilated. Full ACLS was initiated for 55 minutes with multiple rounds of bicarb, calcium chloride, magnesium, and epinephrine. Patient was intubated. Patient continued into V. Fib arrest and was shocked multiple times.

Systemic: reported by staff patient expired under suspicious circumstnces after receiving vaccine. Patient was on hospice, reported not expected to pass this soon; symptoms lasted 0 days

Extreme lockjaw unable to barely talk or chew

Day 7 post vaccine, woke with vertigo, nausea and double vision prior to my alarm going off at 5:30am, told my husband that I did not feel right and it felt like something was wrong with me. I asked him to send a message to work that I was not feeling well and would not be in. I was not able to see my phone clearly as I had double vision. I went back to sleep to try to get relief, woke up and called out to husband for help and he said I was just making groaning noises but I know in my head I was saying please help me as I could not move my right side and I was not sleeping or having a dream. At approximately 9:30am my husband kept telling me someone was trying to text me and needed a response. I tried to get up and still could not move my right side. He helped me sit up and I could not use my right arm and hand. He helped me get some clothes on and took me to the ED. When we arrived I still could not use my right hand and my arm still felt weak. The weakness resolved within a couple of hours and I got the strength back in my hand. I did have some concern that my TIA type symptoms could possibly be related to vaccine but it was just a thought until I received my second dose. 3 hours post vaccine my face became numb and tingly. It remained that way until I went to sleep. This is why I am reporting this incident.

Per patient report on follow-up: admitted to hospital following initial vaccine on 12/29 with N/V and severe HA. Patient placed on Morphine for pain, now resolved. Admission occurred outside of hospital system providing initial vaccine.

Patient reports no symptoms until 1/8/21 at which time a rash developed along with fatigue and fevers. Patient was seen in ED 1/8 and 1/11/21. Was admitted 1/11/21 with Concern for STevens Johnson and sepsis. Patient subsequently developed full body macular rash and mucosal lesions. Fevers to 102-104.

Reported redness, swelling and pain at injection site, diarrhea and light headedness1/5/21. Evaluated in ED and hospitalized for neurological symptoms that started 1/8/21.

vaccinated at Hospital on 1/12/2021. According to patients father she developed stomach pains, constant vomiting, sweating which started at approx. 4am. She arrived at Medical center at approx. 7:20 stating she had been vomiting since 4am. Attempted PO fluids while in ED. Uncontrolled nausea persisted despite medication. Admitted to Hospital for observation for uncontrolled nausea. IV fluids given

Developed pulmonary embolism in right lung one week after vaccination. Sharp pain on right side when breathing. Treated with IV Apixaban while inpatient for 2 days, oral Apixaban 5 mg, 2 tabs twice daily 1/5/21-1/11/21, then one 5 mg tab twice a day. Pain has subsided as of 1/14/21.

No adverse reactions observed after administration of medication. Patient starting complaining of shortness of breath around 0500 the following morning. SP02 checked in the 80s. Patient expired 01/09/2021;

altered mental status, hypoxic, fever 39.3, agitated

a positive Covid test after receiving their first dose; a positive Covid test after receiving their first dose; The initial case was missing the following minimum criteria: No adverse effect. Upon receipt of follow-up information on 06Jan2021, this case now contains all required information to be considered valid. This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A contactable other healthcare professional (student pharmacist) and a contactable pharmacist reported that a patient of unspecified age and gender received BNT162B2 (PFIZER BIONTECH COVID-19 VACCINE, lot number unknown), via an unspecified route of administration, on an unspecified date, at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Reporter that works at a hospital pharmacy called about a patient that received their first dosage of COVID-19 vaccine who had a positive COVID test on an unspecified date after receiving their first dose of the vaccine. They wanted to know hoe to proceed and if they needed the second dose. The outcome of the event was unknown. Information on the lot/batch number has been requested.

covid a week after the1st dose of the vaccine. When to get the 2nd dose?/tested positive for COVID; covid a week after the1st dose of the vaccine. When to get the 2nd dose?/tested positive for COVID; body aches; fever; Headache; This is a spontaneous report from a contactable physician. A 31-year-old female patient (healthcare worker) received the 1st dose of bnt162b2 (BNT162B2) at single dose in Dec2020 (9 days before 07Jan2021) for Covid-19 immunisation. The patient medical history and concomitant medications were not reported. The patient received the 1st dose of the COVID vaccine 9 days before 07Jan2021 and got a headache afterward in Dec2020. After 6 days, in Jan2021 the patient had a worse headache, body aches, and fever. She was swabbed for COVID on 06Jan2021 and tested positive. The reporter wanted to know what to do about the 2nd dose. The outcome of events was unknown. A product complaint was filed. information about lot and batch number was requested.

tested positive for covid/headache, ever, cough, diarrhea; tested positive for covid/headache, ever, cough, diarrhea; This is a spontaneous report from a contactable consumer (patient) via a Pfizer Sponsored Program IBCC (Inbound Call Center for HCPs). A 47-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK5730, expiration date: 20Mar2021), via an unspecified route of administration on 19Dec2020 16:15 at left arm, at single dose for covid-19 immunization. Medical history included hysterectomy in 2010, pulmonary Embolism in 2010, gallbladder removed on an unknown date. There were no concomitant medications. The patient received 1st dose 19Dec2020, she was supposed to get her second dose, but tested positive for covid. She thought she had side effects after vaccine, she began with a headache, fever a week later and

thought they were from the vaccine, but then her sister-in-law was positive for COVID, her sister-in-law passed away from covid virus. Then the patient, her mom, and husband tested positive for COVID. She tested positive for COVID on 27Dec2020. She developed symptoms of COVID on 27Dec2020. It was exactly one week after receiving the first dose. It was also reported that she got tested on the 30th (as reported) and received results on 31Dec2020 that she was positive. After she got sick she has taken Mucinex. Day eleven, she is doing ok, but has a little cough. No more fever. Sometimes she has diarrhea but today no diarrhea. The patient asked if she can get her second dose of the covid vaccine on day 24. The outcome of the events was recovering.

arm is red, warm, and itchy; arm is red, warm, and itchy; arm is red, warm, and itchy; Chest tightness; bitter taste in her mouth; funny feeling; arm was hurting; swelling; patient thinks the vaccine was given to her subcutaneously instead of intramuscularly; This is a spontaneous report from a contactable nurse (reporting for herself). A 43-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot number: EK9231), subcutaneously in the left arm on 05Jan2021 15:00 at 0.3 mL, single for COVID-19 immunization. The patient's medical history was not reported. Concomitant medication included an unspecified multivitamin, taken at one tablet daily by mouth for supplementation therapy. The patient previously took the flu vaccine (MANUFACTURER UNKNOWN) in 2016 for immunization and experienced chest tightness, which she took diphenhydramine hydrochloride (BENADRYL). The patient experienced arm is red, warm, and itchy on 05Jan2021, which was reported as being medically significant. On 05Jan2021, the patient experienced chest tightness, bitter taste in her mouth, funny feeling, arm was hurting, swelling and patient thinks the vaccine was given to her subcutaneously instead of intramuscularly. On 06Jan2021, the patient experienced arm is red, warm, and itchy was reported as worsened. The outcome of arm is red, warm, and itchy, chest tightness and arm is red, warm, and itchy was reported as worsened was not recovered and of bitter taste in her mouth, funny feeling, arm was hurting, swelling and patient thinks the vaccine was given to her subcutaneously instead of intramuscularly was unknown. The reporter assessed the relatedness to the event, arm is red, warm, and itchy to the Covid-19 Vaccine as related; Sender's Comments: Based on the time association, the possible contribution of suspect BNT162B2 to the events pruritus, erythema and feeling hot cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

The patient had an ongoing medical history of Crohn's disease/Concomitant medication included vedolizumab (ENTYVIO) for Crohn's disease; shortness of breath; difficulty swallowing; fever; headache; nausea; she was feeling as if her throat was closing; Chest tightness; This is a spontaneous report from a contactable physician reporting for a patient. A 34-year-old female patient received the first dose of BNT162B2 (COIVD-19 Vaccine) , via an unspecified route of administration on 03Jan2021 at single dose for covid-19 immunisation. Medical history included Crohn's disease from an unknown date and unknown if ongoing, COVID-19 in 2020 to an unknown date and unknown if ongoing. Concomitant medication included vedolizumab (ENTYVIO) for Crohn's disease. The reporter is a physician who is

reporting and AE for a patient who received the vaccine and subsequently developed symptoms including short of breath, fever, headache, nausea, difficulty swallowing with seriousness criteria of Medically significant on 03Jan2021. The patient self-medicated with benadryl and symptoms resolved briefly but then went to urgent care with re-occurring symptoms and was prescribed prednisone. Caller states the patient's symptoms have resolved. She is calling to get more information to determine if the patient should receive the second dose. The reporter further stated that she has a patient who received her first shot, clarified as the COVID-19 Vaccine. About an hour and 45 minutes later, the patient had shortness of breath and then later had a fever, headache and nausea. It was later that night when the patient had a fever. The patient had difficulty swallowing which worsen; she was feeling as if her throat was closing. The patient is a nurse, so she self medicated with Benadryl. After taking the Benadryl, the patient was better in the early morning. When the doctor's office opened, the patient called and was having similar symptoms, clarified as all the symptoms mentioned above. The patient went to the urgent care where she received more Benadryl and was started on prednisone. Caller did not know the dose of prednisone the patient had received. After that, the patient started feeling better. The patient's second dose of the COVID19 Vaccine is due around 24 to 26Jan2021. The patient has not called the doctor/caller back. The caller assumes that the patient has recovered but could not be certain. Caller added that the patient also experienced chest tightness when she was having shortness of breath. The patient's fever was 101 on 03Jan2021. The patient was not drooling with her difficulty swallowing. Caller stated that the patient had a positive COVID test earlier, she thinks it was maybe 3 to 4 months ago (in 2020). The patient has not received another COVID test since she received the first dose of the COVID-19 vaccine to the caller's knowledge. Reporting physician is an internal medicine physician. Therapeutic measures were taken as a result of the events. The outcome of the events was unknown. Information on the Batch/Lot number has been requested.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported short of breath, fever, headache, nausea, difficulty swallowing, throat closing, chest tightness, and the administration of COVID 19 vaccine, BNT162B2, based on the plausible temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

headache; injection site is itchy and swelled up; injection site is itchy and swelled up; But this one turned red; can't lift her arm it's heavy and painful; can't lift her arm it's heavy and painful; shortness of breath; palpitation; Dizziness, lightheaded/ feeling dizzy; Uneasiness; hands are so cold; nauseous; This is spontaneous report from a contactable nurse reported for herself. This 42-year-old female patient (No pregnant) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via Intramuscular on Left arm on 29Dec2020 17:00 PM on left arm at single dose (Lot # EL1284) for COVID-19 immunisation. Medical history included None. No Allergies to medications, food, or other products. Concomitant medications included ascorbic acid, bioflavonoids nos, hesperidin, malpighia glabra, rosa canina, rutoside (VITAMIN C), collagen, colecalciferol (VITAMIN D), cynara cardunculus, malus spp. vinegar extract, taraxacum officinale (APPLE CIDER). No other vaccine in four weeks. The patient experienced Dizziness, lightheaded, palpitation, uneasyness, shortness of breath on 29Dec2020 17:15 pm. Then when the patient drove home, she felt so uneasy and hands are so cold, nauseous and feeling

dizzy on 29Dec2020 17:15 pm. Felt the same way in the house for a good 2 hours after the vaccination. Drank water and didn't sleep right away. Tried to monitor herself. After that day the patient felt better but with bouts of headache and dizziness every now and then. The injection site was itchy and swelled up. But it went down if didn't scratch it. The patient didn't have allergies to any medications. But this one turned red. And the next day after the vaccination (30Dec2020) the patient can't lift her arm it's heavy and painful. Then pain went away. But now it was the itchiness in the site that bothered her. But the patient didn't scratch it. So it didn't swell up as much. Prior to vaccination, was the patient did not diagnose with COVID-19. Lab data on 07Jan2021 Nasal Swab post vaccination for Covid 19: result was pending. No treatments received for the events. Outcome of the events Dizziness, lightheaded/ feeling dizzy, palpitation, Uneasiness, shortness of breath, hands are so cold, nauseous was recovering. Outcome of the event pain in arm was recovered. Outcome of other events was unknown.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the dizziness, lightheaded, palpitation, shortness of breath and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including chest x-ray, EKG and chemistry panel, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

trouble breathing; She had bad pain in her chest; Her oxygen saturation dropped to 92 and it is usually 98 or 100; not been feeling well; A fast heartbeat 5-10 minutes after initial dose; This is a spontaneous report from a contactable healthcare professional (dental assistant) reporting for self. This female patient with unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 22Dec2020 at single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. The patient previously had reactions with the flu shot in the past for immunisation and she only was able to take the vegan version of the flu shot due to the egg content in the regular version of the flu shot. She also stated not being able to take the flu shot in the arm, leg, hip etc. Patient stated she was scheduled to take her second dose of vaccine tomorrow. She received the first dose on 22Dec2020. She stated she was in the ER on Monday for 5 hours because she was unable to see her primary care physician because his office was filled with patients with Covid and they could not provide her with guidance. She stated after receiving the first dose of vaccine she had not been feeling well ever since. Stated she had had trouble breathing and this took her by surprise. She had bad pain in her chest and a fast heartbeat 5-10 minutes after initial dose (on 22Dec2020). Her oxygen saturation dropped to 92 and it was usually 98 or 100. She stated something inhibited her ability to breathe and this scared her because she was healthy prior to the vaccine and never been in hospital and wasn't born in the hospital. She stated the condition she was diagnosed with will take 6-12 months for her to recover from and go back to normal. She stated during her ER room visit there were a lot of tests done. She would like to know if she should receive the second dose of the vaccine. The outcome of events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on available

information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the dyspnea, chest pain, oxygen saturation decreased and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including chest x-ray, arterial blood gas and pulmonary function tests, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

On 1/12/20 resident woke up and was not able to stand in the E-Z stand. E-Z lift was needed. In addition he needed assistance with eating. At that time VS were stable, equal hand grasp noted, and no further concerns. Around 3pm resident became flaccid on the left side of his face and speech became mumbled. Hand grasp was equal at that time and VS were stable, but B/P was elevated compared to previous recordings earlier in the day. Family did not want him sent to the hospital and asked for comfort cares. Hospice referral obtained and he will be admitted to hospice in the near future. Resident's left side of face has improved within the last 48 hours. He remains total assist with all cares.

develops symptomatic covid; develops symptomatic covid; This is a spontaneous report from a contactable physician received via a Pfizer sales representative. This physician reported similar events for two patients. This is the first of two reports. A patient of unspecified age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiry date were not provided) solution for injection, via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient developed symptomatic Covid on an unspecified date. The patient received dose #1 of a Covid-19 vaccine and contracted Covid-19 prior to dose #2. The patient underwent lab test which included Covid-19 test in which he/she developed a symptomatic Covid-19 on an unknown date. Outcome of the event was unknown. Information about batch/lot number has been requested.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate. ,Linked Report(s) : US-PFIZER INC-2021014755 Same reporter/drug/event, different patient

"flushed; hives; tongue felt ""thick""; the lump in my throat feels bigger; This is a spontaneous report received from a contactable pharmacist. A 23-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number EL0142), via an unspecified route of administration in the left arm on 22Dec2020 (at the age of 23-years-old) as a single dose for COVID-19 immunization. The patient's medical history included: allergies to medications, food, or other products (unspecified). It was unknown if the patient was pregnant at the time of vaccination. The patient's

concomitant medications were not reported. It was unknown if the patient received any other vaccine within 4 weeks prior to the vaccine. On 22Dec2020, approximately 8 minutes after vaccine administration, the patient began feeling flushed. She reported to the observation area, and the registered nurse noted hives on her left neck (22Dec2020). The patient was brought back for closer monitoring. The doctor evaluated the patient. Vital signs were monitored every 5 minutes (22Dec2020). The patient was given 50 mg diphenhydramine (BENADRYL) orally. Some improvement was noted in hives; however, the patient began to state her tongue felt ""thick"" and ""the lump in my throat feels bigger"" (both on 22Dec2020). Per doctor, 0.3 mg epinephrine (MANUFACTURER UNKNOWN) given intramuscularly with rapid improvement in hives. The patient reported feeling some improvement as well. The patient was taken to the emergency department for ongoing observation. The patient was released from emergency department after observation. The clinical outcome of flushed, hives, tongue felt ""thick"", and ""the lump in my throat feels bigger"" was recovered on an unspecified date.; Sender's Comments: Based on the compatible time association, the events flushing, urticaria, tong disorder, sensation of foreign body are possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

Egg sized lymphadenopathy under right arm 36 hours after 2D injection; flu symptoms; joint aches; muscle and joint aches; arm pain; arm pain and swelling; 1st dose of BNT162B2 on 17Dec2020 15:45/ 2nd dose on 06Jan2021 14:30; 1st dose of BNT162B2 on 17Dec2020 15:45/ 2nd dose on 06Jan2021 14:30; This is a spontaneous report from a contactable nurse (patient). A 55-year-old female patient received 2nd dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in right arm on 06Jan2021 14:30 at single dose for COVID-19 immunisation. Medical history included mild hypertension and arthritis. The patient was not pregnant. No Covid prior vaccination, no Covid tested post vaccination. No known allergies. Concomitant medication included estradiol, norethisterone acetate (COMBIPATCH), meloxicam, propanol. The patient previously received 1st dose of BNT162B2 in left arm on 17Dec2020 15:45 for COVID-19 immunisation. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced egg sized lymphadenopathy under right arm 36 hours after 2D injection (08Jan2021 03:00), after flu symptoms of muscle and joint aches, arm pain and swelling at 20 hours (07Jan2021 12:00). No treatment received for the events. The outcome of events was not recovered. This case was reported as non-serious. Information on the lot/batch number has been requested.; Sender's Comments: Based on the compatible temporal association and the drug's known safety profile, the vaccination with BNT162B2 might play a contributory role in triggering the onset of lymphadenopathy. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

She was wiped out the next day with aches and pains still.; tired; brain fog; started to get cold; shake/her hands were shaking so hard; they took her temperature and it was 100/her fever went to 101/temperature had gone to 102.6; heart rate was elevated at 100/heart rate was 110/heart rate went to the high 120s; headache; backache; nauseated; chest was hurting; The initial case was missing the following minimum criteria: Invalid for unspecified adverse event. Upon receipt of follow-up information on 08Jan2021, this case now contains all required information to be considered valid. This is a spontaneous report from a contactable nurse (patient). A 54-year-old female patient received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EK5730), via an unspecified route of administration in deltoid left on 29Dec2020 07:30 at single dose for COVID-19 immunisation. Medical history included ongoing sleep apnoea (diagnosed about 3-4 years ago, wear her CPAP religiously), Hashimoto's hypothyroid, and chronic low vitamin d (lack of sunlight). Concomitant medication included levothyroxine sodium (SYNTHROID) from 2016 and ongoing for Hashimoto's hypothyroid, ergocalciferol (VIT D) from 2018 for chronic low vitamin d; lack of sunlight (She did not take it religiously, but was supposed to take it everyday). At 10:30 AM (29Dec2020), she started to get cold and shake. She thought that this was insane and it was in her head. It became so severe she could not use her computer her hands were shaking so hard. She went back up to where they were giving vaccines, they took her temperature and it was 100. It had been normal the morning before she got the vaccine. Her heart rate was elevated at 100. They put a blanket on her and said they wanted to watch her for 15 minutes. In that time her fever went to 101 and her heart rate was 110. They took her to the ER. She was there for 5 hours. Her heart rate went to the high 120s. They did a 12 lead EKG. Her temperature had gone to 102.6, which was the highest. They gave her a liter of Normal Saline. She also had a headache, backache, and felt nauseated. The liter of fluid helped, no doubt. She was not admitted. She was wiped out the next day (30Dec2020) with aches and pains still. Their concern was they said they did not give her epinephrine because her heart was too high. She had no breathing issues. Just extreme cold. At one point she had woke up in the ER (29 or 30Dec2020) and her chest was hurting, she knows from her heart rate being too fast. She was so cold. She had on 6 blankets. The next day (30Dec2020) she still had the aches and pains, she was tired, and had brain fog. It all went away on 30Dec2020. She had nothing after that. What scared her was the heart rhythm. The ER doctor says its not great, but felt that getting the second dose was better than her having COVID. The Electrophysiologist she saw, said she was unsure if she should get the second dose. The hospital said that for this next dose, they would give her the injection, wait 15 minutes, then send her home, expecting that she would have the same thing happen. When after the first dose, she was in the ER on a 12 lead EKG with an intravenous (IV). She had no arm pain the whole time. The reporter assessed all events related. She felt fine prior, walking in to get the vaccine. But she was much better the next day and recovered completely. She was just worried about the second dose. The outcome of events was recovered on 30Dec2020.; Sender's Comments: Based on the compatible temporal association and the drug's known safety profile, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the reported events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Myocardial Infarction; This is a spontaneous report from a contactable Other healthcare professional (patient). A 64-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Batch/lot number: 20201216-1), via an unspecified route of administration on 16Dec2020 08:15 at single dose for COVID-19 immunization, vaccine location provided as Left arm. Medical history included arthritis and sulfa allergy. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient's concomitant medications were not reported. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced myocardial infarction on 19Dec2020 23:00. The patient was hospitalized for myocardial infarction for 3 days. The patient underwent lab test which included Covid test via Nasal Swab post vaccination on 20Dec2020 with test result Negative. Therapeutic measure Cardiac cath procedure was taken as a result of myocardial infarction. The outcome of the event was recovering. This case was reported as Serious with seriousness criteria hospitalization.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported myocardial infarction and the administration of COVID-19 vaccine, BNT162B2, based on the reasonable temporal association. However, more information is required, such as the complete medical history, clinical course, for the Company to make a more meaningful causality assessment. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

Rash over all over body, started at neck.; itching; This is a spontaneous report from a contactable Nurse. A 25-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EL3246, expiry date: unknown), intramuscular on 06Jan2021 15:15 at single dose (Left arm) for COVID-19 immunization. The patient medical history and concomitant medications were not reported. Facility type vaccine was Clinic/Facility. The patient experienced rash over all over body, started at neck and also complained of itching on 06Jan2021 15:30. Patient denied breathing difficulties. EMTs arrived and gave client oxygen and Benadryl. AE resulted in Emergency room/department or urgent care. It was unknown if patient had COVID prior vaccination. The patient was not tested for COVID post vaccination. Therapeutic measures were taken as a result of rash over all over body, started at neck and itching. The outcome of the events was recovering.; Sender's Comments: Based on the close temporal association, the Company considers the events rash and pruritus are possibly related to vaccination with BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

took a rapid test and it came up positive; took a rapid test and it came up positive; fever 100.8; coughing; This is a spontaneous report from a contactable consumer (patient herself). A 41-year-old female patient (non-pregnant) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, reported as Pfizer covid19 el1284), via an unspecified route of administration on 30Dec2020 14:30 in left arm at single dose for covid-19 immunisation. Medical history included asthma and

arthritis. Concomitant medication included ibuprofen and paracetamol (TYLENOL). The most recent COVID-19 vaccine was administered in public health clinic/ veterans administration facility. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had been tested for COVID-19. Patient got the vaccine on Wednesday 30Dec2020, and by Saturday (02Jan2021 22:30) she started with a little coughing that increase on Monday (04Jan2021), Monday afternoon she had fever 100.8. She thought she was experiencing side effects and reported to her supervisor and didn't work the 2 next days. She when back to work on Thursday (07Jan2021), she was sent to a covid clinic and took a rapid test and it came up positive. The patient underwent lab tests and procedures which included nasal swab (rapid antigen testing - SARS-CoV-2): positive on 07Jan2021. The events were reported as non-serious. No treatment was received for the events. Outcome of events were recovering. Information on the lot/batch number has been requested.

diebities; overweight; This is a spontaneous report from a contactable consumer. A 53-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date t a single dose for COVID-19 immunization. Medical history included 'dibeities'. The patient's concomitant medications were not reported. The patient experienced 'diebities' and was overweight on an unspecified date with outcome of unknown. The patient was not tested for COVID-19 post vaccination. Information on the Lot/batch number has been requested.

Received the first dose of the COVID Vaccine on 29Dec2020 and tested positive for COVID on 08Jan2021; Received the first dose of the COVID Vaccine on 29Dec2020 and tested positive for COVID on 08Jan2021; This is a spontaneous report from a non-contactable consumer. A 45-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730), via an unspecified route of administration on 29Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient received the first dose of the COVID Vaccine on 29Dec2020 and tested positive for COVID (Nasal Swab) on 08Jan2021. The outcome of the event was not recovered. No follow-up attempts are possible. No further information is expected.

12/31-mild facial weakness left forehead, left cheek/smile asymmetry.; 12/30-headache, left ear pain, left face pain/continued numbness tingling; 12/30-headache, left ear pain, left face pain/continued numbness tingling; 12/30-headache, left ear pain, left face pain/continued numbness tingling; 12/30-headache, left ear pain, left face pain/continued numbness tingling; 12/29-+fatigue, SOB, left sided lowback pain - severe; 12/29-+fatigue, SOB, left sided lowback pain - severe; 12/29-+fatigue, SOB, left sided lowback pain - severe; 19:00- chills, myalgias, cold sensation of b/l feet; 19:00- chills; 19:00- chills, myalgias; At 16:00- palpitations; At 16:00- palpitations, chest tightness; At 12:00 (within 4 hrs) began experiencing L sided facial and Left foot numbness/tingling and left hand.; Reported to health care provider, began steroids for early onset bell's palsy; This is a spontaneous report from a contactable other health professional (patient). An adult female patient (not pregnant) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) lot number EL1284 via intramuscular in left arm on 28Dec2020 08:30 at single dose for COVID-19 immunization. Medical history included Crohns, asthma,

migraine, GERD (gastrooesophageal reflux disease), Known Allergies: pyridium. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient did not have COVID tested post vaccination and did not have COVID prior vaccination. Concomitant medication included mesalazine (PENTASA), famotidine (PEPCID), paracetamol (TYLENOL), calcium phosphate, colecalciferol (VITAFUSION CALCIUM), ascorbic acid, biotin, calcium, choline bitartrate, chromium, copper, folic acid, inositol, iodine, iron, magnesium, manganese, molybdenum, nicotinamide, pantothenic acid, phosphorus, potassium, pyridoxine, retinol, riboflavin, selenium, thiamine, tocopherol, vitamin b12 nos, vitamin d nos, zinc (MULTIVITAMIN) , biotin, colecalciferol (VITAMIN D). Reported Event: on 28Dec2020 at 12:00 (within 4 hrs) began experiencing L sided facial and Left foot numbness/tingling and left hand. At 16:00- palpitations, chest tightness. 19:00- chills, myalgias, cold sensation of b/l feet. 12/29-+fatigue, SOB, left sided low back pain - severe. 12/30-headache, left ear pain, left face pain/continued numbness tingling. 12/31-mild facial weakness left forehead, left cheek/smile asymmetry. Reported to health care provider, began steroids for early onset bell's palsy. On 08Jan2021 continue to have paresthesia of my left face, left hand, left foot, headache, mild left facial weakness/altered sensation. The events resulted in Doctor or other healthcare professional office/clinic visit. The patient received treatment received for the adverse events on 01Jan2021. The outcome of the events was recovering.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of bell's palsy /facial paresis cannot be fully excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate

Bell's palsy; Loss of taste; Can not close one eye, no muscle movement on one side of the face.; This is a spontaneous report from a contactable nurse. An adult female (not pregnant) patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular in left arm on 05Jan2021 15:30 at single dose for COVID-19 immunization. There were no medical history or concomitant medications. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient did not have COVID tested post vaccination and did not have COVID prior vaccination. The patient had no known allergies. The patient experienced Half face paralysis, Bell's palsy. Loss of taste. Can not close one eye, no muscle movement on one side of the face. All on 08Jan2021 14:30 with outcome of unknown. No treatment was received.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of Half face paralysis/Bell's palsy cannot be fully excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate

He collapsed with left sided hemiparesis; Stroke; Rt basal ganglia hemorrhage w/ edema and mass effect.; Rt basal ganglia hemorrhage w/ edema and mass effect.; Low platelets, 114; His bp as high as

200s/100; Hand weakness; Myalgia; Fever; Severe fatigue; This is a spontaneous report from a contactable physician. A 58-year-old male patient received first dose of bnt162b2 (Pfizer BioNTech COVID vaccine), intramuscularly on 16Dec2020 at a single dose for COVID-19 immunization. Medical history included hypertension with reported med noncompliance in the last few months due to stress. Concomitant medication included hypertension medications in two weeks. The patient was presumed neg covid status prior to vaccine. He worked as a Pulm/critical care physician. He reported fever, myalgia, fatigue on 16Dec2020. Next day (17Dec2020), he took off from work due to his symptoms. The following day (18Dec2020), he came to work. He c/o ongoing severe fatigue & hand weakness in am. Staff noted him to be evaluating his hands during clinic. At 12:15, he collapsed with left sided hemiparesis. The reporter had suspicion for stroke. He was transported to the Emergency Room (ER), head CT showed Rt basal ganglia hemorrhage w/ edema and mass effect. Labs notable for Low platelets, 114 (unknown baseline) on 18Dec2020, normal coags on an unspecified date. BP recorded as 179/101, but it was noted in trauma room his bp as high as 200s/100. He had a history of hypertension with reported med noncompliance in the last few months due to stress. Patient was transferred for further care. Full course was unknown but had rebleed there with low plts. Adverse event (he collapsed with left sided hemiparesis) resulted in hospitalization (22 days), life threatening illness (immediate risk of death from the event), disability/incapacitating or permanent damage. Treatment was received for adverse events. Results of tests and procedures for investigation of the patient: on 18Dec2020, Nasal Swab test: negative. The outcome of events was not recovered. Unknown if any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient was not tested for COVID-19. Information on the lot/batch number has been requested.; Sender's Comments: Collapsed with left sided hemiparesis/suspicion for stroke are as consequences of basal ganglia hemorrhage with edema, which is caused by worsening of hypertension. Low platelet also contributes to brain hemorrhage. All these serious events are unrelated to the vaccine use. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"Sore throat, severe chest tightness and pressure, very hard to breathe in, more than 30 minutes after covid vaccine, dizziness, headache, lightheadedness; severe chest tightness and pressure; very hard to breathe in, more than 30 minutes after covid vaccine; Dizziness /lightheadedness; headache; This is a spontaneous report from a contactable consumer (patient). A 35-year-old female (not pregnant at the time of vaccination) patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EL0142), via an unspecified route of administration at left arm on 09Jan2021 10:30 at single dose for COVID-19 immunization at a hospital. The patient's medical history included migraines, asthma, diabetes, sleep apnea, low immune system, post-traumatic stress disorder (PTSD), depression, panic attacks, insomnia, borderline personality disorder, and known allergies to medications, food, or other product (10 total). Concomitant medications included adult tetanus vaccine on 04Jan2021 received at right arm, for immunization (within 4 weeks prior to the COVID vaccine); first dose of botulinum toxin type a (BOTOX) on 06Jan2021 at single (31 shots in 7 muscle groups) for migraines (within 4 weeks prior

to the COVID vaccine); and clindamycin antibiotic for infection in finger (took within in two weeks). The patient was not diagnosed with COVID-19 prior to vaccination, and had not been tested for COVID-19 since the vaccination. On 09Jan2021 11:00, the patient experienced sore throat, severe chest tightness and pressure, very hard to breathe in, more than 30 minutes after COVID vaccine, ""dizziness/lightheadedness"", and headache. The above mentioned events resulted in emergency room/department or urgent care visit, and patient received breathing treatment, oxygen for over an hour for these events. The outcome of the events was unknown. The reporter considered the events as non-serious."

complete hearing loss at the right ear, 5 hours post injection, continued till now 3 days past injection, not resolved yet prior to report; This is a spontaneous report from a contactable physician. A 72-years-old male patient started to receive bnt162b2 (BNT162B2) Lot number# ek9231 intramuscularly on 06Jan2021 12:00 at single dose for covid-19 immunisation. Anatomical Location: Arm Right. Facility where the most recent COVID-19 vaccine was administered: Hospital. Medical history included diabetes mellitus, hypertension. The patient did not received any other vaccines within 4 weeks prior to the COVID vaccine. Concomitant medication included alprazolam (AZOR [ALPRAZOLAM]), metformin hydrochloride, sitagliptin phosphate monohydrate (JANUMET [METFORMIN HYDROCHLORIDE;SITAGLIPTIN PHOSPHATE MONOHYDRATE]), atorvastatin calcium (LIPITOR [ATORVASTATIN CALCIUM]). The patient on 06Jan2021 18:00 reported complete hearing loss at the right ear, 5 hours post injection, continued till now 3 days past injection, not resolved yet prior to report. The action taken was not applicable.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported hearing loss cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Allergic reaction to vaccine; tingling to upper lip and face; tingling to upper lip and face; red rash on bilateral forearms; Patient developed Bell's Palsy 2-3 days later; This is a spontaneous report from a contactable consumer. A 45-year-old non-pregnant female patient received the first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL1284), via an unspecified route of administration on 23Dec2020 at 14:30 at single dose in left arm for covid-19 immunization. Medical history included mitral valve prolapse from an unknown date, and allergies: Cephalosporins and nut (peanut derived). Concomitant medication included epinephrine (EPIPEN) 0.3MG/0.3ML, fluticasone propionate 50MCG/ACT nasal spray. On 23Dec2020 at 14:45, the patient experienced allergic reaction to vaccine, tingling to upper lip and face, red rash on bilateral forearms. Reactions resolved with no treatment. The patient developed Bell's Palsy 2-3 days later in Dec2020. Currently being treated with high dose steroids and acyclovir. All events required emergency room visit and physician office visit. All events were reported as non-serious by reporter. The outcome of event Bell's Palsy was not resolved, outcome of other events was resolved on an unspecified date. The patient was not diagnosed with COVID-19 prior to vaccination, and it was unknown if the patient has been tested for COVID-19 since the vaccination.

fever and chills; fever and chills; blood pressure was low, about 90/50; did not feel well; syncope episode; unconscious; This is a spontaneous report from a contactable other health professional. A 27-year-old non-pregnant female patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: EH9899), via an unspecified route of administration in the left arm on 08Jan2021 at 12:00 at a single dose for COVID-19 immunization; received at a nursing home/senior living facility. The patient did not receive any other vaccines within four weeks prior to the COVID vaccine. Medical history included COVID-19 from an unknown date and unknown if ongoing. No known allergies. Concomitant medications included unspecified birth control taken for an unspecified indication from an unknown date to an unknown date; within two weeks of vaccination. The patient experienced the following events and outcomes: syncope episode in Jan2021 with outcome of unknown, unconscious in Jan2021 with outcome of unknown, fever and chills on 09Jan2021 with outcome of unknown, blood pressure was low, about 90/50 on 09Jan2021 with outcome of unknown, did not feel well in Jan2021 with outcome of unknown; all of which were assessed as medically significant. The clinical course was reported as follows: the fever and chills began about one hour after vaccination (as reported). About 18 hours after the vaccination, the patient was getting up to take more paracetamol (TYLENOL) and did not feel well. The patient had a syncope episode in the bathroom (no issues as she sat on the floor before hand). The patient was unconscious for about 1-2 minutes. The patient's blood pressure several minutes later was low, about 90/50; however, the patient took the blood pressure measurement herself, so it may not have been exactly accurate. The patient underwent lab tests and procedures which included blood pressure measurement: low, about 90/50 on 09Jan2021. Therapeutic measures were taken as a result of fever. Prior to vaccination, the patient was diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of all reported serious events cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"Heart rate shot up to 170 with numbness of feet.; Heart rate shot up to 170 with numbness of feet.; Chest pain; feeling like I was going to vomit and faint; feeling like I was going to vomit and faint; This is a spontaneous report from a contactable other hcp (patient). A 25-year-old non-pregnant female patient received the first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 06Jan2021 at 11:45 at single dose in left arm for covid-19 immunization. There was no medical history. Concomitant medication included valaciclovir hydrochloride (VALTREX), topiramate (TOPAMAX), lamotrigine (LAMICTAL), duloxetine hydrochloride (CYMBALTA), ziprasidone hydrochloride (GEODON). On 06Jan2021 at 12:30, The patient experienced heart rate shot up to 170 with numbness of feet, started to feel chest pain, and feeling like she was going to vomit and faint. The events required emergency room visit and were reported as serious per hospitalization. Heart rate at the hospital was 135-140 where two EKG were done and fluids were given. An x-ray of the heart was done and blood work was completed. The patient didn't receive treatment for the events. The patient didn't receive any

other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination, and has not been tested for COVID-19 since the vaccination. The outcome of the events was resolved in Jan2021. Information on batch/lot number has been requested.; Sender's Comments: There is a reasonable possibility that the event ""feeling like she was going to vomit"" was related to BNT162b2 based on known drug safety profile. Based on the temporal relationship, the association between the other reported serious events with BNT 162b2 can not be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

resident coded on 09Jan at 8am and expired; This is a spontaneous report from a contactable Other Health Professional. A 70-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL0140), intramuscularly in left arm on 05Jan2021 15:15 at single dose for COVID-19 immunization. Medical history included DM2(Type two diabetes mellitus), CHF(congestive heart failure), open wound, wound infection, heart failure. Allergies to medications, food, or other products: none. Concomitant medications included unspecified products (List of any other medications the patient received within 2 weeks of vaccination: yes). If the patient received any other vaccines within 4 weeks prior to the COVID vaccine: Unknown. Facility where the most recent COVID-19 vaccine was administered: Nursing Home/Senior Living Facility. The resident coded on 09Jan2021 at 8 AM and expired. The patient died on 09Jan2021. An autopsy was not performed. AE resulted in: patient died. Death cause: unknown at this time. Was treatment received for the adverse event: Unknown. Prior to vaccination, was the patient diagnosed with COVID-19: No. Since the vaccination, has the patient been tested for COVID-19: No. Serious: Yes. Seriousness criteria-Results in death: Yes. Seriousness criteria-Life threatening: No. Seriousness criteria-Caused/prolonged hospitalization: No. Seriousness criteria-Disabling/Incapacitating: No. Seriousness criteria-Congenital anomaly/birth defect: No.; Sender's Comments: The old patient had diabetes mellitus, congestive heart failure, open wound complicated by infection, all these pre-existing medical conditions contribute to the patient death. More information including complete medical history, concomitant medications and event term details especially death cause and autopsy results are needed for a full assessment of the case. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate; Reported Cause(s) of Death: resident coded on 09Jan at 8am and expired

Saturday had. Sweating. Chills. Headache. Nausea.; Saturday had. Sweating. Chills. Headache. Nausea.; Saturday had. Sweating. Chills. Headache. Nausea.; Saturday had. Sweating. Chills. Headache. Nausea.; Sunday had emergency appendectomy for actuate appendicitis.; Friday at 3pm, the patient had numbness and tingling to left hand, lips and throat; Friday at 3pm, the patient had numbness and tingling to left hand, lips and throat; Friday at 3pm, the patient had numbness and tingling to left hand, lips and throat; Friday at 3pm, the patient had numbness and tingling to left hand, lips and throat; Friday

at 3pm, the patient had numbness and tingling to left hand, lips and throat; Friday at 3pm, the patient had numbness and tingling to left hand, lips and throat; Post surgery had allergic reaction unknown reason with head to toe rash; Post surgery had allergic reaction unknown reason with head to toe rash; This is a spontaneous report from a contactable nurse (patient). A 34-year-old female patient (pregnant: No) received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via intramuscular (lot number: EL1283) on left arm on 08Jan2021 at 6:30 AM at single dose for covid-19 immunisation. The relevant medical history included celiac, anemia, known allergies: Sulfa and Gluten. Concomitant medications were not reported. The patient received first dose of BNT162B2 via intramuscular (lot number: Ek5730) on left leg on 18Dec2020 at 11:00 AM at single dose for covid-19 immunisation. The patient previously took Codeine, fish oil and experienced allergies. Friday at 3pm, the patient had numbness and tingling to left hand, lips and throat. On Saturday the patient had sweating, chills, headache, nausea. On Sunday had emergency appendectomy for actuate appendicitis. Post surgery had allergic reaction unknown reason with head to toe rash. It was also reported that the adverse event started on 08Jan2021 at 03: 15 PM (as reported). The patient had 1-day hospitalization. The patient received treatment for the events. The adverse events resulted in Emergency room/department or urgent care. The events were reported as serious due to life threatening and hospitalization. The most recent COVID-19 vaccine was administered at hospital. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The outcome of the events was recovering.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. Medications administered during appendectomy may confound reactions experienced post-surgery. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

passing out sensation; heart palpitations; sweating; diarrhea; This is a spontaneous report from a contactable consumer (patient's boyfriend). A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter reported that symptoms were related to the use of Covid 19 vaccine. The patient received the first dose on 15Jan (as reported) and the day after developed sweating, passing out sensation, heart palpitations and this morning on 11Jan2021 when she woke up she had the same symptoms plus diarrhea. The outcome of the events was unknown. Information on the lot number/batch number was requested.

severe hypertension (190/100); flushing tachycardia; flushing tachycardia; blurred vision in the left eye; This is a spontaneous report from a contactable healthcare professional reporting for self. This 65-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via unspecified route of administration on unspecified date at single dose for COVID-19 immunisation. Medical history included ongoing underlying HTN (hypertension). Concomitant medications were not reported. The patient experienced AE following administration of first dose of vaccine of including:

severe hypertension (190/100), flushing tachycardia, and blurred vision in the left eye. These symptoms started 20minutes after administration. The patient stated her PCP thought that she had underlying hypertension and had since started her on medications. She was looking for guidance with regard to receiving the second dose. The outcome of events was unknown. Information about Batch/Lot number has been requested.; Sender's Comments: The administration of BNT162B2 might have played a contributory role in triggering the onset of serious event hypertension worsened, considering the plausible temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate

"he was in AFIB for about 3 hours after receiving his first dose of the COVID19 Vaccine; he noticed the rest of the day, right up to going to bed that he felt cold; This is a spontaneous report from a contactable consumer. A 66-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: EL1284) at arm, left upper, via an unspecified route of administration on 29Dec2020 06:15 at single dose for covid-19 immunisation. Medical history included atrial fibrillation (Afib) formally diagnosed around Jan2020. There were no concomitant medications. The patient reported he got the COVID-19 Vaccine at 06:15 on 29Dec2020 and had to sit for 15 minutes afterwards before he could leave. He said everything was fine, and he walked out to the hospital lobby, and was speaking with a work associate for 10 minutes before he headed to his car. When he got ready to leave, he got in his car, and started his car. He started driving home, and realized he was in AFIB. He did have an AFIB issue. His AFIB has been pretty well controlled for a year now, as long as, he didn't do something stupid. He had a moderately aggressive run of AFIB. He said his ""smart"" watch told him his heart rate was 117. His normal heart rate is around 60-70. He was in AFIB for about 3 hours. His typical runs of AFIB are considerably shorter. He only had a total of 2 episodes of AFIB in the last year. His prior AFIB episodes would have been about 4-5 minutes. The last time he had AFIB that lasted any length of time was when he was hospitalized for AFIB around Jan2020. He said at that time, he was hospitalized overnight for observation. He received medication during the hospitalization and his AFIB broke. He didn't remember what medications were given to him during the hospitalization. He said he had flutters before that hospitalization, but the flutters were always gone after a few minutes, so he never sought treatment because there would be nothing to treat. The patient reported he noticed the rest of the day on 29Dec2020, right up to going to bed that he felt cold. His house wasn't cold, and he didn't have a fever. He said the cold feeling went away during the night while he was sleeping. He said the cold feeling easily lasted for a 12 hours. He said the cold feeling could have been something else. The outcome of ""he was in afib for about 3 hours after receiving his first dose of the covid19 vaccine"" was recovered on 29Dec2020; of ""he noticed the rest of the day, right up to going to bed that he felt cold"" was recovered on 30Dec2020."

she was diagnosed with bilateral deep vein thrombosis (DVT) and pulmonary embolism (PE); she was diagnosed with bilateral deep vein thrombosis (DVT) and pulmonary embolism (PE); This is a spontaneous report from a contactable nurse (patient). A 22-year-old female patient received 2nd dose

of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EK9231), via an unspecified route of administration in left arm on 06Jan2021 13:45 at single dose for COVID-19 immunisation. Medical history included allergy to all fish, and clots. The patient was not pregnant. There were no concomitant medications. The patient previously received 1st dose of BNT162B2 (lot numer: EH9899) in left arm on 16Dec2020 13:45 for COVID-19 immunisation and experienced left sided lower back pain on 20Dec2020. No other vaccine received in four weeks. It was reported that the patient had the first covid vaccine on 16Dec2020 and on 20Dec2020 started with left sided lower back pain and then received the second on 06Jan2021 and then on 09Jan2021 11:00 her legs became blue and swollen and she was diagnosed with bilateral deep vein thrombosis (DVT) and pulmonary embolism (PE). The patient otherwise healthy and had never had covid. Other than the clots, she had no other health issues. The patient underwent lab tests and procedures which included nasal swab: negative on 09Jan2021. Events resulted in doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care, hospitalization, and life threatening illness (immediate risk of death from the event), hospitalized for 2 days (in Jan2021). Adverse event treatment: heparin drip and xarelto at home. Recovered with lasting effects on an unspecified date of Jan2020. This case was reported as serious, serious criteria was life threatening, caused/prolonged hospitalization.; Sender's Comments: The underlying risk factors/predisposing condition of thrombotic diathesis have been assessed to have played a contributory role toward the events.

Resident expired on 12/30/20, dx cardiac arrest.

Resident expired on 1/2/21.

Per pt, sx onset began at 1520 with pruritus/hives of the scalp. She was in the post vaccine observation area at this time. At 1530, EE returned to vaccination room to alert staff of her reaction. Upon hearing her new onset cough, an assessment was performed immediately. Reported tingling and swelling of her lips, cough, minor difficulty breathing with mask on, facial flushing and feeling hot, and severe pruritus, especially on the scalp. 50 mg IM Benadryl administered and was taken to ED via wheelchair which is 7 minutes away. Epi Pen administered in ED and admitted overnight for observation d/t irregular HR and ST depression on monitor.

felt kind of tired; Tested positive for COVID after receiving the first dose of the COVID Vaccine; Tested positive for COVID after receiving the first dose of the COVID Vaccine; slight fever; body aches; headache; This is a spontaneous report from a Pfizer-sponsored program. A contactable nurse (the patient) reported that a 39-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK5730) via unspecified route of administration on the left arm/shoulder on 22Dec2020 at single dose for COVID-19 immunisation. Medical history included gained weight since the pandemic started. The patient's concomitant medications were not reported. Patient received first dose of the vaccine. She had symptoms right after she got the vaccine the next day, on 23Dec2020. She had a slight fever, body aches, and a headache, which she never gets. She had these for about 2-3 days, they lingered around, and kicked back up around 26Dec2020/27Dec2020. She also felt kind of tired. She got covid 19 infection tested on 02Jan2021 and the results came back positive on 03Jan2021. Patient was calling to report this and see what to do about the second dose. She was

supposed to get her second dose next Tuesday. The outcome of events was unknown.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 cannot be completely excluded. However, individuals may not be protected until at least 7 days after their second dose of the vaccine. It is unlikely that the patient would have fully developed immunity due to the very short time lag between the first vaccine dose and the event onset.

received the first dose of the vaccine on 21Dec2020 and tested positive for Covid-19; received the first dose of the vaccine on 21Dec2020 and tested positive for Covid-19; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiration date was not provided) via an unspecified route of administration on 21Dec2020 at single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient received the first dose of the vaccine on 21Dec2020 and tested positive for covid-19 on 07Jan2021. The patient was isolated for 10 days. Outcome of event was unknown. Information on the lot/batch number has been requested.

COVID virus/on 29Dec2020 tested positive/symptoms of cough, chills, lost of taste and smell; COVID virus/on 29Dec2020 tested positive/symptoms of cough, chills, lost of taste and smell; This is a spontaneous report from a contactable other health professional (patient). A 57-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number EJ1685, expiration date: 31Mar2021), intramuscularly on 20Dec2020 17:43 at left deltoid, at single dose for vaccination. Medical history included asthma and diabetes. There were no concomitant medications. The patient received the first dose of vaccine on 20Dec2020. On 22Dec2020 she was exposed to Covid, on 28Dec2020 developed symptoms of cough, chills, lost of taste and smell, she had onset of COVID virus symptoms on 28Dec2020 with positive COVID result from COVID nasal swab test performed on 29Dec2020. She has already completed her Bamlanivimab infusion therapy to treat COVID virus on 31Dec2020. Her 2nd dose is due on 10Jan2020 and she wanted information on the use of antibody therapy with the Covid-19 vaccine. She asked if she should still get the second dose of Pfizer-BioNTech COVID-19 Vaccine as scheduled on 10Jan2021 relative to these events. She reported she still has COVID symptoms which have improved, but the symptoms she can't taste or smell are ongoing and persistent. Seriousness criteria: she thought it was serious but she was not injured or anything with it; she thought event was offset it by taking some medication and the Bamlanivimab infusion. In addition to Bamlanivimab infusion for treatment of the COVID virus she was also prescribed Azithromycin for 5 days started on 29Dec2020 which she completed; and Prednisone for 7 days started on 29Dec2020 which she stopped after 5 days of therapy because she did not like how it made her feel. The outcome of the event was recovering. Event relatedness between Pfizer-BioNTech COVID-19 Vaccine and COVID virus was unrelated.; Sender's Comments: Based on the information currently available, lack of efficacy of the suspected vaccine BNT162B2 cannot be completely excluded. However, individuals may not be protected until at least 7 days after their second dose of the vaccine. It is unlikely that the patient would have fully developed immunity due to the very short time lag between the first vaccine dose and the event onset.

positive COVID-19 test; positive COVID-19 test; positive COVID-19 test; This is a spontaneous report from a contactable pharmacist. A around 50-year-old male patient received bnt162b2 (PFIZER-

BIONTECH COVID-19 VACCINE, lot/batch number and expiration date not provided), via an unspecified route of administration on 22Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The physician reported that he knew the patient got the vaccine on 22Dec2020. On 02Jan2021, he tested positive to COVID-19. The outcome of the events was unknown. Information on the Lot/batch number has been requested.; Sender's Comments: The association between the event lack of effect (tested positive for COVID-19) with BNT162b2 can not be completely excluded.

Tufts of my hair came out by the handful - first time in my life I have experienced ANY hair loss! It is still ongoing and I am worried it will result in permanent baldness.

Cardiac arrest within 1 hour Patient had the second vaccine approximately 2 pm on Tuesday Jan 12th He works at the extended care community and was in good health that morning with no complaints. He waited 10-15 minutes at the vaccine admin site and then told them he felt fine and was ready to get back to work. He then was found unresponsive at 3 pm within an hour of the 2nd vaccine. EMS called immediately worked on him 30 minutes in field then 30 minutes at ER was able to put him on life support yet deemed Brain dead 1-14-21 and pronounced dead an hour or so later

He died nine hours later.

Patient died on 1/21-2021

1/7/2021 @ 5:00 a.m. patient woke up and couldn't move her right side (neck, arm and leg). Sister helped dress her and drove her to the hospital. During the ride the hospital the patient had 2 seizures and a 3rd seizure in the ER at the hospital. Patient states she has never had multiple, back to back seizures before. States she hasn't had a seizure for 2 years. EEG was done. Was released from the hospital on 1/9/2021 and to have outpatient MRI of head, shoulder, c-spine. Does not have full range of motion of right neck, and arm, hand and fingers and is painful. 1/14/2021 - full release back to work on 1/14/2021.

Resident had been monitored and had shown no signs or symptoms of any kind until 2 pm on 1/14/2021. Resident was found in the floor of her room. She had fallen and was having a seizure, temperature was 99.7F and Oxygen saturation was 82%.

Resident found unresponsive and without pulse at 05:45am.

on 1/14/21 patients HR 155 at 0800 per patient's home pulse ox device. arrived at ER, HR 148 at 1130. Continued to stay up even after 2 doses of 10mg iv push Cardizem and one dose of 30mg Cardizem. Cardizem drip started, heparin drip started, patient admitted to hospital

"12/23/2020: 2 hr after injection, patient noted swollen lymph nodes, nausea, room spinning (motion sickness-like) sx. Stayed home from work that day and slept. 12/24/2020: ""typical injection site pain"" 12/30/2020: injection site hot, itchy, welts 12/31/2020: area of welts doubled in size to entire upper left arm; throat starting to close up"

Patient presented herself to LPN slurring words and 'not herself'. Upon evaluation, patient denied drinking alcohol, knew she was not able to speak correctly and visibly frustrated . With great difficulty she was able to communicate that she had a headache and was slightly dizzy. Failed FAST and does have a history of CVAs. EMS called and patient was taken to ER where they admitted her for observation post Stroke. Per the hosp nurse, patient received tPA treatment and will be moved to step-down unit when a bed is available.

On 1/11/21 noted with headache, nausea/vomiting, severe melaise. On 1/12/21 resident expired.

Vaccination given 1314 and sent to waiting room for monitoring. Began to have itching at 1325. PO benadryl administered. Then with throat swelling. Epinephrine administered by EMS/Fire at 1:32pm: 0.5mg IM right arm. 1342 improving 1350 itching/throat swelling returning while EMS/Fire on phone with medical director. 1352 second dose of epinephrine administered by De Pere EMS/Fire: 0.5mg IM left arm Medical Director on site for evaluation. Client given option to transport to hospital or stay for monitoring with EMS/Dr. Condition improving, chose to stay for monitoring. Client improved and up walking halls 1513 Client cleared to be released home via private transport

EXTREME LETHERGY, NAUSEA, REFUSING TO EAT OR DRINK, ELEVATED HEARTRATE, FATIGUE, ELEVATED TEMP

Day after vaccine : mild shortness of breath, sensation of swelling in my throat/neck area. Took Benadryl 50mg before bedtime. 2 days after vaccine: woke up with voice changes, coughing/choking with speaking. Used epipen once, felt full relief for about 1-2 hours. Trouble speaking again. Then went to ER, had epipen again twice, over two hours, Benadryl 50IV and Pepcid and steroids. Sitting in the ER now debating admission. Likely being admitted., home epipen are too expensive to treat q2h by myself.

Generalized myalagias, weakness, vertigo, nausea with emesis, one episode of urinary incontinence. Admitted for observation. Patient improved without intervention with some residual dizziness on day two of symptoms.

Dec 24 felt light headed and loss of appetite, Dec 25, fever 103 and chills, Dec 26 Team member Covid hub had me do a Covid test, negative result, continue high fever, no appetite, chills and body ache, Health Hub contacted me daily with app to review symptoms, Dec 27-29 continued symptoms, unable to eat and little bit of water intake, Dec 29 appointment made with Health Urgent Care, received text from Urgent Care cancelling appointment and instructed to take sips of water and Tylenol that I was having an immune reaction to vaccine. Dec 29 virtual appointment with PCP continued symptoms, Dec 31 repeat of COVID swab along with Flu swab both negative, Jan 2-3 hospital admission for abnormal labs, jaundice, dehydration, Sodium/Potassium and Magnesium boluses given, and work up for infectious process was negative. Discharged to home Jan 3 with low grade fever, dry mouth, dry eyes, nausea, body ache and continued loss of appetite. Jan 4-7 continued worsening jaundice and appetite with low grade fever, GI Clinic consulted at Health Clinic, PCP in daily contact, repeat liver function labs on Jan 8 showed worsening labs. Jan 9-12 afebrile, started Ursodiol, low appetite better energy, continue dry mouth, GI appointment Jan 12 with plan to repeat liver functions on Jan 15, jaundice improved and able to eat liquids. No Tylenol or antipyretic taken since Jan 3 due to liver function tests.

Developed chest pressure 8.5 hours after vaccine, unrelieved after 3 hours, went to ED, elevated troponin, EKG changes. Admitted to hospital low grade fever next day

I developed severe abdominal pain 3 days after injection that turned out to be pancreatitis

71yo female resident who died after receiving Pfizer BioNTech vaccine. On 1/14/2021, VS taken at 10am, B/P 99/60, O2 sats, 95% (trach w/O2). At 11:30am, Patient showed no s/sx of distress, A&Ox3. At 11:50am, a nurse went to perform a COVID test and assessment (the facility is experiencing an outbreak), and found the patient unresponsive on the bathroom floor. CPR was immediately started; no shock advised per AED; 12:15pm EMS arrived and took over. At 12:38pm, EMT called time of death.

Has underlying dementia and often with difficulty eating. 1 week after immunization she developed a stroke with left sided weakness and difficulty swallowing. Comfort measures instituted. Not sure if this is related to the vaccine, but thought I should report

"83yo female resident who died after receiving Pfizer BioNTech vaccine. On 1/14/2021, the patient reportedly got up in the middle of the night with c/o feeling ""blah"", restlessness, and nausea. VS normal, no other s/sx. At 4:15am, the patient was asked to go back to bed, assisted by a nurse and GNA. At 6am, GNA was going to do morning VS and found the patient unresponsive, no pulse, no respirations. GNA notified the nurse. At 6:03am, CPR started and EMS called. At 6:15am, EMS arrived and took over. At or around 6:30am, EMT called time of death"

I had fatigue, headache, pain, weakness and I was so miserable decided to go to ER on (12/24/20) and then was transferred to hospital admitted (12/25/20) one day - discharged on 12/26/20 at night

Staff reported that he wasn't being himself. He was leaning more towards the right. Had symptoms similar to Bell's Palsy, some right sided facial droop, right eyelid drooping. On CT right maxillary sinusitis, ventriculomegaly.

Shortness of breath Chest pain Ongoing since

Fever to 100.4 on day 1 after vaccine, to 101.9 on day 3 after vaccine. Acute kidney injury (creatinine rose from 1.73 to 2.43) requiring hospitalization.

After first vaccine i experienced fatigue, body aches, headache and nausea for 2 days and injection site pain for two weeks. After second Vaccine given at 9:55am. tingling of feet for about 20 mins, 30 mins after the vaccine. Two hours later fatigue, body aches, headache and nausea began. At 0030 1/12/2021 I woke up with severe chills and left chest pain, temp was 101.6 and heart rate was 160. I began to see black and chest pain was severe feeling like i was having a heart atack and was going to pass out so i called 911. I then began to get short of breath and got numbess on my legs, left arm and left side of neck. Chest pressure/pain radiated to left arm and neck. I was taken by the ambulance to hospital. Arrived around 0130. My heart rate sustained at 140s in the ER so I was admitted at 0530 am. My D Dimer was a bit elevated as well as my lactic so I was given a bolus of fluids plus maintenance. I had a CXR done, CTA chest(negative for PE), UA, Labs, entire cardiac workup including an ECHO during my admission. I also began to have loose stools and wrist joint pain. MY heart rate sustained at 125-147 for

about 30 hours. Fevers on and off. After everthing was negative we determined this was secondary to the covid 19 vaccine. I was discharged 1/13/2021 at around 1:30 pm. My heart rate is still not at baseline which is 87-90. I'm 100-130 and still get very fatigued with a simple slow walking. Still having tachycardia, fevers, body aches, joint wrist pain, chest discomfort and headaches. My potassium was 3.0 at discharge so will be needing labs in a week. Also bruised a little different than I usually do with lab draws so keeping an eye on them and will be checking my platelets again in a week. Ive been taking tylenol for my fever and pain and ativan for any anxiety when my heart rate goes up. (treatment during hospital stay was normal saline bolus, nomal saline maintenance fluids at 150 cc/hr, tylenol, ativan, ice packs, rest)

Fever, joint pain, weakness. Pain at the injection site.

No reactions immediately after vaccine was given. Resident has dementia, has had multiple hospitalizations related to a renal stone recently. Had a tooth that was bothering her, went to see her dentist and it was extracted on 1/6/21. On 1/10 they noted feet and ankles are dark purple with white splotches appears to be mottling. Minimally responsive to voice and touch. Not eating. Compassionate visit with family. Family did not want hospice, did not feel it was needed, said, what more could they do for her than you're already doing? On 1/11 at 1950 was determined to be deceased.

Anaphylaxis- throat tightness , nausea , rash , pruritis , chest tightness, wheezing . 9-11 called epinephrine x 2 , decade on , IV Benadryl , duo-nebs, famotidine, admission to icu high dose prednisone , nebulizers , zofran , duo-neb nebulizers

Had no immediate issues with the vaccine. He had returned from the hospital on 12/21 and had some concerns about his weight which were shared with his physician on 1/4/21. On 1/5/21 had a visit with his cardiologist for a pacemaker check. On 1/8/21 staff were called to his room, he was on the floor, bluish skin color. No vital signs found, no heart rhythm heard at 2200.

Had COVID infection 10 days after the getting the vaccine; Had COVID infection 10 days after the getting the vaccine; This is a spontaneous report from a contactable physician. A 48-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EK5730), intramuscular in right arm on 24Dec2020 09:00 at a single dose for Covid-19 immunization. Medical history was reported as none. The patient's concomitant medications were not reported. The patient was not pregnant at the time of vaccination. Patient did not receive any other vaccines within 4 weeks prior to Covid vaccine. The patient was not diagnosed with Covid-19 prior to vaccination. Patient has no allergies to medications, food, or other products. Physician would like to know if her patient can receive second dose of vaccine. Patient received vaccine 10 days ago. On 05Jan2021, the patient had Covid infection 10 days after the getting the vaccine. No treatment was received for the event. Patient tested positive for Covid after receiving vaccine. The patient underwent lab test which included nasal swab: positive on 04Jan2021. The outcome of the event was recovering.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported COVID 19 infection based on the known safety profile. However the short duration of 10 days since the vaccine first dose is given it is unlikely patient would have fully developed immunity.

Caller received the first dose of covid 19 vaccine and tested positive for covid.; Caller received the first dose of covid 19 vaccine and tested positive for covid.; Caller received the first dose of covid 19 vaccine and tested positive for covid.; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A contactable other health professional (patient) reported that a female (age: 22; unit: not reported) patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the first dose of COVID 19 vaccine and tested positive for COVID on an unspecified date. She was under quarantine and wanted to know when and if she should get the second dose. Due date for second dose is 11Jan2021. The patient underwent lab tests and procedures which included Covid-19: positive on an unspecified date. The outcome of event was unknown. Information on the lot/ batch number has been requested.; Sender's Comments: The association between the event lack of effect (Covid-19 test positive) with BNT162b2 can not be completely excluded.

had her 1st dose of Covid vaccine yesterday and started experiencing all expected side effects today including lost of smell and taste/ Rapid PCR Test which came back positive; had her 1st dose of Covid vaccine yesterday and started experiencing all expected side effects today including lost of smell and taste/ Rapid PCR Test which came back positive; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not provided), via an unspecified route of administration on 07Jan2021 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient had her 1st dose of COVID vaccine yesterday, 07Jan2021 and started experiencing all expected side effects today (08Jan2021) including loss of smell and taste. She also had a Rapid PCR test done today which came back positive. She wanted to know if this could be a false positive result from the vaccine. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available.

It felt like a viral meningitis; arm soreness; feel some tension; migraine headache; body started shaking; chills/Rigors; temperature 104; I had sensitivity that I never had; headache; photophobia; Sinophobia; paresthesia/tingling sensation along my upper extremity; I felt like I was freezing; I didn't feel comfortable; vertigo; nausea; hard time to focus; This is a spontaneous report from a contactable other health professional (patient himself). A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in Jan2021 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. He didn't have any allergies. He was in good health, no underlying issue. He never had a surgery. In Jan2021, patient got the vaccine last night around. It started with arm soreness. Around 10:00 am he started to feel some tension, migraine headache. Around 11:00 he felt his body started shaking. He had chills, rigors and temperature 104. For 5-6 hours he had sensitivity that he never had. Patient had a headache, photophobia, sinophobia, paresthesia and tingling sensation along his upper extremity. he

felt like he was freezing. He didn't feel comfortable. It resolved afterwards, he felt no weakness, no facial paralysis. It felt like a viral meningitis. He also had vertigo, nausea and hard time to focus. Outcome of events were unknown. Information about lot/batch number has been requested.; Sender's Comments: Based on the temporal relationship, the association between the event viral meningitis with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

"I have latent TB and am diagnosed with herpes 1 and 2; I have latent TB and am diagnosed with herpes 1 and 2; This is a spontaneous report from a contactable other health professional. A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 11Jan2021 at single dose for covid-19 immunization. Patient had the first dose of the vaccine on 11Jan2021 and she/he had pre-existing conditions. A long time ago, she/he had 2 tachycardia episodes and was sensitive to epinephrine. Patient had latent TB and was diagnosed with herpes 1 and 2 in Jan2021. Outcome of events were unknown. Information about lot/batch number has been requested.; Sender's Comments: The association between the events ""latent PTB and Herpes 1 and 2"" with BNT162b2 can not be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

difficulty breathing and stridor; difficulty breathing and stridor; noises on inspiration; dizziness; headache; sore throat; Anaphylaxis developed within 2 hours of injection; This is a spontaneous report from a contactable other health professional (patient). A 57-year-old female patient (not pregnant) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EL0142), via an unspecified route of administration in arm left on 08Jan2021 09:00 at single dose for covid-19 immunisation. Medical history included Idiopathic Angioedema, Hypothyroidism. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient did not have COVID tested post vaccination and did not have COVID prior vaccination. The patient's concomitant medications were not reported. Reported Event: Anaphylaxis developed within 2 hours of injection. 9:00 am injection; 9:05 am Developed sore throat, 9:20 am Developed dizziness and headache, 10:00 am developed noises on inspiration, 10:20 am Presented to Emergency Services, 10:40 am IV (intravenous) diphenhydramine (BENADRYL) and dexamethasone (DECADRON), 10:45 am difficulty breathing and stridor, 11:00 am intramuscular Epinephrine, 11:10 am Racemic Epi Nebulizer, 11:20 am Breathing improved, 14:00 Discharged home. The adverse events result in Emergency room/department or urgent care. The outcome of all the events was recovering.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of anaphylaxis reactions considering the plausible temporal relationship and the known adverse event profile of the suspect product. The underlying predisposing condition included Idiopathic Angioedema. The impact of this report on the benefit/risk profile of the

Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Receives dose #1 of the covid vaccine and contracts covid prior to dose #2; Receives dose #1 of the covid vaccine and contracts covid prior to dose #2; This is a spontaneous report from a contactable physician via Pfizer sales representative. This physician reported similar events for two patients. This is 2nd of two reports. A patient of unspecified age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiry date were not provided) solution for injection, via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that patient received dose #1 of the COVID vaccine and contracts COVID prior to dose #2 on an unspecified date. The patient underwent lab test which included Covid-19 test in which he/she tested positive on an unknown date. Outcome of the events was unknown. Information about batch/lot number has been requested.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate. ,Linked Report(s) : US-PFIZER INC-2021012928 Same reporter/drug/event, different patient

"My heart rate, I was like in AFib; very high fever of 103; dizzy, light headed; arms sore; exhausted like an extreme fatigue; palpitations; This is a spontaneous report from a contactable consumer (patient). A 38-year-old female patient received the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: EH9899), via an unspecified route of administration on 30Dec2020 at 38-years-old at a single dose for COVID-19 immunization. Medical history included blood clotting disorder from an unknown date and unknown if ongoing. The patient experienced the following events and outcomes: my heart rate, I was like in AFib (medically significant) on 31Dec2020 with outcome of recovering, very high fever of 103 (non-serious) on 31Dec2020 with outcome of unknown, dizzy, light headed (non-serious) on 31Dec2020 with outcome of unknown, arms sore (non-serious) on 31Dec2020 with outcome of unknown, exhausted like an extreme fatigue (non-serious) on 31Dec2020 with outcome of not recovered, palpitations (non-serious) on 31Dec2020 with outcome of not recovered. The clinical course was reported as follows: The patient stated, ""the day after the shot I got a very high fever of 103. I was dizzy, lightheaded. My heart rate I was like in AFib, it was going from 60s to 50s all over the place. And this was the next day after the vaccination. That evening nothing my arms was just sore. But the next day all of these side effects just started in and even still today I just feel so exhausted like an extreme fatigue and I am still getting like palpitations."" The patient stated, ""So I went to urgent care and they check my vitals and stuff and when they wanted me to send me to the hospital. But I told them I will get a ride and I go by myself just because I didn't want, capable of an ambulance ride and I ended up just going home because I couldn't get a hold up anybody. So, I came home and took my blood thinner

medication because I do have blood clotting disorder."" In regard to the outcomes of the events, the patient stated, ""I am not experiencing all of them still definitely my heart is much better. I am still getting palpitations but nothing near how it was that first day. I am experiencing extreme fatigue."""

received the vaccine on 17Dec2020 the next dose is today but during this time she was positive for covid; received the vaccine on 17Dec2020 the next dose is today but during this time she was positive for covid; This is a spontaneous report from a Pfizer-sponsored program, Pfizer First Connect. A contactable nurse reported for herself, a female patient of an unspecified age who received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date unknown), via an unspecified route of administration on 17Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that patient received the vaccine on 17Dec2020, the next dose is today (07Jan2021) but during this time she was positive for covid since an unspecified date. She was asking if she would take the second vaccine or if she needed to be revaccinated with the first dose. She was also asking what should she do. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The association between the event lack of effect (positive for COVID) with BNT162b2 can not be fully excluded.

"received first dose of bnt162b2/ symptoms started on the 26th (26Dec2020) but did not test positive until the 29th (29Dec2020); received first dose of bnt162b2/ symptoms started on the 26th (26Dec2020) but did not test positive until the 29th (29Dec2020); This is a spontaneous report from a Pfizer-sponsored program via a contactable nurse (patient). A 61-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot/batch number: VAC0002881; expiration date not provided), via an unspecified route of administration on 17Dec2020 at SINGLE DOSE for COVID-19 immunisation. Patient's medical history included hypothyroidism and osteoporosis from unknown dates, both ongoing. Concomitant medications included levothyroxine for hypothyroidism and alendronate sodium (FOSAMAX) for osteoporosis. Patient reported that her symptoms started on the 26th (26Dec2020) but did not test positive until the 29th (29Dec2020). Patient further stated ""She received the first dose of Pfizer vaccine last 17Dec (17Dec2020) and 26Dec she was positive with COVID (later clarified of tested positive on 29Dec2020) because of someone else, it seems that it has been transferred, the virus has been transferred to her and then after a few days she got fully recovered, no symptoms, just fully recovered. She is just asking if she really need the second dose of vaccine if she is fully recovered right now."" It was reported that patient did not receive treatment for the event. Laboratory test included COVID-19 virus test on 29Dec2020 with positive result. Outcome of the event was recovered.; Sender's Comments: Based on the information currently available, lack of efficacy of the suspected vaccine BNT162B2 cannot be completely excluded. However, individuals may not be protected until at least 7 days after their second dose of the vaccine. It is unlikely that the patient would have fully developed immunity due to the very short time lag between the first vaccine dose and the event onset."

Tested positive for Covid, 10 days after receiving the vaccine; Tested positive for Covid, 10 days after receiving the vaccine; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender started to receive bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution

for injection, lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient tested positive for COVID on an unspecified date 10 days after receiving the vaccine. The patient underwent lab tests and procedures which included Covid test: positive on an unspecified date. The outcome of the events was unknown. The information on the batch/lot number has been requested.

coughs once in a while, may be a nervous cough every 40 min; voice hoarse; tested positive for Covid-19; tested positive for Covid-19; didn't feel well at all; bad headache; dry cough; This is a spontaneous report from a contactable consumer who reported for himself, a 70-year-old male patient who received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot number and expiration date unknown), via an unspecified route of administration on 06Jan2021 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient stated that he received the first dose of the Pfizer-BioNtech Covid-19 vaccine on Wednesday, 06Jan2021, and on that day he had no problem. On Thursday, 07Jan2021, he started experiencing dry cough. On Friday, 08Jan2021, he didn't feel well at all and had a bad headache. On Saturday, 09Jan2021, he felt better but he tested positive for Covid-19. Today, 11Jan2021, he stated he feels good, he coughs once in a while, may be a nervous cough every 40 min. He had not experienced fever or chills, he breathes well, he can hold his breath for 5-10 seconds, no chest pain or congestion, but his voice was hoarse. Patient wanted to know if this has been reported before, and wanted to know how long should he test himself again for Covid-19. The events were reported as non-serious. The outcome of the events was unknown. Information about lot/batch number is requested.

I was exposed to Covid-19 4 days after and tested + 9 days after dose #1; I was exposed to Covid-19 4 days after and tested + 9 days after dose #1; I was exposed to Covid-19 4 days after and tested + 9 days after dose #1; This is a spontaneous report from a contactable female nurse (patient) via Pfizer sponsored program. A female patient of an unspecified age received bnt162b2 (BNT162B2) on 26Dec2020 at single dose for Covid-19 immunisation. The patient medical history and concomitant medications were not reported. The patient was exposed to Covid-19 4 days after on 30Dec2020 and tested + 9 days after dose #1 on 04Jan2021. The outcome of events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

positive for covid19; positive for covid19; got or felt sick; This is a spontaneous report from a contactable physician reported for self and consumer. This 51-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on Dec2020 at single dose for covid-19 immunisation. As soon as patient got vaccine she got or felt sick in Dec2020 and had the test and finds out she was positive, so she stays home two weeks and doesn't have no symptom at all and wants to know when has to take a test. The day after the patient developed symptoms thought it was the

vaccine, but the symptoms continued for 2-3 days, the 3rd day the patient got herself tested. The patient was positive for covid19 at the time had the shot/ as soon as she got vaccinated she became positive. The patient hasn't had any symptoms for the past 2 weeks. The patient was scheduled to get retested. The patient was scheduled for 2nd dose of vaccine. The patient asked if there are any risks since developed covid the day after getting the vaccine. What if miss today. The patient wanted to know time after having no symptoms past two weeks, when she has to take a test. Outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Test positive for covid19 found as soon as following the vaccination, no adequate effect of the suspect vaccine thus could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag.

I've got the 1st dose of vaccine and then unfortunately, in the interim, I started feeling sick and tested positive for Covid.; I've got the 1st dose of vaccine and then unfortunately, in the interim, I started feeling sick and tested positive for Covid.; This is a spontaneous report from a Pfizer-sponsored program, received from a contactable consumer (patient). A male patient of an unspecified age received his first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiry date were not provided) solution for injection, via an unspecified route of administration on an unspecified date at a single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient reported he got the 1st dose of the vaccine and then unfortunately, in the interim, he started feeling sick and tested positive for Covid. The patient underwent Covid test and resulted positive on an unknown date. Outcome of the event was unknown. No follow-up activities are needed. No further information is expected.

13 people, who were applied the vaccine previously, were corona positive after a week; 13 people, who were applied the vaccine previously, were corona positive after a week; This is a spontaneous report from a non-contactable consumer. This consumer reported similar events for 13 patients. This is 12th of 13 reports. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; lot number and expiration date: not known), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that 13 people, who were applied the vaccine previously, were corona positive after a week on an unspecified date. The outcome of the events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021018407 same reporter, similar suspect drug and event; different patient

Positive COVID-19 test with symptoms; Positive COVID-19 test with symptoms; This is a spontaneous report from a Pfizer-sponsored program, from a contactable nurse (patient). A 35-year-old female patient (weight 55.79 kg, height 160 cm) received the first dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine, Lot. EK5730) intramuscularly, in the left deltoid, at single dose, on 23Dec2020 at 12:30, for COVID-19 immunisation. The patient had not received any other vaccines within 4 weeks prior to the BNT162B2 vaccine. Relevant medical history and concomitant medications were none. On 25Dec2020, the patient felt extremely tired (fatigue). On 28Dec2020, the patient had headache and minor cough noticed. On 29Dec2020, the patient experienced back pain and she said that it felt like sunburn soreness

more than anything else. She said that she literally slept 3 days in a row (29Dec2020, 30Dec2020, and 31Dec2020). On 31Dec2020, the patient lost her sense of smell and developed dizziness. On 01Jan2021, the patient experienced nausea and lost her sense of taste. COVID-19 virus test was found positive on 01Jan2021.The patient recovered from back pain, sunburn and sleepy on 31Dec2020, recovered from tiredness on 01Jan2021, recovered from nausea and dizziness on 06Jan2021. Clinical outcome of the events, smell loss, cough, headache, and loss of taste was recovering. Final clinical outcome of positive COVID-19 test with symptoms was unknown at time of this report. The case was assessed as serious (medically significant). She is scheduled to get 2nd dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine) on 13Jan2021 and is wanting to know if she is supposed to get it.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available.

Received Covid vaccine and tested positive for Covid 10 days after; Received Covid vaccine and tested positive for Covid 10 days after; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received COVID vaccine and tested positive for COVID, 10 days after on an unspecified date. The patient underwent lab tests and procedures which included sars-cov-2 test: positive on an unspecified date. The outcome of the events was unknown. Information on the lot/batch number has been requested.

started with left sided lower back pain; This is a spontaneous report from a contactable Nurse (patient). A 22-year-old female patient received the first dose of BNT162B2 (lot number: EH9899), via an unspecified route of administration at left arm on 16Dec2020 13:45 at single dose for covid-19 immunization. Medical history included allergies for All fish. The patient's concomitant medications were not reported. The patient had the first covid vaccine on 16Dec2020 and on 20Dec2020 started with left sided lower back pain. The event resulted in Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, Hospitalization (2 days), Life threatening illness (immediate risk of death from the event). The patient received the Heparin drip and xarelto at home for the event. The patient was not pregnant. The patient received the covid test post vaccination on 09Jan2021. Test type was Nasal Swab. The result was negative. The outcome of the event was recovered with sequel on unspecified date.; Sender's Comments: From the information provided it is unclear what is the nature of the reported event and what are the reasons that have put the subject at immediate risk of death. The event is considered possibly related to the suspect product based on the positive temporal association.

throat closing up; struggled the breath; This is a spontaneous report from a contactable consumer (patient). A 44-year-old female patient (non-pregnant) received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: Pfizer EL 3302), via an unspecified route of administration on 09Jan2021 07:30 am at single dose at left arm for covid-19 immunization. Medical history included diabetes, high blood pressure, allergies. The patient's concomitant medications were

not reported. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. Since the vaccination, patient has not been tested for COVID-19. On 10Jan2021 14:30, patient woke up with throat closing up and struggled the breath. Patient immediately drank a dose of diphenhydramine hydrochloride (BENADRYL). Patient did that two more time in the evening of 10Jan2021. Patient called the doctor in the morning. Events were considered serious per life-threatening. The adverse events resulted in doctor or other healthcare professional office/clinic visit, life threatening illness (immediate risk of death from the event). Patient received treatment liquid diphenhydramine hydrochloride, epinephrine (EPI-PEN) for events. Outcome of events was recovered in Jan2021.

chills; body aches; fever; flu like symptoms; headache; was drenched in sweat; This is a spontaneous report from a contactable nurse (patient). A 46-year-old female patient received the second dose of BNT162b2 (lot: EL1283), via an unspecified route of administration in left deltoid on 09Jan2021 15:30 at single dose for covid-19 immunization. Medical history included asthma from Dec2019 and ongoing, insomnia, hypertension. Concomitant medication included ongoing hydrochlorothiazide, metoprolol tartrate (LOPRESSOR HCT) for Hypertension. The patient previously took lopressor and experienced edema. The patient previously received the first dose of BNT162b2 (Lot number: EK5730), intramuscularly in right deltoid at single dose on 19Dec2020 for covid-19 immunization. The patient experienced fever, chills, flu like symptoms, headache all day long on 10Jan2021. The above events were reported as serious as medical significant. No nausea or diarrhea. She had chills and was drenched in sweat on 10Jan2021. She woke up at 10:30 am with chills, body aches on 10Jan2021. Last night at 10 pm she finally fell asleep. She woke up this morning (11Jan2021) and felt fine. The outcome of the event sweating was unknown, other events was recovered on 11Jan2021.; Sender's Comments: Based on a close temporal relationship there is a reasonable possibility of an association between the events and the product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Moderna COVID-19 Vaccine At 2 PM I went blind in my left eye. Went to emergency room at Hospital Was told I have Blood clot in my eye causing the blindness and Ophthamologist says it will probably be permanent

At approximately 10:30pm on 1/14/2021, resident was noted to have a rash on her face, hands, arms, and chest. VS:100.2, 113, 20,108/59, 84% room air. applied nasal cannula at 4-L, telephoned Physician orders 6mg Decadron one time order, a second set of Vitals , reads 99.3, 110, 20, 106/60, 90% on 4-L N/C. On coming shift advised. At approximately 2:00am on 1/15/2021, resident congested and coughing. BP 151/70, pulse 124, temp 98.1 forehead, resp 20 and pulse oc 79% on 3L. At approximately 2:30am PRN cough syrup and breathing tx. Resident's condition began to worsen with breathing tx. This LPN updated at 0248 doctor on resident's condition. Doctor gave permission for resident to go to hospital. At 4:19am the Er called to say resident passed away.

THAT EVENING BETWEEN 10-11 PM HAD A GRAND MAL SEIZURE AND WAS UNRESPONSIVE. TAKEN TO ER WHERE BLOOD WORK WAS DONE AND CT SCAN. SENT HOME AROUND 6:30 AM ON JAN 1ST. (I DO NOT REMEMBER MUCH JUST WHAT MY FAMILY HAD TOLD ME) . I DO REMEMBER BEING SEVERLY SICK WITH VOMITING IN THE ER. CURRENTLY FOLLOWING UP WITH MY FAMILY MD AND HAVE MRI AND EEG TESTS SCHECULED WITHIN THE NEXT COUPLE OF WEEKS.

51 year old M with h/o O2 dependent COPD, Severe pulmonary fibrosis became increasingly hypoxic around 1800hours 1/7/2021. He was transported to hospital for acute on chronic hypoxia respiratory failure. On 1/12/2021 he decompensated further, and after discussing with family and palliative care, He was changed to comfort care. He expired on 1/12/2021@2325 at medical center.

Maybe 1 minute after receiving the vaccine I began to have a syncopal episode, the nurse practitioner thought that since I was heavy I began to have a vasovagal reaction. From there they asked me to sit with the others waiting 15 minutes to make sure they were ok to leave. As I sat the symptoms would come and go, as if in a pattern, and then return. The longer I sat there the more the symptoms began to grow, after sitting for an hour they decided to send me to the ER. At this time I was experiencing nausea, vomiting, sweating, I was itchy, I could not stop coughing, it was difficult to breath, and I had the worse headache. When I got to the ER they gave me drugs to reverse the allergic reaction and told me they would watch me for a while. In the next 4 hours all of the symptoms started again and I had to get another round of the reaction drugs, I ended up going through this process 4 times before I was safe enough to go home the next day. The provider that saw me and admitted me did not do any blood work or labs, they simply provided me with the reaction drugs when needed and my home medications.

Increased lethargy on 1/14/21 at 9pm, Vital signs-106/66, Heart rate-112, temp 98.2; Sent to ER for eval admitted with fever.

On 1/8 she took her 2nd dose of Pfizer vaccine around 3 PM. She went home in the evening and started sweating. She passed out. Her daughter was at home and she took her to the nearest hospital. Her BP was 60/34 and she had a temp of 100.3F on 1/8 during hospital admission. Her K was low. She received lot of fluids. She called our office on 1/10 and during the f/u she was still in the hospital. On 1/10 she has a temp of 98.4F and BP of 109/61. But she still has dizziness, nausea, anorexia and mild cough (Former smoker). COVID-19 test was done on 1/9, its negative. Dx was dehydration. Discharged from the hospital on 1/11, feels better but is tired. Will follow up with PCP on 1/16/21.

anaphylaxis by lethargy, nausea, vomiting, palpitations, funny feeling in chest, swollen lips

"Patient received Pfizer COVID-19 vaccine without any immediate complication on 1/14/21approx 1455, was then escorted to observation area for a 30 minute observation time. Pt had previously had a known reaction to contrast media. Approximately 5 -8 minutes into observation, pt had one audible cough. Nurse asked patient if this was a new onset cough. The patient stated she would try to ""manage"" cough. Pt escorted to bay for monitoring. Pt developed shortness of breath and wheezing rapidly. Rapid response team called and local 9-11 also called. Pt received albuterol nebulizer treatment, placed on O2 at 8L. O2 sat 99%, HR 115-120. Respiratory therapy assisted and Rapid Response Team monitored pt while waiting for EMS. Physician order to give Epinephrine 0.3 mg IM in right deltoid, given as directed

at approx 1515. Second epinephrine 0.3 mg IM given approx 1530-1535. HR 144, O2 sat 99%. Patient transported to local ER, pt intubated approx 1927."

Received the 2nd vaccine at 10am on 1/11/21 intramuscular in the right arm. At 3pm on the same day, I had a painful swolle lymph node on left side of neck. That same evening I developed pain, swelling, in my right armpit radiating to the right upper breast and down my right arm with a swollen lymph node under the right arm pit. The pain was about a number 7 on a scale of 1 to 10. The pain and swelling still persist today on 1/15/2021 Still painful, especially to touch. Still radiating down the arm. Lymph node still swollen The pain is about a 2 on a scale of 1 to 10

Rash, swollen tongue and 2 seizures. Admitted to hospital with diagnosis of seizure and allergic reaction.,

7:00PM fatigued, burning up fever 100., ibuprofen/tylenol dose; Sunday afternoon nausea, loss control of body, anxious, feeling of fainting, unable to move-paralyzed, pressed button for medical help, ambulance arrived, pt transported to ER -- 102. temp ambulance, RN at hosp temp 98., pt was shaky, 8:30PM erratic heartbeat per admitting doctor - pt admitted. Pt PCP/Cardiologist contacted, kept on heart monitor, pt discharged Monday afternoon. 1/14/21 chest pain, nausea, 102. fever. symptoms

#Right parietal/temporal subarachnoid hemorrhage and right intra-axial hemorrhage CT brain (1/12/21): Right parietal intra-axial hemorrhage toward the convexity measuring 2.3 x 1.1 x 1.7 cm with decompression into the subarachnoid space, mild right predominantly temporal and parietal subarachnoid hemorrhage is seen with minimal associated hemorrhage along the tentorium. Mild diffuse right cerebral sulcal effacement with minimal leftward midline shift measuring 2.5 mm. #Dural sinus thrombosis CTA head (1/11/21): Increased density within the superior sagittal sinus, inferior sagittal sinus, and transverse sinuses on noncontrasted images with no flow seen on postcontrast sequences consistent with venous sinus thrombosis #Left sided weakness 2/2 above #Recent jaw alignment procedure

Patient developed headache and nausea on 1-11-2021. She was hospitalized on 1-14-2021 at Hospital. Found to have dural sinus thrombosis of the superior sagittal and right transverse/sigmoid sinus on MRV brain. Currently admitted to ICU at Hospital, getting injectable blood thinners. Neurology and hematology have been consulted.

Hospital Course: á Patient is a 43 y.o. female patient who originally presented to the hospital on 1/3/2021 due to Left lower extremity pain and swelling. Patient found to have extensive DVT of left lower extremity and started on heparin drip. Vascular was consulted and recommended thrombolysis. Patient was also seen by IR who took patient for thrombectomy and left iliac stent placement on 01/05/2021. Patient tolerated procedure well. Patient was transitioned from heparin drip to Eliquis upon discharge. Patient given vascular follow-up as well as Hematology follow-up.

Sudden death 18 hours post vaccine .

Onset of shortness of breath and cough on 1/3 that progressively got worse. Clinical diagnosis of pneumonia without fever was made, patient started azithromycin on 1/5 and albuterol treatments every 4-6 hrs. Initially he improved, but then worsened. chest xray on 1/6 was negative for pneumonia, PCR covid test was negative, albuterol treatment did not bring much relief. He started respiratory distress on 1/10 and was taken by car to the local ER where another covid test was negative and chest CT revealed multiple bilateral pulmonary emboli. The leg US revealed blood clots in both of his legs. He had an emergency catheter-delivered thrombolysis and was discharged home from the ICU on 1/12 on oral anticoagulants. He is gradually improving, but very weak. He tires easily and gets a drop in oxygen to 90- 93%, as well as an increase in the heart rate to 120 when walking less than half a mile. He runs out of breath with exertion.

Patient developed a hoarsenss of voice and tightness of throat and flushed feeling immediately following vaccination. Epi Pen was administered and 50 mg Benadryl given p.o., EMS transport to ED after administration of solumedrol 125 mg - received Pepcid and Zofran and NS IV in the ED. Discharged from ED with prednisone 40 mg daily x 4 day with Epi Pen prescription.

Resident received Moderna vaccine on 12/23/2020 around 5 pm. At approximately 3:35 am on 12/25/2020, resident had a CVA and died on 1/1/2021 at 3:00 am.

"it hard to inject; some came out and squirted down her arm; some came out and squirted down her arm; he did not get the full 0.3mL dose; This is a spontaneous report from a contactable nurse (patient). A 74-year-old-female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot EK9231) via Intramuscular on 05Jan2021 13:00 at single dose in the left arm for COVID-19 immunisation. Medical history included COPD and high cholesterol. Concomitant medications included Symbicort for COPD. Patient took COVID vaccine (Verbatim) since precaution as frontline healthcare worker. On Tuesday, she received the first dose of the Pfizer COVID Vaccine. The nurse who was injecting found it hard to inject, and at the end of the injection, it came back and squirted down her arm. It was a decent amount. She is unable to say if she got 0.1ml, 0.2ml, but she certainly did not get full 0.3ml. The hospital said they are just going to go ahead and give her the second dose, but she wanted to call and find out what would be the safest thing. Would it be best to receive another dose or go ahead with the second dose or get a third dose. She is due in 2 1/2 weeks to get second dose. She also has COPD and is a little more concerned than if she were 25 years old. There was no prescriber provided. When asked about other medications, she stated she has a list of medications, but did not think they were relevant. She was diagnosed with COPD last year and had a series of test. Reporter seriousness for ""it came back and squirted down her arm"" is medically significant. Outcome of events was unknown.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events due to temporal relationship. There is limited information provided in this report. This case will be reassessed once additional information is available."

positive COVID-19 test with symptoms; positive COVID-19 test with symptoms; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date were not reported), via an

unspecified route of administration on 23Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received her first dose on 23Dec2020 and was subsequently exposed at work to the virus and became symptomatic and tested positive on 31Dec2020. Her next scheduled dose is on Sunday, they may have to reschedule. The patient queried on how long should they delay the next dose. The patient underwent lab tests and procedures which included sars-cov-2 test: positive on 31Dec2020. The outcome of the events was unknown. Information about Lot/Batch number is requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of suspected Covid-19 infection and suspected LOE due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

fainting spell; almost passed out; dizzy spells; weak; This is a spontaneous report from a contactable consumer (patient herself). A 22-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot: EL3246), via an unspecified route of administration on 07Jan2021 in right upper arm shoulder area at single dose for prevent covid. Medical history included ongoing acne. Concomitant medication included doxycycline from 2020 (taking it 6 months ago) and ongoing for acne. Patient stated that she got the Covid vaccine yesterday 07Jan2021 and almost passed out in her kitchen after a couple hours. Patient stated got in shower had dizzy spells and was weak 07Jan2021, she felt better now. Patient stated that she was a small girl of 105 pounds and the dose could have made her sick. She wanted to make sure she did not need to go and be seen. Patent had another spell in shower this morning and stated that the fainting spell and feeling weak started at 9:00 yesterday evening on 07Jan2021. Outcome of dizzy spells was recovering, and outcome of other events were unknown.

Body chills; fever that went up to 100.4 degrees F.; fatigue; excess mucus; bone pain 10/10; muscle pain 8/10; other vaccine same date vaccine date 05Jan2021; This is a spontaneous report from a contactable other health professional (patient). A 66-year-old female patient (not pregnant at the time of vaccination) received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiration date not provided), via an unspecified route of administration on 05Jan2021 at single dose for COVID-19 immunization. Medical history included DM type 2, hypertension (HTN), fibromyalgia, chronic asthma, Covid prior vaccination, No Allergies to medications, food, or other products. Concomitant medications received within 2 weeks of vaccination. Facility where the most recent COVID-19 vaccine was administered at Nursing Home/Senior Living Facility. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Other vaccine same date included other vaccine same date product was Pfizer, other vaccine same date vaccine date 05Jan2021. On 06Jan2021, the patient experienced Body chills, fever that went up to 100.4 degrees F., bone pain 10/10, muscle pain 8/10,

fatigue and excess mucus. No treatment received for the adverse events Body chills, fever that went up to 100.4 degrees F., bone pain 10/10, muscle pain 8/10, fatigue and excess mucus. The events were non-serious per the reporter. Prior to vaccination, the patient was diagnosed with COVID-19. Since the vaccination, the patient hadn't been tested for COVID-19. The outcome of the events Body chills, fever that went up to 100.4 degrees F., bone pain 10/10, muscle pain 8/10, fatigue and excess mucus was recovering. No follow-up attempts are possible. Information about Lot/Batch cannot be obtained.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of bone and muscle pain cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

burning of the tongue; Difficulty in breathing; headaches; Pressure in the chest area; nausea; dizziness; fast heartbeat; tiredness; Had a hard time swallowing at night from the dryness; bitter taste; her mouth went completely dry; patient received 0.45 mL, single dose (225mcg) of PFIZER-BIONTECH COVID-19 VACCINE; This is a spontaneous report from a contactable nurse (patient). A 64-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EJ1685), via an unspecified route of administration on 23Dec2020 15:00 at 0.45 mL, single dose (225mcg) at left arm to prevent COVID. Medical history included a bout of dry mouth about 7 years ago, no other relevant medical history (including any illness at time of vaccination). The patient's concomitant medications were not reported. There's no adverse events following prior vaccinations. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. From the time she got the vaccine her mouth went completely dry on 23Dec2020 and she kept thinking it would go away and she still had it. Event was reported as serious per medically significant. Had a hard time swallowing at night from the dryness. Patient had the bitter taste was also on 23Dec2020, but it went away. It lasted about 5-6 hours. Then after that the dry mouth started right after. It is tolerable but she still had it. Mentioned she had a bout of dry mouth about 7 years ago and it did go away, but she never got a diagnosis for it. Patient thought that something underlying may have triggered it again. Patient also experienced burning of the tongue, tiredness, headaches, pressure in the chest area similar to difficulty in breathing, nausea, dizziness, and a fast heartbeat on unspecified date. Outcome of event dry mouth was not recovered, outcome of event bitter taste was recovered on unspecified date in Dec2020, outcome of other events was unknown. No family medical history relevant to adverse events. No relevant tests. No history of all previous immunization with the Pfizer vaccine considered as suspect. No additional vaccines administered on same date of the Pfizer suspect. The adverse events resulted in neither doctor or other healthcare professional office/clinic visit, nor emergency room/department or urgent care. Relatedness of Pfizer BioNTech Covid-19 vaccine with dry mouth and bitter taste per primary source reporter with method of assessment of global Introspection was related. Reporter seriousness for event bitter taste was not serious.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of dry mouth cannot be excluded, considering the plausible temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures

for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

throat tightness; This is a spontaneous report from a non-contactable other healthcare professional (HCP). An 18-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot EK9231) via an unspecified route of administration on Jan2021 at a single dose in the left deltoid muscle for COVID 19 vaccination. Medical history and concomitant medications were not reported. The patient denied any history of previous adverse reactions to vaccines and denied reaction to her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) for COVID 19 vaccination on an unspecified date. The patient was seen at a COVID vaccine clinic today for her second dose of the COVID 19 vaccination. She was given the Pfizer vaccination in the left deltoid muscle. During her 15-minute waiting period after the injection, the patient began to experience throat tightness on Jan2021. Treatment included: Benadryl 25mg po (orally) and Solumedrol 125mg IM. The event did not result in death, not life threatening, did not caused/prolonged hospitalization, not disabling/incapacitating, did not cause congenital anomaly/birth defect. The outcome of the event was unknown. No follow-up attempts are possible. Information about lot/batch has been obtained. No further information is expected.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of throat tightness cannot be excluded, considering the plausible temporal relationship. Sever allergic reaction is the known risk for the product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

blood pressure skyrocketed, it was 175/110/Very high blood pressure; almost falling down; Severe fatigue; Dizzy/dizziness; Bad headache/severe headache; Neck pain; This is a spontaneous report from a contactable nurse (reporting for herself). An adult female patient (over the age for 60) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration in an unspecified deltoid on 28Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced dizzy/dizziness, bad headache/severe headache, neck pain on 28Dec2020 and almost falling down, blood pressure skyrocketed (175/110)/very high blood pressure and severe fatigue on 29Dec2020 10:00. Clinical details were reported as follows: After the vaccine the patient was there waiting for 20 minutes and when she got in her car, after about an hour after the patient was really dizzy and was driving and was going to get in the next lane and thank God did not get in an accident. The patient parked and called her family to come pick her up. She had a bad headache, neck pain and dizziness that lasted for an hour. Finally, they came in and took me home. The patient slept for 7 hours. 9 hours after, the headache, neck pain, and dizziness were gone. The next day at 10:00 at work the patient almost fell down and one of the coworkers held her. The patients blood pressure skyrocketed, it was 175/110 and the patient was very dizzy again had severe fatigue. Her blood pressure was high for about 2 hours and slowly came down, but the fatigue lasted for almost a week and it slowly got better. The patient underwent lab tests

and procedures which included blood pressure measurement: 175/110 on 29Dec2020 skyrocketed/very high. The outcome of the events was recovered on an unspecified date. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.; Sender's Comments: Based on the time association, the possible contribution of suspect BNT162B2 to the event blood pressure increased cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

exposed to my sister/she did not know she had Covid/I tested positive with Covid test; exposed to my sister/she did not know she had Covid/I tested positive with Covid test; This is a spontaneous report from a contactable other HCP (patient). This female patient of unspecified age reported for herself that she received dose one of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number and Expiration date were not reported) on 21Dec2020 00:00 (at unspecified age) as single dose, unspecified route, for COVID-19 immunisation. Medical history and concomitant medications were not reported. The Patient received the vaccine on 21Dec2020 and was exposed to her sister on 22Dec2020 she did not know she had Covid. Patient tested positive with Covid test on 26Dec2020. Patient is scheduled to get second dose 11Jan2021. Lab data included a positive Covid test on 26Dec2020. The outcome of exposed to my sister/she did not know she had Covid/I tested positive with Covid test was unknown. The lot number for the vaccine BNT162B2 was not provided and will be requested during follow up.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. Efficacy of suspect drug however, is documented 7 days after second dose. Patient has received only the 1st dose.

"old scar that I forgot that I have there, it just swelled up really bad; The injection site looked like ""a small pox vaccine,"" in which appear red and scabby with a blue dot in the middle; The injection site looked like ""a small pox vaccine,"" in which appear red and scabby with a blue dot in the middle; The injection site looked like ""a small pox vaccine,"" in which appear red and scabby with a blue dot in the middle; The injection site looked like ""a small pox vaccine,"" in which appear red and scabby with a blue dot in the middle; Injection site began to itch; Injection site soreness; This is a spontaneous report from a contactable nurse (patient). A 50-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL0142 (also reported as EL0140, pending clarification), expiry date: 03Mar2021 (also reported as 31Mar2021, pending clarification), intramuscular on the right arm on 08Jan2021 06:30 at a single dose for covid-19 immunisation. Medical history included heartburn, hot flashes, Grave's disease (father also has Grave's disease), had a thyroidectomy in Dec2015, menopause, weight loss, and appetite control, allergies, compromised immune status (brother and father side with autoimmune), respiratory illness, genetic/chromosomal abnormalities, endocrine abnormalities (including diabetes) and obesity, and diabetes type 2 diagnosed in 2019 (both parents and brother also with diabetes). Concomitant medications included levothyroxine sodium (SYNTHROID) in Dec2015 for Grave's disease and had a thyroidectomy, esomeprazole sodium (NEXIUM

[ESOMEPRAZOLE SODIUM]) on 02Jan2021 for heartburn, phentermine for weight loss and appetite control, estradiol on 02Jan2021 for hot flashes and menopause, medroxyprogesterone acetate (PROVERA) on 02Jan2021 for hot flashes and menopause, prednisone for unexplained whelps (pending clarification), and cimicifuga racemosa (also reported as black cohosh) for hot flashes. The patient previously took metformin and experienced GI upset (she quit taking metformin/it was causing GI upset because they increased dose/current dose is 1,000mg twice daily increased from 500 mg twice daily) and generic levothyroxine sodium and experienced feels like crap. The patient had no previous history of immunization with the Pfizer vaccine. No additional vaccines administered on same date of the bnt162b2. No prior vaccinations within four weeks. The patient wanted to know if she can receive the second dose of the Covid vaccine after experiencing adverse events. On 08Jan2021, the patient experienced some injection site soreness, in which she took TYLENOL for. Around 14:30, she noticed that the injection site began to itch. Around 16:00, the injection site looked like ""a small pox vaccine,"" in which appear red and scabby with a blue dot in the middle. The patient also reported, ""scar that I have on my arm, it is not a reaction, it is an old scar that I forgot that I have there, it just swelled up really bad."" Event injection site looked like a smallpox vaccine was assessed as serious-other medically important condition. No emergency room or physician's office required. Therapeutic measure was taken as a result of injection site soreness. Outcome of the event injection site looked like a smallpox vaccine was not recovered. Outcome of the events injection site soreness, injection site began to itch, vaccination site erythema, vaccination site scab, vaccination site discoloration, and old scar that I forgot that I have there, it just swelled up really bad was unknown.; Sender's Comments: Based on the time association, the possible contribution of suspect BNT162B2 to the event vaccination site discomfort cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

Dizzy; headaches; flu feeling; side effects she had were like the COVID symptoms she had, like the chills and everything; lethargic feeling; weak; Nausea; the whole left side of her body went numb including even her vagina; left side of her body was so numb and weird and tingly feeling/left leg went numb; whole left side of face swelled up; left eye turned red; pressure in head; felt like someone squeezing her eyeball out; eye went black/left eye looked bruised/blackness around the eyes; whole face went numb/left side of face slightly numb; bells palsy; allergic reaction; This is a spontaneous report from a contactable consumer (patient). A 44-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in arm left on 05Jan2021 at single dose for COVID-19 immunization. Medical history included cutaneous t-cell lymphoma from 2017 and ongoing, ongoing cholesterol, ongoing thyroid, covid-19 from Nov2020 to an unknown date not ongoing (lasted about 1-1.5 months; she did not have any breathing problems) and blood cancer. Concomitant medication included bexarotene ongoing for cutaneous T-cell lymphoma, rosuvastatin ongoing for cholesterol, levothyroxine ongoing for thyriod. The patient underwent lab tests and procedures which included COVID 19: positive in Nov2020, found out tested positive around holiday. Clinical course: onset about 26 hours after administered the first dose; onset as soon as she got back to

work next day: 06Jan2021. The side effects were at their worst for at least 24-48 hours. Further described as all side effects occurred only on left side of her body: whole left side of face swelled up on 06Jan2021; left eye turned red on 06Jan2021; whole face went numb/left side of face slightly numb on 05Jan2021; eye went black/left eye looked bruised on 05Jan2021; pressure in head on 06Jan2021; felt like someone squeezing her eyeball out on 06Jan2021, within the first 24-48 hours, her 'left leg went numb'. She called to talk to physician and nurse who advised her to take Benadryl; which she did take and the Benadryl stopped the side effects; but she could not take a lot of Benadryl or anything because she was at work. She stayed at work because at least there were healthcare professionals, adults in case she passed out; at home she has 7 young children and is also raising her grandchild. The side effects did not completely go away. The arm thing was normal; The next day she was at work and had the swelling on left side of face; blackness around the eyes; arriving home she had headaches on 07Jan2021 and then her leg went numb for like 20 mins; the whole left side of her body went numb including even her vagina; left side of her body was so numb and weird and tingly feeling that she started panicking because she was driving on 06Jan2021. She calmed herself down thinking it's only the left side; you can drive with your right side to get home and be fine. It was more like left side of her body was asleep, tingling, she has never had that happen before. Everything else like the headache, flu feeling was about 48 hours later (on 07Jan2021). She had COVID already back in Nov2020 for about 1-1.5 months; the next side effects she had were like the COVID symptoms she had, like the chills and everything on 06Jan2021. She had the lethargic feeling again, her head was hurting, she felt extremely weak on 06Jan2021. Patient also felt nausea on 06Jan2021, Dizzy on 08Jan2021. Another doctor said it sounded like the side effects she experienced with the vaccine sounded like allergic reaction or Bell's palsy. Patient was asking the doctor if she could get like an Epi-pen or prescription Benadryl or something because she is afraid to get the second dose of Pfizer COVID-19 Vaccine and not have something to respond to side effects with. The outcome of event whole face went numb/left side of face slightly numb was recovered on 07Jan2021, for headaches was recovering, chills and nausea was recovered on 08Jan2021. Outcome of other events was unknown. Information about lot/batch number has been requested.

"felt like she had Covid; felt like she had Covid; stomach cramps; chills; aches; not feeling good; temp was around 101- 101.6/fever 102; Icy hot sensation; lethargy; arm was red and swollen; arm was red and swollen; This is a spontaneous report from a non-contactable nurse (patient). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. Medical history included covid-19 from Jul2020. The patient's concomitant medications were not reported. The patient got her injection on Tuesday (specified date unknown) at 3pm. Felt good but then woke up with stomach cramps. She went to work and at around 1pm she started having chills, aches and not feeling good at 4:30 pm her temp was around 101- 101.6 so she took Tylenol went to bed. She woke up with fever 102 and felt like she had Covid all over again reporting that she had covid in Jul. Having what she has heard described as ""Icy hot sensation"" and lethargy and not feeling good with chills aches. Then on Thursday her arm was red and swollen with the redness expanding swelling and her fever was going back up. The outcome of the events was unknown. No follow-up attempts are possible. Information about lot/batch number cannot be obtained. No further information is expected.; Sender's Comments: Based on the information currently available, the local reactions and flu like symptoms following

vaccination with BNT162B2 are more likely attributed to the vaccine use. Further information like diagnostic detection of virus genetic material or virus protein antigen needed for meaningful medical assessment on protective effects with the vaccine."

"convulsive chills, fever- (high); convulsive chills; fever- (high); all of my muscles and joints were flaring in extreme pain; all of my muscles and joints were flaring in extreme pain; I could NOT move my vaccine arm more than 3 inches and my whole body hurt; my vision was extremely blurry; When I tried to walk, it was slow; achy/whole body hurt; tired, and took a nap; This is a spontaneous report from a contactable consumer (patient). A 54-year-old female patient (no pregnant) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL0142) via an unspecified route of administration on the left arm on 05Jan2021 11:00 AM at single dose for COVID-19 immunisation. Medical history included having Covid the 3rd week in Mar2020, Positive for Antibodies in early May2020. Fairly sick but not emergency situation ""Long haulers"" covid symptoms that continued through Nov2020. Patient still had skin pain. Other medical history included hashimoto's. Past drug event included known allergy to codeine. The patient's concomitant medications included 25 mg of Levothyroxine in two weeks. No other vaccine in four weeks. On 05Jan2021 at 12:30, patient felt achy, tired, and took a nap. By 2:00ish. The patient's vision was extremely blurry and continued for 2 days. At 05Jan2021 8 pm- 6 hours later of convulsive chills, fever- (high) and all of her muscles and joints were flaring in extreme pain. Patient could not move vaccine arm more than 3 inches and whole body hurt as if she had been hit by a train. When patient tried to walk, it was slow. Patient groped walls for support. Patient had a televisit with a doctor friend who said this was not a normal side effect and go to emergency room (ER). Doctor or other healthcare professional office/clinic visit. Covid test post vaccination included nasal swab, Covid -19 diagnostic on 08Jan2021 with pending result. No treatment received for events. The outcome of convulsive chills fever was unknown. The outcome of other events was recovered in Jan2021."

tunnel vision; experienced a sudden onset of vertigo; presyncope; My hands became cold and numb; My hands became cold and numb; fatigue; sore arm, leg/thigh aching; sniffles; sore throat; brief dry cough; slight headache; neck ache; This is a spontaneous report from a contactable Nurse (patient). A 34-year-old non-pregnant female patient received the first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular on 05Jan2021 at 12:30 at single dose in left arm for covid-19 immunization. Medical history included Mild ADHD/ADD. The patient's concomitant medications were not reported. Approximately 5 minutes after receiving vaccination, she was standing in the observation room (where they had all of them stay for at least 15 minutes to ensure no severe reactions) and experienced a sudden onset of vertigo, tunnel vision and pre-syncope. Her hands became cold and numb and she was trying to talk to another staff member who was arranging/scheduling her second vaccination dose at the same time when this event occurred, but it subsided quickly and she started to feel normal again. All these events occurred at 12:45 on 05Jan2021. She reported this event right away and they had her stay in the room longer. She was stable at that point but experienced these symptoms again but very mildly twice more while she walked back to her car to go home. Other side effects on 05Jan2021 that started in the evening and for the following 2-3 days included fatigue, sore arm, leg/thigh aching, sniffles/sore throat, brief dry cough and slight headache/neck ache. Very mild and tolerable symptoms. All events

were reported as non-serious by reporter. The patient did not receive treatment for the events. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination, and the patient has not been tested for COVID-19 since the vaccination. The outcome of all events was resolved in Jan2021. Information on the lot/batch number has been requested.; Sender's Comments: Based on temporal association, a possible contributory role of BNT162B2 cannot be excluded for reported events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Experienced vasovagal syncope after standing, resulting in fall; Experienced vasovagal syncope after standing, resulting in fall; Awoke with severe chills; nausea; body/muscle aches; body/muscle aches; left arm pain; extreme thirst; fatigue; This is a spontaneous report from a contactable consumer. A 44-year-old female patient (non-pregnant) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot: EK9231), via an unspecified route of administration on 08Jan2021 14:30 in left arm at single dose for covid-19 immunization. There was no medical history and concomitant medications. Allergies to medications, food, or other products was no. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The most recent COVID-19 vaccine was administered was in hospital. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. On 09Jan2021 01:30 am, patient woke with severe chills, nausea, body/muscle aches, left arm pain, nausea, extreme thirst. Patient experienced vasovagal syncope after standing, resulting in fall. Worst symptoms were lasted about 30 minutes, muscle aches and fatigue continue about 16 hours later. All events were reported as non-serious. No treatment was received for these events. Outcome of all events were recovering.

foggy minded; on first vaccine it made him feel a little sluggish; tired; This is a spontaneous report from a contactable pharmacist. A 36-year-old male patient started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730), intramuscular from 18Dec2020 to 18Dec2020 at SINGLE DOSE for COVID-19 immunisation. Medical history included ADHD. Concomitant medication included amfetamine aspartate, amfetamine sulfate, dexamfetamine saccharate, dexamfetamine sulfate (ADDERALL) and escitalopram oxalate (LEXAPRO). On an unspecified date, the patient stated that on first vaccine, it made him feel a little sluggish, tired and foggy minded. Outcome of the events was unknown.; Sender's Comments: Based on temporal association, a possible contributory role of suspect BNT162B2 cannot be excluded for event mental dullness. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

partial complex seizure; I lost muscle tone and collapsed; severe LUE weakness; severe pain; aura; I lost muscle tone and collapsed; This is a spontaneous report from a contactable other health care professional (HCP) reporting for herself. A 40-year-old female not pregnant patient received first dose of

BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in the Left arm on 30Dec2020 h 05:00 PM at single dose for COVID-19 immunisation, lot number: EH9899. Patient did not receive any other vaccines within four weeks prior to the vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. Medical history included epilepsy (well controlled with medications) and she was allergic to phenytoin (DILANTIN). Concomitant medications in two weeks prior to the vaccination included carbamazepine, lamotrigine (LAMICTAL) and fluoxetine. It was reported that on 31Dec2020 h 14:00 (also reported as approximately 22 hours after vaccine) patient experienced severe left upper extremity (LUE) weakness and severe pain. She then experienced an aura and had a partial complex seizure. Patient lost muscle tone and collapsed. The episode lasted approximately 1.5 minutes, no treatment was given. Patient was tested for Covid post vaccination, she underwent Covid-19 PCR Test (Nasal Swab) on 04Jan2021 and on 07Jan2021, both with negative results. She also underwent a Covid-19 PCR Test on unknown unknown date in Jan2021 with unknown results. Patient recovered on 31Dec2020 from the events.; Sender's Comments: There is not a reasonable possibility that the reported events were related to the suspect product event most likely due to patient underlying contributory factors. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators as appropriate.

spontaneous rupture of membranes at 36-0 weeks; Pregnant at the time of vaccination?: Yes; This is a spontaneous report from a contactable physician. This physician reported information for both mother and fetus/baby. This is the maternal report. A 29-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular (left arm) on 18Dec2020 and 08Jan2021 at a single dose for COVID-19 immunization. Medical history included cold sores, no active cold sore at time of labor. On an unspecified date, it was reported that a healthy 29-year-old G1P0 with good prenatal care and no pregnancy complications who had spontaneous rupture of membranes at 36-0 weeks, one day after her second Pfizer CoVid vaccine (09Jan2021). She felt well after her vaccine and had no symptoms today. The mother reported she became pregnant while taking BNT162B2. The patient takes prenatal vitamins. The mother was 33 Weeks pregnant at the onset of the event. The mother was due to deliver on 06Feb2021. Therapeutic measures were taken as a result of premature rupture of membranes. The outcome of the event was recovering. Information about Batch/Lot number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported event of spontaneous rupture of membranes due to temporal relationship. However, the reported event may possibly represent intercurrent medical condition in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any

appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Within 15 minutes, I began feeling dry throat; Within 15 minutes, I began feeling dry throat, then itching, then it felt like I had a lump inside my throat.; it felt like I had a lump inside my throat.; Then I began to have difficulty swallowing my saliva.; difficulty breathing; very groggy; This is a spontaneous report from a contactable pharmacist. A 47-year-old female patient received the first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EL0140), intramuscular in left arm on 20Dec2020 at a single dose for COVID-19 immunization. Vaccination was administered in a hospital. Prior to vaccination, the patient was not diagnosed with COVID-19. Medical history included hypertension, overweight, and known allergies to bee stings and hair dye. The patient's concomitant medication included multivitamins. On 20Dec2020, within 15 minutes, the patient began feeling dry throat, then itching, then it felt like she had a lump inside her throat. Then she began to have difficulty swallowing her saliva. And then the lump inside her throat started to feel larger and larger. By this time, the doctor had already injected the patient with Epipen and the pharmacist injected her with Solumedrol and she still felt as if she was having difficulty breathing and then she was taken to ER and she really can't remember too much after that. The patient was very groggy and then was discharged from ED about 9:30 pm. The outcome of the events was recovered on an unknown date. Treatment for the events included epinephrine, methylprednisolone, diphenhydramine. Since the vaccination, the patient has not been tested for COVID-19.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of feeling dry throat, itching, felt like having lump inside her throat, having difficulty swallowing saliva, difficulty breathing and very groggy cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. Severe allergic reaction is the known risk for the product. The underlying predisposing condition of allergies to multiple materials may put the patient at high risk of anaphylactic reactions. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

significant swelling to lymph nodes under armpit of injection side (L arm); This is a spontaneous report from a contactable consumer. A 26-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK9231), via an unspecified route of administration at the left arm on 09Jan2021 08:00 at SINGLE DOSE for COVID-19 immunization at a hospital. Medical history included asthma, food allergy with peanuts and pine nuts. No known medication allergy. The concomitant medications included albuterol and unspecified multivitamin. The patient previously took the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899) at the left arm on 19Dec2020 08:00. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination and was not tested for it since the vaccination. The patient was not pregnant. On 10Jan2021 16:00, the patient noted significant swelling to lymph nodes under armpit of injection side, swelling in the left armpit lymph nodes began approximately 32 hours after injection. Swelling measuring approximately size of a ping pong ball. At

time of this reporting (approximately 40 hours post-injection) lymph node swelling still persists, with no change in size. The patient did not receive any treatment for the events. The patient has not recovered from the events. No follow-up attempts are needed. No further information expected.

Patient was tested for Covid post vaccination/ Covid test on 28Dec2020 and resulted positive; Patient was tested for Covid post vaccination/ Covid test on 28Dec2020 and resulted positive; This is a spontaneous report from a contactable healthcare professional (patient). A 40-year-old female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK7530) solution for injection, intramuscular on left arm on 16Dec2020 12:00 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient was not pregnant. It was reported that patient was tested for Covid post vaccination. Nasal swab for Covid test was done on 28Dec2020 and resulted positive. Outcome of the event was unknown. No follow up attempts are possible. No further information is expected.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient cannot be completely excluded.

had a metallic taste; turned to swollen tongue; hives around chest and neck; difficult to breathe; tachycardia; This is a spontaneous report from a contactable other HCP (Patient). A 33-year-old non-pregnant female received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number=EL 3248), via an unspecified route of administration at right arm on 07Jan2021 16:15 at single dose for covid-19 immunization. Vaccine was administered at hospital. Known allergies included cyclobenzaprine and dairy latex. Concomitant medication included amfetamine aspartate, amfetamine sulfate, dexamfetamine saccharate, dexamfetamine sulfate (ADDERALL) 10 mg, gabapentin 300 mg, venlafaxine 150 mg. No other vaccine in four weeks. Three minutes after vaccination the patient had a metallic taste, turned to swollen tongue, hives around chest and neck, difficult to breathe, and tachycardia on 07Jan2021 16:18. The events resulted in Emergency room/department or urgent care. Treatment received included Epinephrine, methylprednisolone sodium succinate (SOLU-ME dork) and famotidine (PEPCID) also diphenhydramine HCl (BENADRYL). The outcome of the events was unknown.; Sender's Comments: Based on temporal association, a possible contributory role of suspect BNT162B2 cannot be excluded for events metallic taste, swollen tongue, hives, difficulty breathing and tachycardia. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

tested (COVID-19 virus test) positive after receiving first dose of vaccine; tested (COVID-19 virus test) positive after receiving first dose of vaccine; This is a spontaneous report from a contactable pharmacist. A patient of unspecified age and gender received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiration date not provided) via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunisation. Patient's medical history and concomitant medications were not reported. It was reported that patient tested (COVID-19 virus test) positive after receiving first dose of vaccine. It was also reported that they are looking for administration recommendations following receipt of monoclonal antibodies and interval information. Outcome of the

events was unknown. Information of the lot number/batch number was requested.; Sender's Comments: A causal association between reported event and suspect BNT162B2 cannot be excluded.

really extreme high blood pressure (202/104); feeling very sick; This is a spontaneous report from a contactable consumer (patient). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration, on 04Jan2021 at a single dose for COVID-19 immunization. Medical history included strokes and bleeding disorder (gene that makes blood clot). The patient's concomitant medications were not reported. The patient experienced really extreme high blood pressure (202/104) and feeling very sick on an unspecified date. The clinical course was reported as: The patient received the vaccine on 04Jan2021 and experienced a lot of side effects, the most concerning of which was really extreme high blood pressure. The patient went to the emergency room (ER) on an unspecified date and her blood pressure was 202/104 on an unspecified date. The patient stated that she had been very sick and in bed for days. The patient had a follow-up appointment with her doctor on the day of the report. The clinical outcome of really extreme high blood pressure (202/104) and feeling very sick was unknown. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.

tested positive for COVID; tested positive for COVID; This is a spontaneous report from a contactable nurse (patient). A 64-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730, expiration date: 31Mar2021), via intramuscular on 21Dec2020 at 0.3 mL single in left deltoid for preventative. Medical history included she only had one kidney from 25Feb2020. There were no concomitant medications. It was reported that the patient was supposed (was scheduled) to get her second dose today (11Jan2021) but this past weekend she tested positive for COVID on 09Jan2021. The patient wanted to know if it would affect getting the second dose of the vaccine. The patient supposed to be quarantining right now and she was not symptomatic. On 09Jan2021 she found out she was positive for covid. The outcome of the event was unknown.; Sender's Comments: A causal association between reported event and suspect BNT162B2 cannot be excluded.

he is infected with COVID-19; he is infected with COVID-19; This is a spontaneous report from a contactable nurse (patient). A male patient of an unspecified age received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient called to find out if there should be a delay in the second dose because he was infected with COVID-19 on an unspecified date. His second dose was scheduled on 13Jan2021 and he was wondering if he should continue in 2 days. Outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient cannot be completely excluded.

she had a little bleed in the blood vessel of her left eye; This is a spontaneous report from a contactable other healthcare professional (patient). A female patient of unspecified age received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiration date not provided), via an unspecified route of administration on 21Dec2020 at single dose for COVID-19 immunization. The

patient's medical history and concomitant medications were not reported. The patient asking if bleeding of the eye was an adverse reaction to bnt162b2. Patient received the Covid vaccine on 21Dec2020 and on the 27Dec2020, she had a little bleed in the blood vessel of her left eye. She was supposed to get the second vaccine today (11Jan2021) at 12:30. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported event cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

"got the first dose of the vaccine and on 25Dec2020, he started getting symptoms of possible covid; got the first dose of the vaccine and on 25Dec2020, he started getting symptoms of possible covid; This is a spontaneous report from a contactable pharmacist. A 7-decade-old (65 years or 66 years) male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 25Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The stated, ""my uncle got the first dose of the vaccine and on 25Dec2020, he started getting symptoms of possible Covid. He got tested for covid today (11Jan2021). He's supposed to get the second dose on 15Jan2021. If he is positive for covid, what does that mean for his second dose? If he is positive, and waits for quarantine, then he wouldn't be able to get the second dose until day 36."" The outcome of the events was unknown. Information on the Lot/Batch Number has been requested.; Sender's Comments: A causal association between reported event and suspect BNT162B2 cannot be excluded."

On (Dated) tested positive for Covid; On (Dated) tested positive for Covid; On (Dated) tested positive for Covid; Felt run down; This is a spontaneous report from a contactable other health professional (HCP). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 28Dec2020 at a single dose (first dose) for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient got her first dose on 28Dec2020 and on 07Jan2021, she felt run down so she decided to get tested for COVID. On 09Jan2021, she tested positive for COVID. Her second dose is due 18Jan2021 and she needed to know if it is ok for her to get her second dose. The patient underwent lab tests and procedures which included sars-cov-2 test: positive on 09Jan2021. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The association between the event lack of effect (tested positive for COVID) with BNT162b2 can not be completely excluded.

Caller tested positive on 05Jan2021.; Caller tested positive on 05Jan2021.; Caller tested positive on 05Jan2021.; This is a spontaneous report from a contactable physician (patient). A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 29Dec2020 at a single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. Patient received the first dose of the COVID 19 vaccine on 29Dec2020, second dose is due on 20Jan2021. Patient tested positive on 05Jan2021. Patient wanted

to know if he should get the second shot and if he chooses to wait the 90 days, would he need to start over. The patient underwent lab tests and procedures which included sars-cov-2 test: positive on 05Jan2021. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The association between the event lack of effect (tested positive) with BNT162b2 can not be completely excluded.

13 people, who were applied the vaccine previously, were corona positive after a week; 13 people, who were applied the vaccine previously, were corona positive after a week; This is a spontaneous report from a non-contactable consumer. This consumer reported similar events for 13 patients. This is second of 13 reports. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; lot number and expiration date: not known), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that 13 people, who were applied the vaccine previously, were corona positive after a week on an unspecified date. The outcome of the events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021018407 same reporter, similar suspect drug and event; different patient

She tested positive for Covid-19 a week later after receiving the first dose of the vaccine; She tested positive for Covid-19 a week later after receiving the first dose of the vaccine; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs) received from a contactable consumer (patient). A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot/batch number unknown), via an unspecified route of administration on 29Dec2020 at a single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient took the first dose of Covid-19 vaccine on 29Dec2020. She tested positive for Covid-19 a week later after receiving the first dose of the vaccine. She is scheduled to get the second dose on 19Jan2021 and she was asking what to do. The outcome of the event was unknown. Information about lot/batch number has been requested.

tested positive for COVID; tested positive for COVID/fatigue, headache, body aches again; allergies were flaring up; Coughing; congestion; body aches; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A contactable nurse (female) reported that a female patient of an unspecified age received first dose of bnt162b2, via an unspecified route of administration on 21Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced tested positive for covid on 31Dec2020, coughing, congestion, body aches on 24Dec2020, fatigue, headache, allergies were flaring up on 28Dec2020. The caller got her first COVID-19 injection on 21Dec2020. She didn't have symptoms until 2 days after the vaccine. She then experienced coughing, congestion, body aches, but no fever. Then the next day, she felt fine. On 28Dec2020, she thought her allergies were flaring up. She started to feel fatigue, headache, body aches again. She went and got tested for the virus. She tested positive on 31Dec2020. Caller was due for a second vaccine on 11Jan2021. She was to remain in quarantine until 10Jan2021. Caller wanted to know should she get her second shot on 11Jan2021 or should she wait. The patient underwent lab tests and procedures which included Covid-19: positive on 31Dec2020. The outcome of events for tested positive for covid, fatigue, headache and allergies were flaring up was unknown, for other events was resolving. No further information was obtained. Information on lot/batch number has been requested.; Sender's Comments: A causal association between BNT162B2 and the events drug ineffective and COVID-19 cannot be excluded based on a compatible temporal relation between vaccination and onset of events.

short of breath; aching so bad again; was still short of breath, getting worse, aching so bad again; choking; got as cold as ice; throat was real swollen; started itching terribly; This is a spontaneous report from a contactable consumer (patient). A 73-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EK4176), via an unspecified route of administration

on 06Jan2021 single for COVID-19 immunization. Medical history included hypertension and had 4 heart attacks. The patient's concomitant medications were not reported. The patient just had the Covid 19 Vaccine first shot. After the shot he went to the dining room to get some lunch. He was reading since 'calculative'. He started itching terribly. Onset date for started itching terribly was reported as 06Jan2021. He got as cold as ice. He started getting real short of breath, he was choking but he managed to get them out of his throat. His throat was real swollen and choked. He went back to the clinic and the Nurse took him straight to the emergency room. He was there in his wheelchair freeze in and crawling himself, struggling to breathe for almost 25 minutes before the Nurse finally came in and helped him get him on the stretcher. She took his time, she got the IV started and gave him a steroid a shot and Benadryl. He did not know the dosage and some capsules. He did not know why the capsules and he was still struggling for a while but he found day tough for about an hour. When he came too he was still short of breath, getting worse, aching so bad again. He was struggling to breathe, he was still having some breathing problem, some choking and aching. The events was still short of breath, getting worse, aching so bad again were serious as hospitalization. Laboratory work: Work was normal. The COVID Test was negative. The outcome of events short of breath and started itching terribly was not recovered while for other events were unknown.

dehydration; This is a spontaneous report from a contactable Nurse. A patient of unknown age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on an unknown date at single dose for COVID-19 immunisation. Medical history and concomitant medications were unknown. After vaccination on an unknown date, the patient went to ER and was diagnosed with dehydration. Patient was hydrated and recovered. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

died two days after receiving the vaccine; Fever; This is a spontaneous report from a contactable consumer (patient's stepchild). A 66-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration, on 07Jan2021 (at the age of 66-years-old) as a single dose for COVID-19 immunization. The patient's medical history was not reported. Concomitant medications included an unspecified statin. The patient experienced fever on 08Jan2021. The patient died two days after receiving the vaccine on 09Jan2021, which was reported as fatal. The clinical course was reported as follows: The patient had a fever the day after getting the vaccine and then he just died in the middle of night. It was reported that it was not clear what exactly happened, but they are looking into this. The clinical outcome of fever was unknown and of died two days after receiving the vaccine was fatal. The patient died on 09Jan2021. The cause of death was not reported. An autopsy was not performed (was reported to be taking place soon). The batch/lot

number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Reported Cause(s) of Death: died two days after receiving the vaccine

Pt. with dizziness, then Afib with RVR, then massive cerebral hemorrhage Pt. non oriented & unable to give history - History provided by S.O and daughter

Accelerated decline in condition with decreased input, decreased responsiveness, somnolence, and death

Received vaccine in left deltoid within minute felt throat tighten self administered personal epi pen.

I had no side effects after my vaccine on 12/24/20 until 1/8/21. On Friday, 1/8/21 at 830pm I began with severe abdominal pain, low grade fever, nausea and loss of appetite. My abdominal pain persisted and worsened over the next 24-36hours. I presented to the ER on Sunday, January 10, 2021 at 8am with severe right lower quadrant pain, pelvic pain, nausea and low grade fever. I was promptly diagnosed with appendicitis and taken to the OR at approximately 2pm on the same day. In the OR my appendix was gangrenous, there was pus in the pelvic area nd fluid in my peritoneum. My appendix was not ruptured. My appendix was removed as well as part of the omentum. I remained in the hospital on IV Metronidazole and Ciprofloxacin for 2 days and was discharged on 1/13/21 at 9pm. I am continuing to recvoer at home on the same 2 antibiotics in oral form. I have a JP drain that is still in place. Of note I had two negative COVID 19 tests on 1/9/21 and 1/10/21. Both were PCR tests.

Tingling and throat swelling to Moderna COVID-19 Vaccine EUA

Patient had no immediate effects from the vaccine, but died approximately 8 hours after receiving first dose of vaccine.

positive for Covid; positive for Covid; This is a spontaneous report from a contactable healthcare professional (patient). A 48-years-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EH9899, expiration date unknown), via an unspecified route of administration in right deltoid, on 18Dec2020 07:15 at a single dose for Covid-19 immunization. Medical history included ongoing hypothyroidism and hysterectomy. Concomitant medications included estradiol (taking after hysterectomy) and levothyroxine for hypothyroidism, both ongoing. The patient has no any other vaccinations within four weeks prior to the first administration date of the suspect vaccine. The patient stated that she received the Covid vaccine mid- Dec2020. She stated she was supposed to receive the 2nd dose 2 days ago, 06Jan2021. On 03Jan2021, she started feeling bad the day before testing positive, went to urgent care to be tested, thought she had the flu. She tested positive for Covid on Monday 04Jan2021, so she has been in quarantine. She was unable to receive her 2nd dose because she was in quarantine. She wanted to know if it's ok to delay the second dose or if she needs to re-start the series. The reporter assessed the event relatedness was unknown, patient stated that she doesn't know the causality, she has not been in contact with anyone that was known to be positive, but she is a healthcare worker who sees multiple patients a day, so one of them could have been asymptomatic. Outcome of the events was not recovered.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the

events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available.

received first dose of bnt162b2/by the 3rd (03Jan2021), he was diagnosed as covid positive; received first dose of bnt162b2/by the 3rd (03Jan2021), he was diagnosed as covid positive; patient lost his sense of smell and taste; patient lost his sense of smell and taste; This is a spontaneous report from a contactable nurse (patient). A male patient of an unspecified age received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiration date not provided), via an unspecified route of administration on 17Dec2020 at SINGLE DOSE for COVID-19 immunisation. Patient's medical history and concomitant medications were not reported. The patient reported he needs advice on the second dose of the vaccine. Patient stated he is an ER nurse and received the first dose of the vaccine on 17Dec2020. On 31Dec2020, patient lost his sense of smell and taste and by the 3rd (03Jan2021), he was diagnosed as covid positive. The patient underwent lab tests and procedures which included Covid test: positive on 03Jan2021. The patient is asking how safe it is to get the second dose now and if there's a time period that he should wait so that he can get the second dose. Outcome of the events was unknown. Information about lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient cannot be completely excluded. Further information like diagnostic detection of virus genetic material or virus protein antigen needed for meaningful medical assessment.

"she tested positive for COVID-19 on Monday 27Dec2020; she tested positive for COVID-19 on Monday 27Dec2020; This is a spontaneous report from a contactable nurse (patient herself). A female patient of an unspecified age received her first dose of bnt162b2 (BNT162B2 also reported as Pfizer-Biontech Covid-19 Vaccine, lot/batch number and expiry date not reported), via an unspecified route of administration on 19Dec2020 at single dose, for Covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient was scheduled for her second dose today 09Jan2021. However, she tested positive for COVID-19 on Monday, 27Dec2020. She stated that she has still some of the symptoms of COVID-19 even though she has been declared fit to work. She was asking if she could take the second dose today. Information about batch/lot number has been requested.; Sender's Comments: Based on available information, a possible contributory role of BNT162B2 cannot be excluded for reported event ""she tested positive for COVID-19""."

Resident was found without a pulse and not breathing 20 minutes after vaccine administration. Upon MD review, no signs of anaphylaxis were noted.

About 10 minutes after getting my vaccine I noticed the roof of my mouth itching as well as my tongue and back of my throat. I waited to see if it would go away and then a couple minutes later noticed my lips started itching and swelling and from there it just got worse. I told the nurse practitioner that I think I was having a reaction, she had me take a seat told her my entire mouth throat & lips felt swollen and itching and she looked and said it was full blown anaphylaxis reaction. Administered EpiPen, benadryl and called ambulance where they took me to medial emergency department.

Patient had just recovered from COVID and ended quarantine on 1/1/21. On 1/4/21, she received the first COVID vaccination. While driving home on 1/6/21, she experienced an MI diagnosed in the emergency room 30 minutes later. She was admitted to the hospital and underwent a heart catheterization and received a STENT. She had previous cardiogenic shock in 2003.

Pfizer-BioNTech COVID- 19 Vaccine EUA Received communication that patient experienced a stroke and received alteplase at a non-facility (Medical Center) 5 days after receiving COVID-19 vaccination.

increase weakness and fatigue, weakness in extremities, incontinent, jerky arm movements, within first 24 hours, continue to decline sent to hospital returned weaker, within 24 hrs hours BP dropped, low pulse oximeter reading, diaphoretic, lung sounds diminished, loss consciousness and passed away. 01-12-2021

01/11/2021- Found lying on bed in apartment, incontinent, lethargic, unable to respond to questions, unable to do hand grasps. sent to hospital. 01/14/2021- remains in hospital- confusion and disorientation continues, poor verbal skills, limited ability to feed self, out of bed to sit in chair. uncertain of return to facility status.

Abdominal pain, Headaches, chest pain, loss of appetite, confusion, elevated liver enzymes 1/8-1/15/21

01-09-2021 Very confused, nauseous, sweating profusely. sent to hospital- admitted with encephalitis, severe cognition decline. 01-13-2021 still in hospital, cognition Improved.

Death Chest pain; irreg heart rhythm; evening of vaccine; death on toilet on 1/13/21

Initially headache and body aches. Within 24 hours developed chest pain, dyspnea on exertion and shortness of breath. Patient still currently hospitalized.

Patient reportedly expired the day following receipt of the vaccine.

Observed in her room having seizure activity and unresponsive to stimuli. BP of 200/120, oxygen level dropped to 86%, HR was 116. She was transferred from Hospital A and later transferred to Hospital B and placed on a ventilator. This remains her current status

We (myself and 2 other pharmacists) were conducting a COVID-19 vaccine clinic. The patient is on staff at the clinic and came in for her 1st dose of the Pfizer/BioNTech COVID vaccine. 10 minutes post-vaccination, patient started experiencing SOB, tingling fingers and face, and swelling of her lips and tongue. She moved herself outside to cooler air and then sent someone back inside to ask us for help. I ran outside with an EpiPen and immediately noted her pulse of 158 on her watch and she appeared to be experiencing an anaphylactic reaction. Patient stated she did not want to use the EpiPen but wanted to try chewing Benadryl instead first. I asked the staff for a blood pressure monitor and pulse oximeter. The 1st readings, approximately 12 minutes after vaccination, were HR 158, BP 155/105, and pulse ox 97%. Patient stated the Benadryl was working and her swelling was decreasing. The patient was not having trouble breathing at the time. I continued monitoring vitals and talking with the patient and approximately 20 minutes post-vaccination, she was improving (BP down to 134/80 and HR 120) but

agreed we should call 911. She decided she wanted to move inside and lie down. I escorted her with support to a bed. Her vitals then increased again to BP 152/95 and HR 133 and her lips and tongue started swelling again. The patient appeared to be more labored in breathing then but still refused the EpiPen. Roughly 5 minutes after lying down, the medics showed up and took over and I went back to the vaccination area. I learned later that the patient refused to go to the hospital and after more observation was eventually allowed to leave with a friend/coworker driving her home.

Patient was at work on 1/15/21 after having received the vaccine on 1/12/21. She complained of being diaphoretic and her heart rate was 156. She was taken to Hospital. She is being admitted to hospital and has reported that her heart rate is 122 and she has a temperature of 99.4 and elevated lactic acid levels.

1/5/2021 0718 Pt received 2nd COVID vaccine 1/4/21. Oral temp 100.6, near syncope, muscle aches and head aches. Per EMS NSR, denies SOB, and chest pain. 500 ml bolus received in route. In ED, Pt c/o nausea. Pt anxious, sweating and uncomfortable. 0855 Pt resting comfortably, reports decease in pain/body aches 4/10. 1043 Discharge disposition: home. Accompanied By: self. Mode: walk. --Hospital

Expired on 1/12/2021; unknown cause of death

We got a call from a home health nurse Brandu Talamo, stating that the patient passed away.

5-6 HOURS AFTER VACCINATION. CONVULSIONS/SEIZURE, HIGH BLOOD PRESSURE, INCREASED HEART RATE,

Severe pain at injection site with some swelling, lethargy, and fever to 101.6 degrees F the day after the injection. He was given acetaminophen, which reduced fever to normal. Low grade fever (99-100 degrees F) two days after vaccine. On the third day after vaccine, on 12/31, he became confused and anxious. Temperature was 104.8 degrees F. He was given acetaminophen and oral hydration overnight. He continued to have a fever to 102 on the following day and was taken to the ED. He was COVID-positive and admitted to the hospital for treatment of COVID-19.

Initially started as shortness of breath followed by fevers, aches, muscle cramps. Ultimately ended up in the hospital with hypoxemia, pleural effusions. Laboratory values showed evidence of acute renal insufficiency, eosinophilia. Physical exam consistent with pulmonary edema and lower extremity macular rash. Entire presentation concerning for DRESS syndrome

Resident had lunch on 01/14/21 and after lunch around 2:00pm, he vomited and stopped breathing. We coded the resident and 911 paramedics came. They pronounced him dead at 2:18pm.

Around 00:50am on 01/15/21, C.N.A. reported that the resident looked different and not responding. Initiated Code Blue and started CPR. 911 arrived and pronounced resident dead at 1:01 am.

"The patient stated "" I just feel Blah"". vital signs obtained. 156/75 p-84 spo2 94% via NC 2L. T-96.7, c/o feeling restless, c/o nausea with no vomiting. Patient observed at 0600 nonresponsive, CPR initiated, and EMS notified Patient expired"

Received Pfizer vaccine, first dose on Wed. 01/13/21 between 12 and 1 P.M. Thurs. 01/14/21 in the afternoon he began to note that he had difficultly walking. Went to bed when he woke up at 5:48 A.M. he reported he had ataxia. Patient reported having to walk in tiny steps to stay upright. He went to the emergency room. Had CT scan of head and found blood clots. MRI performed. Stroke found in right PCA territory, but no loss in strength in left lower extremity. Sensation and vision intact. Strength in all four extremities is 5 out of 5.

At 6 days after my second COVID-19 Pfizer vaccine (first dose given 12/17/20), I had acute onset of chest pain and shortness of breath prompting a trip to the Emergency Department. A chest CT Angio to rule out pulmonary embolus was done and negative for pulmonary embolus. My EKG showed some mild ST changes and a troponin I level was elevated at 0.08 (normal 0.04). Subsequent troponin levels 90 minutes apart showed a rising troponin at 0.18 and 0.38. An echocardiogram was performed which showed regional wall motion abnormalities consistent with Takotsubo cardiomyopathy and an ejection fraction of 45%. I was then taken to cardiac catheterization lab for coronary angiograms which were normal. My LV angiogram was consistent with Takotsubo cardiomyopathy and my LVEDP was elevated. I was started on a beta blocker and sent home the following day.

This patient has been under hospice care for over 2 years at the nursing home. She has had a steady decline with gradual weight loss. She was totally dependent in her care needs. She received the vaccine on 1/2/2021 as part of the facility vaccination campaign. No adverse events noted initially. On 1/3/2021 at 6:06 pm, she was noted on vital sign checks (done every 4 hours for first 72 hours after vaccination) with BP 64/52 but otherwise asymptomatic. Subsequent BP improved. On 1/4/2021 at 4:45 am, pt found with respiratory rate of 30 with otherwise normal vital signs. Tachypnea persisted, so she received liquid morphine 2.5 mg without improvement. Supplemental oxygen was applied. Tachypnea persisted. She had poor oral intake after that point had persistent tachypnea and worsening hypoxemia despite clear lungs on exam. She remained under hospice care and comfort measures were continued. No blood testing or imaging tests were done. She required increasing amounts of oxygen, became hypotensive, and died peacefully on 1/8/2021 at 7:45 pm.

Veteran was found by family slumped over and unresponsive at the breakfast table on 1/13/21, had expired

Anaphylaxis

Pt had 3 vessel CABG on 1/14/21 after presenting to ED with chest pain on 1/9/21. Pt is critically ill following OR after cardiogenic shock, bleeding. Requiring inotropes and Impella.

vertigo nausea / vomiting diarrhea low-grade fever pain at injection site

Bells Palsy 1st injection on 12/20/21 symptoms started 1/7/21, 2nd dose on 1/10/21 immediate numbness in mouth and tightness in throat which triggered bells palsy symptoms immediately

Patient information was reviewed. Patient was asked if they ever had any form of severe reaction to anything they had had in the past. Patient did not state yes to anything other than having a reaction that

was managed at home to shellfish as a child. They stated their throat had swollen as a child during the event. Patient was told that it was an anaphylactic reaction and shouldn't have been managed at home as a child by nurse and should have been taken to the hospital. Patient was told they would be monitored for 30 minutes after receiving the vaccine. Within 2-3 minutes after receiving the vaccine the patient reported tingling or burning around the site of injections. Within 5 minutes they stated to be feeling tired and that their arm had felt numb. After this the patient began starring into the distance and was unresponsive. Called for help and advice by turning around as patient had syncoped. Got nurses and other team members attention and had an epi-pen ready just in case it was needed. Patient began having notable distress with respiration and administed an epi-pen. Advised for a nurse to call EMS for patient and crash cart/oxygen was also obtaine dby the facility. Oxygen was required. Patient was not responsive after the first dose and was given a second as they remained un-alert with notable distress. The patient became alert a while after receiving the second shot and not long after that the EMS arrived to the event.

Resident reported loose stool, not feeling well, resident complaint of lost taste. Hospitalization on 01/14/2020.

Vomiting

"Per husband, was in usual state of health on the AM of 1/10/20, AOx3 able to perform all I/ADLs. At around 2:30pm that day was complaining of chills and generalized malaise. Then at ~9:30pm when husband returned home from work found patient diaphoretic, confused (stating things like ""not now, I want to go to lake""), and complaining of chills and weakness. Unable to provide any additional hx regarding other sx. Initially presented to ED, where mental status had deteriorated to AOx0, unable to respond to verbal commands. Initial vitals notable for T102.6F (unclear other vitals). Patient is now AOx0 most concerning for encephalopathy."

Patient 101 years old, nursing home resident, received vaccine 1/11, on 1/13 found on floor without obvious trauma, unresponsive. Brought to ED and was bradycardic, hypotensive, hypothermic and refractory to aggressive medical management. No obvious cause of death found on exam or labs, cxr. Unknown if event could be related to vaccine or not. Medical Examiner accepted case although initially unknown that patient had recently received vaccine. ME updated with that information today as soon as discovered.

Throbbing head ache, difficulty breathing, lips numbness, chest discomfort, upper back, lower legs, fingers tingling/numbness, high blood pressure 148/83, underarm sweating, feels weak

Nausea with emesis, headache, upper abdominal pain.

Patient suffered a cardiac arrest and was unable to give details about her symptoms. Per husband, patient did not complain of any symptoms after vaccine administration. She began seizing without warning which was complicated by cardiac arrest of uncertain etiology

Right arm weakness 2 hrs after vaccine and then right leg weakness later that evening

"On 1/15/2021 at 1800, resident noted to be lethargic and shaking, stating ""I don't care."" repeatedly. C/O head and neck pain. T100.6. Given Tylenol with no relief of pain. Order received for Aleve and administered.. Assisted to bed as usual in evening. Monitored during night shift and noted to be resting comfortably/sleeping.. Noted agonal breathing at 4:10 AM 1/16/2021 , T 99.4, Absence of vital signs at 4:15AM 1/16/21 and death pronounced at 4:40AM 1/16/21."

"""Moderna COVID-19 Vaccine EUA"" It has been reported to me that pt. had gone into hospital for a heart catheterization on 1/12/2021. It was found during this procedure that pt. had suffered a MI. She was release to home the following day and passed away at her residence on 1/15/2021."

anaphalactic shock reaction, epi injection by hospital emergency staff at vaccine site, emergency room admission . We were very lucky vaccine site was Hospital was concerned that this might happen as patient had a previous anaphalactic shock by antibiotic injection few years ago

Right thumb joint pain. I can't hold unto things in my right hand that requires me using pressure from my thumb. Pain is a 9/10 when holding, grabbing, or using the thumb in any way. When not using the thumb there is no pain at all. I work out everyday and I am no longer to lift weights using my right hand because of the excruciating pain when I try to.

Patient had COVID-19 infection April 2020, ataxia and myoclonus developed, treated with IVIG and steroids at that time. June 2020 had full recovery after PT. Pt received Pfizer COVID-19 dose 1 on 12/22/20 and developed similar symptoms to above on 1/7/2021. Ataxia and tremor on examination, no myoclonus at this time.

Appendectomy Narrative: Developed abdominal pain with nausea on 12/24/2020, went to ER and noted to have appendicitis, resulting in an appendectomy

Swollen tongue and sob with decreased swallow

Vaccinated at 8:55am, Per Nurse Practitioner note patient started experiencing itching upper chest, medicated with Benadryl P.O., started with throat itching, medicated with Benadryl IM, EPI IM, EMS called, placed on O2, diminished breath sounds bases, slight stridor, EPI IM, Solumedrol IM, EMS transported to local ED. Patient called NP later in day and said she was admitted to the hospital.

Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.

Tachypnea, Angina, Tachycardia, Sore Muscles Narrative: Started feeling ill on the 28th. Drove himself to get checked out at the hospital. Hospital sent him home. Called EMS at 12/30/2020 @ 0200 and was hospitalized for 1 day. He is more stable now but still has these symptoms at a moderate level.

ADVERSE REACTION REPORTED AS TEMPERATURE OF 100.0, CONFUSION, AND VERTIGO. PATIENT WAS TAKEN TO HOSPITAL, UNAWARE OF CURRENT STATUS, TREATMENTS, OR OUTCOME.

After vaccination on 1.8.21 felt fatigue, metallic taste, and intermittent tingling. on 1.15.21 at approximately 8 am developed occipital headache (4/10 pain) inability to move right upper or lower extremities and slurred speech. No evidence of intracranial hemorrhage on CT. Patient administered Alteplase and transferred to higher level of care

Day 1-3 after the dose flu like symptoms Day 3-7 swelling in lymph nodes on left side of body (baseball sized) took ibuprofen and Tylenol Day 8 angioedema, anaphylaxis. Received epi subq, IVP 50mg Benadryl, Pepcid 20mg IVP, liter of NS Day 9 raised red rash all over body and face still going on Day 16-present: severe joint pain and fever, unable to obtain any relief

Muscle Spas; Weakness in both limbs. Pressured speech

Pounding headache, heart racing to over 145 bps, chest burning and tightness and hard to breath. I was taken to the Emergency Room at Hospital immediately. Reaction occurred within 30 minutes of the injection. An EKG was administered. I was prescribed prednisone and Benadryl. I was diagnosed with Anaphylaxis.

Patient had slow progression of kidney disease but since vaccine had unexpected acute kidney failure. He had to have dialysis and may need biopsy of kidney to confirm if he needs lifelong dialysis. He is still being hospitalized.

Numbness and tingling sensations in both hands and sometimes radiating up my forearms, more severe in right hand and right thumb; these symptoms still didn?t go away since 1/11

Death

After 2nd dose in the afternoon at 2:30pm pt collapse in the unit V/S was high blood sugar was high. Pt was held over at work for 16 hours. Shot was given at 6:45am. Paramedics was called. Sent to ER.

Remarkable Myalgia of extremities and back, interfering with rolling or sitting. Spasmodic twitching of upper extremities, These resulted in Hospitalization.

Resident expired

On 1/9/2021 started to have Postural Orthostatic Tachycardia Syndrome and PVCs associated with SOB and chest tightness and not recovered yet.

Headache after dose was given at 10:00 a.m Died at after 7:30 pm the same night the dose was given.

On January 14, 2021, I noticed generalized petechiae all over my body. I went to seek medical care and was found to have platelet count of 2. I was hospitalized for idiopathic thrombocytopenic purapura. I was given platelets which increased my platelets to 4. Next day, given IVIG dose. Also receiving 4 doses of decadron. Day after IVIG, platelets to 20. I am still in the hospital getting treatment today.

Moderna COVID-19 Vaccine EUA. Patient has tested positive for Covid 19 as of 1/10/2021, when he was hospitalized. Patient's wife had been rushed to the ER previously, and they discovered she was Covid positive when she was admitted. Patient immediately notified public health and was being restricted and followed up with. During his quarantine, he started developing symptoms (08Jan2021). On 10 Jan, he was rushed to the ER and diagnosed with pneumonia due to Covid. He was also experiencing painful stomach cramps, low oxygen saturations and fluctuations in blood pressure. He spent 3 days inpatient in the Covid wing then was discharged to resume resting at home. Our provider immediately reached out to the member and checked in with them. At this time, the patient's only real complaint is lack of energy or getting winded when doing projects around the house. Patient will isolate at home and monitor his symptoms. Public health and the provider will follow up with the member and her family periodically to ensure recovery.

PATIENT GOT HER FIRST COVID PFIZER VACCINE AT 12/31 IN THE AM. HAD GOTTEN FLU LIKE SYMPTOMS AND HAD BEEN SICK FOR A COUPLE OF DAYS. HAD NAUSEA AND VOMITTING DURING THIS TIME AS WELL. ON 1/3 THE CARE GIVER WENT TO CHECK ON HER PT AT HER LTC FACILITY WHERE SHE LIVES AND SHE WASN'T ACTING RIGHT. SHE WAS UNABLE TO DO A STROKE EXAM. PT HAD NO MOVEMNET IN ARMS OR LEGS AND WAS UNABLE TO SPEAK. PT WAS VITALLY STABLE AT THE TIME. EMS RECORDED THAT THEY THOUGHT DIAGNOSIS WOULD BE STROKE, PNEUMONIA OR SEPSIS. AFTER ARRIVAL AT THE HOSPITIAL DETERMED THAT SHE HAD A STORKE, ACUTE KIDNEY INJURY, ABNORMAL LFTS.

allergic reaction- skin rash , throat itching. patient visited the ER and was given episode and steroids but returned because symptoms were not improving. She was hospitalized on 1/11 for this reason

12/29/2020 Vaccination 12-13 minutes later started left arm was tight and sore. Wasn't feeling right; hot, hives, rash at injection site up neck and face; tightness in throat; tachychardic, BP increase. I took benadryl and Pepcid . Sat for another 30-45 min. Palpitations, heaviness. Transported to ER. IV and medications. Stayed till 1:30, went home, and then came that evening. 5:00 that same night, hives, chest pressure, burning sensation, 'didn't feel right', anxious. Benadryl. Tachychardic; admitted to hospital that evening. Stayed in house admission till the 12/31/2020. Went back to admission in house, 1/3/2021 - 1/4/2021. Two hospital admissions.

Approximately 28 hours after vaccine, I began to feel tingling in my right eye Approximately 12 hours after that, my face started drooping and was numb so I went to ER. Today is Sunday, and the numbness and drooping was called Bells Palsy at the hospital.

Injection given without unusual pain, but appeared to be at higher site than usual for other vaccinations patient has received. No immediate reactions. No redness or swelling at injection site. Approximately 3 hours later with restriction of abduction of left arm, which became worse over 24 hours. No numbnness, pain 4-5/10 diffusely over deltoid and in acromium, posterior suprascapular area.. Able to passively move arm, treated with topical Voltaren gel, Naproxyn 500 x 1 dose. D2 with increased ROM, but still restricted.

New onset leukopenia/neutropenia with fever, unclear if related to vaccination, but temporally occurred the day after receiving 1st dose. No labs immediately prior to vaccination, so leukopenia may have

preceded vaccine. No other new medications to explain neutropenia. Off chemotherapy since 8/2020. Possible relapsed disease though no other evidence in support of this as remainder of CBC stable.

Shortness of breath, Congestive heart failure, Afib

RespDepression found to have low potassium Narrative: Patient reports experiencing shortness of breath 24 hours after the vaccine was administered, went to ER and admitted for one night. Informed her supervisor she had low potassium.

Patient presented with diffuse petechiae, easy bruising and oral bruises. She has a history of stable ITP with her last required infusion of IVIG 12 years prior during pregnancy and monitors her CBC every 6 months. Her baseline platelet count is ~50-60k. She received treatment with dexamethasone 40 mg IVPB x 3 doses and IVIG 95 grams (1 gram/kg) IVPB x 2 doses.

3 days after receiving the first dose of the vaccine on 12/21/2020, experienced flu-like symptoms that lasted 24 hours. About 17 hours after receiving the second does on 1/11/2021, flu-like symptoms reoccurred. The following day (1/13/2021) severe chills, and difficulty breathing occurred. Patient was admitted to Medical Center, where blood work, EKG, and oxygen were given and ordered. After overnight observation, the patient was discharged and informed that he had a severe reaction due to the Pfizer vaccine for Covid-19. As of 1/17/2021, patient still recovering and feeling generally weak and tired without much appetite.

Vaccine was administered on 1/12/21 at Memory Care. On 1/15/21 at 12:30 he developed slurred speech at his facility and slumped to his left side. Out of concern for stroke he was sent by ambulance to Hospital. There he was found to have no evidence of stroke on MRI or CT angiogram. He was admitted to the hospital due to fever and elevated inflammatory markers (ferritin, CRP) and transaminases. He was found to have a positive SARS-CoV-2 PCR and IgG. His symptoms resolved the following morning and may have represented a TIA. He had many markers consistent with COVID-19 and his CT pulmonary angiogram did show ground glass opacities but no pulmonary embolism. It was difficult to assess if this was a reinfection with COVID-19, persistent PCR positivity from November, or an adverse event to the vaccine.

I received the dose at 1:45 pm on 1/13/2021 at Medical Center. Almost 1 hour post vaccine I started to feel a lump in my throat, as the minutes passed my throat started to feel tighter and fight and flight mode kicked in. It was hard to swallow, my tongue was swelling and I called EMS at 2:40 pm 1/13/2021. EMS noticed hives on my chest and left arm where I got the first dose of Moderna. I received epinephrine IM and IV benadryl in the ambulance. I was sinus tachycardic with heart rate in the 140s oxygen was 99% room air, lungs clear.. I was taken to ER where I was on observation for 2 hours. I was discharged around 5:10 pm on 1/13/2021. On my car ride home around 5:40pm I again started to feel my throat tighten, tongue swell, and heart race. I called EMS again, and was treated with IV benadryl, and epinephrine IM. I was taken to Medical Center where I was given IV solu-medrol and got blood taken and a pregnancy test done. My potassium was 3.1 and I took 2 potassium tablets to supplement. My EKG was normal sinus tach, oxygen 100% room air, blood pressure 140s/90s and got down to

120/80s. I was transported to another Medical Center for overnight observation because first Medical Center was full.

"Narrative: Patient with severe aphasia and only able to say ""hey, hey, hey"" or ""uh huh"" or shake his head no as a way to communicate. Patient previously able to ambulate with significant limp and hyperextension of right knee, but mostly wheelchair bound over last several years as he had had a slow and steady decline in overall health and mobility. Patient developed aggressive behavior of shouting ""hey"" and grabbing of groin in 2016. This was worked up with CT scans, labs, referral to urology, neurology, and referrals to psychiatry. The exact etiology of this action was never able to be affirmed, but thought to be more psychiatrically related. It improved significantly with addition of antipsychotics, worsened when antipsychotics were reduced, and improved again with addition of injectable antipsychotic on 12-10-2020.Patient suffered from falls on occasion given his significantly impaired physical mobility. His last documented fall was 8-31-2019. Patient began utilizing wheelchair most of time following that fall. No significant injuries noted in documentation of the falls. In the last 3 months, patient would often refuse medications. He would sometimes indicate that they would cause dizziness, and other times he would simply refuse. We attempted to hide medications in his food/fluid (with wife's blessing) and when he detected this he would occasionally refuse to eat. Patient previously on DOAC. After pharmacy review in 12/2020 it was recommended to discontinue this as no clear indication to continue use. He was high fall risk and would often refuse this medication as well since 10/2020. Noted to be in NSR on EKGs and decision made to discontinue the DOAC. Patient had no evidence of adverse effects noted after vaccination on December 28th. Patient seen by provider on the morning of his death (1/4/2021) with no noticeable significant change in health condition. Temperature 36.8Con January 4th at 19:45. During routine bedtime cares, patient suddenly collapsed and death was pronounced January 4, 2021 at 20:05. Autopsy was requested from next of kin and no autopsy was granted. Symptoms: & DEATH Treatment:"

Narrative: Symptoms: Palpitations & Syncope Treatment: EPINEPHRINE 1 MG ONCE ,EPINEPHRINE 1 MG ONCE ,SODIUM BICARBONATE 50 ML ONCE

Ventricular fibrillation- Code blue

Severe Right sided chest pain, right sided muscle spasms and difficulty breathing two weeks after vaccine was administered Diagnosis of bilateral pulmonary embolism was made on presentation to ER. No personal or family history of clots in arteries or deep veins or any risk factors in patient. Received heparin drip, pain medications, muscle relaxants inpatient. Pain progressively improved over days. Was discharged after 6 days on admission. Was discharged on oral anticoagulant (Rivaroxaban aka xarelto)

Developed dizziness and nausea within 90minutes of vaccine; then developed tingling, and flushing of my skin. Then rapid heart rate and chest tightness by 2.5hrs post vaccine. I went to urgent Care and they thought it was an allergic reaction (BP 182/90, HR 82) and gave me 125mg solumedrol and Benadryl intramuscularly which caused worsened dizziness and a racing heart which caused me to collapse and they gave me a epi pen and called 911. I was transferred to ER and they completed EKG which was

normal and monitored vitals for a few hours and I was released. I continue to remain extremely dizzy and nauseated 2days after the vaccine.

"2.5 hours after receiving vaccine, I started getting dizzy and vomiting. I vomited 6 or 7 times. I was so dizzy I couldn't open my eyes without getting sick. We called ER and explained that we thought I was having a reaction to the vaccine, and their response was they had never heard of that type of reaction. I was sick all night, called my primary Dr in the am and they told me to go to ER. We had to call ambulance to take me there because I was so sick and couldn't open my eyes without having to vomit. Room spun in circles. My arrival at ER, they did MRI, EKG, blood work. My blood pressure was very high, so they connected me to a heart monitor. I had low Magnesium due to vomiting so much. I was treated with Valium and anti-vert medication and fluids. I stayed overnight in hospital- had PT Jan 13th for DX of Vertigo. Then referred to Outpatient PT for Vertigo. Dr's felt it was a ""coincident"" that I got Vertigo shortly after vaccine, and strongly felt it was not related. . Today is Jan 17th, and I am still dizzy, but feeling better. I have an appointment with my primary Jan 18th and not sure if I should take the 2nd dose. That is the question."

Acute Appendicitis

Heart attack death medical test

Resident expired 1/17/21

29yo female patient reports feeling her throat tingling and closing sensation in her throat with a metallic taste and diaphoretic approximately 3 minutes after receiving vaccine. She did not report these sensations until about 15min after injection. EMS assist was immediately called and pt was brought into one of the patient rooms. She was given Epipen injection approx. 20min after injection and EMS arrived to transport patient down to ER within 1-2 minutes after Epipen administered. Patient was monitored in ER and recovered well

rash on the arm and side of my body where the injection was given. i took some Benadryl on 01/14/2021 the rash came back and the injection spot became really warm and harden. i took Benadryl again it went away. the rash came back 01/16/2021 and i took more Benadryl and the itcing stop. isaw a few red spots on my arm today bot no itching.

lymphadenopathy on left side (starting in axillary and progressing to supraclavicular and eventually neck as well. swollen and extremely tender) in addition to normal side effects of chills, fatigue. also was having irregular heart rhythm (reason for hospitalization) do not know if the heart rhythms are related to the vaccine or not, onset was a few days after vaccination (ER 12/30/2020, then another hospital 1/1-1/2). but the hospitalization below is referring to the heart rhythm not the lymphadenopathy.

The patient received her first Moderna COVID-19 vaccination on 12/29/2020. However the patient was diagnosed with a positive COVID-19 test on January 4, 2021. Patient complained of nausea, vomiting, back pain, and sharp chest pain. On January 13, the patient presented to the emergency department again with shortness of breath and sharp, stabbing left-sided chest pain radiating to her back and right

side. Initial work up ruled out cardiac etiologies. CTA chest demonstrated COVID-19 pneumonia. The patient complained of bilateral lower extremity weakness which had been progressing since her COVID-19 vaccination, per patient report. However, during her hospitalization the patient's bilateral lower extremity weakness began to accelerate. On the 13th, the patient was able to ambulate to and from the bathroom herself. Then on January 14 the patient required maximum assistance. Neurology was consulted and work up initiated for suspected possible Guillain-BarrT syndrome (GBS) secondary to recent COVID-19 infection. On January 15, 2021, the patient became obtunded and unable to protect airway. She was emergently intubated for acute hypercapnic respiratory failure secondary to GBS. Neurology started GBS treatment with IVIG. Patient also developed NSTEMI and Takotsubo cardiomyopathy. Patient remains critically ill requiring mechanical ventilation.

The day after receiving the second vaccination, I began to have mild intermittent abdominal pain2-3/10. The pain gradually increased, became more intense, and more constant. Mild fever and chills started happening, and I took Ibuprofen. By about 4 days after the vaccine, the abdominal pain was severe enough that I had some difficulty walking and I couldn?t sleep at night. Pain was 6-8/10. I went to the ER, and CT scan with IV contrast showed 18 mm appendicitis. I underwent laparoscopic surgery and it was found to be perforated. It was removed. I am currently recovering in the hospital. I received the vaccine as a health care provider at my hospital, specifically I am a practicing pediatrician physician for over 10 years.

I felt quite sick, like I had the flu; became very lightheaded and dizzy; passed out; felt quite sick; This is a spontaneous report from a contactable consumer (patient). A 69-year-old non-pregnant female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 08Jan2021 at 12:30 at single dose in left arm for covid-19 immunization. Medical history included R.A.D., osteopenia, migraine with aura, the patient had previously suffered episodes of vasal vagal syncopy when she got the flu or other severe illnesses, and the patient was diagnosed with COVID-19 prior to vaccination. Concomitant medication included atenolol, atorvastatin, azelastine, and fluticasone. The patient previously took gramicidin, neomycin sulfate, polymyxin b sulfate (NEOSPORIN) and experienced allergies. The morning after receiving the vaccine, she felt quite sick, like she had the flu. When she got up from bed and went to the bathroom to urinate, she became very lightheaded and dizzy. She attempted to return to bed, but passed out on the bedroom floor before she could get to the bed, and seized while she was unconscious. Once she came to, she was helped to bed and, after about 90 minutes, felt much better, and got up, and ate food and had coffee. All events occurred at 07:30 AM on 09Jan2021. All events were reported as non-serious by reporter. The patient did not receive treatment for the events. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient has not been tested for COVID-19 since the vaccination. The outcome of the events was resolved in Jan2021. Information on the lot/batch number has been requested.

Blacked out; Fainted; Felt very unwell; Nauseous; Chills; Fell; Knocked out, hit her nose, started to bleed; Humongous scar on her nose; In her hand there's a rash with different dots/red; She has petechiae/rash on the forearm; hit her face; knocked out, hit her nose; This is a spontaneous report from a contactable physician. This physician reported that a 30-year-old female patient (daughter) received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on

08Jan2021 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced blacked out, fainted, felt very unwell, nauseous, chills, fell, knocked out, hit her nose, started to bleed, humongous scar on her nose, in her hand there's a rash with different dots/red, she has petechiae/rash on the forearm, all on an unspecified date in Jan2021. The Caller wanted information on side effects specifically looking at platelet or clotting or bleeding issues. Her daughter, (female, age 29 date of birth) received the 2nd dose of Pfizer vaccine, received it at the (State name), last night. She felt very unwell, nauseous, chills, and then blacked out, fell, knocked out, hit her nose, started to bleed; fainted and hit her face, didn't stop bleeding for 2 hours. There's a humongous scar on her nose. It took 2 hours to stop bleeding. She's going to urgent care today. Her daughter was healthy, yesterday was 2nd dose. In her hand, there's a rash with different dots/red. She has petechiae/rash on the forearm. Thankfully it (bleeding) did stop. The outcome of events for 'knocked out, hit her nose, started to bleed' was resolved on an unspecified date, for other events was unknown. The case was reported as non-serious. Information on the Batch/Lot number has been requested.; Sender's Comments: Based solely on a chronological association a causal relationship between events blacked out and fainted and BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), cannot be completely excluded. The case will be reevaluated should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

fist dose on 21Dec2020, second dose on 07Jan2021; pain and stiffness radiating from injection site all the way down arm,into breast, and middle of back; pain and stiffness radiating from injection site all the way down arm,into breast, and middle of back; pain and stiffness radiating from injection site all the way down arm,into breast, and middle of back; Started having chills; Severe headache; collapsed on the way back to bathroom and was unable to get up for about 20 minutes; tachycardia; extremely fatigued entire day; This is a spontaneous report from a contactable Pharmacist who reported for herself. A 30-year-old female patient received her second dose of BNT162B2 (Pfizer/ BioNTech Covid-19 vaccine, lot number Ej1685) at a single dose at 09:45 AM 07Jan2021 at left arm for Covid-19 immunization in a hospital. The patient had her first dose of Pifzer Covid-19 vaccine on 21Dec2020 at 12:00 PM at left arm, and experienced very mild reactions which included mild pain at injection site and runny nose/sneezing day after vaccine. The paitent had a medical hisotry of rash to penicillin as a child. Concomitant medications were not reported. The patient did not receive any other vaccines within 4 weeks prior to her first dose of Pfizer COVID vaccine. In the evening of second vaccine (around 17:00), pain and stiffness radiated from injection site all the way down arm, into breast, and middle of back. She started having chills. Around 10 hours after dose chills became somewhat violent despite being under 4 blankets. Severe headache also started. In the middle of the night to go to bathroom, she collapsed on the way back and was unable to get up for about 20 minutes. She also suffered from tachycardia overnight. her baseline heart rate runs in 60s- 70s, but was in 110s-120s (based on Apple Watch monitoring). Day after vaccine, she was extremely fatigue entire day and spent all but a few hours in bed. Arm pain mostly gone. Headache was very strong and persistent through the day. On second night chills not as bad but still occurred overnight. HR still elevated in 80s overnight. Morning of day 2 still had

headache and fatigue. The patient did not receive any treatment for the events. The outcome of collapse and unable to get up for 20minutes, pain and stiffness radiating from injection site all the way down arm,into breast, and middle of back was resolved, chills and tachycardia was resolving, headache, fatigue was not resolved. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. The reporter considered that the events was non-serious.; Sender's Comments: Based on a chronological temporal association and known BNT162B2 vaccine safety profile, causality between events fainting, violent chills and severe headache and BNT162B2 ((Pfizer/ BioNTech Covid-19 vaccine) cannot be completely excluded. The case will be reevaluated should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

anaphylactic reaction/anaphylaxis; This is a spontaneous report from a Pfizer Sponsored Program from a contactable pharmacist. A female patient of an unspecified age received first dose of bnt162b2 (Pfizer BioNTech COVID vaccine, lot number: EK4176), via an unspecified route of administration on 09Jan2021 at 0.3 mL, single (standard like 0.3ml by injection once to deltoid, side unknown) to prevent from getting COVID. The patient's medical history and concomitant medications were not reported. The patient experienced anaphylactic reaction/anaphylaxis on 09Jan2021. Clinical course: The patient got the vaccine while waiting to go into the watch room, to be watched for a few minutes, and she experienced anaphylactic reaction/anaphylaxis, she went down, they gave her an Epinephrine, she didn't respond to the first dose, a second dose was given in the arm where the vaccine was given, then she was picked up by an ambulance. Agent stated the caller has been on hold for almost an hour. Caller clarifies dose was given in the arm, it occurred on Saturday with the same lot. Saturday and it went away on Saturday, the patient was worried about it coming back, thus why she asked about Epinephrine pen, the patient was taken to the hospital, and given Epinephrine a couple more times, and it resolved eventually, the patient was not admitted, she went to the Emergency Department. It could have required hospitalization but would most likely say life threatening had she not been treated. Reporter seriousness for anaphylaxis is life threatening. The outcome of event was recovered on 09Jan2021. Relatedness of bnt162b2 to reaction anaphylaxis is related for primary source.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset anaphylactic reaction/anaphylaxis cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

developed symptoms for Covid/tested positive after receiving the vaccine; developed symptoms for Covid/tested positive after receiving the vaccine; developed symptoms for Covid/tested positive after receiving the vaccine; This is a spontaneous report from a contactable physician (patient) and a

consumer (patient's spouse). A 67-year-old male patient received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; lot number: EH9899; expiration date: not known), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The physician had a question. As a patient, he received the first dose of Pfizer BioNTech vaccine and on an unspecified date, two days later, he developed symptoms for Covid and tested positive after receiving the vaccine. He stated this had nothing to do with vaccine but had to do with the timing. He wanted to know if should take or delay vaccine. He is doing fine now. His second dose is coming up next week. The outcome of the events was recovered on an unspecified date.; Sender's Comments: The association between the event lack of effect (he developed symptoms for COVID and tested positive) with BNT162b2 can not be completely excluded.

got the first vaccine and then tested positive for the virus; got the first vaccine and then tested positive for the virus/fairly sick; This is a spontaneous report from Pfizer-sponsored Program IBCC (Inbound Call Center for HCPs). A contactable physician reported similar events for two patients. This is the first of two reports. A patient of unspecified age and gender received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; lot number and expiration date: not known), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter is a cardiologist. He is inquiring about the COVID-19 vaccine. He had several patients (pending clarification) who got the first vaccine and then tested positive for the virus. He is asking when can they get the second dose after testing positive. He had two patients that are fairly sick now. He has had patients who have monochromal antibodies (pending clarification). He is asking when they can get the vaccine after that treatment. The outcome of the events was unknown. Information about lot/batch number has been requested.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events.,Linked Report(s) : US-PFIZER INC-2021022171 same reporter, similar suspect drug and event; different patient

got the first vaccine and then tested positive for the virus; got the first vaccine and then tested positive for the virus/fairly sick now; This is a spontaneous report from Pfizer-sponsored Program. on a compatible temporal relation between vaccination and onset of events.,Linked Report(s) : US-PFIZER INC-2021022153 same reporter, similar suspect drug and event; different patient

The day following vaccination, the patient experienced nausea/vomiting, shortness of breath, followed by extremity paresthesia, and increased heart rate. The patient went to the emergency room and was assigned an overnight admission for a potential post-vaccination adverse event. Patient was discharged the following day.

The day of vaccination, the patient presented to the emergency room with a complaint of dizziness and syncope. Reported that she became dizzy, presyncopal feelings, and had a witnessed syncopal event. The patient stated she does have vasovagal syncopal events after blood draws in the past. The patient was assigned an overnight admission for a potential post-vaccination adverse event, new onset atrial fibrillation, dehydration, and syncope. Patient was discharged the following day.

Myalgia Narrative:

Patient became sick 3 hours after the vaccine and was found deceased 1 day after his vaccination. He passed away in his sleep.

nausea and vomiting possible cause of diabetic ketoacidosis and svt

Jan 11-vaccination day. On Jan 14, in afternoon had tinnitus and muffled hearing that went away. The next morning Jan15, complete sudden hearing loss on left ear. Tinnitus and muffled hearing that has not went away.

Patient experienced abdominal pain on January 12th. She reported having a headache and joint pain as well. Her temperature was 103.5. On January 14th the patient was admitted for acute appendicitis with perforation, localized peritonitis, and gangrene. Patient was discharged on January 16th post appendectomy.

Patient received Moderna Covid vaccine on Friday evening 1/8/21. She awoke Saturday am around 2AM with a severe headache. She also developed a fever during the day. She did not seek treatment until Sunday and went to Hospital ED. She was treated and released same day. She went back to hospital on Monday as she felt worse and she was admitted at that time and treated for a bloodstream infection and meningitis. We are not sure it was caused by the vaccine. She consulted her PCP and her PCP feels it may be more coincidental given her medical HX.

A few days after the vaccine I began to have a cough about mid morning which changed to SOB. Covid test on 12/27 which was neg. I went to work on 12/28 but woke up 12/29 with a low grade fever and felt like my throat was on fire. so on the 29th I went and got a Strep and flu test which were negative. I was feeling so bad so on the 6th of Jan do I went to the stand alone ER and got a chest xray and CT scan which revealed I did have pnemonia. I went back home but was feeling worse and was taken to and admitted in hospital for 2 days. Initially I was admitted into the COVID unit but never was diagnosed COVID positive so I was moved off the COVID unit. I was given albuterol pills to try to help with the symptoms but didnt work causing me to have to be admitted and was given several doses of steorid and other antibioics and had to use O2 at night because my stats kept falling.

Patient reported to the emergency room from fever and shortness of breath the day after receiving the COVID-19 vaccine. Patient was found to have a UTI and possible sepsis. Unknown if truly related to COVID vaccine.

Severe fatigue, Headache frontal and temporal, dizziness/vertigo, tinnitus,

"Pt is 33 yo female with h/o multiple drug allergies , including allergy to benadryl. She has received first dose of COVID vaccine made by Phfizer at 3:45. She reports about 10 minutes after the vaccination she started feeling tingling in her lips, throat and prickly sensation on her chest and feeling ""off"". Felt dizzy, developed small hives on her chest. She was attended to immediately at the vaccine site and our team was called to white code. Pt was sitting on the floor, alert , breathing comfortably. Her BP was 151/84, HR 90, O2 Sats 100%. Her lungs were clear the whole time, no wheezing, no difficulty swallowing or talking. Patient received 125 mg of IV solumedrol and 20 mg of pepcid in vaccination room, she felt the same, still breathing comfotably, speaking full sentences, hives faiding away. She was transported to Urgent Care clinic on wheelchair. Pt kept her EpiPen by her site the whole time but refused to used it, states she is afraid to use it and wants to hold off or get it in ER if necessary. About 16:30 patient reported her tingling, prickly sensation In her chest is getting worse, developed sensation of lump in her throat, able to swallow and breath without problems, lungs exam clear. Again recommended to give Epipen but patient again refused as she feels very anxious about getting new medicine. She was able to speak full sentences and breathing well, O2 Sats 100% the whole time, she repetitively refused EpiPen. EMS called and patient transported to ER, ER notified. Pt left in stable condition."

On 01/13/2021 at about 11pm I began having pain in both arms and across my chest. Also nausea and vomiting. At midnight I went to the Emergency room and was diagnosed with a heart attack, underwent emergency catheterization and stent placement. I had complete occlusion of the right coronary artery

Patient is 39-year-old male with no significant past medical history who works at long-term care facility. He received COVID-19 vaccine on 1/13/2021 and immediately developed numbness and tingling in the area of injection which was the left shoulder. Over the next 15 to 30 minutes numbness and tingling expanded to the left side of his body including face arm and leg and the left side of his trunk. He began to feel foggy and had some slurred speech. He presented to the Emergency Room and tests were performed to rule out a stroke. The patient denies any other symptoms such as fever chills myalgias. He

did not have any weakness of the extremities. He did not have any speech disturbances or visual disturbances. This morning on examination he states his symptoms are much better. He still has some residual numbness in his leg and arm. Facial numbness is almost all gone. As of 1/18/2021, residual numbness and tingling is only in his left ring and pinky finger.

"Patient with PMH of depression and GERD who presented 1/8 with constipation, abdominal discomfort and worsening dyspnea. Symptoms began around 12/29. COVID vaccine 12/19. Previously quite active, marathon runner, gained some weight over last couple years but was still in good enough shape to complete 10K in New Orleans in early February. In late February, had a flu-like illness, as did one of his friends from church. 2020 was hard on him - weight gain, decreased activity, stress, overall deconditioning. No issues apart from sore arm after COVID vaccine 12/19 but then starting getting abdominal fullness/discomfort around 12/29, which steadily worsened, also develop worsening dyspnea on slight exertion. No known sick contacts.. Work-up notable for pericardial effusion, pleural effusions. Echo with severe diffuse LV hypokinesis, concern raised for myocarditis. COVID PCR negative, serology negative. RVP negative. . Concern raised that COVID vaccine may have played a role in myocarditis. He was found to have the following conditions Acute heart failure with reduced EF NYHA FC II, non-ischemic cardiomyopathy. Myocarditis appears subacute per MRI hypertension obesity small pericardial effusion-asysmptomatic no pericarditis suspected obstructive sleep apnea. .Started on the following medications. Continue Carvedilol 12.5mg BID, Farxiga 5mg daily, Digoxin 0.125mg daily, Entresto 97-103mg BID, and Spironolactone 25mg daily. Per MD note. While it remains uncertain, team is doubtful COVID vaccine played a role in his cardiac issues. Given the MRI findings are not acute, more likely that the cardiac insult occurred weeks to months ago - potentially in the setting of the February 2020 illness. Perhaps his ""deconditioning"" in 2020 was related to worsening cardiac function. Nevertheless, will hold on 2nd COVID vaccine dose given absence of a clear explanation for his myocarditis. conversation with team will continue to determine if candidate for second covid vaccine. If consensus is that myocarditis pre-dated vaccine, might be able to proceed with dose 2 of vaccine."

"PATIENT RECEIVED VACCINE 1/7/21 AT 1000. THE NEXT DAY, PATIENT PRESENTS TO ER ON 1/13/21 WITH COMPLAINTS OF PALPITATIONS AND DIZZINESS OCCURING SINCE HER FIRST DOSE OF VACCINE. ""The patient states she has had these episodes for the last 6 days and they started when she got her COVID vaccine. The patient states she has had numerous episodes over the last 6 days of this that lasts between 2 and 4 hours. The patient can feel her heart fluttering and she gets a little dizzy with it. The patient has not had any nausea, shortness of breath or chest pain with these episodes however. The patient has not had any prior episodes of this. The patient takes no regular medications apart from vitamins."" PATIENT WAS DIAGNOSED WITH NEW FOUND A. FIB WITH RVR. ADMITTED TO HOSPITAL FOR OBSERVATION. PATIENT RETURNED TO NORMAL SINUS RHYTHM THE NEXT DAY AFTER INITIATING DILTIAZEM AND ELIQUIS."

EDD July 4, 2021 January 15th baby no longer had a heartbeat after two previous visits confirming heartbeat and EDD.

DVT in right leg 4 days after injection, severe pain in thigh/calf, difficulty walking Placed on Xarelto 15mg 2X daily for 21 days and then 20mg daily for 9 days. Next Doctor visit is 1/26/2021 at 9:00am Next scheduled Covid 19 vaccine is scheduled for 2/5/2021 at 7:15am

After I received the vaccine went home rested temp went up one time 99.0. The next day woke up heart was pounding check my BP 150/80 laid back down. I woke up around 5pm my BP had elevated to 160 (don't remember diastolic reading) pulse rate normal limits. I informed my spouse of what was happening called 911. At the hospital checked vitals, EKG, CT Scan, Chest X-ray, Blood work and Potassium was low took 2 Potassium pills. I went back home on 12/31 returned to work did fine that day. On New Years day everything started back again discomfort went back to ER. I felt like force in my chest the doctor collected my information and I was placed on a low dose BP medication until I return to my PCP, cardiologist(stress test). I followed up with PCP via Telehealth about my BP concerns, my dosage was increased to 25 mg and due to my symptoms I was placed on leave from work 2 wks. I also have a appointment scheduled with Neurologist.

Daughter call in for VAERS report to file for father whom committed suicide 1/16/2021 in the AM after reportable ae of COVID 19 vaccine administered 1/14/2021. Patient sought care twice at ER; first visit by ambulance around 5PM and Friday 1/15/2021 Medical Center: Emergency Room. 1st Discharge summary diagnosis: adverse reaction to COVID shot; 2nd Discharge summary diagnosis: adverse reaction to COVID shot, fever, Panic Disorder-- ER. Medical Center Discharge summary diagnosis: Adverse reaction to the vaccine, acute anxiety. Reportable patient symptoms at, 1st visit : fever, shaking stomach cramps, breathing issues. Medical Center -- No fever, confusion and dementia type, patient would not stay in patient bed; patient would get up and sit down again repeatedly, agitated and anxious. Attempted to urinated hospital bed. Patient committed suicide in home.

Anaphylaxis (urticaria, tongue swelling, subjective difficulty breathing) starting approx. 24hrs first moderna dose. No prior episodes of anaphylaxis/allergic rxn. Treated with Benadryl 100mg PO (prior to arrival, pt administered), famotidine 20mg IV, Epinepherine 0.3mg IM. Monitored in ED, complete resolution of symptoms, discharged home.

Weakness, Low O2, death. Positive for COVID on 1/12/21, dies on 1/16/21

Patient presented to ED with complaint of chest pain, radiating down left arm, not relieved with Tums. Symptoms started at 0530 1/12/2020. Patient presented to ED b/c of strong family history of CAD, with father having MI in his 50s.

On 1/17/2021 at 4:35 am resident found apneic and pulseless, at 4:40am death confirmed

I was vaccinated at 3:30pm . At 5:27pm while driving home i felt a cold sensation in the back of my neck and back of my throat which began spreading to the back of my head . My heart felt as if I was startled by something. I looked at my smart watch and my heart rate was 145. I began trembling and having abdominal cramping . The back of my head felt like I had swelling or collection of fluid. I opened my windows and began taking slow deep breaths to bring down my heart rate . It took quite a while to get it below 100. I felt as if I was going to pass out. After deep breathing for what felt like atleasr 15 to 20

minutes , my pulse came down and I closed my windows . As soon as my body warmed back up in the car , the symptoms returned and my heart rate went back up to 130s , 140s . I had to keep my windows down and deep breathe the entire way home which took an hour . My body was trembling. When I got home I felt as if I was too week to get out of the car . I still felt that startled feeling in my heart and was afraid of what could happen next . My lips and face were swollen. My lips were also slightly itchy. I called 911 for help . By the time they arrived my vital signs had stabilized but I still had swelling in my face and lips . My EKG , vital signs and oxygen levels checked out normal so I did not go to the ER. That night I took benadryl and Tylenol. Day 2 post vaccine the collection of fluid or swelling in the back of my head had now spread to the top . That night I had the feeling that my throat was swelling do I took benadryl and Tylenol and my face and lips were still slightly swollen . Day 3 post vaccine I woke up with slightly blurry vision. The swelling in my head now feels like it has encompassed my entire head and have a slight headache. I went to the urgent care requesting an MRI of the head and an epi pen . I was given Medrol dose pack , an RX for epi pen for emergencies and advised to continue benadryl and Tylenol. Day 4 post vaccine, slight headache continues. Slightly blurry vision

12/29/2020 Vaccination. Within minutes blurry vision, dizzy, tx to stretcher. EXTREME HA, coughing, sensitivity to light. EPI pen in ER. I fell asleep. Woke up, don't remember much. Admitted to hospital. Chest pains started within 2 hours, SOB, HA. Admitted for 2 nights, 3 days. Discharged home. Still having SOB and referred to Pulmonologist. Waiting on appt. *did NOT have problems before this vaccine. I was fine. Now i am completely different person, I have to monitor my walking, etc.

"80YO male who htn, cva, epilepsy, ckd, cerebral avm s/p repair, cad s/p cab, cva (left sided hemiplegia) , hx of prostate cancer recent admission for pna on abx presents to ED on 1/11 with dizziness, hypoxia. CT with Bilateral PE ""Large bilateral pulmonary artery emboli in the right and left main pulmonary artery extending into the right and left main pulmonary artery branches bilaterally. Findings are associated with right-sided heart strain."" ""Patchy alveolar airspace disease within the lungs highly suspicious for COVID pneumonia"" Covid negative. Patients wife recovered from Covid-19 infection within last month. Patent thus far has tested negative. Doppler lower extremity revealed Acute occlusive vein thrombosis of the entire course of the gastrocnemius vein and soleal vein. Patient received covid vaccine on 1/4/21. Patient has several risk factors for clot - age, previous CVA, hx of prostate cancer. Also had positive covid exposure though tested negative"

Resident was seen by MD on 1/11/2021 due to increasing in edema and shortness of breath. Lasix 40 mg STAT given. New orders to get a STAT CBC, CMP, and BNP. Resident has been dependent on Oxygen since his diagnosis of COVID-19 on 11/23/2020. Labs were abnormal. Continued on the lasix 40 mgs. Resident remained short of breath with exertion and on oxygen. He was assisted to the toilet on 1/15/2021 in the morning where he subsequently passed away.

hives on her face; This is a spontaneous report from a contactable healthcare professional (physician assistant). A 42-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot number: EK5730), via an unspecified route of administration, on 24Dec2020 as a single dose (reported as 0.3) for COVID-19 immunization. The patient had no medical history or concomitant medications. The patient experienced hives on her face in Dec2020, which was reported as

medically significant. It was reported that within 24 hours of vaccination, the patient had hives for 48 hours. The event was reported as a moderate systemic reaction. The clinical outcome of hives on her face was recovered in Dec2020.; Sender's Comments: Based on the compatible time association, the event hives on her face is possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"a low grade fever; cough; doesn't feel very well; feeling yucky; soreness in the arm where vaccine was given; This is a spontaneous report from a contactable Nurse (reporting for herself). A 29-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE solution for injection, bacth/lot no: EK9231 while expiry date was unknown), intramuscular on left deltoid on 07Jan2021 16:45 at a single dose for covid-19 immunization. There were no medical history and concomitant medications reported. Patient has no prior vaccination within 4 weeks.The patient got her first dose of the COVID 19 vaccine yesterday (07Jan2021) from her employer. She started ""feeling yucky"" today (08Jan2021) around noon with a low grade fever,and developed a cough that was not persistent. Patient has soreness in the arm where vaccine was given. She was asking what should she do about it? Outcome of the events low grade fever, cough, feeling unwell, feeling abnormal were not recovered while vaccination site pain was unknown. The events low grade fever, cough, feeling unwell were considered serious medically significant and related to vaccine.; Sender's Comments: Based on the time association, the events fever, cough and malaise are possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

generalized weakness; flushing; my BP is high; dose 1 start date 19Dec2020; dose 2 start date 8Jan2021; This is a spontaneous report from a contactable pharmacist. A 34-year-old female patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EL3246), intramuscular in left arm on 08Jan2021 at a single dose for COVID-19 immunization. Medical history included chronic HTN and allergies to baclofen and statins. The patient's concomitant medications were unspecified medications taken for hypertension. The patient previously received the first dose of bnt162b2 on 19Dec2020 via intramuscular in left arm, lot EL0140. On 08Jan2021, the patient was brought into ER as code MET. Patient was receiving her second vaccine for COVID-19 when she experienced generalized weakness and flushing. She stated that she knew her BP was high. Endorses hx chronic HTN, reports she took all three medications this AM. The patient denied any headache, new visual change, CP, SOB, or focal weakness. The events recovered on an unknown date in Jan2021. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. No treatment was received for the events.; Sender's Comments: Based on the time association, the events asthenia, flushing and hypertension are possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer

procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Profuse watery vaginal bleeding 12 hrs after injection. Bleeding lasted approximately six hours. After first injection and vaginal bleeding, gynecology exam completed for abnormalities; This is a spontaneous report from a contactable physician (patient). A 55-year-old female patient received the first dose of BNT162B2 (Pfizer-BIONTECH Covid-19 Vaccine), intramuscular in the left arm on 22Dec2020 at 16:00 at a single dose; and the second dose via intramuscular in the left arm on 08Jan2021 at 08:00 at a single dose as COVID-19 vaccine. Medical history included a known latex allergy and previous spontaneous cerebral artery dissection x 3 (nonspecific connective tissue disease). The patient was not pregnant at the time of vaccination and did not receive any other vaccine within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to the vaccination and was not tested for COVID-19 post vaccination. Concomitant medications (reported as other medications within two weeks of vaccination) included estrogens conjugated (PREMARIN), micronized progesterone, colecalciferol (Vitamin D), folic acid (FOLATE), and diphenhydramine hydrochloride (BENADRYL). On 23Dec2020, the patient experienced profuse watery vaginal bleeding 12 hours after the injection. The bleeding lasted approximately six hours. After the first injection and vaginal bleeding, a gynecology exam was completed for abnormalities. Previously diagnosed uterine fibroids present and some free fluid in the pelvis by ultrasound. Bleeding resolved by the end of post-vaccine day 1. After the second vaccine, heavy vaginal bleeding started 10 hours after a injection. It was reported that the adverse event result in a doctor or other healthcare professional office/clinic visit. Treatment for the event involved removal of the IUD. Outcome of the event was recovering. The case was reported as non-serious (did not result in death, was not life-threatening, did not cause/prolong hospitalization, was not disabling/incapacitating, and did not result to any congenital anomaly/birth defect). Information about the lot/batch number has been requested.; Sender's Comments: There is reasonable possibility that the event vaginal hemorrhage is related to suspect drug BNT162B2 based on a compatible temporal relation between vaccination and the onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

few enlarged and abnormal lymph nodes believed to be reactive in nature; patient was pregnant at the time of vaccination; large mass appeared in right axilla; mass was painful to touch; large mass appeared in right axilla; mass was painful to touch; This is a spontaneous report from a contactable healthcare professional (patient). A 36-year-old female patient received the first dose of bnt162b2 (COVID 19, brand: Pfizer) lot no: EJ1685, via an unspecified route of administration in right arm on 23Dec2020 07:15 at a single dose for COVID-19 immunization in a hospital. The patient had no relevant medical history and no known allergies. The patient was pregnant at the time of vaccination, last menstrual date was on 05Oct2020, delivery date will be on 12Jun2021, gestation period: 11. Concomitant medication includes daily multivitamin. The patient did not receive other vaccines within 4 weeks prior to the COVID vaccine.

The patient was not diagnosed with COVID-19 prior to vaccination and was not tested for COVID-19 since the vaccination. On 30Dec2020 04:00 am, 7 days after vaccine (as reported), a large mass appeared in right axilla. The mass was painful to touch. Overnight mass more than doubled in size on 31Dec2020 the mass took up her entire arm pit, went to immediate care and was given antibiotics. The mass decreased in size but has not gone away. She followed up with primary care. She had bloodwork and ultrasound of axilla and right breast. Blood work was normal. Ultrasound showed a few enlarged and abnormal lymph nodes believed to be reactive in nature. Largest lymph node as of 08Dec2020 2.5 x 0.9 x 2.2 cm. The events were reported as non-serious. The events resulted in doctor or other healthcare professional office/clinic visit and emergency room/department or urgent care. Outcome of the events was unknown.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

Syncopal event; Nausea; Vomiting; This is a spontaneous report from a contactable nurse. A 29-year-old female received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number:EL1284), via an unspecified route of administration on the right arm on 08Jan2021 12:15 at single dose for COVID-19 immunisation. The patient medical history was not reported. Concomitant medication included influenza vaccine (INFLUENZA VACCINE) on 13Dec2020. The patient previously took first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899) on 18Dec2021 12:15. The patient experienced syncopal event, nausea and vomiting on 09Jan2021 05:00. The patient received no treatment. The outcome of the events was recovering. No follow-up attempts are possible. No further information is expected.; Sender's Comments: Based on the compatible time association, the event syncope is possibly related to suspect drug BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

allergic reaction; large red itchy rash on her neck / chest area; trembling; This is a spontaneous report from a contactable pharmacist. A 33-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via unspecified route of administration (lot number: EL1283) in the arm right on 07Jan2021 09:00; at single doses for COVID-19 immunization. Medical history included known allergies: latex. Concomitant medications included magnesium oxide (MAG OXIDE) at 200 mg, daily (every day) and cetirizine hydrochloride (ZYRTEC) at 10 mg, daily (every day); and toprolol at 25 mg, every day (pending clarification for the drug). The patient previously received first dose of BNT162B2 on 17Dec2020 (lot number: EK5730) for COVID-19 immunization. Patient was not diagnosed with COVID-19 prior to vaccination; and has not been tested for COVID-19 since vaccination. Within the 15-minute observation period on 07Jan2021, the patient developed a large red itchy rash on her neck and chest area; she stated she felt fine but was observed trembling. She was transported to ED

(emergency department, 5 min transport). She was treated with diphenhydramine hydrochloride (BENADRYL) at 25mg IV X1 (intravenous), and methylprednisolone (SOLUMEDROL) at 60mg IV X1 and famotidine 20mg IV X 1. Patient diagnosis was allergic reaction on 07Jan2021. Patient improved after treatment and was discharged (after being in Emergency room/department or urgent care) as she was observed from 09:11 until 10:33. Final outcome of the events was all recovered on unspecified date.; Sender's Comments: Based on the time association, the allergic reaction, rash erythematous and trembling are possibly related to suspect BNT62B2 administration.The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

couldn't differentiate the tingling in hands and feet from shot or from that; sharp pain jolt behind eyes/eyes hurt; icreamed; Her hand eye coordination was off as well and she wasn't able to be accurate on keyboard and her cursive was off; Whole body still weak; sharp pain jolt behind eyes, left one in particular so bad she screamed and the nerves went all the way to finger tips; Twitching of face when do certain movements; brain zaps and brain buzzing began; numbness to right side of face to neck/made its way to left side; Horrible headache; fatigue; felt pressure behind her right eye; felt in a fog; forgetful mid conversation; This is a spontaneous report from a contactable other health professional (patient). A 42-year-old female patient (not pregnant at the time of vaccination) received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, EL0140), intramuscular on 23Dec2020 08:00 at single dose at right arm for COVID-19 immunization; prednisone via an unspecified route of administration from an unspecified date to an unspecified date (for 4 days) at 50 mg for an unspecified indication. Medical history included Known allergis: latex, contrast dye. Concomitant medication included the first dose of influenza vaccine (FLU) on 30Nov2020 at single dose at right arm for immunization. Facility where the most recent COVID-19 vaccine was administered at Hospital. The patient received other vaccines within 4 weeks prior to the COVID vaccine. It was reported that Day 1: on 23Dec2020 08:15, the patient felt pressure behind her right eye after shot, felt in a fog, forgetful mid conversation. Day 2. (24Dec2020) Horrible headache started, fatigue. Day 3 (25Dec2020) brain zaps and brain buzzing began, headache, fatigue, numbness to right side of face to neck. By day 5 (27Dec2020) made its way to left side. Twitching of face when do certain movements. Her Dr gave her Prednisone and she took 50 mg for 4 days and stopped because she couldn't differentiate the tingling in hands and feet from shot or from that. Still brain zaps, newest issue sharp pain jolt behind eyes, left one in particular so bad she screamed and the nerves went all the way to finger tips. Her hand eye coordination was off as well and she wasn't able to be accurate on keyboard and her cursive was off. Whole body still weak, eyes hurt. Head a lot better than a day ago but still having buzzing and twitching. Today was day 18. She was awaiting an MRI with contrast on Friday hoping it got moved sooner as she was scared to what was going on. The adverse events result in Doctor or other healthcare professional office/clinic visit and Emergency room/department or urgent care. Treatment received for the adverse events included CT/MRI/Optic Nerve Scan/Pain Shot/Meds for Zaps. The events were non-serious per the reporter. Prior to vaccination, the patient wasn't diagnosed with COVID-19. Since the vaccination, the patient had been tested for COVID-19. The patient underwent lab tests and procedures which

included Nasal Swab: negative on 28Dec2020. The action taken in response to the events for prednisone was permanently withdrawn on an unspecified date. The outcome of the events reported as not recovered.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of all these reported serious events might not be fully excluded, considering the plausible temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"Heart fluttering; chest pressure; This is a spontaneous report from a contactable nurse (patient). A 55-year-old female patient received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; lot number: EK5730; expiration date: not known), via an unspecified route of administration in the left arm at hospital on 31Dec2020 10:00 at at single dose for COVID-19 immunization. Medical history included known allergies with sulfa. The patient is not pregnant. The patient's concomitant medications were not reported. The patient previously took clarithromycin (BIAXIN), metronidazole benzoate (FLAGYL), and sulfamethoxazole, trimethoprim (BACTRIM), and all but experienced allergies (reported as ""known allergies: Biaxin, Flagyl, sulfa, Bactrim""). No COVID prior to vaccination and no COVID tested post vaccination. The patient experienced heart fluttering and chest pressure on 04Jan2021. There was no treatment received for the reported events. The outcome of the events was not recovered.; Sender's Comments: A causal relationship between the reported heart fluttering and the use of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) cannot be completely excluded due to temporal relationship. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

Tachycardia up to 150 resting; Nausea; Vomiting; Diarrhea; Headache; Migraine; Body aches; Chills; Fever up to 102; This is a spontaneous report from a contactable nurse (patient). This 26-year-old female patient (pregnant: no) received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number: EL3248), intramuscular on 08Jan2021 at 07:45 AM at single dose on right arm for COVID-19 immunisation. Medical history included anxiety and depression. No known allergies. Concomitant medication included fluoxetine hydrochloride (PROZAC), bupropion hydrochloride (WELLBUTRIN), diphenhydramine hydrochloride (ZZZQUIL). No other-vaccine-in-four weeks. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number: EK5730), intramuscular on 22Dec2020 at 08:00 PM on right arm for COVID-19 immunisation. The patient experienced tachycardia up to 150 resting, nausea, vomiting, diarrhea, headache, migraine, body aches, chills and fever up to 102. Symptom onset around 7PM on 08Jan2021 and stopped around 12PM 09Jan2021 except for headache which was still persisting as of 9PM 09Jan2021. No treatment was received for the events. The outcome of headache was not recovered. The outcome of other events was

recovered on 09Jan2021 at 12PM. The patient did not have COVID-prior-vaccination. The patient did not have COVID tested post vaccination.; Sender's Comments: The reported tachycardia was probably related to the use of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) due to temporal relationship. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Bell's palsy onset within 48 hours of second vaccine, R side of face; First dose of vaccine on 20Dec2020 and second dose received on 06Jan2021; First dose of vaccine on 20Dec2020 and second dose received on 06Jan2021; This is a spontaneous report from a contactable healthcare professional reporting for himself from a Pfizer sponsored program. A 24-year-old male patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; lot number EJ1686) via an unspecified route of administration, on 06Jan2021 at 11:30am on left arm, single dose for COVID-19 immunization. Relevant medical history and concomitant medications were reported as none. The patient had no known allergies. The patient had no other vaccine in four weeks and no other medications in two weeks. The patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number EL0140) at right arm on 20Dec2020 10:30am for COVID-19 immunization. On 08Jan2021 at 12:00pm, the patient experienced facial droop 2 days after taking the 2nd dose of the vaccine. The patient went to the hospital for doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care and were advised to take Valtrex and Prednisone and told its Bell's palsy. Bell's palsy onset within 48 hours of second vaccine, R side of face. Wanted to confirm if there will be a problem once they take these drugs since the paient have just received the vaccine recently or wanted to know if the new medications prescribed will affect the vaccine's effectivity. The patient was not diagnosed with COVID prior vaccination and was not tested for COVID post vaccination. Outcome of the event Bell's palsy was not recovered.; Sender's Comments: Facial droop/ Bell's palsy occurred 2 days after taking the 2nd dose of the BNT162B2 vaccine, a possible causal association between administration of BNT162B2 and the event onset thus might not be fully excluded, considering the plausible temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

7 days later diagnosed with pneumonia; 3 days after developed hives on my stomach and arm; felt tired; confused; unwell; This is a spontaneous report from a contactable healthcare professional (patient). A 37-year-old female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: Ek5730), via an unspecified route of administration on the left arm on 28Dec2020 12:00PM at a single dose for COVID-19 immunization at hospital facility. Medical history included Hashimotos disease. The patient had no known allergies and has not had COVID prior to vaccination. The patient's concomitant medications were not reported. The patient reported that she felt tired and confused and unwell on day of injection, 28Dec2020. After three days (31Dec2020), she developed hives on her

stomach and arm and seven days later (04Jan2021), she was diagnosed with pneumonia and continued to have hives all over her legs and arms to this day. The patient was treated with antibiotics for pneumonia. She underwent Covid test/ Nasal swab post vaccination on 09Jan2021, pending result. The outcome of the events was not recovered.; Sender's Comments: The reported pneumonia was more likely an intercurrent disease, and unlikely causally related to the use of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE). The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

difficult breathing; Pain on the chest; Not being able to move my upper neither lower body; itchiness all over my body; unconscious; Headaches; major anxiety; depression; very light-headed; weak; almost faint; This is a spontaneous report from a contactable Other HCP (patient). A 28-years-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 08Jan2021 12:00 at single dose on Left arm for COVID-19 immunisation. Facility type vaccine was Hospital. Medical history was none. The patient's concomitant medications were not reported. No other vaccine in four weeks. The patient experienced Not being able to move my upper neither lower body, Headaches, major anxiety, and depression, unconscious, very light-headed, weak, almost faint, Pain on the chest, difficult breathing, itchiness all over my body on 08Jan2021. AEs resulted in Emergency room/department or urgent care, Hospitalization. Received injected fluids as treatment. The outcome was Not Recovered. No COVID prior vaccination. No COVID tested post vaccination. Information on the lot/ batch number has been requested.; Sender's Comments: Based on a close temporal association, a causal relationship between reported events and BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

I had a very early miscarriage at five weeks; I had a very early miscarriage at five weeks; I had a very early miscarriage at five weeks; This is a spontaneous report from a contactable Physician (patient). A 31-year-old female patient received BNT162B2 first dose of (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EJI685) intramuscular at arm right on 19Dec2020 06:30 at single dose for covid-19 immunization. Facility type vaccine was hospital. Medical history was none. The patient had no known allergies or other medical history. There were no concomitant medications. No other vaccine in four weeks and no other medications in two weeks. The patient experienced a very early miscarriage at five weeks on 01Jan2021. The event result in doctor or other healthcare professional office/clinic visit. No treatment received. The outcome of the event miscarriage was recovered in Jan2021. No covid prior vaccination and no covid tested post vaccination.; Sender's Comments: All pregnancies have a risk of birth defect, loss, or other adverse outcomes. The data on BNT162B2 administered to pregnant women is insufficient to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this

report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

almost pass out; Chills; nausea; diarrhea; abdominal pain; clammy; elevated heart rate; dizzy; This is a spontaneous report from a contactable consumer (patient's parent). A 24-year-old female patient (pregnant: No) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK9231) via an unspecified route of administration on left arm on an unspecified date in Dec2020 at single dose for COVID-19 immunization. The relevant medical history included asthma, migraines and anxiety all from an unspecified date. Concomitant medications included ethinylestradiol, etonogestrel (NUVARING), topiramate (TOPAMAX), verapamil and sertraline hydrochloride (ZOLOFT). The patient experienced chills, nausea, diarrhea, abdominal pain, clammy, elevated heart rate, almost pass out, dizzy, all on 05Jan2021. The patient had no treatment for the events. No covid prior vaccination. The patient underwent lab test included heart rate showed elevated on 05Jan2021, Nasal Swab showed negative on 06Jan2021. The outcome of the events was not recovered.

Rash on lower legs similar to that seen with Thrombocytopenia.; Rash on lower legs similar to that seen with Thrombocytopenia.; This is a spontaneous report from a contactable Other HCP (patient). A 21-year-old female patient (not pregnant) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot number= EJ1686), via an unspecified route of administration at Left arm on 05Jan2021 10:00 AM at single dose for covid-19 immunization. The COVID-19 vaccine was administered at Hospital. The patient's medical history and concomitant medications were unknown. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced rash on lower legs similar to that seen with thrombocytopenia on 09Jan2021 at time of 12:00 PM. No treatment received for the events. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient was not been tested for COVID-19. The outcome of the events was not recovered.; Sender's Comments: A possible contributory effect of suspect drug on reported thrombocytopenia cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Fatigued; Sore in her throat; Lost her voice (hoarse); Reddish nose; Intermittent coughs; she went to work to a COVID unit which she usually didn't do; described her symptoms as a chest cold; Feeling strange like coming down; swelling and soreness in the injection site for a day or two; swelling and soreness in the injection site for a day or two; This is a spontaneous report from a contactable nurse reported for self. This 41-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number unknown) via unspecified route of administration on 07Jan2021 13:30 PM at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not provided. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number unknown) for COVID-19 immunization on an

unspecified date. On 07Jan2021 after second dose vaccination, the patient started experiencing swelling and soreness in the injection site for a day or two. On 08Jan2021 the next day, she went to work to a COVID unit which she usually didn't do. On 08Jan2021 the next day after her shift at 15:00 PM, she started feeling strange like coming down. On 09Jan2021, she felt totally fatigued. The symptom that bothered her the most is the sore in her throat which has gone 10Jan2021, she said she lost her voice (hoarse). She was also experiencing a reddish nose and intermittent coughs. She described her symptoms as a chest cold. The patient also stated she didn't have fever or chills. She's afraid she might be sick. The outcome of event the sore in her throat was resolved on 10Jan2021. The outcome of other events was unknown. Information about lot/batch number has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported chest cold cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

"tingling sensation in right eye and mid cheek area,Unable to wink, or scrunch right eye; muscles on the right side of my face were noticeably weaker; This is a spontaneous report from a contactable nurse (patient). This 48-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot # EH9899), via an unspecified route of administration, on 23Dec2020 at 04:00 PM at single dose for COVID-19 immunisation. Vaccine location was right arm. The patient was vaccinated at Public Health Clinic/Veterans Administration facility, age at vaccination was 48-years-old. No other vaccine was received in four weeks. Medical history included gastrooesophageal reflux disease (GERD). Known allergies included levofloxacin (LEVOFLOXACIN), pethidine hydrochloride (DEMEROL), phenobarbital, cefalexin monohydrate (KEFLEX), charithromycin (BIAXIN). Concomitant medications included dexlansoprazole (DEXILANT), estradiol, phentermine, ergocalciferol (VIT D), calcium. The patient was not tested for covid prior or post vaccination. On 23Dec2020 at 04:45 PM, after leaving the clinic, the patient felt tingling sensation in right eye and mid cheek area. Within 1.5 hours, muscles on the right side of her face were noticeably weaker. Unable to wink, or scrunch right eye. The events resulted in doctor or other healthcare professional office/clinic visit, and emergency room/department or urgent care. The patient was treated with prednisone. Outcome was recovering.; Sender's Comments: Based on a close temporal relationship causality between events ""tingling sensation in right eye and mid cheek area"" and ""muscles on the right side of her face were noticeably weaker"" and BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

She is still freezing to death; Sick as a dog; Fever; Chills; cannot eat and have no appetite; nauseous; This is a spontaneous report from a contactable nurse (patient). A 79-year-old female patient received first dose of bnt162b2 (also reported as Pfizer Covid vaccine, lot number: EK4176), intramuscular into left arm on 05Jan2021 16:00 at single dose indicated as presentation because she is a nurse/Covid-19

immunization. Medical history included Type 2 Diabetes, about 2 years ago in 2019 in which she takes metformin 1,000mg twice daily. Concomitant medication included metformin on unspecified date at 1,000mg twice daily for Type 2 Diabetes. There was no history of all previous immunization with the Pfizer vaccine nor there were additional vaccines administered on same date of the Pfizer Covid vaccine. The patient received the Pfizer COVID vaccine last Tuesday and since 06Jan2021 at 06:00, she has been sick as a dog. She is running a fever, has chills, can't eat and has no appetite because she is nauseous; all on 06Jan2021 at 06:00. This is the third day of it. She would like to know what she can she do. She said that it all started Wednesday morning when she got up. It just gets worse every day. It looks like it would get better by now, but it hasn't. She never runs a temperature, but she has now (unspecified date). She is still freezing to death on unspecified date. She usually has a good appetite. Even the thought of food makes her sick. She further reported that she has had nothing but chills, fever, and nausea and states it will not go away. She is treating it with ibuprofen. She confirms she already talked to a nurse in this department to report this and she was transferred to see what she could do and states they never answered. This is her first dose and she does not know if she should get the second dose. The patient can't calm down since she has been sick since last Wednesday. She stated that she needed some help because she is so sick. She was suggested to call again calling Pfizer medical information department. She stated that she had called back three times, but there is no such number. The events sick as a dog, fever, chills, can't eat and has no appetite, and nauseous were considered serious (Other medically important condition). The outcome of the events sick as a dog, fever, chills, can't eat and has no appetite, and nauseous was not recovered, and the outcome of the remaining event was unknown.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be completed based on known safety profile and a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

palms of my hands were bright red; very warm flush feeling; nausea; swelling of the throat; rash on my arms and abdomen; This is a spontaneous report from a contactable nurse (patient). A 49-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899 and expiration date not provided), intramuscular in the left arm on 06Jan2021 16:00 (at the age of 49 years old) at a single dose for COVID-19 immunization. Medical history included psoriasis, microscopic colitis, allergies to shellfish, and coconut. The patient's concomitant medications were not reported. The patient previously took estrogen patch, etanercept (ENBREL) and sulfamethoxazole, trimethoprim (BACTRIM) and experienced allergies to all. The patient was not pregnant at the time of vaccination. The patient did not receive any other vaccine within 4 weeks prior to the COVID vaccine and did not take any other medications with 2 weeks of vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. On 06Jan2021 16:15, the patient experienced a very warm flush feeling, nausea started and by 15 minutes, she had swelling of the throat and rash on her arms and abdomen and the palms of her hands were bright red. The events resulted in Emergency room/department or urgent care visit. The patient was treated with diphenhydramine hcl (BENADRYL), steroids (unspecified), famotidine (PEPCID) and ondansetron (ZOFRAN) in response to the events. The patient assessed the events as non-serious.

The outcome of the events was recovered with sequel on an unspecified date in Jan2021. The patient has not been tested for COVID-19 since the vaccination.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

glaucoma; This is spontaneous report from a contactable consumer (patient). A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiry date unknown) via unspecified route of administration on unspecified date at single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the first shot and was scheduled to receive the second dose on 27Jan2021 however, she has an eye surgery for glaucoma scheduled on 22Jan2021 and 25Jan2021. The patient wanted to know if she re-schedule the eye surgery. The outcome of the event glaucoma was unknown. Follow-up activities are possible, information on the batch number has been requested.

"Stevens Johnson Syndrome; rash was starting to peel; developed a rash all over her neck/ the rash has spread to face eyes, cheek; developed a rash all over her neck, ""looks like its peeling and taut""; developed a rash all over her neck, ""looks like its peeling and taut""; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age (Age: 48, Unit unknown) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 10Jan2021 at single dose for covid-19 immunization. Medical history included she had an allergic reaction to sulfa and developed Stevens Johnson syndrome from an unknown date and unknown if ongoing. The patient's concomitant medications were not reported. The patient experienced Stevens Johnson Syndrome, developed a rash all over her neck/ the rash has spread to face eyes, cheek; ""looks like its peeling and taut""; and the rash was starting to peel, all in Jan2021. The patient received 1st dose of vaccine on 10Jan2021, developed a rash all over her neck, ""looks like its peeling and taut"". She had an allergic reaction to sulfa and developed Stevens Johnson syndrome, this looks similar to that (Experience of Stevens Johnson Syndrome). The patient was asking if she did take the steroid dose pack from her dermatologist for the skin rash will it prohibit her from taking the second dose of the vaccine. She called yesterday and reported a rash after receiving the first dose of the COVID-19 vaccine. She stated that she went to her Dermatologist this morning because the rash has spread to face eyes, cheek and the rash was starting to peel. She stated that the dermatologist wanted to know if it was safe to treat her with a prednisone dose pack after receiving the vaccine. Her rash was worsening so she went to her dermatologist for treatment. She was asking if she should get the second dose. The outcome of events for developed a rash all over her neck/ the rash has spread to face eyes, cheek was not resolved, for other events was unknown. Information about lot/batch number has been requested.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of suspect Stevens Johnson Syndrome presented as skin reactions cannot be excluded, considering the plausible temporal relationship. Severe allergic reaction is the known risk for the vaccine. The underlying

predisposing condition of an allergic reaction to sulfa developed Stevens Johnson syndrome may put the patient at high risk of the similar occurrence. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate"

following day around 7pm lip swelling; tongue tingling; body hives; chills; After first dose of Covid vaccine face flushing; increased HR about 45 mins. went away on its own; hours later left eye swollen; This is a spontaneous report from a contactable Nurse (patient). A 31-years-old female patient received first dose of bnt162b2 (BNT162B2, Lot number: EK9231), via an unspecified route of administration on 06Jan2021 15:00 at single dose on Left arm for covid-19 immunisation. Medical history included Known allergies: Shellfish, IV contrast dye, Penicillin. There were no concomitant medications. No other vaccine in four weeks. No other medications in two weeks. The patient experienced after first dose of covid vaccine face flushing; increased hr about 45 mins. went away on its own since 06Jan2021 16:00; hours later left eye swollen on 06Jan2021; following day around 7pm lip swelling, tongue tingling, body hives, chills on 07Jan2021 19:00. The patient underwent lab tests and procedures which included heart rate: increased on Jan2021. Ae resulted in: Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. Ae treatment: Steroids, IV fluids, Benadryl. No COVID prior vaccination. No COVID tested post vaccinate. This report was reported non-serious. The event outcome of increased hr about 45 mins. went away on its own was recovered on 06Jan2021 16:45, outcome of other events were not recovered.; Sender's Comments: Based on the compatible time association, the serious events are possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

kidneys weren't acting/kidney issues; not having the feeling to urinate; Light-headed; This is a spontaneous report from a contactable consumer (reported for herself). A 91-year-old female patient received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; lot number: EL3248; expiration date: not known), via an unspecified route of administration in the left arm on 07Jan2021 at single dose for COVID-19 immunization. Medical history included high blood pressure and blood thinner. Concomitant medication included apixaban (ELIQUIS) for blood thinner. The patient is asking if there were any reports of adverse events with kidneys and the vaccine. She received the 1st shot last Thursday (07Jan2021) and told that yesterday (10Jan2021), she had an episode where kidneys weren't acting. She also mentioned that she is on a blood thinner, ELIQUIS. She is due to receive the 2nd shot on 28Jan2021. She said that she wouldn't want to receive the 2nd dose if this was related to her adverse reaction. The issue with the kidney started after on 10Jan2021, yesterday she was really having problems, she went to church then came home by that time she would have to go to the bathroom, but she did not go, she ended up cooking dinner which was 3 hours later, she was noticing that she was not urinating. She drank some Gatorade and that made it little better, she is wondering if it's a side effect.

On 10Jan2021, when she noticed the kidney issues, she did not know for certain if it started before that, she didn't pay attention. Also, yesterday (10Jan2021), she got sick in which she had to grab the counter, she felt bad, she wasn't dizzy, but felt light-headed. The symptom of not having the feeling to urinate had improved a little today but she is concerned and wanted to know if this was a side effect. Her being light-headed only occurred on 10Jan2021, it was a onetime occurrence yesterday. However, she was also just sitting around, laying around, after that yesterday. The outcome of the event 'light-headed' was unknown; while outcome of other events was recovering.

difficulty thinking; Extreme fatigue; dizziness; This is a spontaneous report from a contactable nurse (patient). A 42-year-old female patient received her second dose of BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 10Jan2021 11:15 at single dose at Arm Right for COVID-19 immunisation. Medical history included hypothyroidism, thyroid cancer, hypertension from an unknown date and ongoing, Known allergies: Latex, aluminium, nickel.The patient was not pregnant. Concomitant medication included gabapentin, propranolol, levothyroxine sodium (SYNTHROID), and pantoprazole. The patient has previously received her first dose of BNT162B2 on 20Dec2020 08:45 PM for COVID-19 immunisation at Arm left. There was no any other vaccines within 4 weeks prior to the COVID vaccine.The patient experienced difficulty thinking, extreme fatigue and dizziness resulted in Doctor or other healthcare professional office/clinic visit. All the events occurred on 11Jan2021 09:00 with outcome of recovering. No treatment was received. Prior to vaccination the patient was not diagnosed with COVID-19 and since the vaccination, the patient has not been tested for COVID-19.The events were considered as non-serious. Information about lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the mental impairment and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

concern for injection to the subcutaneous tissue/concerned about improper administration/patient has a mark where you can see the vaccine and it's higher up where you expect it to be; induration at the injection site; felt induration was moving down his/her arm/can feel it migrated down her arm, 7 inches below injection site; This is a spontaneous report from a contactable pharmacist. A patient of unspecified age and gender received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EK4176), subcutaneous (reported as injection to the subcutaneous tissue to deltoid) on 09Jan2021 at 0.3 mL, single to prevent from getting COVID. The patient's medical history and concomitant medications were not reported. The patient previously took the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) on Dec2020 for COVID-19 immunization. On 09Jan2021, within a couple hours after, the patient experienced induration at the

injection site. The patient felt induration was moving down his/her arm with concern for injection to the subcutaneous tissue. The patient can feel it migrated down his/her arm, 7 inches below injection site. The reporter assessed that the causality was yes for the suspect drug and the patient was concerned about improper administration. The reporter was unsure if it is administration or vaccine, the patient has a mark where you can see the vaccine and it's higher up where you expect it to be. Outcome of the vaccination site induration and induration was not recovered. The events were considered medically significant by the reporter.; Sender's Comments: Based on the available information a causal relationship between reported events induration at the injection site / induration and incorrect route (subcutaneous) of BNT162B2 vaccine administration cannot be excluded. The case will be reevaluated should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Slight left sided facial weakness/droop 4 days post vaccination; Slight left sided facial weakness/droop 4 days post vaccination; Tingling in injected arm and facial tingling in cheeks/lips same day of vaccination/Tingling to lower extremities; Tingling in injected arm and facial tingling in cheeks/lips same day of vaccination; Tingling in injected arm and facial tingling in cheeks/lips same day of vaccination; This is a spontaneous report from a contactable consumer (patient herself). A 36-year-old female patient received her first dose of bnt162b2 (BNT162B2 also reported as COVID 19 brand Pfizer, lot EK9231), via an unspecified route of administration in the left arm on 04Jan2021 13:00 at single dose, for Covid-19 immunisation. The vaccine was given in a Nursing Home/Senior Living Facility. Medical history was none. No known drug allergies. No other vaccine in four weeks. No Covid-19 prior vaccination. Concomitant medication included naproxen sodium (ALEVE). The patient experienced tingling in injected arm and facial tingling in cheeks/lips same day of vaccination (04Jan2021). Tingling to lower extremities the day after vaccination (still continuing). Slight left sided facial weakness/droop 4 days post vaccination (04Jan2021). Tingling to left arm continuing on and off. No treatment reported. On 04Jan2021, she was negative to PCR covid test post vaccination. She went to the Emergency room/department or urgent care. The outcome of events was not recovered.

"slurring speech; rash around his neck and upper chest; his earlobes were bright red, as was his nose; mouth was dry; nose was dry; dry throat; almost ""drunk""; Only abnormal finding was BP 159/94; This is a spontaneous report from contactable pharmacist. A 36-year-old male patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number=EL1283 and Expiration Date unknown) via Intramuscular on 08Jan2021 11:25 at single dose for COVID-19 immunisation. The patient's medical history was reported toradol made him feel lightheaded and foggy (similar to his first Pfizer BioNTech covid vaccine), Attention deficit hyperactivity disorder (ADHD). History vaccine included first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number =EK5730 and Expiration Date unknown) via Intramuscular on 18Dec2020 at single dose for COVID-19 immunisation. Patient did report that on first vaccine it made him feel a little sluggish, tired and foggy minded. The concomitant medications were reported as amfetamine aspartate, amfetamine sulfate, dexamfetamine saccharate,

dexamfetamine sulfate (Adderall XR) at 25mg twice a day (BID) and escitalopram oxalate (LEXAPRO) oral (PO) at 10mg every day. No other vaccine in four weeks. Patient was vaccinated at 11:25. Patient was observed for 30 minutes. Pharmacist checked on patient at 17 minutes after vaccination - he was fine able to communicate and showed no signs of distress. Pharmacist came back and checked on patient at 25 minutes after vaccination (11:50) and patient was slurring speech, had developed rash around his neck and upper chest, his earlobes were bright red, as was his nose - mouth was dry, reported dry throat - no visible swelling of the lips or tongue. Patient was transported to ED (2 min) Home meds: Adderall XR 25mg BID [Twice a day], Lexapro 10mg Q [every]PM. Only abnormal finding was BP 159/94 - after initial workup patient was noted to be almost ""drunk"" as reported by Emergency Room (ER Doc). Patient was offered diphenhydramine declined several times but eventually agreed. Approx 30 min after diphenhydramine patient fully recovered and stated ""I'm back"". The second dose reaction was much more exaggerated and lasted much longer. No COVID prior vaccination and no COVID tested post vaccination. The adverse event result in Emergency room/department or urgent care. The outcome of events was recovered in Jan2021 after treatment was given.; Sender's Comments: Based on the time association, all events are possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

SOB; leukocytosis; acute onset of fever (101.2); CXR = bilateral vascular congestion; This is a spontaneous report from a contactable consumer. An elderly NH resident patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on an unspecified date, at single dose, for COVID-19 immunization. Medical history and concomitant medications were not reported. On an unspecified date the patient experienced shortness of breath (SOB), leukocytosis (17,800), acute onset of fever (101.2), bilateral vascular congestion. The patient was admitted with acute onset of fever (101.2), leukocytosis (17,800, no eosinophilia) and SOB, all beginning 3-4 hours after BNT162B2 administration. CXR showed bilateral vascular congestion. No facial or SQ edema. No evidence of myocardial damage or CHF based on BNP and troponin, respectively. The patient was treated with brief (3 days) pulse of methylprednisolone sodium succinate (SOLUMEDROL) with improvement. Chalking it up to acute capillary leak syndrome 2^2 vaccine. The final events outcome was unknown. Information on lot/batch number has been requested.

Blood in stool; Fever; Night sweats; Chills; Ache; This is a spontaneous report from a contactable physician reporting for herself. An adult (reported as 30-something year old) female patient received the 1st dose of bnt162b2 (BNT162B2), via an unspecified route of administration, on 30Dec2020, at single dose, for COVID-19 immunisation. The patient's medical history was none. Concomitant medications were not reported. The patient experienced blood in stool in Jan2021 with outcome of unknown, chills on 31Dec2020 with outcome of unknown, ache on 31Dec2020 with outcome of unknown, fever in Jan2021 with outcome of unknown, night sweats in Jan2021 with outcome of unknown. The patient reported that 24 hours after vaccination she experienced chills and aches, and after the 24 hours experienced some significant fevers that wouldn't break and chills. Then, after about 2 hours, the fever

would break and come back and it was like a cycle. Also had night sweats and blood in her stools after that. The information on the lot/batch number has been requested.; Sender's Comments: The female patient received the 1st dose of bnt162b2 (BNT162B2) on 30Dec2020, and experienced blood in stool in Jan2021 with outcome of unknown. The information available is limited, and case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Patient presented to our Emergency Department via EMS in full code status; asystole. Patient expired. Per nursing, husband stated patient awoke this AM and reported pain in back between shoulders and in bilateral shoulders. Patient then went unresponsive and husband called EMS.

1/11/21 at 8:57 Resident with fever and at 11 am saturation down to 83 O2 to 10 liters. Resident continued to decline until CTB on 1/14/2021 at 1325

I was diagnosed with COVID-19 on 12/7/2020. My course of symptoms lasted 16 days, meaning I started feeling healthy again on 12/23/20. I am a pharmacist with a healthcare system and they have been offering the Pfizer/Biontech COVID-19 vaccine for essential associates. I received by first dose of vaccine on 12/31/20. On 1/1/20 I woke up with very noticeable muscle aches and fairly profound lethargy, which last 18-20 hours. I was not able to do much on 1/1/21 because of the way I was feeling. I'm not sure if this reaction is normal for patients who receive their COVID-19 vaccine close to their illness/infection with COVID-19, which is why I'm reporting this to the FDA.

Heart rate slowed significantly down to 32bpm Tightness in chest, trouble breathing Elevated blood pressure

injection site became red & swollen, the size of a softball. Employee started having seizure like symptoms on 1/14/21 and was admitted to hospital. DC from hospital on 1/16/21 and on 1/17/21 started having seizures again and readmitted back to hospital. Employee has no history of seizures.

I received the Pfizer vaccine on 12/21/20 without adverse events other than soreness in deltoid. On 12/31/20 I began to notice pain, redness and swelling in second toe on R foot from base of toe to base of nail. I initially thought it was gout and self medicated with ibuprofen 400 mg BID x 1 day on 01/01/21 with some improvement. I did not take anything on 01/02/21 and woke up on 01/03/21 with return of swelling, redness and pain. I took another 400 mg of ibuprofen and it felt better but after examining the toe, I questioned whether I had developed pernio (COVID toe).

patient began with vomiting and diarrhea the day after administration, leading to bowel and urine incontinence. patient was hospitalized on 01/16/20 with sepsis. no origin discovered yet. still waiting on blood/urine/stool cultures.

Patient was living in a nursing home with positive cases when administered. His age and chronic condition was such that he did not have time after the vaccination to avoid exposure or develop immunity.

Resident had seizure like activity that was about 30 minutes in duration where her upper/lower extremities were shaking uncontrollably. Resident had to be admitted into hospital for observation.

blistering rash - bullous pemphigoid, steroids, admitted to hospital pending further evaluation.

1day after vaccine,developed severe headache & later blister in head officially Shingle . Then decreased platelet count fatally to 29(ITP).now hospitalized getting treatment.

Was feeling anxious right after vaccine given. Laid in cot for a short time, then stated her throat felt like it was closing.

Severe rash. Platelets drop to almost needing transfusion

1252 Resident rang with complaints of chest pain and shortness of breath. BP 126/70, Temp 97.5, pulse 72, resp. 20, O2 sats on room air 90%. While awaiting transport complained of increasing shortness of breath. Resident transported to Community Hospital via Ambulance with 3L O2 . Resident placed on ventilator and transported to Medical Center

severe body aches; severe chills; night sweats; Fatigue; This is a spontaneous report from a contactable Physician (patient). A 55-year-old male patient received the second dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 06Jan2021 at 12:00 at single dose in left arm for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient previously received the first dose bnt162b2 in Dec2020 three weeks ago at 12:00 noon in the left arm for covid-19 immunization and experienced mild pain at the injection site which lasted two days and then was gone. The patient experienced severe body aches, severe chills, night sweats, and fatigue on 07Jan2021. Event details: The patient reported that he received the first dose of the Pfizer COVID 19 vaccine three weeks ago at 12:00 noon in the left arm. He did not know the exact date. After the first dose there was mild pain at the injection site which lasted two days and then was gone. He received the second dose of the Pfizer COVID 19 vaccine on 06Jan2021 at 12:00 noon in the left arm. He noticed 12 hours later severe body aches, severe chills, and night sweats. He also felt fatigue. Everything had mostly resolved except for the night sweats and they were still pretty severe. All events were reported as serious by reporter per medically significant. The outcome of event night sweats was not resolved, outcome of other events was resolved on 10Jan2021. Information about lot/batch number has been requested.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported severe body aches, severe chills, fatigue and night sweats, and the administration of the COVID 19 vaccine, bnt162b2, based on the reasonable temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

eosinophil count is 12.2%; Congestion; rhinitis; Cough; This is a spontaneous report from a contactable consumer. A 68-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot/batch number unknown), via an unspecified route of administration on 21Dec2020 at a single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient who is an MD received the COVID vaccine on 21Dec2020. She quickly developed rhinitis, cough, and congestion which have persisted. Her eosinophil count is 12.2%. She received a Medrol pack, but it did not relieve her symptoms. She has delayed her second injection for now. The outcome of the events was unknown. Information about lot/batch number has been requested.

resident expired; This is a spontaneous report from a contactable healthcare professional. An 82-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot number: EL0140), intramuscular in the left arm on 05Jan2021 15:00 at a single dose for COVID-19 immunization. Medical history included metabolic encephalopathy from, failure to thrive (FTT), diabetes mellitus (DM) 2 , chronic obstructive pulmonary disease (COPD), arthritis, weakness, hyperlipidemia, chronic kidney disease (CKD), dementia. Known allergies was none. The patient took unspecified concomitant medication. On 11Jan2021, the resident expired. The patient underwent lab tests and procedures which included nasal swab: negative on 09Jan2021. There was no treatment given for the event. The patient died on 11Jan2021. An autopsy was not performed.; Sender's Comments: Lacking information on the cause of patient's demise, the Company cannot completely exclude a causal relationship between COVID 19 vaccine, BNT162B2, and patient's death of unknown cause, as a cautionary measure and for reporting purposes. The patient's pre-existing medical condition of metabolic encephalopathy from, failure to thrive (FTT), diabetes mellitus (DM) 2 , chronic obstructive pulmonary disease (COPD), arthritis, weakness, hyperlipidemia, chronic kidney disease (CKD), dementia may have provided the contribution to the event in this 82-year-old male patient. The impacts of this report on the benefit/risk profile of the product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: resident expired

Facial paralysis; This is a spontaneous report from a contactable consumer (patient herself). A 36-year-old female patient received bnt162b2 (COVID-19 Vaccine by Pfizer, lot EK9231, expiry date was not reported), via an unspecified route of administration on 08Jan2021 at SINGLE DOSE for Covid-19 immunisation (to prevent the COVID). Medical history was none. There were no concomitant medications. The patient experienced facial paralysis on the left side of her face upon waking up on 09Jan2021. The outcome of event was not recovered.

"Congestion in my lungs; I am coughing up junk; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date was not reported) via an unspecified route of administration on an unspecified date at single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient experienced congestion in lungs and was reportedly coughing up ""junk"" on an unspecified date. It was also reported that the patient

woke up this morning with a pretty bad side effect. Outcome of events was unknown. Information on the lot/batch number has been requested."

"Started to have symptoms and fainted; Hit her nose and has a scar now; She blacked out; hit her nose, got the scar in the nose, àshe was bleeding from that scar; hit her nose, got the scar in the nose, àshe was bleeding from that scar; She started to feel unwell; Chills; Nausea; Rash in her arm; She had little red in her bumps; This is a spontaneous report from a contactable physician. A 29-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE Solution for injection, batch/lot no. and expiry date: unknown), via an unspecified route of administration on arm on unspecified date at a single dose (2nd dose) for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Physician stated, ""she had no medical conditions, she was in very good you know very like standing with herself."" Patient had her 1st dose of Covid vaccine on unspecified date for COVID-19 immunization. Physician (reporter) stated, ""I am the parent of someone who got the COVID dose, the second dose yesterday. I am very concerned because my daughter yesterday (08Jan2021) started to have symptoms and fainted at 4:00 in the morning and hit her nose and has a scar now. She had her second dose yesterday (pending clarification), after the second dose last night she started to feel unwell, getting chills, nausea and when she got up to go to the bathroom, she fainted, she blacked out. She lives alone, she is an adult, she hit her nose, got the scar in the nose, and the bleeding wouldn't stop, she was bleeding from that scar. She told me it took two hours for bleeding to stop from that scar."" When asked when the events started, Physician stated, ""Last night (08Jan2021), at 4:00 am she took the shot during the day while she was at work. She said, she started to getting chills and then she was nauseated."" When asked if patient was still experiencing the event, the parent reported no as patient was just resting. Also stated, ""She didn't take any treatment but she said she took Tylenol."" Physician further added, ""I am concerned, we are going to be taking her to the urgent care now but I am concerned about what is going on with platelets and all of that because of what had happened, last night the bleeding wouldn't stop for two hours and she was alone at the night and weekends. She said, she had to lay down and then her dad is there now because he is closer, he is going to be taking care of the urgent care but I want Pfizer to know what my daughter has gone through last night after she took this second dose."" Physician further added, ""she is having a rash in her arm, she had little red in her bumps as well. I want her to go get checked up as soon as possible in urgent care."" Patient was taking some Ibuprofen (later clarified that patient took Tylenol as treatment). She was not taking any other medication. Outcome of the events was unknown. Information Requested on Lot/ Batch number.; Sender's Comments: The reported faint was most likely due to an accident, and less likely causally related to the use of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE). The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

1) Skin rash over 80% of my body including, face and lips; started to change my voice sound and started to compromise my airways. 2) Uncontrollable shakes, but not sure if this was related to Covid-19 itself.

Was given steroids via injection into my blood stream, within minutes the shakes stopped and within 2 hours the rash was gone.

12/22 Vaccine 12/23 ER. Admitted to hospital for 7 days. Dr stated was due to fluid. Radiology stated no fluid present. Couldn't breath. Pulmonologist put on 2nd inhaler. Coughing a lot. Not able to walk more then 6 steps without stopping to catch breath. *Has had 2nd vaccination on 1/13/2020

1/12 vaccination 1/13 swelling and pain at injection site. Admitted for 4 days.

patient suddenly developed pneumonia 7 days after vaccination and died the evening of developing pneumonia

Couple hours after the vaccine, experienced elevated temperature, difficulty taking full deep breathes (attributed to fatigue). Temperature improved but fatigue and shortness of breathe continued until 1/16/21. a bilater arm rash occurred and employee went to the Emergency Department for an assessment. At this time, she was having chest tightness, shortness of breathe. Lab - troponins elevated. Other labs - within normal limits. Admitted to hospital for observation and discharged next day. Today, during cardiac follow-up appt, was having decreased oxygen saturation levels, increased pulse rate. Admitted again today for obsevation with cncern of acute endocarditis.

Death

1 hour post injection patient returned with redness and borderline hives in her left arm, chest, neck and face. She complained of feeling very hot and with mental confusion. We administered 50 mg of diphenhydramine, and 15 minutes later sent her to the ED. At the ED they diagnosed her with a minor anaphylaxis reaction, gave her methylprednisolone and epinephrine.

"Individual felt fine except a sore arm until 1/5/2021 legs became weak and dizziness and light headed and did t"" feel well"" and passed out. had general muscle weakness and went to ER. She was given fluid for possible dehydration and went home and weakness increase and went back to ER and was admitted to hospital for testing."

Individual had no side effect except sore arm for 5 days then on 1/5/2021 became weak and dizzy and passed out. had not felt well in am. she had continued weakness and extreme leg weakness and taken to ER for evaluation. She states got IV fluids and sent home but weakness increase and went back to ER on 1/5/2021 and admitted to hospital.

patient started to decline 1/10/2021, patient seen at facility by medical professional - patient deceased 1/13/2021

REPORTING ONLY AS RESIDENT EXPIRED ON 1/17/2021 3 DAYS AFTER. S/S HYPOXIA/CONGESTED LUNG SOUNDS

ventricular fibrillation cardiac arrest. Witnessed collapse. Bystander CPR performed. Paramedics performed ACLS with defibrillation x 6 before ROSC

PVCs with compensatory pauses, postural orthostatic hypotension associated with chest tightness, shortness of breath, dizziness and blurry vision

The day following the vaccine, the patient complained of throat issues and anxiety. This was not new... however . That evening he reported difficulty breathing and was placed on oxygen; a COVID test was performed and was negative. On 12/30/2020, patient complained of sternal pressure and was transferred to the hospital. The patient died 12/31/2020 and records obtained from the hospital indicated the patient died from a massive myocardial infarction.

Seizure

WITHIN 30 SECONDS OF RECEIVING VACCINE PATIENT STATED THAT SHE DID NOT FEEL WELL. HER FACE BECAME FLUSHED. HER LIPS BECAME NUMB AND HER TONGUE AND THROAT STARTED SWELLING. AN EPIPEN WAS ADMINISTERED AND 911 CALLED. AFTER THE EPIPEN SYMPTOMS BEGAN TO RESOLVE. EMS CHECKED HER OUT AND SHE REFUSED TRANSPORT.

8 hours after vaccine severe injection site pain/swelling, severe body aches, 101.0 temp. 16 hours after vaccine woke up from sleeping with flushed skin, facial swelling, and throat swelling. I immediately took 100mg of Benadryl and went to hospital emergency room. Approximately 30-40 minutes later symptoms started to lessen. Once at the ER, at the same time symptoms began to resolve, I was given PO Solumedrol and Pepcid. I was monitored and then discharged with RX for prednisone, and EPIPEN (to use if needed). No other issues with allergic reaction. Mild injection site soreness, mild body aches, 99.3 temp persist at 36 hours post injection.

Received Moderna COVID vaccine 12/31/20, 3 days later noticed generalized joint pain all over. Day 4 noticed both knees were red and tender and could palpate pockets of fluid. Had bilateral ankle and foot pain, right ankle swollen. Overnight 1/5-1/6/21 was in severe pain and unable to sleep, very difficult to walk on ankles and feet, stairs were very painful. Motrin relieved symptoms to where able to walk more comfortably but generalized achiness and tenderness to ankles and knees remain.

Anaphylaxis after Covid 19 vaccine #1. Pfizer Lot # EH9899

71 year old woman at rehabilitation center for physical therapy with history of cirrhosis of the liver, asthma, and heart condition was tested for COVID-19 on 01/07/21, received 1st dose of Pfizer COVID-19 vaccine on 01/08/21, positive test result for COVID-19 received on 01/09/21. She was sent to the hospital and admitted on 01/12/21 after O2 was 70% and was in a confused state. Patient passed away on 01/17/21.

Received shot Wednesday night, developed arm soreness and mild flu like symptoms on left side of my body and facial paresthesias on the left side of my face. Twelve hours later, after waking up those same symptoms were only on the right side of my body. Friday morning, mostly normal physically just with some overall fatigue. Friday afternoon I started to get hives on my chest and overnight into Saturday they were on my lower back, sides, and legs. I took 50 mg of Benadryl every 6-12 hours until Monday mid-day when Benadryl was not helping reduce the hives and so I had full body hives. I did try an

drugstore cortisone cream which did not help. Sought treatment at an urgent care as I was feeling anxious and could not control the itching. I and was diagnosed with likely allergic reaction to the covid-19 vaccine.

She woke up soaking wet. She had sweats kind of.; Tested positive for COVID; Tested positive for COVID; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A contactable nurse (patient herself) reported that a 64-year-old female patient received her first dose of bnt162b2 (BNT162B2 also reported as PFIZER-BIONTECH COVID-19 VACCINE, lot EK5730, expiry date not reported), via an unspecified route of administration in the upper left arm on 21Dec2020 17:00 at SINGLE DOSE for Covid-19 immunisation. Medical history included ongoing hypertension (blood pressure high). She was a former smoker, a teenage smoker. She has not smoked since the age of 19 years old. Concomitant medication included amlodipine for high blood pressure. The patient informed that she was vaccinated on 21Dec2020. On 05Jan2021, she had a positive COVID Test and she was wondering when she should have the second dose of the COVID Vaccine. She thought initially she just had a cold. She took the COVID test as a precaution. It started out with a stuffy nose. She had a congested cough, upper airway cough, nothing deep in the lungs. She had a low grade fever. It was like 99.9. It was possible it was higher, but she had taken Ibuprofen at night. She woke up soaking wet. She had sweats kind of. Her temperature however never registered a true fever if a fever was considered 100.4. She was not really having body aches any more unusual than one would have for a 64 year old. She has a very mild sore throat. Her stuffy nose had improved, it's still there slightly, but not like it was the first few days. The outcome of events was unknown.; Sender's Comments: Test positive for covid19 found 14 day following the first dose of COVID-19 vaccination, bnt162b2, no adequate effect of the suspect vaccine thus could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag.

"received the first dose of vaccine in a hospital on 18Dec2020/tested positive for COVID on 01Jan2021; received the first dose of vaccine in a hospital on 18Dec2020/tested positive for COVID on 01Jan2021; This is a spontaneous report from a contactable nurse (patient) via Pfizer-sponsored program, Pfizer First Connect. A 43-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection, Lot number: EK5730, expiration 31Mar2021) , via an unspecified route of administration in left arm, on 18Dec2020 at 15:00, at 0.3 mL, single, for COVID-19 immunization. Medical history and concomitant medications were reported as none. The patient received the first dose of vaccine in a hospital on 18Dec2020 at 15:00 as she works in emergency room and tested positive for COVID on 01Jan2021. The patient stated that the second dose is scheduled this afternoon (08Jan2021) and wants to know if she should proceed with the vaccine. The patient is looking for guidance on whether or not to get the second dose or wait. The patient has been directed to receive second COVID vaccine. No additional vaccines administered on the same date. The event required a visit to urgent care. The patient did not have prior vaccinations within 4 weeks. No events prior to vaccination. The patient underwent lab tests and procedures which included COVID 19: positive on 01Jan2021. Outcome of the events was unknown. The event was assessed as serious (medically significant). The event ""Tested positive for COVID"" was assessed as unrelated to COVID vaccine as her husband was COVID positive before her.; Sender's Comments: The information currently provided is too

limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available."

She reported being exposed to her husband, who tested positive for COVID, and that she tested positive following her first vaccine dose; She reported being exposed to her husband, who tested positive for COVID, and that she tested positive following her first vaccine dose; She reported being exposed to her husband, who tested positive for COVID, and that she tested positive following her first vaccine dose; This is a spontaneous report from a contactable female nurse (patient). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE Solution for injection, batch/lot no. and expiry date unspecified) via an unspecified route of administration on 23Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient was asking if it is safe to get the second dose of the vaccine after being exposed to or having COVID? She reported being exposed to her husband (on an unspecified date), who tested positive for COVID, and that she tested positive following her first vaccine dose. She got her Covid-19 vaccine on the 23Dec2020 and tested positive for Covid-19 on the 28Dec2020. She was scheduled to get the next dose on Wednesday and wants to know if she should still get it. Outcome of the events drug ineffective, COVID-19 and Exposure to COVID-19 was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 23Dec2020, and COVID-19 test positive on 28Dec2020. No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the positive COVID test was likely associated with being exposed to her husband, who had COVID-19. Further information is needed for full medical assessment.

She had sniffles and post nasal drip; Got first dose then went to (Entertainment complex name) and contracted COVID/tested positive after getting the 1st dose; Tested positive after getting the 1st dose; She returned home with sniffles, fatigue, and no taste/She had sniffles and post nasal drip; This is a spontaneous report from a contactable nurse (patient) via Pfizer-sponsored program: IBCC (Inbound Call Center for HCPs). A 53-year-old female patient received first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730, exp date not reported), via an unspecified route of administration on 19Dec2020 for given since patient works with COVID patients (COVID-19 immunisation). The patient had no relevant medical history. There were no concomitant medications. Nurse called asking if she can get the 2nd dose of the vaccine 6 days after the 21st day. She tested positive on 05Jan2021 after getting the 1st dose and was still in quarantine. The nurse works at a hospital. She received her first dose of the COVID-19 Vaccine on 19Dec2020, and afterwards donated blood on the same day. She got the vaccine through her place of work. She said when she donated blood on 19Dec2020, her blood was tested for the COVID-19 Virus antibodies, and her blood was negative for the virus antibodies. She lives about 30 mins from work, so she thought she would get both done in the same day. She gave blood right before she got the vaccine. She gave the blood then went and got the Vaccine. She said on 26Dec2020 she went to Entertainment complex as it was her vacation. Her and her family went for 4 days. On 30Dec2020 she returned home with sniffles, fatigue, and no taste. She said she tested positive for the COVID-19 Virus on 05Jan2021. On 30Dec2020 they got back,

and on 02Jan2021 she had sniffles and post nasal drip. On 03Jan2021 she did not wanna get out of bed. She was profoundly fatigued. She also lost her smell. She had to go back to work on 07Jan2021, but did not want to go back in unless she was sure she was okay because she works with babies. She had no other symptoms after 03Jan2021, except no smell and no taste. She got tested for COVID and was positive on 05Jan2021 (also reported as 06Jan2021 [pending clarification]). Her and her husband were both positive, but her kids were not. The weird thing was she also on 06Jan2021 got her results back from giving blood and she was negative for COVID on 19Dec2020 prior to getting the vaccine. Caller clarifies that her COVID test was a nasal swab. Patient thought her age may have contributed to her feelings of fatigue. She had indicated she worked in either a hospital NICU or nursery, and that is why she had to quarantine for 14 days. She probably would not have even gotten tested for COVID if she was not a nurse and did not know that losing taste and smell were a sign. She feels fine. She said she was scheduled for her second dose of the COVID-19 Vaccine on 12Jan2021. She said she was now in quarantine for 14 days due to testing positive for the COVID-19 Virus, and her quarantine period ends on 14Jan2021. Since now she is in quarantine, she will miss her second dose which was supposed to be on 12Jan2021. She said she rescheduled her second dose of the COVID-19 Vaccine to 18Jan2021, which was 6 days later than when she was supposed to receive the 2nd COVID-19 Vaccine dose. She asked if getting the dose 6 days late was okay. The events were considered as non-serious by the reporter. The outcome of the events was unknown.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

tested positive for COVID; tested positive for COVID; achiness; Chills; not feeling well; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A contactable consumer (patient's wife) reported similar events for four patients. This is the first of four reports. A 48-year-old male patient received his first dose of bnt162b2 (BNT162B2 also reported as Pfizer-Biontech Covid-19 Vaccine, lot/batch number and expiry date were not reported), via an unspecified route of administration on 17Dec2020 at single dose, for Covid-19 immunisation. Medical history was none. There were no concomitant medications. The patient received the vaccine last 17Dec2020. The following day, 18Dec2020, he was not feeling well. Clarified those side effects as achiness and chills. He had been working so hard and thought initially were getting side effects from the COVID Vaccine. He was tested positive for COVID on 22Dec2020. He was in bed basically until 31Dec2020. His wife wants to know if he should get the second dose. The outcome of events was recovered. Information on the Lot/Batch number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021019513 same drug, similar events, different patient;US-PFIZER INC-2021019535 same drug, similar events, different patient;US-PFIZER INC-2021019534 same drug, similar events, different patient

"tested positive for SARS-COV-2; tested positive for SARS-COV-2; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect, received from a contactable nurse (patient). A 31-year-

old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiry date were not reported), via an unspecified route of administration on 18Dec2020 at a single dose for an unspecified indication. The patient's medical history and concomitant medications were not reported. The patient received first dose of vaccine on 18Dec2020 and tested positive for SARS-COV-2 20Dec2020. She reported ""las major symptom"" on 27Dec2020 and asked if it was okay to take the second dose. Outcome of the events was unknown. Information about lot/batch number has been requested.; Sender's Comments: Positive SARS-COV-2 came back 2 days following the vaccine use is compatible with COVID 19 infection. No adequate effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag."

Fevers; Chills; he is suspecting that he got infected with the Covid-19 though he already received the 1st dose; he is suspecting that he got infected with the Covid-19 though he already received the 1st dose; Body aches; Patient suspected that he has gotten infected also from his spouse; This is a spontaneous report from a contactable physician (patient). A 48-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 05Jan2021 (Tuesday) at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. Patient reported body aches developing the evening of receiving the vaccine, and it has persisted for three days. Patient started to get the chills on Wednesday (06Jan2021). Patient said his wife has been tested positive after he took the 1st dose and he is suspecting that he got infected with the Covid-19 though he already received the 1st dose. Patient thought that he may have been infected by his spouse. He got the vaccine on Tuesday and on Wednesday had fever and chills and still has them. Stated that his spouse lost her sense of smell and taste and tested positive for Covid on Wednesday. Patient stated that this was the day after he received his vaccine. Patient suspected that he has gotten infected also from his spouse and was not aware when he got the vaccine. Stated that now that he is having expected side effects of fever and chills. The outcome events was not recovered. This case was reported as non-serious. Information on the lot/batch number has been requested.; Sender's Comments: The subject received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 05Jan2021, and suspected got COVID-19 infection via exposure to COVID-19 living with his wife, who lost her sense of smell and taste and tested positive for COVID on 06Jan2021. No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Further information is needed for full medical assessment.

exposed to her 6 month old grand daughter who was positive; tested and received a positive test result, without symptoms.; tested and received a positive test result, without symptoms.; This is a spontaneous report from a contactable consumer. A 59-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EJ1685), via an unspecified route of administration at the right arm on 30Dec2020 at a single dose for COVID-19 immunization. Medical history included high blood pressure from 2001 and ongoing. There were no concomitant medications. Patient had the flu, shingles and pneumonia vaccines and a booster for MMR in the past 6 months. Patient was exposed to COVID-19 on 01Jan2021. Patient was tested on 07Jan2021 and received a positive test result on

08Jan2021. Patient does not have any symptoms. She was exposed to her 6 month old grand daughter who was positive. The doctor said he thinks it was a false positive. Outcome of the events was unknown.

Tested positive for the Covid virus; Tested positive for the Covid virus; This is a spontaneous report from a contactable nurse. A male patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 29Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient received the first dose of the vaccine on 29Dec2020 and four days ago, he tested positive for the Covid virus (02Jan2021). The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Test positive for the Covid virus found 4 day following the vaccination, no adequate effect of the suspect vaccine thus could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag.

"the symptoms as ""having Covid all over again""; the symptoms as ""having Covid all over again""; headache; nausea; severe joint and body pain; body pain; coughing; fever; This is a spontaneous report from a contactable other healthcare professional (HCP) reporting for herself. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. Medical history included covid-19 from an unknown date. The patient's concomitant medications were not reported. The patient just got the Covid vaccine and was experiencing side effects. She described the symptoms as ""having Covid all over again"", mentioned headache, nausea, severe joint and body pain, coughing and fever on an unknown date. Want to see how long these side effects last. The outcome of the events was unknown. Information regarding lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further information like confirmative virus genome /nucleic acid detection is needed for meaningful medical assessment."

caller was rushed to the emergency room and was tested positive for COVID-19; caller was rushed to the emergency room and was tested positive for COVID-19; caller became symptomatic and experienced headaches; This is a spontaneous report from a contactable physician. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 18Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that the patient received the first dose on 18Dec2020 and is scheduled for the second dose today, 09Jan2021. However, on 24Dec2020, she became symptomatic and experienced headaches. On Saturday, she was rushed to the emergency room and was tested positive for COVID-19. Her physician told her that she could get the COVID-19 vaccine if she has no symptoms anymore. She wanted to know the guidance per Pfizer. The patient underwent lab tests and procedures which included SARS-COV-2 test: positive on 09Jan2021. The outcome of the events was unknown. Information about lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient cannot be completely excluded.

got a positive test on 31Dec2020. Her 2nd dose is due on Wed and she is currently symptomatic.; got a positive test on 31Dec2020. Her 2nd dose is due on Wed and she is currently symptomatic.; This is a spontaneous report from a contactable consumer via Pfizer-sponsored program . A female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot and expiration date unknown), via an unspecified route of administration on an unspecified date at a single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. On 31Dec2020, the patient got a positive test. Her 2nd dose was due on wed and she was currently symptomatic. Patent would to know if she should get second dose on her scheduled date even though she still was feeling unwell. The outcome of the events was unknown. Information about batch/lot number has been requested.

COVID test result as positive; COVID test result as positive; Chills; Body aches; Headache; Weakness; This is a spontaneous report from a contactable nurse (patient). A 46-year-old female patient received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection, Lot number: 49899, unknown expiration), intramuscular in right arm, in Dec2020 at 09:00 AM, at single dose, for COVID-19 immunization. Medical history included asthma, hypothyroid, and interstitial cystitis. The patient has no known allergies. Concomitant medication included influenza vaccine in right arm (lot number: US47SAA) on 08Dec2020 for immunization. Patient also received other unspecified medication within two weeks of vaccination. COVID-19 vaccine was administered in a hospital. On 23Dec2020 at 01:30 AM, the patient woke up with chills, body aches, headache and weakness. On 31Dec2020, the patient had nasal swab for COVID with COVID test result as positive post vaccination. Patient is not pregnant at the time of vaccination. The patient did not have COVID prior to vaccination. The patient received ibuprofen for the events chills, body aches, headache and weakness. The patient recovered from the events chills, body aches, headache and weakness on unspecified date; while unknown outcome for the remaining events.; Sender's Comments: The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 23Dec2020, and nasal swab for COVID-19 test positive on 31Dec2020. No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the positive COVID likely represents the pre-existing infection prior to vaccine use. Further information is needed for full medical assessment.

maybe she could have COVID too; maybe she could have COVID too; a rash on her leg; some shortness of breath; This is a spontaneous report from a contactable consumer. A 72-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiry date were not reported), via an unspecified route of administration on 06Jan2021 at a single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that the patient received her first dose of COVID-19 vaccine on Wednesday, 06Jan2021 and today, on 09Jan2021, the patient started having a rash on her leg, some shortness of breath. She used an asthma inhaler. She experienced some of the symptoms before Wednesday. The reporter was concerned that maybe the patient could have COVID, too. The reporter heard that with COVID, sometimes rashes and/or shortness of breath can come, too. The outcome of the events was unknown. Information on the lot/batch number has been requested.

severe headache behind the eyes; Initially extreme fatigue; started to have shortness of breath; muscle aches; cough; second dose on 05Jan2021 08:30; This is a spontaneous report from a contactable physician (patient). A 39-year-old female patient received second dose of BNT162B2 (Lot number: EL3246), intramuscularly on 05Jan2021 08:30 in left arm at single dose for COVID-19 immunization. Medical history included known allergies: latex and asthma. Patient did not have COVID prior vaccination. Concomitant medications included sertraline hydrochloride (ZOLOFT), drospirenone/ethinylestradiol (YASMIN), melatonin, and ibuprofen (MOTRIN). Patient previously took montelukast sodium (SINGULAIR) and experienced allergy. Patient received first dose of BNT162B2 (Lot number: EK5730), intramuscularly on 18Dec2020 09:00 in left arm at single dose for COVID-19 immunization. Patient experienced initially extreme fatigue, then muscle ached all within 12-24 hours, severe headache behind the eyes. Then when thought was getting better, she started to have shortness of breath, worsening fatigue, and cough; all on 05Jan2021 12:00. These events were resulted in emergency room/department or urgent care. COVID was tested post vaccination. COVID test type post vaccination was nasal swab. COVID test name post vaccination was COVID 19 nasopharyngeal swan. COVID test date was on 08Jan2021. Test result was pending. Treatment received included nebulizer treatment, and steroid course. Patient was not recovered from these events.; Sender's Comments: Based on a compatible temporal relationship and known product safety profile, causality between events severe headache and extreme fatigue and BNT162B2 vaccine cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Hospitalized for stroke on 31Dec two days after vaccine.; sudden loss of hearing to right ear; dizzy and lightheaded/severe dizziness/felt like fainting; difficulty breathing; vomiting; This is a spontaneous report from a contactable nurse (patient). This 43-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), (Lot number: EL1285) via intramuscular route on 29Dec2020 14:30 at single dose on the left arm for COVID-19 immunization. Medical history included anxiety. No known allergies. Concomitant medications were not reported. Patient was not pregnant. Facility type vaccine was Nursing Home/Senior Living Facility. No other vaccine received in four weeks. Patient hospitalized for stroke on 31Dec2020 two days after vaccine (Days of hospitalization: 4). Day of vaccine-6 hours after patient had dizzy and lightheaded for about 45 min then went away. On 31Dec2020 at 19:15 had sudden loss of hearing to right ear and severe dizziness, difficulty breathing, vomiting, and felt like fainting. Paramedics were called-sent to ER, had CTA which showed partial blockage and received TPA. Treatment included TPA, fluids, medications, hospital stay, outpatient follow ups, physical therapy. Patient was not diagnosed with COVID prior to vaccination. Patient has been tested for COVID post vaccination. The patient underwent lab tests and procedures which included Nasal Swab: Negative and Pixel: Negative on 08Jan2021. Outcome of the events was recovering.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported events including stroke, dizzy/lightheaded/felt like fainting, difficulty breathing, vomiting, and sudden loss of hearing to right, and the administration of the COVID-19 vaccine, BNT162B2. More

information regarding the patient's underlying medical conditions, relevant lab tests would be helpful for the Company to make a more meaningful causality assessment.

fever 102 F; headache; chills; body aches; This is a spontaneous report from a contactable Nurse reported for herself. A 63-years-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) at single dose on 22Dec2020 14:30 and the second dose single dose (lot number=EK9231) on 09Jan2021 19:15 for COVID-19 immunization. Vaccine location=Left arm, dose number 1 and dose number 2. Facility-type-vaccine: Hospital. Medical history included asthma. The patient's concomitant medications were not reported. On 10Jan2021 at 14:00 the patient experienced headache with outcome of not recovered, fever 102 ¦F with outcome of not recovered, chills with outcome of not recovered and body aches with outcome of not recovered. The action taken was not applicable. Tylenol was received as therapeutic measures for fever.; Sender's Comments: Based on a compatible temporal association and known product safety profile, a causal relationship between reported events and BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Developed chest tightness around right side of chest into back and SOB 50.5 hours after vaccination. Went to local ER and found to have a right lower lobe pulmonary embolism. Treated with Xarelto and sent home with outpatient follow up.

Temperature spike to 104.6; received first dose of bnt162b2 on 20Dec2020 and second dose on 08Jan2021 13:15; This is a spontaneous report from a contactable consumer. A 38-year-old male patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were not reported), via an unspecified route of administration, on the left arm on 08Jan2021 13:15 at a single dose for COVID-19 immunization. Medical history included prediabetic kidney disease. Concomitant medications included salmo salar oil (OMEGA-3 [SALMO SALAR OIL]), lisinopril, furosemide, escitalopram, and rosuvastatin calcium (CRESTOR). The patient is reported to have received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) on 20Dec2020 15:45, on the left arm, for COVID-19 immunization. The patient had no prior Covid vaccination. The patient was not tested for Covid post vaccination. The patient had no known allergies. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. It was reported that the patient received first dose of bnt162b2 on 20Dec2020 and second dose on 08Jan2021 13:15. On 09Jan2021 at 04:30, the patient experienced temperature spike to 104.6, brought down with TYLENOL to hover around 101.0 to 102.0 for 24 hours, normal after that. The patient called a nurse who instructed to go the emergency room/physician office visit. Outcome of the event Temperature spike to 104.6 was recovered on unspecified date in Jan2021. Information about lot/batch number has been requested.

tested positive for COVID; tested positive for COVID; This is a spontaneous report from a non-contactable consumer. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH

COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient who is a nurse visited last weekend in the reporter's home for a few hours was advised that she tested positive for COVID today (unspecified date) and her family as well. She was vaccinated recently with the Pfizer vaccine. The outcome of the events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

I tested positive for COVID 8 days after my first dose.; I tested positive for COVID 8 days after my first dose.; This is a spontaneous report from a contactable consumer (patient). A 55-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiration date were not reported), via an unspecified route of administration on an unspecified date in Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient got his first dose of Pfizer COVID 19 vaccine 21 days ago in Dec2020. He mentioned that he tested positive for COVID 8 days after his first dose in Dec2020. He stated that he got the second dose yesterday (unspecified date) and queried if should he not have gotten it. The outcome of the events was unknown. Information about Lot/batch number has been requested.

9th: cold (?fever?), restless, body aches (especially headache, neck pain, bilateral knee pain), nausea, vomiting 10th: profound fatigue, hives, intermittent vertigo 11-17th: vertigo, mild headache and neck pain, nausea, vomiting 18th-current: vertigo, nausea, vomiting *Hospitalized from 17-18th, diagnosed with vestibular neuritis secondary to the vaccine

positive COVID-19 test with symptoms; positive COVID-19 test with symptoms; This is a spontaneous report from a Pfizer-sponsored program, Pfizer First Connect. A contactable 39-year-old male healthcare professional reported to have received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 02Jan2021, for COVID-19 immunization. Medical history and concomitant medications were not reported. On an unspecified date in Jan2021, after the first dose of vaccine, the patient felt sick at some point, so he took a rapid test which came back positive. He stated that the test if testing the antigens (as reported). Antibody testing was not currently recommended to assess for immunity to COVID-19 following Pfizer-BioNTech COVID-19 vaccination. Events outcome was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient cannot be completely excluded.

13 people, who were applied the vaccine previously, were corona positive after a week; 13 people, who were applied the vaccine previously, were corona positive after a week; This is a spontaneous report from a non-contactable consumer. This consumer reported similar events for 13 patients. This is first of 13 reports. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; lot number and expiration date: not known), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that 13 people, who were applied the vaccine previously, were corona positive after a week on an unspecified date. The outcome of the events was unknown. No follow-up attempts are possible; information about lot/batch number

After getting the first shot and the patient test positive for Corona virus; After getting the first shot and the patient test positive/perhaps positive; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A contactable pharmacist reported that a patient of unspecified age and gender started to receive BNT162B2 (PFIZER BIONTECH COVID-19 VACCINE), via an unspecified route of administration, first dose on an unspecified date at single dose for COVID-19 vaccination. The patient's medical history and concomitant medications were not reported. A pharmacist in a hospital wanted to know if after getting the first shot and the patient test positive for Corona virus, how long do they have to wait to get the second? A colleague is perhaps positive. He doesn't know if they got tested. Outcome of the events was unknown. Information on the lot/ batch number has been requested.; Sender's Comments: A causal association between reported event and BNT162B2 cannot be excluded.

Tested positive for COVID; Tested positive for COVID; Phlegm in throat; Cough; Runny nose; cold; Sneezing; Body aches; Nausea; Chills; Headache; This is a spontaneous report from a contactable consumer (patient). A 51-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 29Dec2020 14:50 at single dose at right arm for covid-19 immunization. No additional vaccines administered on the same date. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. Medical history included ongoing migraine. Concomitant medication included acetylsalicylic acid, caffeine, paracetamol (EXCEDRIN EXTRA STRENGTH) for migraine, patient had been alternating this with paracetamol (TYLENOL) while she has been recovering. She clarified the symptoms she experienced as the same day she got the vaccine that evening she had a headache on 29Dec2020. It eventually became a migraine and she left work early. On 30Dec2020 she had body aches, little nausea, and chills. On 31Dec2020, she had more chills, a runny nose, she felt like she was coming down with a cold. She was sneezing, had more chills, more body aches. On 01Jan2021 she felt like she noticed she had phlegm in her throat, but she did not have any pain. The phlegm was causing her to cough more. She had a runny nose the next morning as well. She did the rapid test for COVID on 02Jan2021 evening, and it was positive. She had a headache almost every day. The body aches had pretty much worn off. Runny nose and sneezing

resolved in Jan2021. Phlegm in throat confirmed with no pain. This also resolved, as well as coughing. Outcome of event tested positive for COVID was unknown, outcome of event headache was not recovered. outcome of event nausea was recovered on 07Jan2021, event chills was recovered on 08Jan2021, outcome of other events was recovered on unspecified date in Jan2021. The adverse events resulted in neither doctor or other healthcare professional office/clinic visit, nor emergency room/department or urgent care. Information of lot/batch number has been requested.

Positive COVID test; Positive COVID test; This is a spontaneous report from a contactable consumer (patient's wife). This consumer reported similar events for 2 patients. This is the 2nd of 2 reports. A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient was an Odontist and received COVID vaccine on Monday. He was scheduled to have a cath done on Thursday, but that was not happening now. The patient has positive COVID test. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021013678 same reporter/drug, similar event, different patient

Her stomach is still weirded out/sour stomach; feeling sick; arm pain; She was sick to her stomach; kidneys were hurting; body aches; tested positive; tested positive; The arm wasn't swollen it was just burning.; This is a spontaneous report from a contactable consumer (patient). A 51-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EL1284) via an unspecified route of administration on 29Dec2020 at single dose for COVID-19 immunization. Medical history was none. The patient's concomitant medications were not reported. At first, she thought she was having a reaction, but then she started feeling sick so she got tested. She was positive so she wasn't having a reaction. She was scared from the pain of COVID. She experienced sickness. Her stomach was still weirded out. She did experience arm pain from the vaccine. Her doctor told her it was fine that it needed to air out. She left the bandage on too long. She didn't have a prescribing doctor. She received the vaccine on the 29Dec2020. She tested positive 02Jan2020. The arm wasn't swollen it was just burning. She was sick to her stomach when she got the stomach. The sick to the stomach lasted maybe two days, but then she got COVID. The burning was around the arm. It wasn't that bad. It lasted for a day. It started the day she got the shot (on the 29Dec2020). On 07Jan2021, she went to the hospital because her kidneys were hurting. The doctor said her kidneys were good. They did labs which were good. She was still going through body aches. She was told she was currently in the worst part of the virus. She still had a sour stomach going on from the virus as well. The outcome of the body aches and sour stomach was not recovered, for other events was unknown.

tested positive after receiving the vaccine; tested positive after receiving the vaccine; she did not think symptoms were related to COVID like leg pain. She noticed that it was a lot worst; she did not think symptoms were related to COVID like leg pain. She noticed that it was a lot worst; This is a spontaneous report from a contactable consumer (patient herself). A 27-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE Solution for injection, batch/lot no. EH9899 and expiry date Mar2021), via an unspecified route of administration on 05Jan2021 on her left arm at a single dose

for covid-19 immunization. Medical history included leg pain. There was no reported concomitant medications. On an unspecified date, patient received COVID vaccine. She stated that she was symptomatic during the vaccine and somewhere after confirmed that she was COVID-positive. She wanted to know if there are any health concerns with getting the vaccine while COVID positive. She added that this was her first dose. she did not think symptoms were related to COVID like leg pain. She noticed that it was a lot worst but did not think that it was a symptom. She stated that she does not recall the first time ever that she had leg pain but stated that the leg pain was really bad the night before the vaccine. She added that she was isolated until 14Jan2021. Outcome of the events drug ineffective, COVID-19 virus test positive and leg pain were unknown.; Sender's Comments: Leg pain is considered intercurrent and unrelated to suspect BNT162B2.

COVID-19 or flu-like symptoms following COVID-19 vaccination/COVID-19 results were to be positive; COVID-19 or flu-like symptoms following COVID-19 vaccination/COVID-19 results were to be positive; COVID-19 or flu-like symptoms following COVID-19 vaccination; This is a spontaneous report from a contactable Other-HCP. A 61-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via unspecified route of administration on unspecified date at single dose for COVID-19 immunization. Patient medical history and concomitant medications were not reported. On unspecified date, COVID-19 or flu-like symptoms following COVID-19 vaccination was reported for the patient. COVID-19 results were to be positive on unspecified date. Changing diet to vegan was reported. Outcome of the events was unknown. Information on the lot/batch number has been requested.

contracted COVID two days after receiving vaccine; contracted COVID two days after receiving vaccine; This is a spontaneous report from a non-contactable nurse. A patient of unspecified age and gender received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that the patient got their first dose of the COVID vaccination. The patient contracted COVID on an unspecified date two days after receiving the vaccine. The outcome of the events was unknown. No follow-up attempts are possible. Information about lot/batch could not be obtained. No further information is expected.; Sender's Comments: A causal association between reported event and suspect BNT162B2 cannot be excluded.

tested positive for covid; tested positive for covid; This is a spontaneous report from a contactable consumer (patient) via a Pfizer sponsored program Pfizer Connect. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date not reported), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient works for a hospital. Said had 1st dose of vaccine. Had tested positive for covid on an unspecified date and is under quarantine. The patient would like to know when she should get 2nd dose. The patient underwent lab tests and procedures which included sars-cov-2 test: positive on an unspecified date. The outcome of the events was unknown. Information on the lot/Batch number has been requested.

got sick and tested positive with COVID; got sick and tested positive with COVID; This is a spontaneous report from a contactable consumer via Pfizer Sponsored Pfizer First Connect. A contactable consumer reported similar events for four patients. This is second of four reports. A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot and expiration date unknown), via an unspecified route of administration on an unspecified date at a single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. It was reported that the patient got sick and tested positive with covid on an unspecified date. It was further reported that patient who received the COVID vaccine, tested positive for COVID, and experienced side effects afterwards. The outcome of the events was unknown. Information about batch/lot number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021013589 same drug, similar events, different patient

got sick and tested positive with COVID; got sick and tested positive with COVID; This is a spontaneous report from a contactable consumer via Pfizer Sponsored Pfizer First Connect. A contactable consumer reported similar events for four patients. This is fourth of four reports. The patient's medical history and concomitant medications were not reported. The patient got sick and tested positive with covid on an unspecified date and experienced side effects afterwards. The outcome of the events was unknown. Information about batch/lot number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021013589 same drug, similar events, different patient

got sick and tested positive with COVID after getting the first dose of the COVID vaccine; got sick and tested positive with COVID after getting the first dose of the COVID vaccine; This is a spontaneous report from a contactable consumer received from Pfizer-sponsored program Pfizer First Connect. This consumer reported similar events for four patients. This is 3rd of four reports. A patient of unspecified age and gender received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient got sick and tested positive with COVID after getting the first dose of the COVID vaccine. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021013589 same reporter, same product, similar events, different patient.

caller tested positive on covid a week after taking the 1st dose of vaccine; caller tested positive on covid a week after taking the 1st dose of vaccine; This is a spontaneous report from a contactable consumer (patient) via Pfizer-sponsored program Pfizer First Connect. A female patient of an unspecified age received the 1st dose of bnt162b2 (BNT162B2) at single dose on an unspecified date for Covid-19 immunisation. The patient medical history was and concomitant medications were not reported. The patient was tested positive for Covid a week after taking the 1st dose of vaccine on an unspecified date. The outcome of events was unknown. Patient wanted to know if she can get the second dose. Information on the lot/batch number has been requested.

"COVID-19 virus test positive; COVID-19 virus test positive; This is a spontaneous report from a Pfizer-sponsored program ""Pfizer First Connect"" from a contactable consumer reporting for himself. A male patient of an unspecified age received the 1st dose of bnt162b2 (BNT162B2), via an unspecified route of administration, on 22Dec2020, at single dose, for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient experienced COVID-19 virus test positive on an unspecified date with outcome of unknown. It was reported that the patient was scheduled to get his second dose on 12Jan2021, however between 22Dec2020 and 12Jan2021 the patient experienced the adverse event. The information on the lot/batch number has been requested."

Got the first dose and was contracted with COVID; Got the first dose and was contracted with COVID; This is a spontaneous report from a contactable consumer (patient) from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A female patient of an unspecified age received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 20Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient was contracted with covid on an unspecified date in Dec2020 (27Dec2020 or 28Dec2020) with outcome of unknown. Information about lot/batch number has been requested.

throat swelling; headache; Pain; little bit of chills; GI upset; This is a spontaneous report from a contactable nurse. A 48-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot: EK9231, expiry: 30Apr2021), via an unspecified route of administration on an unspecified date at 0.3 mL, single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received her first dose of bnt162b2 on an unknown date for covid-19 immunization and experienced pain at the injection site. On an unspecified date, the patient experienced head ache, throat swelling, gastrointestinal (GI) upset, pain, and little bit of chills (don't believe to have had fever). It was clarified that the event took place after use of product. The outcome of the events was unknown.; Sender's Comments: The information in this report is limited, and does not allow a full medically meaningful assessment of the case. Considering temporal relationship, a causal relationship between the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) and the reported events including throat swelling cannot be excluded. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

five employees in a nursing home have gotten the first dose of the vaccine, and then tested positive for COVID; five employees in a nursing home have gotten the first dose of the vaccine, and then tested positive for COVID; This is a spontaneous report from a contactable nurse. This nurse reported similar events for five patients. This is the first of five reports. A patient of unspecified age and gender received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; lot number and expiry date not reported) via an unspecified route of administration, on an unspecified date, single dose for COVID-19 immunization. Relevant medical history and concomitant medications were not reported.

It was reported that five employees in a nursing home have gotten the first dose of the vaccine, and then tested positive for COVID on an unspecified date. They would like to know if they still get the second dose. Outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of Covid-19 virus test positive and suspected LOE due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. five employees in a nursing home have gotten the first dose of the vaccine, and then tested positive for COVID; five employees in a nursing home have gotten the first dose of the vaccine, and then tested positive for COVID; she had felt weird; This is a spontaneous report from a contactable nurse. This nurse reported similar events for five patients. This is the fifth of five reports. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; batch/lot number and expiration date unknown), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The nurse reported on behalf of her sister (patient). It was reported that the patient called right before Christmas and she had gotten the Pfizer COVID Vaccine. She reported that she had felt weird and had side effects to the vaccine. The patient works in a nursing home type thing, and she said she has had people who have gotten the first dose of the vaccine, and then tested positive for COVID. The patient called to ask the reporter if they should still get the second dose. The only other details that her sister (patient) provided her was that this has happened with several people; 5 employees and several or 9 patients. She is unsure if she said several patients or 9 patients, but there were 5 employees. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics

Committees, and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2021021881 Same reporter/ drug/ event for different patients.

Diarrhea; nausea and vomiting; nausea and vomiting; rash on her right arm, like a hive or whelp; Fever; Headache; really sore right arm; right arm felt numb; This is a spontaneous report from a contactable nurse (patient). A 44-year-old female patient received the first dose of BNT162B2 (Pfizer COVD 19 vaccine), lot number: EL0142, via an unspecified route of administration on 07Jan2021 17:00 at single dose in right arm for COVID-19 immunisation. Medical history included blood pressure abnormal, had a cough from having COVID 19 on 16Dec2020, cough was ongoing and unknown for COVID-19. Concomitant medication included amlodipine from an unspecified date (taking for 2 years) and ongoing at 10mg once daily by mouth for blood pressure abnormal. No other vaccines were administered on same date and no prior vaccinations (within 4 weeks). Registered nurse (patient) was calling regarding Pfizer COVID 19 vaccine. Reported she received the first dose last Wednesday 07Jan2021 17:00 in the right arm. Reported she noticed the next day (08Jan2021) fever and a headache. On 08Jan2021, Friday she had a really sore right arm and her right arm felt numb. On 09Jan2021, Saturday, she experienced nausea and vomiting and also noticed a rash on her right arm, like a hive or whelp. On 10Jan2021 Sunday, again with the fever, nausea, vomiting and she had diarrhea. Today she stated she woke up a new woman. She feels felt with no fever and her arm was better. She still had a cough from having COVID 19 on 16Dec2020. Stated she was used to coughing. Added she treated the fever with Tylenol 1000mg. Stated she didn't remember exactly but she took a little everyday starting on Thursday the day after the vaccine. Stated she was unsure if she would have the next dose. The events didn't require a visit to physician office or emergency room. The outcome of fever was recovered on 10Jan2021, of Headache, sore arm, rash on right arm, nausea and vomiting was recovered on 11Jan2021, of arm numb was recovered on 09Jan2021, of diarrhea was recovering. Serious criteria for fever was reported as yes, medical significant, for Headache, sore arm, arm numb and Diarrhea was non-serious, for rash on right arm, nausea and vomiting was unspecified.; Sender's Comments: Based on the compatible time association, the event fever is possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

COVID-19 confirmed by positive COVID-19 test; COVID-19 confirmed by positive COVID-19 test; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient develop Covid-19 diagnosed by PCR about may be six or seven days after received the vaccine. The patient recovered from the event. Information on the lot/batch number has been requested.

after the patient got vaccinated his relative tested positive; after the patient got vaccinated his relative tested positive; This is a spontaneous report from a Pfizer-sponsored program . A contactable nurse (relative of the patient) reported for a patient of unspecified age and gender received the first dose of

bnt162b2 (also reported as Pfizer Covid-19 Vaccine, lot no. and expiry date was not reported), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The nurse called in because his relative got the 1st dose of vaccine but after the patient got vaccinated his relative tested positive on unspecified date. The nurse called in if the patient can take the 2nd dose of vaccine. The outcome of the event was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) but after the patient got vaccinated his relative tested positive on unspecified date. The case will be reassessed should additional information become available.

Tested positive for COVID; Tested positive for COVID; This is a spontaneous report from a contactable nurse (patient). A male patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not provided), via an unspecified route of administration on 22Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and patient's concomitant medications were not reported. The patient received his first dose on 22Dec2020 then, nine days later, on 31Dec2020, he tested positive for COVID. He is scheduled for his second dose on 12Jan2021. However, he is still out of work. He called to see if he could get his second dose a couple of days later or does it have to be exactly 3 weeks from the first shot and if it is okay to go a little longer. During the call, he stated he just wanted his question answered about the second shot, if can he wait a little longer. The outcome of the events was unknown. Follow-up attempts are completed. The following information on the batch number has been requested.; Sender's Comments: A causal association between reported event and suspect BNT162B2 cannot be excluded.

Got my Covid vaccine on the 20th and then I came back positive for Covid last week; Got my Covid vaccine on the 20th and then I came back positive for Covid last week; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number/expiration date unknown), via an unspecified route of administration on 20Dec2020 at a single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. It was reported that the patient got the COVID vaccine on the 20th (20Dec2020) and then came back positive for COVID on an unspecified in Jan2021 (reported as last week), then tested negative on 08Jan2021 and was due for vaccine on 09Jan2021. It was asked if the patient will be able to get the vaccine. The outcome of the events was recovered on 08Jan2021. Information on the lot/batch number has been requested.

"diagnosed with Covid; diagnosed with Covid; This is a spontaneous report from contactable other healthcare professional via a Pfizer sales representative. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date was not reported) via an unspecified route of administration on 04Jan2021 at single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. It was reported that the patient received the vaccine on 04Jan2021 and was diagnosed with COVID on 07Jan2021. Outcome of the event was unknown. Information about Lot/Batch number has been requested.; Sender's Comments: Although, BNT162B2 vaccine immunogenicity is not in full effect after short time (3 days in this case) from the first dose administration, a causal relationship between event

""diagnosed with COVID"" (coded to Drug ineffective / COVID-19) and BNT162B2 vaccine cannot be completely excluded."

Patient received 1st dose on 28Dec and presented symptoms on 05Jan; Patient received 1st dose on 28Dec and presented symptoms on 05Jan; This is a spontaneous report from a contactable pharmacist reporting for self via Pfizer field representative (Field Medical Director). A patient of unspecified age and gender received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number and expiry date not reported) on 28Dec2020 via an unspecified route of administration for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient presented COVID-19 symptoms on 05Jan2021. No lab tests reported. The outcome of the event was unknown. Information about lot/batch number has been requested.; Sender's Comments: The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 28Dec2020, and patient presented COVID-19 symptoms on 05Jan2021. No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, patient's COVID-19 symptoms on 05Jan2021 likely represents a pre-existing infection prior to vaccine use. Further information is needed for full medical assessment.

This morning he is diabetic. His sugar it was elevated, it was up to 300 which is he said much higher than normal; This is a spontaneous report from a contactable consumer (patient) from a Pfizer-sponsored program Pfizer First Connect. A male patient of unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 09Jan2021 at single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. He has his first dose of the COVID Vaccine yesterday and this morning he is diabetic. When he woke up this morning to test his sugar it was elevated, it was up to 300 which is he said much higher than normal and wants to know if that would be a symptom. Outcome of event was unknown. Information on the lot/batch number has been requested.

1/16/21, Covid vaccine injection at 12:09 PM Minute 1: dizzy and light headed (like drinking a beer on an empty stomach) Minute 10: Nausea Minutes 23-25: Neck tightness (like doing unsupported crunches and holding my head up) Minute 27: Inability to swallow and inability to speak EMS on site administered EpiPen auto-injection to left thigh, immediate improvement in symptoms Transport to hospital via ambulance Hospital monitored me for several hours and discharged same day

itching, hives, short of breath, numbness and tingling to lips with hives to bottom. headache.

On 1/13/2021, resident had sudden emesis. Immediately following emesis he was noted without a pulse and pronounced deceased. No acute symptoms noted prior to this episode. Resident does have a significant cardiac history.

Started with severe chills, body aches and feverish. The. Slight leg pain which worsened with time , swelling on the right leg calf, warm to touch and difficulty breathing. Got hospitalized on 1/16 21 with multiple clots in my right leg and clot in the lung. Still in the hospital now.

She had the first dose of Pfizer vaccine at the Campus on Friday 1/15 at 4:30 pm. After the vaccine, she had no new symptoms or signs of vaccine reaction and MD friend reports that he checked her pulse which was not elevated from baseline. On 1/16, she awakened and continued to feel at her recent baseline. However, in the early afternoon, she complained of headache, nausea/epigastric pain, and chest heaviness. These apparently were not unusual symptoms for her to feel intermittently. Per her niece, who has a home O2 sat device, her 02 sat that morning was 97 with a HR of 87 irregularly irregular. She was afebrile. (continue on page 2)

Aphasia, ,right-sided weakness and garbled speech

"Had severe body aches m, fever, headache, progressed into dizziness and ""foggy memory"", started to have some chest pain. Felt as if I was intoxicated, lasted the whole day. Woke up the next morning and still felt ""out of it"" and weak but thought it would get better, went to work (im a nurse). Started having continous vomiting, shortness of breath and chest pain at work. As well as severe tremors. I was taken to the hospital, given fluids and my QT was prolonged with my heart which i have never had before . Was given iv magnesium and waited for my heart rhythm to improve. Was told not to take anymore of my prescribed medications or nausea medications and follow up with my pcp the next day. Im still feeling horrible, nausea, body aches, low grade fever and I am 72 hours out. Now I have huge hospital bill to pay, can't work currently because I still feel bad and my heart has a weird rhythm. Hoping this helps as if this was what I was expecting I would have never got it."

Pt complained at ED of Headache, Nausea, SOB, felt like had been running. Pt in AFIB started on cardizem admitted to hospital 1/15 discharged 1/17

Patient tested positive for COVID 19 on Jan 5th 2021 Patient was admitted to the hospital January 9th for pneumonia due to COVID

Acute liver injury requiring transplant evaluation and acute kidney injury

Anaphylaxis after Covid 19 vaccine #1. Pfizer Lot # EH9899

Two days after her shot, she was sitting down working on her computer paying bills. She became nauseas and dizzy and then fainted. She hit the tile floor.

Lot number for the first dose was EK5730. After receiving the 2nd dose on the 01/11/2021 went to lunch and in the evening started feeling nausea and was throwing and abdominal pain. Went to work sick Tuesday and Wednesday low grade fever, nausea and abdominal pain, wasn't eating was to sick to eat. Thursday early morning hours the pain was unbearable so she went to the ER and the cat scan. It was determined that she had appendicitis and they removed my appendix same day. Feels so much better now.

"After receiving Moderna vaccine, pt became increasingly tired, withdrawn, and confused, refusing to walk at home. He has begun to have mild memory changes after suspected COVID illness (covid testing negative) in November, but daughter of patient, with whom he lives, states that his memory and orientation now significantly changed- he seems to have forgotten the last ""3 years"" of memory.

Presented to ER 1/16/21 as she checked his O2 and found him to be hypoxic in 60s. He is being treated for possible CAP with underlying perviously undiagnosed ILD vs post-covid lung changes (per pulmonology), and his energy and ability to walk have returned but memory is significantly impaired, confabulating and oriented only to self despite good oxygenation on 5L O2 by NC."

About 22 hours after the shot, I had a mini stroke that required going to the emergency room by ambulance. I was transported that evening to the stroke division that same evening for further evaluation, tests and care. I have never had a mini stroke before this.The doctors said it may have been from the vaccination, or it may not have been precipitated by it. They said they don't have enough information on the Moderna vaccine to make that call.

Patient was vaccinated in right arm. Within 5 to 10 seconds after vaccination, patient started clinching his hands tightly and became unresponsive. Patient was lowered to the floor and did not exhibit a pulse. CPR was initiated and 911 was called. An AED was used and healthcare professionals onsite continued compressions until the paramedics arrived.

Death

Received vaccination on 12/30/2020, had positive Covid test result on 1/6/2021, was hospitalized with respiratory issues on 1/11/2021, and discharged home from the hospital on 1/18/2021

12:52 PM resident rang her call bell with complaints of chest pain and shortnes of breath. BP 126/70, Temp 97.5, Pulse 72, Resp. 20, O@ stats on room air 90%. resident requesting transport to ER. EMS called at their arrival resident had increasing SOB o2 on at 3L Nasal Canula. Transported to hospital. Resident placed on ventilator and tranported to different hospital.

"Felt tachycardia immediately, thought she was anxious. After 35-45 minutes she felt like she was having a hard time swallowing which progressed to tongue swelling, all taste buds popped up and sore, hives on face & neck, reddened face. Itchy neck and face. Took double dose of Atarax and went to bed. Felt extremely fatigued unsure if double dose of Atarax. Woke with swelling all over body. Woke up feeling heaviness as if she had ""sumo wrestler"" on her body. 24 hours post vaccine heaviness started to lift but felt as if she had a vise on her lungs. Continuing to take Atarax every 6 hours per MD order."

Resident received vaccination on January 15, 2021. She was found unresponsive with shallow respirations on the morning of January 16, 2021 and was sent to ER via ambulance. The resident was admitted to medical center ICU where she passed away later that day.

resident had a pressure ulcer to RT hip, was getting treatment on. Was scheduled to have wound debrided and wound vac applied on 1-19-2021. Appetite was poor, not wanting to get out of bed, and decline in alertness. Passed away on 1-16-2021

patient received vaccine 12/29. Unexpected death 1/5.

Patient had received second Pfizer vaccination after no reported issues with the first dose. Patient was observed post vaccination without incident and released. Patient developed wheezing and attempted to

treat with her albuterol inhaler but did not improve. patient presented to the ED approximately 2 hours after vaccination and was admitted for respiratory failure and placed on BiPAP for a brief period of time. patient has known history of Asthma Exacerbation requiring hospitalization and intubations. D/C diagnosis Asthma Exacerbation

Systemic: Anaphylaxis-Severe; symptoms lasted 1 day

Systemic: Anaphylaxis-Severe, Systemic: Seizure-Severe

Temp of 104.5, hospitalization

COVID 19 Vaccination administered by pharmacy staff. No adverse effect at the present time. Staff will continue to observe adverse reaction. Will continue to monitor. Patient at start of shift awake in the bed. Pt at 3am was on the commode leaned to the side. Patient body still warm to touch no pulse. Called for assistance Asap. Cpr started promptly. Cpr given patient on floor 911 arrived at the scene at 3:10am Cpr rotated Between Nursing and EMT on Scene. Cpr was given to patient for over 45 minutes. Patient was pronounced at the scene at 3:50am. Call placed to Pt family by supervisor on shift. MD to be notified. AT 3:00am, I was notified by the nurse that resident is unresponsive. Upon entering room, resident was sitting on the commode unresponsive with absent respiration and pulse. Resident lowered down on the floor with 4 person assist. CPR initiated, AED pads placed on chest with no shock indicated. 911 called and EMT and paramedics arrived around 3:10am. ACLS performed until code stopped and pronounced death at 3:48am. I called and notified family member of his demise and awaiting for family to call us back for funeral arrangements.

One week after the shot (1-14-2021) Patient (19 y.o.)reported side pain and appeared constipated, Laxatives given along with Tylenol, on further assessment Patient was noted to have left leg redness and abdominal fullness. Dr. was updated and we had orders for close monitoring, the next day when she got up, her leg appeared better, and she had passed a small BM, but by lunch she had developed significant pain and edema in her left leg, and the color of her leg was reddened again. She was sent to the emergency room with her symptoms. She was admitted back to our facility yesterday, her diagnoses included Acute provoked left external illiac, femoral, popliteal, and peroneal DVT. Elevated Factor II levels, Elevated APC resistant, May-Thurner Syndrome, history of developmental disabilities, fecal impaction and urinary retention - suspected related to her fecal impaction. Vascular surgery was consulted, and pt. was started on a heparin drip, and mechanical thrombectomy was needed for both legs due to multiple clots. She was started on Eliquis and Plavix, and thigh high compression stockings were ordered, ace wraps being used until these are supplied. Her Fecal impaction was addressed also and the urinary retention resolved.

Death

Hx Covid infection Had Covid vaccine #1 - no problems Within 1 hr after Covid vaccine #2 progressed to SOB, pruritis throat tickle TxT-ed self with Benadrl but symptoms persisted Went to ED txt with Bendryl, prednisone, zyrtec.

"right sided weakness with numbness from her face down her entire body; right sided weakness with numbness from her face down her entire body; right sided weakness with numbness from her face down her entire body; bad headache; pain at the injection site; This is a spontaneous report from a contactable consumer (patient). A female patient of an unspecified age (reported as 41 unknown unit) received the first dose of bnt162b2 (BNT162B2) via an unspecified route of administration on an unspecified date at a single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient wanted to know how long side effects last after receiving the first dose of the Covid vaccine. The patient received first dose of Covid vaccine on Thursday (unspecified date) and reported side effects. She reported side effects of right sided weakness with numbness from her face down her entire body. She describes the feeling as if she's been ""shot up with novocaine on the right side of her body."" She was also experiencing a really bad headache and pain at the injection site. She reported that the side effects do not seem to be wearing off. She wanted to know if this has been reported as a common side effect. Outcome of the events was unknown. Information on the lot/batch number has been requested."

Severe headache from 12-36h post administration impairing ability to perform ADLs with inability to turn head from side to side or to change positions without lancing temporal pain and a/w photophobia; Severe headache from 12-36h post administration impairing ability to perform ADLs with inability to turn head from side to side or to change positions without lancing temporal pain and a/w photophobia; Severe malaise; Severe headache from 12-36h post administration impairing ability to perform ADLs with inability to turn head from side to side or to change positions without lancing temporal pain and a/w photophobia; loss of appetite; Transient dysgeusia; Mild nausea; Pleuritic chest pain; This is a spontaneous report from a non-contactable physician. This 27-year-old female physician (patient) reported that she received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number=E15249), via unspecified route at left arm on 08Jan2021 07:30 AM at single dose for COVID-19 immunization. Medical history was none. Concomitant medication was not reported. The historical vaccine included the first dose of BNT162B2 for COVID-19 immunization. Facility type of vaccine was hospital. No other vaccine in four weeks. No Covid prior vaccination. No covid tested post vaccination. On 08Jan2021 06:00 PM, patient experienced severe headache from 12-36h post administration (as reported), impairing ability to perform ADLs with inability to turn head from side to side or to change positions without lancing temporal pain and a/w photophobia (nearly meningeal signs); mild nausea; pleuritic chest pain; severe malaise; transient dysgeusia; loss of appetite. Treatment for events included initially NSAIDs until had difficulty tolerating was received. Outcome of events was recovering. No follow-up attempts are possible. No further information is expected.; Sender's Comments: Based on the time association, the possible contribution of suspect BNT162B2 to the events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

tachycardia; shortness of breath; elevated blood pressure 165/90; tired; stomach upset; felt unwell; This is a spontaneous report from a contactable other health professional (patient). A 25-year-old female

patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 31Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient experienced on 04Jan2021 felt unwell, tired, stomach upset (it continued all week) and on 07Jan2021 tachycardia and shortness of breath. Clinical course: she was feeling very like short of breath and her heart racing, had elevated blood pressure 165/90, usually it was normal. The patient was sent to the emergency room (ER) and got worked up, she had a complete blood panel, everything came back normal; she had a chest X-Ray and 2 bags of fluid, then the patient was discharged. The patient outcome of the events was recovered. The information on the batch number has been requested.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

started having a lot of left eye pain/he diagnosed her with Scleritis; This is a spontaneous report from a contactable other healthcare professional (HCP) a Nurse Practitioner, who reported for herself. A 35-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Batch/lot number: EJ1685 also reported as ES1685), intramuscular in left deltoid on 24Dec2020 at single dose for COVID-19 immunization. Medical history included ongoing anxiety diagnosed years ago, maybe when she was 23. Concomitant medication included ongoing celecoxib (CELEXA) for anxiety started about a year, or year and a half ago. She did not take other vaccines on the same day as the COVID vaccine. She had no recent labs. On 02Jan2021 the patient experienced scleritis. Event was described as follows: patient got her first COVID vaccine on 24Dec2020 and on 02Jan2021 she started having a lot of left eye pain. She went to her Ophthalmologist and he diagnosed her with Scleritis. She had no history of anything with her eyes or any vascular or autoimmune issues; no eye disorder history or rheumatology history. Patient is due to get her second dose of the vaccine on 14Jan2021, and she spoke with her primary care doctor and her ophthalmologist, and neither of them have any answer on if she should get the second dose or not, they did not have much guidance for her as this was such a new product. Patient reported that scleritis was persisting, but it has improved and she was on Prednisone eye drops. Event scleritis was considered serious as Medically significant because of what it is and what it can do, but this was not a severe case (as reported). Final outcome of scleritis was recovering.; Sender's Comments: The reported scleritis was more likely an intercurrent disease, and less likely causally related to the use of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE). The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics committees and Investigators, as appropriate.

Appendicitis; Vomiting; Nausea; Chills; This is a spontaneous report from a contactable consumer. A consumer reported that her 65-year-old mother received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot number Unknown), into the arm at single dose on 31Dec2020 for COVID-19 immunization. The patient did not have any medical history and did not receive any concomitant products. On 31Dec2020 the same evening of vaccination, the patient experienced vomiting, nausea and chills that were considered flu like. On 03Jan2021 or 04Jan2021 her appendix ruptured. She entered emergency room on 07Jan2021 and was diagnosed with appendicitis. She was admitted to hospital on 07Jan2021. She has been given hospital care for past four days. She will have surgery in 6 weeks to repair and right now they are cleaning ruptured area. Her care team is wondering if she should get second dosage. The patient is currently hospitalized. The patient recovered from the event vomiting on 31Dec2020, recovered from the events Nausea and Chills on 07Jan2021 and was Recovering from the appendicitis. Information on the lot/batch number has been requested.

"Bell's Palsy; This is a spontaneous report from a contactable consumer. A 63-years-old female patient received the first dose of BNT162B2 Pfizer-BioNTech COVID-19 Vaccine, Batch/lot number: ELD14D, via an unspecified route of administration, in left side of arm, on 04Jan2021 at single dose for COVID-19 immunization. Medical history included early breast cancer from 2017 and ongoing. Concomitant medication included tamoxifen citrate 20 mg tablet by mouth once daily from 2017 and ongoing for breast cancer (cancer pill, she has to be on it for 5 years). The patient received the vaccine as she is ""with fire department, thought she needed to take it, she had early breast cancer, is around lots of people"". On 09Jan2021 the patient was diagnosed with Bell's palsy, assessed as medically significant and in Jan2021 she experienced earache (she thought it was an earache, but it was more than that, but it made her ear hurt, and she has no infection), her mouth was drawled a little, further detailed as numbness and ""the eye, it is messing with it, when she is trying to see out of it, she can see, but it's blurry like"" and, ""where the ear thing is"", on the back of the lymph node was real sore and her face was kind of puffy, which is the reason she went to the doctor. The patient had to go to her doctor, he told her she had a reaction to the shot, he called it Bell's Palsy, and said to let Pfizer know. Her doctor gave her something to take for mouth drawled/numbness, which is supposed to help, and she has to go back in a week. The event Bell's palsy outcome was unknown at the time of the report."

Doesn't feel like eating; Fever; Chills/ Chilled; Nausea; Severe Headache/Dull headache/Frontal headache; Fatigue; Body aches; This is a spontaneous report from a contactable Nurse (patient). This 61-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EJ1686), via intramuscular, on 06Jan2021 (at 14:30) at single dose at left deltoid for COVID-19 immunisation, administered at hospital. Age at vaccination is 61-year-old. Historical vaccine included Diphtheria and Tetanus vaccine (intramuscular, at single dose) on 15Dec2020 for immunization; and Shingles vaccine (intramuscular, at single dose) on 15Dec2020 for varicella immunization. Relevant medical history included usual tenderness. No relevant concomitant medications were provided. On 07Jan2021, she woke up at 2:00 in the morning, she had a high temperature, she was chilled, she had a severe headache, nausea, fatigue, and body aches. She got up and took ibuprofen (ADVIL). She was basically in bed, she had to cancel all her appointments in the morning, she just laid in bed and the following afternoon her fever broke at about 4:30 in the afternoon then she just had a low grade

temperature and a dull headache, nausea through the next day, Friday the 08Jan2021. She still has a very dull headache and just not right, kind of like a flu bug. She had no fever; she had not had any fever after Friday afternoon or Saturday. Fever started at 2 in the morning 07Jan2021 and she experienced the chills until after fever broke. Fever went above 102 degrees. She still had a little of the nausea, she just didn't feel like eating. She still had the dull headache. The nausea and headache have improved when compared to how it was on the 07Jan2021. She was back to work now she just has a dull frontal headache. The reporting nurse assessed all the events, except of 'Doesn't feel like eating', serious for disability. She stated she may have had usual tenderness but nothing like this. The patient had recovered from the event fever on 08Jan2021 and from the event 'chills/chilled' on 07Jan2021; the patient was recovering from 'nausea' and 'severe Headache/Dull headache/Frontal headache', while the outcome of the remaining events was unknown.; Sender's Comments: A possible contribution role of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) to the onset of the reported events cannot be excluded due to temporal relationship. It is worth noting that patient had other vaccines not far ago, including Diphtheria and Tetanus vaccine and Shingles vaccine on 15Dec2020 for immunization. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics committees and Investigators, as appropriate.

throat and tongue started to feel weird and tight/throat got to the point of so swollen and itchy I couldn't swallow; throat and tongue started to feel weird and tight/throat got to the point of so swollen and itchy I couldn't swallow; throat and tongue started to feel weird and tight/throat got to the point of so swollen and itchy I couldn't swallow; throat and tongue started to feel weird and tight/throat got to the point of so swollen and itchy I couldn't swallow; This is a spontaneous report from a non-contactable consumer (patient) via a Pfizer-sponsored program Corporate (Pfizer) Social Media Platforms. This patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration at single dose on an unspecified date for covid-19 immunisation. The patient medical history and concomitant medications were not reported. On an unspecified date, the patient experienced throat and tongue started to feel weird and tight/throat got to the point of so swollen and itchy I couldn't swallow. The patient condition was life threatening. The patient described the events as follows: 40 min after injection my throat and tongue started to feel weird and tight. Pharmacy at my work hospital gave me 25 mg Benadryl and 650mg Tylenol. At about 1 hr 45 min after injection my throat got to the point of so swollen and itchy I couldn't swallow. I went to nearest emergency room hospital they administered Decadron orally, Pepcid P.O. (orally), and Toradol via IM (Intramuscular). The outcome of the events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

"Have a cut in my leg which is very unusual; Saw a big cut in my feet; I was bleeding from somewhere; It was quite a lot of blood drawing out of my body; This is a spontaneous report from a contactable consumer (patient). A 62-year-old male patient started to receive single dose of BNT162B2 (Solution for injection, batch/lot number and exp date not reported), via an unspecified route of administration on

23Dec2020 09:00 for COVID-19 immunization; and adalimumab (HUMIRA), via an unspecified route of administration from an unspecified date at unspecified dose (injection every other month) for arthritis. Medical history included arthritis, blood pressure (abnormal), and blood cholesterol (abnormal). Concomitant medication included rosuvastatin for blood cholesterol, olmesartan medoxomil, metoprolol succinate (TOPROL XL), and vitamins: ascorbic acid, ergocalciferol, nicotinamide, retinol, riboflavin, thiamine hydrochloride. Patient stated, ""The reason I am calling, I have just a concern that something happened to me. I did not pay much attention but now I have read the news one doctor died after getting this COVID Vaccine (Further details were not available over the call) I have a small incident happened to me the day after I received my first dose of the COVID Vaccine. I just wanted to get some information. You know what happened the next day night, in the evening I was taking a shower and all of sudden I was bleeding from somewhere. Lot of blood was coming out while I was toweling my body out. I couldn't find out where the blood is coming from. I checked, it's not from my urine, not from my rectum but it was quite a lot of blood drawing out of my body. Immediately, I called my wife into bathroom, then I squeezed my body then the bleeding stops. It was on 24Dec2020. You know my kids were at home. I don't want them to find it. The bleeding stopped and everything went away. Then I thought maybe it is something related to my GI. I went to my GI doctor yesterday to have a checkup, they don't know anything either but I am due for my second dose for next week Wednesday. Now I had this news about thrombocytopenia on this doctor died (Clarification unknown). So I am just afraid if there is anything related this. Do you have any explanation on how I bleed and where it bleed? It was lot of bleeding even my towel was full of blood."" Patient wanted to see if anybody else had similar experience or if he get the second dose and he get the complication again. Patient was a medical technologist. He was doing ultrasounds. He was working in a pediatric hospital. Patient was not prescribed/recommended vaccination. ""Nobody recommended it. During my hospital. I am healthcare professional. So everybody in my hospital. I just went there and get it. I didn't ask my doctor."" Patient added, ""You know everything I read about this case and then you know, I have a cut in my leg which is very unusual. I have never seen that. I don't know how it happened. You know all of sudden oneday I wake up and I saw a big cut in my feet also. So, I am just afraid (onset date not reported)."" The action taken in response to the events for adalimumab was unknown. The outcome of the events was unknown. Information about Lot/Batch number is requested."

Possible Bells Palsy; Arm/neck soreness; Arm/neck soreness/ neck are painful; travel up neck to side of face/around temple/ Side of head/face/cheeks/jaw; travel up neck to side of face/around temple/ Side of head/face/cheeks/jaw; travel up neck to side of face/around temple/ Side of head/face/cheeks/jaw; Feel numb; Sore-all on same side as injection; This is a spontaneous report from a contactable consumer (patient). A 52-year-old female patient received first dose of bnt162b2 (Pfizer COVID 19 vaccine, lot number: EL3246) , via an unspecified route of administration on 13Jan2021 17:00 at single dose on left arm for covid-19 immunisation . The patient medical history was not reported. Concomitant medication included fluticasone propionate (FLONASE), pantoprazole. The patient experienced arm/neck soreness, travel up neck to side of face/around temple; side of head/face/cheeks/jaw, neck are painful, feel numb, and sore-all on same side as injection; and possible Bells Palsy on 14Jan2021 02:00. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19.

No allergies to medications, food, or other products. No treatment was received for the events. The outcome of the events was not recovered.

his platelet levels dropped and he had a hemorrhagic stroke; his platelet levels dropped and he had a hemorrhagic stroke; This is a spontaneous report from a contactable consumer. A male patient of unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The relevant medical history and concomitant medications were not reported. The patient died 2 weeks after his COVID shot because his platelet levels dropped and he had a hemorrhagic stroke. No further information provided. The autopsy was unknown. The outcome of the events was fatal. Information on the lot/ batch number has been requested.; Reported Cause(s) of Death: his platelet levels dropped and he had a hemorrhagic stroke; his platelet levels dropped and he had a hemorrhagic stroke

expired before receiving the second dose; This is a spontaneous report from a contactable nurse. This nurse reported similar death events for 8 patients. This report is for 5th of 8 patients. A patient of unspecified age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 22Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient expired before receiving the second dose on an unspecified date. The patient died on an unspecified date. It was unknown if an autopsy was performed. Information on the lot/batch number has been requested.; Sender's Comments: The limited information provided in this report does not allow a full assessment of the case. The event death with unknown cause is assessed as related to the suspect drug per company guidance. This case will be reassessed when additional information, particularly the clinical course before death, complete medical history and concomitant medication and autopsy report, becomes available.,Linked Report(s) : US-PFIZER INC-2021034595 same drug, reporter and event but different patient; Reported Cause(s) of Death: expired before receiving the second dose

passed unexpectedly; This is a spontaneous report from a contactable nurse communicated to a Pfizer colleague. This nurse reported similar death events for 8 patients. This report is for 8th of 8 patients. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 22Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient passed unexpectedly on an unspecified date. The patient died on an unspecified date. It was unknown if an autopsy was performed. Information on the lot/batch number has been requested.; Sender's Comments: The limited information provided in this report does not allow a full assessment of the case. The event death with unknown cause is assessed as related to the suspect drug per company guidance. This case will be reassessed when additional information, particularly the clinical course before death, complete medical history and concomitant medication and autopsy report, becomes available. 2021034595 same drug, reporter and event but different patient; Reported Cause(s) of Death: passed unexpectedly

allergy; Short of breath; Tachycardia/my heartrate was like 140 - 150; Blood pressure was like 165 over 114/my blood pressure just like skyrocketed; Upset stomach; Tired; Started to feel not very good/not feeling like wonderful/overall sickness; Muscle ache; This is a spontaneous report from a contactable consumer (patient). A 25-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), lot number: EL014 (can't really tell), via an unspecified route of administration on 31Dec2020 at single dose for COVID-19 immunization. Medical history included allergy and heartburn. Concomitant medication included omeprazole for heartburn, cetirizine hydrochloride (off-brand for Zyrtec) as allergy medicine and a birth control medicine. Consumer stated, she just was calling this number because she didn't necessarily know if she had an adverse reaction or a symptom. She just wanted to report it and see if maybe you had any insight if this has happened to anybody else. Consumer further stated, she had an adverse reaction where she had to go to the emergency room. So, she didn't know if it was from the Vaccine or not because her reaction was very delayed. She got her vaccine on 31Dec2020, New Year's Eve and then starting on Monday after the vaccine on 04Jan2021. She started to feel not very good, it was mostly just like overall sickness, just as muscle aches, tired, having upset stomach so that was after 4 days. Patient had allergy from an unspecified date. And then on 07Jan2021, a week after she got the vaccine, she had signs of tachycardia and her blood pressure just like skyrocketed, her blood pressure was like 165 over a 114 and her heartrate was like 140 - 150. And she worked in healthcare, which was why she was one of the first ones to get the vaccine and she went to the ER and got worked up and they couldn't find, nothing was abnormal with her labs or blood work. She even had a chest X-ray and they couldn't find anything and they just gave her fluids and sent her home. And she was home now and still not feeling like wonderful, she felt better though but she just wanted to report that and see if there was any correlation. She didn't really know because it was so delayed, a week later. So she just wanted to report it. Consumer further stated, she forget to tell one thing, she was also short of breath on 07Jan2021. So that was why they had sent her to ER because of Tachycardia, shortness of breath and her blood pressure was really high. They didn't give her any medicine they just gave two big bags of fluid and then they discharged her. Consumer stated, she was scheduled to have her second one, she thought it was 14Jan2021. She wanted to know if she should get the second one. Consumer stated, when she went into the ER she had a lot of lab work. She didn't even know what all they did but a lot like, blood panels, she checked everything was there, that was on Thursday, last week, 07Jan2021. Consumer stated no treatment was received for the events. Outcome of the events was unknown.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

Approximately 3 days after my injection I began experience severe tremors Ib bilateral arms, bilateral legs, head, and vocal cord tremors as well as blurry vision and memory impairment. Unfortunately, the symptoms don't seem to be improving. My MD prescribed metoprolol, which I will begin today.

a couple hours after the vaccine, I experienced a bit of rapid heart rate, which resolved after a few minutes. The following day around 3 pm I began to have chills and felt like I had the raid heart rate again. By 5 pm I was beginning to feel really bad, I was freezing, chills and my heart rate was now extremely fast, I was having trouble speaking complete sentences, my husband drove me to the emergency department. I had a very high heart rate and high fever, I was admitted and in the hospital until Sunday afternoon. The diagnosis was pneumonia, I don't really believe this, as I felt fine and had no symptoms prior to the onset of the fever.

Patient died 1 week after vaccination. According to family was having very rapid decline in status in recent weeks and they did not think related to vaccination.

Anaphylaxis less than two hours after vaccination. I had no symptoms immediately after vaccine however did develop symptoms within one minute of completing a run. Developed b/l hand swelling and tingling, diffuse hives and itching, tachycardia, elevated blood pressure, lips tingling and swelling which required emergency room visit and EpiPen, IV fluids, Benadryl and IV steroids. This is similar to previous reactions I have had to running previously. Symptoms resolved within one hour after treatment in ED.

Severe headaches, vomiting, dehydration, shortness of breath ... led to trip to Emergency Room at Hospital on 1/16/21 at 10:45 am; diagnosis for treatment was Diabetic Ketoacidosis (DKA); patient was admitted to ICU to address critical fluid and electrolyte imbalances , headaches, body aches, dehydration, nausea, shortness of breath. DKA is medical emergency.

Pt brought to the ER with SVT. He was given 2 doses of adenosine by EMT's. Pt was found to have hypomagnesemia and hypophosphatemia in the ER. He was admitted for observation and evaluated by Cardiology. He remained stable with NSR during admission. Pt has a follow up appt with Cardiology EP clinic on 2/18/21.

Fatigue, wheezing, soreness, palpitations

38 year old female - healthy with no significant past medical history. Morning of 1/15/21, pt woke up with difficulty speaking (would be talking and then unable to articulate words which were replaced by grunting sounds) and tingling to her face. No changes to breathing, no numbness/tingling to extremities, equal facial symmetry. Slow onset of symptoms. Pt went to the ED, where she received a CT, MRI (inconclusive reading), lab work reported as normal per pt, EKG and chest x-ray. Symptoms self resolved while in the ED, however MD staff wanted to admit patient for 24 hours of observation and to complete an echocardiogram. Pt left AMA the evening of 1/15/21 due to resolution of symptoms and wanting to follow up with her cardiologist for the echocardiogram. Pt told by MD staff symptoms were likely caused by either TIA, possible reaction to vaccine or migraine presentation (no report of headaches/auras). Plan

was to have patient on blood thinners x 30 days then baby Aspirin thereafter. Pt still needing to follow up with PCP and cardiologist for further work up.

Received vaccine on 1/16/21, on 1/17/21 started with coughing, white phlegm, SOB and on 1/18/21 developed fever to 101 and increased need for oxygen. Home requirement increased from 3L O2 to 6L O2. On 1/18/21 presented to hospital. Quickly defervesced with steroids and cefepime. Possible post-obstructive pneumonia vs immune response to vaccination.

Patient could not open and close hand after the first day of vaccination. On the third day his arm turned purple and could not be moved and was numb. A week and a half after vaccine, arm hurt and was numb. Patient was hospitalized.

Systemic: Pt monitored by nursing for 30min after inj,pt was stable/no reaction.At ~1hr post inj pt was unresponsive.Pt was a hospice/dnr per director

9 to 36 hours. Lymphnode swelling , pain left axilla. Fever, chills ,muscle aches, brain fog. 1 week post Facial paralysis, fatigue, vocal cord weakness, feeling of unwell.

12/28/2020: generalized weakness and fell twice at home, cough, nausea,1/04/2021: cough, nausea, fever and chronic pain when she fell from being weak. admitted to hospital with Covid pneumonia, shortness of breath, covid postive, 1/09/2021: pt on bipap, 1/15/2021: pt was intubated, on TPN, pt DNR, 1/18/2021: was extubated and put on comfort measures and passed away

Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

27-year-old female with past medical history of anxiety, allergic to shellfish, presented for COVID-19 vaccination, developed shortness of breath after COVID-19 Moderna injection, felt lightheadedness and noted with cyanosis as per nursing, received epinephrine injection and transferred to ED. In ED she received solumedrol, benadryl and pepcid. Vitals in the ER Revealed tachycardia HR 95-105 , Sat 96% on room air not in distress. Patient was admitted for further observation

1. Shaking 2. Whole body tingling 3. Left arm tense (injection was provided in right arm) 4. Felt clammy Walked over to hospital attached to the facility and was discharged the same day. All symptoms resolved.

"Patient called this nurse stating she had an allergic reaction to COVID vaccination given on Friday 1/15/21. States she felt fine for the 15 minutes post immunization, was on her way home and started feeling dizzy, short of breath, chest heavy, throat felt full ""like a ball in it"". She came back to clinic which was closed but sat in the parking lot for a while. While in parking lot trying to figure out what to do, her symptoms lessened. She got home safely but started to feel jittery/shaky and her BP was very high (couldnt remember exact number). She then went to urgent care where they told her she was having an allergic reaction and given a pill of something and steroid for 6 days. Went home from urgent care and BP still high but got better at bedtime. Saturday she had a ""really bad headache and just layed around all day. I was not able to function at all."" Sunday she still had a headache and added muscle aches. Monday she started feeling ""a lot better"" until 8 PM when she was walking around doing her nightly routine and started to feel a wave of dizziness, throat felt funny so she sat down and took her BP with result of 207/131. Says this reaction felt worse than Friday's reaction so she went to ER where she was again told she was having an allergic reaction and the steroid given to her at Urgent Care was not helping and to stop taking them. Given Benadryl in the waiting room, had labs and EKG which came back ""normal"", and given a different med Vistaril to take with any future symptoms. Was also told to NOT take the second dose of COVID vaccination. Says she has not had to take the Vistaril yet and has not had any sign of reaction today so far. Said she did report the initial headache on the V-safe app."

Anaphylactic

At approximately 4pm on Jan 11, 2021, I began to have hard chills and fever that reached 104.9. I was admitted to ICU at the Hospital. My blood pressure dropped to dangerous levels. I was diagnosed with sepsis and the doctors determined it was caused by the vaccine.

Pulmonary Edema, fever, nausea, vomiting

Moderna COVID- 19 Vaccine. Vaccine recipient reported on 1/19/2021 that they received the Moderna Vaccine on 1/8/2021. The following week on 1/15/2021, they reported while driving, their area around their right eye became numb and they began to have blurry vision. The numbness spread to around their face/mouth. They pulled over and their spouse drove him to the hospital. Roughly 20 minutes after the initial symptoms, they developed chest pain and patient reported that the ED noted an abnormality on their EKG. The patient had to be admitted overnight for observation. The patient reported that on 1/18/2021, they still had mild chest pain and facial numbness remains around the right eye, left mouth/cheek area, and tongue. They did develop fever and a headache. The patient reported that on

1/19/2021, they are waiting on results, additional testing, and further follow-up appointment with their provider.

Visited Provider appx 500 pm 1.14.2021 DVT - left calf - 2 clots via ultrasound on Eliquis now

Lacunar infarct (CVA) of right thalamus

Patient developed symptoms of Guillain-Barre syndrome on January 15, 2021 and was admitted the Hospital. She was diagnosed and eventually required ICU level care and has been treated with plasmapheresis. She is currently still in the ICU but is stable.

Family was told that Patient expired in his sleep during the early morning hours of 1/15. I spoke with him the evening before (on 1/14), which was a day after he had received the Covid vaccine. He was not having any symptoms of allergy or reaction then. He did say that he felt tired, but he often complained of feeling tired over time.

Hypoglycemia(40mg/dL) and required ICU admission.

Resident was noted unresponsive, no respiration, no blood pressure, no pulse, code blue called according to facility protocol, resident is full code, CPR started, 911 called, arrived and took over from staff. Resident was pronounced dead at 1:16pm 1/18/21

"""Patient states that he received the Covid vaccine today on left arm. Immediately after receiving it, felt his left arm went numb, then felt his lips on the left side going numb. Sensation progressed to his whole face, and down his neck, and back down to the whole left arm. He states that he even felt his truncal area, kidney, and part of his right foot going numb. States that he went to the ER for further evaluation, and while waiting there for about an hour, the sensation resolved. He denies any tingling or painful sensation. Does not think he was weak at the time."""

Resident was found deceased in his bed at 7:15 am.

Tachycardia, Shortness of breath, headache, dizzyness, weakness, chills, nausea, fever

Dizziness, Headache, Myalgia, Tachypnea, CoughWheeze, NauseaVomiting, Palpitations & Tachycardia & Narrative: Patient stated that after receiving injection on 01/06/2021, tasted metal in her mouth. No reaction noted in clinic after vaccine administered. Patient states that after returning home, she began to have chills, headache, and muscle aches. Could not sleep. On 01/07/2021. Patient continued to experience above symptoms. Approx. 13:50 on 01/07/2021. Patient presented with respiratory difficult, tachypnea stridor, and stated she felt as if her airway was closing. Patient was vomiting and was tachycardic. Epi-pen administered via left lateral thigh. Patient administered 50mg of PO Benadryl, and 2 puffs of albuterol inhaler. Continuous V/S initiated. Patient began to experience relief of symptoms. HR and blood pressure remained elevated, but this was expected side effect of epi. SpO2 stabilized around 99% on room air. Patient was monitored for 60 minutes. Transportation home was arranged and family was present to observe overnight.

mi Narrative: patient with asymptomatic covid 19, covid positive 12/10/2020.

dose given 1/13/21, patient hospitalized with high blood sugar, hyperkalemia, hypernatremia on 1/15/21 after being lethargic with shallow breathing. Patient still hospitalized as of 1/19/21 and diagnosed with Diabetes

Severe dissociative event (psychotic break) beginning <72hr after administration of vaccine, and continuing another 48 hours before resolution. Patient has no prior adverse psychiatric history. Transported to local ER on Monday 11th upon worsening of condition. Administered Haldol in the ER as a sedative after becoming combative during dissociative state. Patient woke up Tuesday the 12th with recurrent, but significantly diminished, dissociation, which had largely resolved by late Tuesday. Patient transported to Mental Health on a 5150. Released Friday the 15th around noon. No recurrent symptoms since.

Resident reported she didn't feel well. She started running a fever of 103. Resident complained her stomach and genitals were burning and pain in her legs. Resident has been vomiting today and diarrhea. EMS was called and resident transported to Hospital today 1/19/21

COVID 19 vaccine, unknown which company Chronically ill in a skilled nursing facility found diaphoretic, hypotensive, hypoxia to 85% arrived to Emergency dept in cardiac arrest Died within 65 minutes of nursing finding patient in distress Wife felt it may have been related to vaccine date of vaccination 1/6/20 hx covid 19 PNA in April 2020

hypoxia, secretions,cough, dyspnea Narrative: ALS patient on hospice with ongoing history of aspiration pna, receiving tube feeds. Developed incr in secretions, hypoxeia, temp and with recently noted clogged feeding tube.

pneumonia Narrative: On 11/9/20, Patient had a presumptive positive COVID (COBAS) screen as part of routine CLC screening and then on 11/13/20, he had a repeat COVID (CEPHID) that was negative. Then on 12/22/20, he received his first COVID vaccine. On 12/26/20, he began to have c/o hurting all over. Noted history of aspiration and COPD. On 12/29/20, he began to have coughing, increased shortness of breath and runny nose with course breath sounds in his bilateral lower lobes. A chest xray was done and he was initiated on oral azithromycin and cefepime for a bilateral pneumonia. On 1/3/21, he continued to decline with increasing shortness of breath and was subsequently transferred to acute care medicine. All COVID tests have been negative since the presumptive positive on 11/9/20. He did have a CTA that ruled out PE but did show bilateral pneumonia. His antibiotics have been changed to meropenem, vancomycin and IV azithromycin. He remains on acute care at time and has not required ICU care.

COVID positive Narrative: Patient is a resident and received his first COVID vaccine on 12/28/20. On 1/4/21, he had a COVID routine screen done that returned positive on 1/6/21. Per notes, he was asymptomatic at the time; however for isolation purposes, he was transferred to acute care medicine services. On 1/7/21, he was noted to have a slight increase in BUN/creatinine ratio thought to be due to volume depletion and has been ordered IV fluids. He still remains free of any respiratory symptoms at this time.

The patient had severe shortness of breath resulting in cardiac arrest on the 5th day after the vaccine. Shortness of breath started 12 hours after injection. On the 5th day, the patient was discovered to also have a rash throughout his body, but it is unknown when this rash started.

Diarrhea & NauseaVomiting Narrative:

Pt is 39 y/o female. Pt is casual RN for ED. Pt received COVID-19 vaccination here on the 23rd of December. Pt began feeling weak on the 17th of January. On the 18, Pt began experiencing numbness and tingling in hands and feet. Pt has been seen at facility and her PCP prior to coming to ED. Pt PCP called me and told me she is concerned that the Pt might have Guillain Barre syndrome and referred her here. Pt now c/o numbness and tingling from feet to mid abdomen and numbness/tingling up entire arm. IV was established and labs drawn, CT Head normal. Pt to IR for LP for definitive Dx of Guillain Berre. Pt admitted to room 202. Director of ED notified.

COVID-19 Vaccine

Sudden death without warning symptoms 4 days after vaccine. Many medical problems which most likely explain the outcome but spouse feels it is related and it is a new vaccine. Monitor for pattern?

Excruciating abdominal pain, left arm pain, chest pain. Gangrenous appendicitis requiring emergency surgery and followed by admission for complicated acute abdomen.

"Resident experienced chest pain the evening he received the vaccine and requested to go to the hospital as he stated his ""chest is pounding""."

Resident received 1st on 1/11/21 at 12:10am (1/12/21) resident was found unresponsive. Code Blue, 911 called at 12:11am. FD and EMS arrived, resident pronounced at 12:51am.

24 hours after the vaccine administration, patient began experiencing respiratory (asthma) symptoms. She was treated with nubulizer treatment and albuterol HFA inhaler.

Hypotension, Prolonged seizure with bowel incontinence, cough, weakness and delirium, resulting in 911 transport and admission to hospital for intubation and mechanical ventilation for acute respiratory hypoxia.

Appendicitis

received first dose of COVID vaccine on 18Dec2020 and tested positive on 30Dec2020; received first dose of COVID vaccine on 18Dec2020 and tested positive on 30Dec2020; she had a 5 day migraine after the first dose; This is a spontaneous report from a contactable other healthcare professional (patient). A female patient of an unspecified age started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Solution for injection (lot number and expiry date were unknown), via an unspecified route of administration on 18Dec2020 at first single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received first dose of COVID vaccine on 18Dec2020 and tested positive on 30Dec2020. The patient stated her isolation will be over

the day that she was to receive her second dose. The patient stated that she had a 5-day migraine after the first dose. Outcome of the events was unknown. Information on the lot/batch number has been requested. Follow-up (06Jan2021): New information received in response to query via mail includes confirmation of the primary reporter's last name. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further information like confirmative virus genome /nucleic acid detection needed for meaningful medical assessment.

Pregnant at the time of vaccination; Pregnant at the time of vaccination; Miscarriage (symptoms started 08Jan2021, confirmed 10Jan2021); This is a spontaneous report from a contactable physician (patient herself). A 37-year-old female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were unknown), via an unspecified route of administration on the right arm on 06Jan2021 12:30 at a single dose for COVID-19 immunization at the hospital facility. The patient had no relevant medical history and no known allergies. Concomitant medication included azelastine;fluticasone nasal sprays, prenatal. The patient did not have any other vaccine in four weeks. She did not have COVID prior to vaccination. The patient was 6 weeks pregnant at the onset of the event. Last menstrual date was on 11Nov2020 and Gestational period was 7. The patient was due to deliver on 26Aug2021. The patient reported miscarriage (symptoms started 08Jan2021 06:00 PM, confirmed 10Jan2021). The event resulted in doctor or other healthcare professional office/clinic visit, Congenital anomaly or birth defect. Treatment and event outcome were unknown. The patient had not been COVID tested post vaccination. Information on the lot/batch number has been requested.; Sender's Comments: Based on a close compatible temporal association, contributory role of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) to patient's miscarriage cannot be completely excluded. The case will be reevaluated should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

tested positive after 1st dose; tested positive after 1st dose; This is a spontaneous report from a contactable nurse reporting for herself. This nurse reported similar events for 2 patients: this is the first of two reports. This 39-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 28Dec2020 for COVID-19 immunization. Medical history and concomitant medications were not reported. On an unknown date, the patient tested positive after first dose. Outcome was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 cannot be completely excluded. However, it is unlikely that the patient would have fully developed immunity due to the very short time lag between the first vaccine dose and the event onset.,Linked Report(s) : US-PFIZER INC-2021021888 same reporter/drug/AE, different patient.

"Between then and now I tested positive; Between then and now I tested positive; This is a spontaneous report from a contactable consumer (patient). A male patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot/batch number unknown), via an

unspecified route of administration on 28Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient stated, ""I have taken the vaccine (1st dose) on 28Dec2020 at the hospital. Between then and now I tested positive on the 04Jan2021, the hospital sent me home for 2 weeks. The 2nd part of the vaccine is coming up, it isn't until the 18Jan2021."" The outcome of the events was unknown. Information about lot/batch number has been requested."

"Hypertensive Emergency (BP 219/114) with no previous blood pressure issues; Radiating chest pain, left arm pain; jaw pain; This is a spontaneous report from a contactable other Health Professional (patient). A 40-year-old non-pregnant female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EX5170), via an unspecified route of administration on 16Dec2020 15:00 at single dose in left arm for covid-19 immunization. Medical history included symptomatic PVC's (Premature ventricular contractions), tachycardia, bradycardia, CVA (cerebrovascular accident) from 2018 to an unknown date, asthma and rhythm. Concomitant medication included flecainide, spironolactone, metoprolol for rhythm. The patient had known allergies included hydrocodone bitartrate, paracetamol (VICODIN), eletriptan and adhesive. Prior vaccination, the patient had no covid. On 22Dec2020 18:00, the patient experienced hypertensive Emergency (BP 219/114) with no previous blood pressure issues. Radiating chest pain, left arm pain, and jaw pain. Admitted to the hospital where an echocardiogram and angiogram was performed showing clear coronary arteries and no hypertensive remodeling of the heart. Issue has been ongoing since, despite interventions. The events result in emergency room/department or urgent care and hospitalization from an unspecified date for 1 day. The patient received the treatment for the events included frequent nitroglycerin, hydralazine and metoprolol. The patient underwent curative-SARS-Cov-2 Assay RT-PCR on 01Jan2021 with negative result. The outcome of the events was not recovered.; Sender's Comments: Based on the information available, contributory role of BNT162B2 ((PFIZER-BIONTECH COVID-19 VACCINE,) to event ""hypertensive emergency (BP 219/114) with no previous blood pressure issues"" cannot be excluded. The events chest pain and pain in jaw are attributed to underlying medical conditions and assessed unrelated. BNT162B2 ((PFIZER-BIONTECH COVID-19 VACCINE,). The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

having symptoms, tested covid+(positive); having symptoms, tested covid+(positive); This is a spontaneous report from a contactable consumer (patient). This 57-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unknown route, on 17Dec2020 at single dose for COVID-19 immunization. No relevant medical history and concomitant medications were provided. The patient started having symptoms on 23Dec2020 and she was tested for COVID 19 on 27Dec2020 and resulted positive. The outcome of the event was unknown. Information on the batch/lot number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021015240 Same patient/reporter, 2nd dose of drug, different AE

tested + 9 days after dose #1; tested + 9 days after dose #1; exposed to Covid-19 four days after vaccination; This is a spontaneous report from a contactable patient. A patient of unknown age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 26Dec2020 at single dose for COVID-19 immunisation. Medical history and concomitant medications were unknown. The patient was exposed to Covid-19 four days after vaccination and tested positive (+) nine days after dose 1 on 04Jan2021. The patient would like the advice for receiving the second dose. Outcome was unknown. Information about batch/lot number has been requested.

"I still have uncomfortable feeling in my arm/I was finally able to raise it above my head, my left arm, after two days but it was not comfortable to do it, it was painful; I have severe pain in my arm/it started hurting and then it continued to get worse and worse and it was severe; It was the worst pain I have ever had and I could not move my arm; It continued to get worse and that night I went to bed and I cannot sleep, it hurts so bad/I could not sleep on the right side or on a left side; This is a spontaneous report from a contactable consumer (patient). An 82-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date was not provided), via an unspecified route of administration (left arm) first dose on 30Dec2020 10:30 at single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient stated that I had the vaccine back a week and half ago on 30Dec2020 and was due to get the booster this month and wanted to report severe pain arm for two days. The patient stated that he had many vaccine (Unspecified Vaccine) over the years and have never had anything that hurts so bad after about six hours. The patient just wanted to know that was that normal. Consumer further stated, ""I took the vaccine about 10:30 in the morning and about four hours later, it started getting sore but that thing was normal you know some vaccines (Unspecified Vaccine) do that but along with that it started hurting about four hours after the vaccine and it continued to get worse and that night I went to bed and I cannot sleep, it hurts so bad. The patient even have thoughts about getting up and go in to the emergency room. It was the worst pain I have ever had and I could not move my arm. I could not sleep on the right side or on a left side and all I did was take Tylenol as prescribed and that helped a little bit but not much but I did not go to the emergency room, I am not going to do that but I felt like it because it hurts so bad but I made it through the night and next day it continued to hurt really bad. I just keep taking Tylenol every four hours and that continued for two days and then finally I was able to raise my arm up above my head without little pain, it was discomfort, but it was not hurting so bad."" The patient stated that the event started about two hours later it started, it started hurting and then it continued to get worse and worse and it was severe, that is the reason why I am calling that it was severe. I wanted a shot or morphine to relieve myself that how bad it was."" (no clarified further). The patient stated that the vaccine was given in my left arm only about one inch below the top of my shoulder which I think that might have been the problem, I don't know if you can answer that or not but I have never received the vaccine or shot anywhere near that area, it is always three or four inches down in my muscle, on my arm either on left or right, this was given in my left arm but this was given almost in my joint I am wondering if that would cause pain."" The patient stated it was given only one inch below the tip above shoulder may be that is causing so much pain."" The patient just wanted to report the severe pain, that was for two whole days and then it was subsided and it lasted for four days and I still have

uncomfortable feeling in my arm. I was finally able to raise it above my head, my left arm, after two days but it was not comfortable to do it, it was painful."" The outcome of the events was unknown. Information on the lot/batch number has been requested."

"Spot on arm where I got the vaccine probably 4 days ago is continuing to increase in size and is red, swollen and hard; it's huge and it's purple and red and it feels like bee sting, it feels like an allergic reaction; purple and red; continuing to increase in size and it is red and swollen and hard now; Made me really, really sick like bedridden for 2 days; Spot on arm where I got the vaccine probably 4 days ago is continuing to increase in size and is red, swollen and hard; This is a spontaneous report from a contactable Other HCP (patient). An unknown age and gender patient received BNT162B2 (lot# unknown) on Jan2021 at single dose for COVID-19 immunization. Medical history and concomitant drug were not reported. Patient stated, ""I just have a question, my Pfizer COVID Vaccine made me really, really sick like bedridden for 2 days which I am finding out is probably normal. But the spot on my arm where I got the vaccine, it was probably 4 days ago that I got it and it's continuing to increase in size and it is red and swollen and hard now. Like I am a Nurse Practitioner, this is not like a normal injection site reaction, it's huge and it's purple and red and it feels like bee sting, it feels like an allergic reaction, should I be concerned, do I need to go to the hospital?"" Outcome of the event was unknown. Information on the lot/ batch number has been requested.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate."

"Tested positive for Covid/had the (Covid) infection; Tested positive for Covid/had the (Covid) infection; Swollen lymph nodes under my right arm; This is a spontaneous report from a contactable nurse. This 42-year-old female nurse (patient) reported for herself that she received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot#: nurse stated she thought she had a lot# it looked like EK5703), via unspecified route at right deltoid on 21Dec2020 at single dose for COVID-19 immunization. Medical history included blood pressure (patient had taken blood pressure medicine but hadn't taking currently because her blood pressure was being controlled). Concomitant medications included unspecified vitamins. Patient was tested positive for Covid on the 29Dec2020. She stated she didn't know about causality, she was saying no but she did have swollen lymph nodes under the right arm before getting sick (Dec2020), now she thought that might get from her vaccination but in her understanding she could get it from Covid so, she couldn't answer that, she tested positive, she didn't think it's from vaccination but her concern was because she had got the vaccination the first one then had the (Covid) infection and right now she should get the second one or not. Regarding treatment, patient stated she was taking methylprednisolone sodium succinate (SOLU-MEDROL) and salbutamol (ALBUTEROL) inhaler, taking over the counter Vitamin D3, Zinc and Vitamin C and acetylsalicylic acid (ASPIRIN). Patient reported she did go to the physician office/ emergency room. Outcome of events was unknown.; Sender's Comments: Based on the mechanism of action of BNT162B2 vaccine, it is unlikely

the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine was given (8 days in this case). However, a causal relationship between events ""Tested positive for Covid/had the (Covid) infection"" (coded to Drug ineffective / COVID-19) and swollen lymph nodes and BNT162B2 vaccine cannot be completely excluded.The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

I am a registered nurse at hospital. On 12/25, seven days after receiving the shot I started to get right lower leg pain and I kept complaining about it till New Years Day. I had no symptoms of a DVT. I triaged on 1/1/21 and the doctors ordered labs/imaging and the results were as followed: D-Dimer biomarker (+) , Ultrasound of the Rt lower leg (-) , CTA showed a PE (segmental right upper lobe pulmonary artery consistent with pulmonary embolus). I was discharged on Xarelto and advised to follow up with a hematologist. On 1/5/2021, I went to hematology and they did a whole bunch of labs. I was sent to get a ultrasound of the leg because the pain persist and they found a clot hidden by my soleus. The plan is to continue on the Xarelto for 6 months. Come back in 3 weeks to scan my leg again and get my lab results. On 1/12/2021, I received the 2nd shot of the Pfizer vaccination.

"Client was administer 2nd dose of Moderna COVID-19 vaccine at 1:32pm. Client reported has ""sore arm from first dose"", but denied any other issues from 1st dose. At 1:44pm, client reported was feeling flushed and slightly dizzy/light headed. Client appeared flushed, clammy and was slightly confused. Client was sitting in chair and was assisted to the floor and clinical assist code was called. VS were: BP: 149/84 and pulse ox was 97% on RA. Initially, HR was in the low 30's, but after lying down, came up to 86 and stayed in the 80-90's during assist. Client began to report chest tightness and feeling foggy and remained slightly confused and at times speech was garbled. Client denies sensation of throat closing and denied shortness of breath. Client was assisted to a cot and transported by ER staff and MD to the ER for evaluation."

Presented to Urgent Care for weakness and confusion, transferred to ED, patient had a cardiac arrest and was unable to be resuscitated

"""I received the Pfizer Covid vaccine Wed afternoon around 4pm. Thursday morning around 9:30 I started with severe pain in my left leg. The pain worsened through the day and my leg began swelling. No other symptoms at all. This morning my leg was twice the size of my right leg so I went to the ER. I live in so I'm at ED. I have a massive blood clot running the the length of my leg - from my thigh to my ankle. I'm very lucky I got here so fast! I?m a very healthy 49 year old with no history of DVT or blood clots so they dug further to find out why. A cat scan showed I have a congenital condition called May Thurner Syndrome. I?m so relieved to have an answer and it?s fixable! The vascular doctors are not 100% convinced that?s not all that was going on as I was born with the syndrome and I?ve gone this long without a clot. So they are doing lots of labs to see if anything else shows up. This is where we are at. I?m being admitted to take care of the clot."""

Pt woke up with tongue swelling morning following her vaccine. Was admitted for angioedema.

Rapid heart Rate that began about 12 hours after the injection. Heart rate of 123 all night and went to ER next morning after calling Nurse on Call system. I was admitted and the Dr ordered bag after bag of fluids to and kept me in the unit overnight for observation. Did may hear tests (EKG, ECHO STRESS,CTA chest) and results all came back good. I was released on 1/19/21 at 2pm and my hear rate is back to normal (82 bpm).

Extreme fatigue since getting shot - effecting ability to work

Started with cough, mild shortness of breath and feeling terrible in evening of 1/19.

Death 3 days after receiving 2nd dose of COVID vaccine, unknown if related to vaccine administration.

Approximately after 20 minutes after vaccine administration, my throat felt numb and i could not swallow my saliva, no acute breathing difficulty , I could not swallow water , I was very anxious and went back to facility I got vaccine , The attending doctor administered Benadryl I 50 mg IM , and then EPI 0.3 mg . EMT was called , and ED at Hospital i was attended , and Solumedrol 1.25 mg was administered IV and Pepsid for GERD , i also had, I was observed for a few HRs and skript for Prednisone and Benadryl was issued. I was then feeling better,

My arm was a little sore after the vaccination but no other symptoms. And on 12/30 I woke up with a sever fever, vomiting and diarreah. Went to the ER and was diagnosed with CHF because my feet were so swollen and was given lasix and released. I continued to feel bad so on that Sunday 1/3 I went back to the hospital and was admitted and tested positive for COVID-19. I spent from Sun-Wed in the hospital

Patient has end stage renal disease and rapidly worsening dementia, family could no longer care for him at home, and he was admitted for 14-day quarantine prior to admission to inpatient hospice. Received vaccine on 1/12 without apparent adverse reactions. Patient started refusing oral intake on 1/16, and CMP on 1/17 showed hypernatremia 165 (new issue). His BUN 138 CREAT 6.93 K 5.2 were his baseline. He was found to be deceased on 1/18 at 11:18 pm.

Pt found unresponsive at home, respiratory distress. Had reported nausea and vointing for two days prior to admit which started 1/15. Acute metabolic encephalopathy and acute renal failure Currently at time of this report still in critical care

Myalgia Narrative:

Shaking and then became unresponsive

Headache and stoke

Stroke-like symptoms approximately 2-3 hours after receiving shot (aphasia), BP bottomed out, was transported by EMS and is currently on a ventilator in hospital. CT scan clear; MRI pending.

The next morning I felt chills, really cold, my arm never hurt at all. I was freezing. I had no energy. Very lethargic, with a blanket around me. Never had a fever. All of a sudden, around 2:30PM all dissipated, it was all gone and I was fine. A week later I called my PCP because the symptoms came back - the lethargy. He suggested me to go to the ER. I went and could barely write my name on the sign in sheet at the hospital. They did 5 COVID tests and 4 of them were negative. I was at the ER for 3 days and finally was admitted and stayed for 11 days. I was sent home with oxygen and my levels are finally getting back to 92/93. I can't walk at this time. I lost 17 lbs and if I try to walk my lungs shut down. (I went to the ER n 01/07 and was discharged on the 17th - I was also at the ER the week before when they tested me and it kept coming back negative) My pulmonary MD

death by suicide Narrative: death by suicide; 12/26/20, self inflicted gun shot wound; found deceased by family member

Started with HA/fever/fatigue and body aches on date of vaccine on 1/5/21. Also had shakes,and had numbness loss of feeling to leg leg. Was admitted to Hospital for 5days. Had intermittnet seizure type episodes. Has had labs and imaging tests that have been neg Under the care of the A Neuro Group. MRI scheduled for 1/20/21. As of 1/20/21 feeling better but still weak.

Fainting, dizziness and weakness, trembling, BP 168/129. HR 145

Patient received Vaccine and during observation period began starring forward and not responding to staff. Patient was taken to the emergency room and evaluated and noted to have a flat affect and general weakness. Patient did not loos consciousness or have any signs of distress. Was admitted to the hospital and noted that she had been in out of country for a week (possibly had cosmetic surgery)

Around 10pm on Tuesday I started to have severe neck pain, headache, fatigue. I ended up going to the emergency room after my shift but due to the physicians recommendations I deferred the lumbar puncture while there. Later Thursday night, the neck pain continued, and I started having fevers with a max of 102.1 so I returned to the ER the following day for the lumbar puncture. I was admitted to the hospital for aseptic meningitis.

severe temporary paralysis from the neck down.

Resident was noted to have increase weakness on 1/15/2021. Resident was warm to touch with low grade fever of 99.3 F. Resident was up propelling self in w/c on 1/16/2021 he was pleasant, accepted medications and ate lunch. He was found slumped over in his w/c not responding and vital signs absent.

Pt was 18 weeks pregnant at the time of the vaccine. Second pregnancy. Pt is a physician. Pregnancy was entirely normal up to that time. On 1/18/2021, she began to have heavy vaginal bleeding probably due to a placental abruption and subsequently delivered at 18 weeks. Baby was stillborn. Ultrasound done 1/15/2021 normal. Lethal event for the fetus. The patient did well.

sinus arrhythmia; Night sweats; Heart rate low; Dyskinesia; This is a spontaneous report from a contactable nurse (patient). This 36-year-old female patient the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular at single dose in the left arm on 07Jan2021 10:00 for

covid-19 immunisation. Medical history included hypotension, rheumatoid arthritis, asthma. Concomitant medication included clonazepam, methylprednisolone. On 07Jan2021 21:00, the patient experienced sinus arrhythmia, night sweats, heart rate low, dyskinesia, all with outcome of recovered with sequelae. Therapeutic measures were taken as a result of the events included Inderal 10mg. The events were assessed as congenital anomaly. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. The patient had not been tested for COVID-19 since the vaccination. The patient was not pregnant at the time of vaccination. Information on the lot/batch number has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

postural dizziness; dyspnea; paresthesia; This is a spontaneous report from a contactable Physician. This Physician reported for a 28-year-old male patient received 2nd dose of BNT162B2 Intramuscular on 10Jan2021 07:30 on Left arm for covid-19 immunization. Medical history and concomitant drug were not reported. No other-vaccine-in-four weeks. No other-medications-in-two weeks. Historical Vaccine was first dose of BNT162B2 on an unspecific date. Patient experienced Moderate reaction: postural dizziness, dyspnea, and paresthesia on 10Jan2021 09:00 AM that resolved with H1 and H2 antagonists and IV hydration. AE-resulted-in Emergency room/department or urgent care. Outcome of the event was recovered. No covid-prior-vaccination. No covid-tested-post-vaccination. Information on the lot/batch number has been requested.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

passed out; dizzy; hit the ground; nausea; pain at injection site; fever; chills; tired; severe headache; vomiting x 2; cold; experienced orthostatic hypotension; This is a spontaneous report from a contactable other HCP. A 65-years-old female patient started to receive bnt162b2 (BNT162B2; Lot # EK9231) vaccine , intramuscular in the left arm on 07Jan2021 11:00 at single dose for Covid-19 immunisation . Medical history included rubber sensitivity (Latex). The patient's concomitant medications were not reported. On 09Jan2021 12:00 the patient experienced orthostatic hypotension , passed out with outcome of recovered , dizzy with outcome of recovered , hit the ground with outcome of recovered. These events were considered serious because medically significant. On 09Jan2021 12:00 the patient also experienced the following non serious events: nausea with outcome of recovered , pain at injection site with outcome of recovered , fever with outcome of recovered , chills with outcome of recovered , tired with outcome of recovered , severe headache on with outcome of recovered , vomiting twice with outcome of recovered , cold with outcome of recovered. The reporter stated the patient attempted to get out of

bed and she passed and hit the floor. Caller states she think she may have experienced orthostatic hypotension. Caller stated if she had stayed in bed she probably would not have fallen. Her husband found her laying in vomit The patient underwent lab tests and procedures which included body temperature: 99.6 fahrenheit on unknown date.; Sender's Comments: Based on a chronological temporal association a causal relationship between events orthostatic hypotension , passed out dizzy and falling down and BNT162B2 vaccine cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Several back operations of stimulator in the back and in pain management; This is a spontaneous report from a contactable Consumer. This adult female Consumer(patient) reported that: An adult female patient received bnt162b2 (BNT162B2) at single dose on an unspecified date for Covid-19 immunisation. Medical history was none. No known allergies. The patient's concomitant medications were not reported. Patient was not pregnant a time of vaccination. The patient had not received any other vaccines within 4 weeks prior to the BNT162B2 vaccine. The patient had not experienced Covid-19 prior to vaccination. The patient experienced several back operations of stimulator in the back and in pain management on an unspecified date, resulted in disability or permanent damage. Post the vaccination, the patient has not been tested for COVID-19. The outcome of events was unknown. Information on the lot/batch number has been requested.

"I began to pass out and yelled for my husband, he said when he came in I was sitting on the toilet with my head back, eyes rolling back not responsive.; I had my 2nd vaccine at work early Sat the 9th and felt increasingly worse all day; I woke up at midnight and felt extreme malaise; I was covered in sweat; vomited; I checked my temp and it was 99.7¦F; sore; I think I had either a seizure or a vasovagal response.; This is a spontaneous report from a contactable nurse (patient). This 58-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot EJ1685 or FJ1685), intramuscular at single dose in the left arm on 09Jan2021 06:00 for Covid-19 immunisation. Medical history included atrial fibrillation on unknown date (1 episode), allergic to Keflex. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot EJ1685 or FJ1685), intramuscular in the left arm on 22Dec2020 for Covid-19 immunisation. On 10Jan2021 01:00 AM, the patient experienced: I began to pass out and yelled for my husband, he said when he came in i was sitting on the toilet with my head back, eyes rolling back not responsive (loss of consciousness) (medically significant), I had my 2nd vaccine at work early sat the 9th and felt increasingly worse all day (feeling abnormal), Iwoke up at midnight and felt extreme malaise (malaise), I was covered in sweat (hyperhidrosis), vomited (vomiting), I checked my temp and it was 99.7¦F (pyrexia), sore (pain), I think I had either a seizure or a vasovagal response (seizure). No treatment required. The outcome of the events was recovered. The events were described as follows: I am healthy RN with no active medical problems. I had my 2nd vaccine at work early Sat the 9th and felt increasingly worse all day, I expected this so was not alarmed and went to bed around 10pm. I woke up at midnight and felt extreme malaise and went to the bathroom in case I might vomit, etc. and I tried to

have a BM. I began to pass out and yelled for my husband, he said when he came in I was sitting on the toilet with my head back, eyes rolling back not responsive. He yelled at me for about 10 seconds and I came to, I was covered in sweat. I asked him to walk me back to the bedroom where I again passed out, fell to the floor and hit the bed, then was unresponsive again for about 10 seconds then came to again and vomited. After this I felt completely relieved of my malaise. I checked my temp and it was 99.7¦F. After this I was sore but otherwise completely okay, the next day I had a temp of 99.5¦F. Today I am back to normal. I think I had either a seizure or a vasovagal response. The vaccine was administered at Hospital Facility. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. The patient had not been tested for COVID-19 since the vaccination. The patient was not pregnant at the time of vaccination.; Sender's Comments: Based on the close temporal relationship, the association between the event ""began to pass out"" with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

"suddenly lost mobility of left arm; Continue paresthesia and proprioreceptive deficits of left arm; Continue paresthesia and proprioreceptive deficits of left arm; This is a spontaneous report from a contactable nurse (patient). This 46-year-old female patient received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot EK5730) intramuscular, in right arm, on 16Dec2020 at 14:00, for COVID-19 immunization. No other vaccine was given in 4 weeks. Medical history included hypothyroidism, migraine headaches, IBS and COVID-19 (on an unspecified date prior to vaccination). Past drug history included allergy to morphine. Concomitant medication included levothyroxine sodium (SYNTHROID). On 23Dec2020 at 09:30 the patient experienced suddenly lost mobility of left arm, continue paresthesia and proprioreceptive deficits of left arm. She was transported to the ER and was admitted to hospital for 2 days. CT of brain X3, MRI of brain X2, MRI of C-spine and Brachioplexus were performed with unknown results. The patient was not tested for COVID19 after vaccination. The events resulted in: Doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care, hospitalization, disability or permanent damage. No treatment was administered. The events had not yet resolved.; Sender's Comments: Based on the temporal relationship, the association between the events "" lost mobility of left arm, continue paresthesia and proprioceptive deficits of left arm"" with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

thrombocytopenia; This is a spontaneous report from a contactable other health professional (patient). A 59-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in arm left on 04Jan2021 13:30 at single dose for COVID-19 immunization. Medical history was none. The patient's concomitant medications were not reported. The

patient did not have COVID tested post vaccination and did not have COVID prior vaccination. The patient experienced thrombocytopenia on an unspecified date with outcome of unknown. It was reported he had thrombocytopenia but did not experience any side effects. Information about lot/batch number has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported thrombocytopenia cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

on 1/12 started body aches and chills, took Tylenol and felt better, Wednesday felt short beat and irregular and heart beat not regular. checked pulse and it was irregular, that night 9-9:30 I went to ER close to house and pulse and heart rate abnormal after 2 hours went home and advised to contact cardiologist, he said to come in Thursday and the irregular beats were off and on atrial flutter, on Friday I came home and went back to hospital and got the shot cardio version or ablation to revert the rhythm and because the rhythm was back and forth I was observed until released on 1/19/21. Surgery was in 2017 and never had problems and they stated heart was compromised and maybe this is your reaction to the vaccine.

The patient was seen in my office on 1/19/21 with complaint of heavy vaginal bleeding. A CBC was obtained which revealed an H/H of 12.2/36.1 and a platelet count of 1 (not 1K, but 1 platelet!) and this was confirmed on smear review. She was immediately sent to the Hospital ED and repeat CBC confirmed the critically low platelet count. She is currently hospitalized and she has received platelet transfusions but her platelet count is still critically low. She is also receiving steroids and immunoglobulin and is under the care of MD (Heme/Onc)

Resident became lethargic, general weakness outside baseline, unable to walk, bumbled speech. Elevated HR and Temp of 105.2F

Death on 1/15/2020

Patient developed right facial numbness and facial droop on 1/7/21. She came to the TMH ED and was admitted. She was afebrile; neurologic exam was consistent with a peripheral facial palsy on the right.

Sudden Death within 24 hours of vaccine

Hemorrhagic Stroke, Right Basal Ganglion

12:00 noon my arm was super sore and swollen and I could barely raise it. By the evening on the 24th I was super tired. Christmas , the 25th,I was really fatigued. 26th, I was very fatigued and no energy - like I almost had the flu. 27th - the same - couldn't get out of bed. 28th - started getting a dry, hacky cough and then it went away. 29th - tried to go to work and I didn't feel good at all and I just wasn't feeling myself. Had brain fog. Went to work - things that I know that Know wasn't there because of brain fog. Felt really like flu symptoms that night. 30th - body aches; headache and eyes felt like pressure behind

them. Sent me to COVID and it was positive - was out 2 weeks from work. Went to back to work last week - but I still had shortness of breath, brain fog and fatigue and cough on Moday the11th; super tired still and I kept pushing myself to try to work and by Friday, 15th, I was just done. Exhausted. 16th - still having fatigue and 17th I thought I felt better when I woke up but still had my shortness of breath, cough and brain fog. At 2:00 pm I started feeling dizzy and faint like. I ate and within 20-30 min after food started throwing up, pounding headache. Every time I started trying to drink I would throw up. Monday, 18th, I went to work and I noticed whenever I moved around I was dizzy and short of breath and I couldn't eat or I would throw up. So slept the rest of the day. About 4:pm on Monday I thought I was going to pass out. 02 level at 86. Heartrate - Palpitations at 130. It was bouncing. Hving chest pressure, dizzy, pounding heart - 02 86 and Heartrate145. ER at 5:00 pm at Medical Ctr. Nausea medicine: Phenergan and Zofran. Did IV to hydrate me as I was dehydrated. Gave me Pepsid. I was a direct admit. They kept giving me hydration and nausea med and med for headaches and cardio workup - cardio came back normal. Severe lung inflammation. Was in the hospital until evening of 19th.

Patient woke apx 0200 complaining of nausea to group home staff. Vitals were checked at that time and WNL. Patient went back to bed. When staff went to wake patient apx 0530, he was unresponsive and had no pulse. Chest compressions were started and EMS called.

Patient got her 2nd dose of Pfizer covid vaccine on 1/8. On 1/11 she had intermittent chest pain that lasted a few days and started to notice small purpura rash on left breast. She didn't think much of it but noticed the same type of rash on her pant line and then right thigh. On 1/15 she called Occupational Health who advised her to go straight to the ED.

On 1/9/2021 observed with elevated respirations of 38-42 per minute, BP manually 72/50. pulse is jumping rapidly between 110-16 bpm. oxygen sat 76% RA, resident refusing oxygen at first attempt, allowed oxygen to be placed, is now 84% on 4L. resident shaking head yes that he is hurting, and yes that he would take medication for pain. Dr. notified, branch block. Received order for morphine 2mg per hr as needed for elevated respirations and pain. Dr. also gave orders to D/C Tamsulosin and finasteride. Resident continue with decreased O2 sats and elevated respirations. Absence of vital signs on 1/10/21 at 826PM.

Jan 4, 2021 received shot at work in morning around 11:00 am- felt fine at work all day. Around 7:00 that night began to have back pain, fever reached up to 102 around 2:00 am and took Tylenol. Felt very weak, headache, difficulty walking and decreased balance. On Jan 5, 2021 still had back ache and headache. On Jan 6, 2021 I felt better and began to have abdominal pain after eating dinner. I assumed it may be because of eating more then I had in past few days and did not attribute to much but the pain gradually increased to a strange burning/pressure across my upper abdomen that night. Very nauseous and ran low grade fever (99.45). Next morning I had less diffuse pain and could localize it to right lower quadrant.

Tinnitus started in right ear within hour after receiving first vaccination but resolved within a couple of day. Within 24 hours of receiving second vaccination had muffled hearing, Jan 3, 2021. Symptoms were ignored thinking they would resolve. When symptoms persisted and evaluated patient was noted to

have a severe right sided low frequency hearing loss with poor word recognition score. Patient was started on high dose steroids with partial recovery of symptoms.

Idiopathic intracranial HTN - IIH

Unknown as to any correlation with vaccine as this was a hospice patient that was already experiencing decline. Patient became Jaundice for approximately one week prior to expiring.

Unrelenting headache, chills, nausea, body aches, fever of 101.3F. Onset 14 hours after vaccine. Fever 20 hours after. Relieved with Tylenol and Motrin, ice packs.

Patient received COVID 19 vaccine 01/14/2021. Patient died in his sleep 01/16/2021.

Patient received COVID-19 vaccination on 1/14/2021. On 1/17/2021, patient was transferred to Hospital s/p multiple cardiac arrests. Patient was hyperkalemic and in acute renal failure at time of transfer. Hyperkalemia was treated, but the patient suffered PEA vs VFib. At the time of transfer, patient was on vasopressin, norepinephrine, and epinephrine. The patient had an EF of 40-45% and elevated troponins. Patient was made DNR and placed on comfort care. Patient passed away on 1/18/2021. Ultimately we suspect that the patients condition was a direct result of his underlying disease states, but wanted to make sure reporting was made available.

Thursday 1/6/21 body aches, fever, chills Fri, Sat, Sun- Vomiting and diarrhea. Low blood pressure (average 70/40 Went to ER Sunday for hydration and low BP Wednesday 1/20/21 diarrhea x 25 episodes while at work, Sent home at 3:30pm. Body aches, chills, sever abdominal pain.

Patient died 4 days after immunization. Probably unrelated to immunization, as patient has been in poor health and was receiving hospice services. I have no details related to his illness or symptoms. Daughter is the HIPAA/emergency contact and will have all the information needed.

Sudden Sensorineural Hearing Loss in left ear. Symptoms began Friday evening Jan. 8, 2021. Sounded like muffled sound in my ear, water running, ringing. Then on Saturday Jan.9, 2021 my left ear felt like it had to pop and I felt my hearing was impaired. By Sunday evening Jan. 10, 2021, I could barely hear out of my left ear. I called MD immediately Monday morning, Jan. 11, 2021 and was seen that afternoon. I was examined and had a hearing test. I was diagnosed with SSHL and started treatment of a series of steroid injections directly into my eardrum to save my hearing immediately. I have had 2 injections and hearing test since then. The doctors feel this was a side effect of the COVID vaccine due to my compromised immune system, but not an allergic reaction, but a side effect. I had the same condition about 15 years ago from a virus.

Pt passed away the day after the vaccine was given.

12 hours after vaccination began experiencing fever, chills, body aches, slight head ache - lasted around 12 hours Had slight pain above eye prior to getting vaccination Saw PCP on 01/08/2021 due to eye pain - had CT scan for possible aneurysm, found 2 spots on brain, thought patient had shingles On 01/10/2021 shingles rash appeared

I was having episodes of dyspnea and non productive cough starting from 1/1/2021. On 1/13/2021 I experienced severe dyspnea and had loss of consciousness for 5 seconds and was found down. I was rushed to the hospital and diagnosed with multiple pulmonary embolus (about 9) which was treated with direct TPA via catheterization. I then recovered in the ICU and transitioned to oral anticoagulation and discharged home on 1/15/2021.

Anaphylaxis Allergic reaction COVID-19 vaccine: dizziness, vomiting and shortness of breath. Received vaccine and about 5/10 minutes later developed symptoms of chest tightness shortness of breath wheezing. Arrived to ED at 1156 and discharged at 1507. Given epi IM Solu-Medrol, Pepcid, Benadryl, albuterol.

1/4/21- Patient stated she had tenderness on the back of her left lower leg with redness then 1/8/21 started to have shortness of breath and made a doctor's appointment for 1/13/21. Seen by provider on 1/13/21 and was sent to ED and admitted to the hospital [ICU] with NSTEMI, acute deep, occlusive venous thrombosis left femoral vein and saddle embolus of pulmonary artery. Transferred to another acute care hospital for removal of thrombosis. Patient started on Eliqus and no intervention for removal of the thrombosis.

Patient received her first dose of the Moderna COVID-19 Vaccination on Saturday January 16th 2021 at approximately 12pm. She completed all necessary screening forms and was deemed to be at low risk for serious allergic reactions. She tolerated the vaccination well, and no complications or immediate adverse events occurred. She was observed for a full 15 mins per CDPHE/CDC guidelines and left the Clinic in stable condition after her observation period was complete. On the morning of Tuesday, January 19th, 2021, the patient was found unconscious and unresponsive by her husband. She was transferred by Ambulance to Hospital shortly thereafter. She was diagnosed with a brain bleed that was determined to be inoperable. She was transferred to other Hospital for higher level care. She was seen by neurosurgery and diagnosed with a ruptured aneurysm. She was treated in the ICU for 24 hours, at which point her team determined that the severity of her brain bleed would not respond to treatment. Supportive cares were withdrawn on Wednesday Jan 20th, and she passed away shortly thereafter.

Resident has increase weakness and lethargy with abnormal labs. He was transferred to the ER. He was admitted to the hospital and treated for worsening AKI and hypotension.

Appendicitis, presenting as periumbilical tenderness at onset (26 hrs after vaccine admin) migrating to RLQ approx 20hrs later (46hrs after vaccine admin) accompanied by fever, chills, sweats, and nausea. Presented to ER that evening and CT confirmed appendicitis (52hrs after vaccine admin). Surgery following day laparoscopic appendectomy (69hrs after vaccine admin). Recovery and clinical improvement over next 8hrs (77hrs after vaccine admin). Discharged following day (96hrs after vaccine admin)

3 days post = tremors; 4 days post= pneumonia; 6 days post= hospitalized

Patient unresponsive post vaccine. Taken to hospital. Please contact facility for full Report.

Per Nursing Staff- patient died within 24 hours of receiving the vaccine. patient has hospice. Please contact director of nursing for more details.

Started itching within (left arm) 15 minutes. THey said I was fine and to go back to work. About an hour later, I started breaking out in hives and whole body itching. I went back in and they gave me to full strength Benadryl and it was not helping and my BP was 190/140 (stroke level) and they tried to bring that down. About 10:15 my face was starting to swell and I was short of breath and 10:30 they took me to ER - and gave me Cortisol shot. And IV fluids. And I was in ER for two hours. They wrote me a prescription for six days for 2 prednisone for every day for one week. The PA saw me at the ER and he prescribed. I went home but couldn't drive home because I couldn't see straight so got a ride home. They tested my O2 levels before they left me. Oxygen was 96. My blood pressure was down to 140/95 - so it was down but still elevated. I still had facial swelling for 3 days. But after three or four days it resolved the face swelling. Had a weakness from the shot and still itching but nothing like it was that day still after the four days. Dr. told me I couldn't get second dose. It was an anaphalactic reaction. Dr - prescribed me an EpiPen in case I have another bad reaction to anything.

per staff at facility patient died 24 hours post vaccination. Please contact Director of Nursing for further details.

Swelling all over her body, ear popping all the time, hands and feet are numb, torso swollen and numb, face swollen and red. Taking steroids for four days. Went to hospital. Then went to other facility.

short of breath Narrative: patient complained of shortness of breath prior to getting covid vaccine, patient and wife stating it was his norm. After vaccine he complained of increasing shortness of breath, and hypoxic with bluish nail beds, lips, and greyish in color. Applied O2 via mask, and nail beds, lips, and facial color returned, sent patient to local ER for treatment and evaluation.

"Narrative: Patient seen in ED 1-17-21 with c/c of ""bloated with epigastric pain"". Patient with complicated medical history including stage 1B pancreatic cancer (was currently on chemotherapy mFOLFIRINOX), and a leadless permanent pacemaker implantation on 1-11-21 for long episodes of SR with complete heart block following symptoms of syncope (other cardiac history: CAD s/p CABG 2009, PAF, and HTN). Regarding ER visit for epigastric pain, nothing notable was found on workup and patient was to discharge home to rest. There were available doses of COVID-19 Vaccine following a vaccine clinic that same day, and patient was offered and agreed to a dose of vaccine. Patient was monitored for 15 minutes post vaccine with no notable issues. The following day, Monday 1-18-21, patient's caregiver called facility at 22:30 to report he had a fever of 102.8 degrees and that he had been ""feeling kind of bad all day"". Patient was advise to seek urgent medical care and reported back to ED on 1-19-21 at 00:55. Patient wasd admitted for SIRS (tachycardia and febrile) -- patient also reported diffuse myalgia. WBC WNL, CXR unremarkable for infection, UA neg for bacteria, LFTs WNL, blood cultures negative. Procalcitonin elevated at 17.8 -- suggesting inflammatory response. Patient initially reported feeling better on the morning of 1-19-21, but around 13:00 began rapidly declining (confusion, unable to walk) and started experiencing EKG changes (9 beats of SVT). Patient then coded and resuscitation was

attempted for approximately 30 minutes. Patient did not survive the code. Coroner has been notified and family is considering autopsy at time of this report."

Vaccine was administered very high, presumably in the joint space, rather than the deltoid. Patient experienced intense pain in the entire shoulder area for 24 hours following administration. After initial 24 hours, pain remained more localized in the joint itself. Pain is intensified when moving out of the neutral position.

significant facial/lip angioedema first noted ~20 hours post vaccination, leading to intubation in ED due to concern for airway protection. extubated and discharged in 2 days

Admitted in Hospital for Anaphylaxis.

Noticed small area of burning sensation at right side of wrist and the vein there was very enlarged and sticking out.

Began itching and wheezing approximately 5 minutes after the injection. Gave first epi dose. Throat started tightening, and nausea presented. Gave second epi 5 min after the first. Gave third epi 5 min after the second. EMS arrived, gave 4th epi in ambulance. ER treated with breathing treatment, IV steroids, IV Benadryl, IV Pepcid and IV zofran. Was observed for 6.5 hours.

Patient came to ED at 1600 with right upper lip swelling and finger swelling after getting covid vaccine earlier. Angioedema of lips, initial encounter; History of allergic reaction; Lip swelling; Vaccination side effects, initial encounter. Pt has history of rheumatoid arthritis. Was treated & discharged home on 1/12/21

Slurred speech started morning of 1/8 and patient went to ED after dialysis appointment. Admitted for TIA (transient ischemic attack). Discharged home on 1/10 with follow up appts with Neurology.

Presented to ED 1/12 with primary complaint of Fatigue starting that AM. Being treated for Stage IV Sacral Decubitus Ulcer w/ possible osteomyelitis, Still admitted

Pt reported difficulty in swallowing and wife noticed left-sided facial droop morning of 1/10. Patient admitted for concerns of TIA. Symptoms resolved prior to hospitalization. Patient had MRI brain without contrast of the find evidence of acute infarct. Neurology recommended treatment patient has TIA and having dual anti-platelet therapy for 21 days followed by monotherapy of Plavix for stroke prevention. Patient was stable discharge to home 1/12/21

Patient was receiving dialysis and had low grade fevers on the morning on 1/15/2021. Patient was sent to the hospital's emergency room and was found to have a temperature of 103. The patient also had mental status changes. It is unsure what caused the mental status changes and fevers.

Pt presented to ED with Left facial numbness and concern for stroke. Observed over night. MRI brain negative for acute process. Stable at baseline neuro status 1/10/21, discharged home.

Pt Rec'd Covid vaccine and injection in Lt eye for macular degeneration. Monday 1/11 slurring speech/jumbled words since dinner, went to bed, wife states improved from last night but still difficult clearly communicating. Also reports difficulty writing. Came to ED and admitted for stroke evaluation. Stable for discharge home 1/13 with neurology follow up visits.

Pt presented to ED 1/12 complaining of shortness of breath and nonproductive cough which onset approximately 8 days ago. Tested positive for COVID. Remains admitted for management of COVID.

Stated since Xmas he has not feeling well after a family gathering. His wife in hospital for Covid-19 pneumonia. He reports for about 1 week, his SOB worsen, not eating well at all for the past 3 days. Which prompt him to visit the ED. Admitted to Hopital for Dehydration; Dyspnea; Pneumonia due to COVID-19 virus; COVID+ 1/10/21; still admitted

expired before receiving the second dose; This is a spontaneous report from a contactable nurse. This nurse reported similar death events for 8 patients. This report is for 1st of 8 patient. A patient of unspecified age and gender received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 22Dec2020 at single dose for covid-19 immunisation. The patient medical history was and concomitant medications were not reported. The patient expired before receiving the second dose on an unspecified date. It was not reported if an autopsy was performed. Information about Lot/Batch number is requested.; Sender's Comments: Current information is very limited for full assessment. The patient died following the vaccine use; further information such as patient demographics, complete medical history, concomitant medications, concurrent illness and event term details especially death cause and autopsy results are needed for meaningful evaluation. platelets dropped so low/thrombocytopenia; Hemorrhagic stroke/brain hemorrhage; This is a spontaneous report from a contactable nurse. A 56-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 18Dec2020 at single dose for covid-19 immunisation. Medical history and concomitant medications were unknown. The reporter read about the doctor that died that developed thrombocytopenia after taking the vaccine, stated it was in the news yesterday. The patient received the Pfizer Covid vaccine on 18Dec2020, and he died 16 days later from a brain hemorrhage. Autopsy stated that said he had a hemorrhagic stroke on 03Jan2021. His platelets dropped so low that he had specialists that tried to get his platelet count back up again and they could not get his platelets back up again and he ended up having the hemorrhagic stroke. The

reporter already had thrombocytopenia and she was debating what she should do about getting vaccine. Outcome of the events was fatal. Information on the lot/batch number has been requested.; Sender's Comments: Very limited information is currently available. Lacking patient's underlying medical conditions, clinical course, relevant lab data, the Company cannot make a meaningful causality assessment. The reported hemorrhagic stroke following low platelet count are managed as related to the suspect, BNT162B2, for reporting purpose only. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.; Reported Cause(s) of Death: Hemorrhagic stroke/brain hemorrhage; platelets dropped so low/thrombocytopenia

"died; tested positive for COVID; tested positive for COVID; This is a spontaneous report from a contactable consumer from a Pfizer-sponsored program, Pfizer First Connect. A 97-year-old male patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 30Dec2020 at 97-years-old at a single dose for COVID-19 immunization; administered by the nursing home. Medical history included glaucoma from an unknown date and unknown if ongoing. Concomitant medications included: ""used a sav for skin tears"", and ""eye drops for glaucoma"" from an unknown date to an unknown date. On 07Jan2021, the patient experienced: tested positive for COVID (medically significant). The patient died (death, medically significant) on 17Jan2021. The clinical course was reported as follows: The reporter stated that in regard to the patient's height and weight: ""was probably getting down to about five foot eight. Shrinking."" The reporter stated that If she remembered correctly, they were trying to maintain the patient's weight 135 to 136 pounds. The reporter stated that her father was in a nursing home. The patient received his first dose of the COVID vaccine on 30Dec2020. The patient died on 17Jan2021. The reporter stated that she ""wanted Pfizer to know that the little old people in the nursing might not be strong enough for the vaccine."" The reporter stated that she was ""not calling to complaining."" The reporter stated that there was nothing wrong with her dad. He was elderly with no health issues. ""He was literally on no medications. The only reason he was in the nursing home was because he was afraid to walk."" The reporter stated that she received a call about giving the patient the vaccine and she said yes because she wanted him to have the vaccine. One week after the vaccine, the patient tested positive for COVID ""like all the other people"" (no further details provided). The reporter stated that her dad had no symptoms of COVID. The director of nursing said the patient was doing so well. The patient ate his lunch, he laid down for nap, and at 14:30 he was gone. The patient ""went peacefully in his sleep."" The reporter then again stated that the patient literally had nothing wrong with him. ""They were shocked. They fed him and he took a nap. He was sleeping, but it was eternally."" The reporter stated that, ""it might not have been the Pfizer vaccine, maybe his heart wore out."" In regard to an autopsy: the reporter stated that they would get it done if needed. The patient underwent lab tests and procedures which included COVID-19 virus test: positive on 07Jan2021. History of all previous immunization with the Pfizer vaccine considered as suspect: none. It was unknown if there were additional vaccines administered on the same date of the Pfizer suspect, but the reporter doubted it. There were no prior vaccinations within 4 weeks. There were no adverse events following the prior vaccinations. The clinical

outcome of the event, died, was fatal. The clinical outcome of the event, tested positive for COVID, was unknown. The patient died on 17Jan2021 due to an unknown cause of death. An autopsy was not performed. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 MRNA VACCINE, were not provided and will be requested during follow up.; Reported Cause(s) of Death: died"

At approximately 930am I arrived at Memory Care. I met with the director of the facility and she directed me to where my team would be setting up. My team consisted of (technician), (nurse) and I. As we were setting up, the director asked how she can help. I explained to her that we would need a designated area for patients to be monitored after vaccination for 15 minutes and maybe even longer . I also explained that we would need one of her staff monitoring while we vaccinate. She agreed, and proceeded to designate her staff and the cafeteria area, facing the vaccination station,the monitoring station. Throughout the day, nurse and I were both vaccinating,while the staff of the facility would monitor the vaccinated patients. I would also stop occasionally to mix the vaccine and check the temperature of the aero safe. At approximately 12:50pm, the director rushed in and stated that a patient is not responding, and that she had been vaccinated. At that point, I grabbed epipens and a thermometer and I also instructed nurse to grab an Epipen and come with me. We followed the director to pt's room. Once we got to the room, the patient was in bed and there were 4 staff members standing bedside and one of them turned and stated the patient has passed. At that point I asked the staff how long ago did the patient get the vaccine, they stated about 30 minutes ago. They also stated that the patient was a hospice patient and that the patient had declined, and was rapidly detiorating and had not eaten or drank anything all day . They also stated that the patient had been monitored for 15 minutes post vaccination. I then left the room and grabbed the patients COVID Vaccine intake consent form. I looked at the answered questionaire and all the responses were circled NO. Patient had a temp of 96.5 at the time of vaccination.The vaccine administration information for Immunizer Section was filled out by Nurse. I then proceeded to ask the director once again if there were staff that was monitoring her for 15 minutes, the director stated they had staff monitoring her. She also stated the Hospice nurse has to announce her death, so they waited for the Hospice Nurse to come. I then called Corporate and explained the situation. After speaking to corporate, I also asked nurse, if she remembered the patient. She stated that she did and at the time of the vaccination the patient was not alert, there were two staff members with the patient. She was non oriented and she kept closing her eyes. At that point, Nurse stated that she asked the two staff members with her if this is how she usually is and if its ok to vaccinate her. Both Staff members stated that it its ok,this is how she is. The Nurse then proceeded to vaccinate. At approximately 3:10pm, as I was leaving I spoke to the director, and one of her Staff members. Staff that the patient has actually not eaten/ or drank anything for the past several days, including today(01/18/21). Staff also stated that on Friday, Jan 15th,2021, they had informed the family that the patient was rapidly detiorating. Staff also stated that the family knowingly gave the consent to vaccinate her. She also stated that the hospice Nurse believes that the death was primarily caused by her detiorating state. She also stated that the hospice Nurse informed that the death was not due to the Vaccine. Per Lead Pharmacist at the clinic.

Extreme Fatigue

Patient developed 104.4 temp approximately 48 hours after being given the vaccine. I treated him with antibiotics, IV fluids, cooling methods. CXR does show a new right perihilar infiltrate. However, his fever came down within the next 24-48 hours. Unfortunately, he suffered a cardiac arrest on 1/21/21 in the early morning and expired.

Resident returned to the memory support unit at 1500. Resident was than toileted and transferred in to bed per his request. At 1515 resident was observed face down beside bed, resident sustained a 1inX1in eccyhmotic/hematoma to the forehead. Neuro Checks with in normal limes Vital signs: 100/52, 100, 97.2, 28. Resident sent to ED for further medical evaluation via EMS.

possibly got it at clinic, possibly who administered shot. Pts. daughter said the pts boyfriend denied any symptoms the whole day but that in the middle of the night the pt passed away.

This is a 94-year-old male who is brought in by ambulance after being found on the floor with unknown downtime. He was in asystole upon EMS arrival. He remains in asystole. No advanced airway is in place. The patient is getting compressions from Lucas device upon arrival. It was reported that he was last talked to by family at 2 PM. The patient got his SARS-CoV-2 vaccination this morning. The patient is evaluated emergently. CPR was ongoing with 3 rounds of epinephrine given. The patient remains in asystole. He has rigor mortis. The patient's pupils are fixed and dilated. The patient has compressions paused and ultrasound is used to evaluate for cardiac activity. None is detected. The patient has no electrical activity on monitor. The patient's time of death is 2113.

approximately 3 hours prior to expiring the patient was experiencing forceful emesis. later was found to have expired, patient was comfort care only.

1/13/2021 12:00 PM: Patient received COVID-19 Vaccine. 1/14/2021 21:00: Nurse performed routine rounds and the patient appeared okay. 1/14/2021 22:00: CNA discovered patient unresponsive in bed, began CPR, and called 911. 1/14/2021 23:08: Pronounced deceased.

Narrative:

"Narrative: Was pt previously covid positive?- Yes. Initial- 10/27/2020, 11/29/2020, 12/22/2020 Are there any predisposing factors for patient experiencing adverse drug event?- Yes, patient had multiple co-morbidities including GI bleed, hepatitis congestion due to cardiac issues, treatment for PE, NSTEMI, or antibiotics for PNA, also on concurrent medications APAP, Atorvastatin, Mirtazapine and Duloxetine. Pt with 2 doses of covid-19 vaccine, second one on 01/08/2021, 2 days pre-death Any occurrence of an ADR at time of administration? Did not specify injection site issues, per RN admin note- Vaccine ""administered without complications."" Did patient recover from event? Not s/p dose on 01/08/2021. First dose given on 12/21/2021, LFTS increased ~01/01/2021, peaked on 01/03/2021 and were

decreasing on 01/07/2021 Was there an ADR between observation period and date of death? No Did patient recover from event? No (01/08/2021 event, died 01/10/2021) Was patient hospitalized prior to vaccination? Yes, in between inpatient and nursing home Was patient hospitalized prior to death--was hospitalization attributable to ADE? Yes re-admitted to inpatient on 12/31/2020. GI bleed Is there an alternative cause of death? Yes, as noted above. Quite a complicated case with many comorbidities/concurrent medications as noted above. Primary Diagnosis: Upper GI Bleed in the death note from 01/10/2021"

tired; legs felt heavy; stopped breathing; This is a spontaneous report from a Pfizer-sponsored program a non-contactable consumer. A 93-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 04Jan2021 11:00 at single dose for covid-19 immunisation. The patient medical history and concomitant medications were not reported. Patient received vaccine around 11:00 a.m. About two hours later, he said he was tired and couldn't continue with the physical therapy he was doing. He was taken back to his room, where he said his legs felt heavy. Soon after, he stopped breathing. A nurse declared a do-not-resuscitate order. The patient died on 04Jan2021. It was not reported if an autopsy was performed. Outcome of stopped breathing was fatal. Outcome of tired and legs felt heavy was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Reported Cause(s) of Death: stopped breathing

died; This is a spontaneous report from a Pfizer-sponsored program. A contactable consumer reported that an 83-year-old female patient (reporter mother) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. Medical history included hospice care and dementia. The patient's concomitant medications were not reported. The patient died one day after getting vaccine. She was reportedly in good health the day before receiving vaccine. She was on hospice, frail, but in good condition and checked by a hospice nurse the day before which she reported her in good health considering. She was with dementia but stable in her health. The reporter read investigating 23 deaths of people receiving vaccine in similar conditions. The patient died on an unspecified date. It was not reported if an autopsy was performed.; Reported Cause(s) of Death: died

"Called to schedule second vaccine and daughter reports that he died on01/19/2021 with ""COVID"""

"Patient's wife called this morning stating that her husband has passed away last night. After receiving first dose of Pfizer COVID-19 vaccine at around 0830, patient remained in the Immunizations Department for the 15-minute monitoring period. Per wife, patient's only complaint was pain at the injection site. At 1300, wife states that patient complaint of dizziness which ""dissipated after a few minutes"" followed by a headache which ""dissipated after a few minutes"" as well. Then patient complained of nausea, no vomiting and ""couldn't relax."" Per wife, from around 1400/1500, patient stayed on his recliner while still having a conversation with her--""he didn't get up to eat."" Last conversation they had was around 2000/2100. Per wife, at around 2100/2200, patient was quiet and when she checked on him, ""he wasn't responding anymore."" Wife then called 911, ""but they couldn't revive him."""

Admitted to hospital after vaccination with Acute hypoxemic respiratory failure, Septic shock; Aneurysm of arteriovenous dialysis fistula; expired 1/16/2021

We do not believe that the patient's death was an adverse event from the vaccine. Patient received COVID vaccine from Pfizer Dose #1 12/19/2020 (lot # EK5730) and Dose #2 1/7/2021 (lot # EL1284). No side effects or adverse events noted; lived in 24/7 care facility and monitored twice daily for reaction. Patient died 1/10/2021 from chronic respiratory failure and congestive heart failure after recent aspiration pneumonia requiring hospitalization. Death was anticipated and not sudden. We were told to report his death to VAERS even though his death was anticipated and not related to his vaccination.

Patient deceased

Patient did not have any adverse reaction to the COVID vaccine, but we were asked by our health dept to submit a VAERS report since the patient died between his first and second dose. Received Pfizer Dose #1 12/17/2020. No side effects or adverse events noted; lived in 24/7 care facility and monitored twice daily for reaction. Date of death 12/23/2020 from aspiration pneumonia complicated by end-stage heart failure and ischemic cardiomyopathy. Death was anticipated and not sudden.

patient expired 1/15/2021; had been treated as outpatient for pneumonia, likely COVID-19 but no positive test result in December 2020. PMH diabetes

Admitted 1/14/21: Patient is an elderly 93-year-old female with multiple medical problems including chronic combined CHF, P 80, diabetes mellitus, HTN, hyperlipidemia, CKD stage 3, has been complaining of generalized weakness, fatigue, decreased appetite for the past few days. She had an outpatient COVID-19 vaccine earlier today. Within 2 hr of admitting the patient to the hospital, condition clinically deteriorated. Patient elected to be DNR/DNI while in the ED. Patient was pronounced dead at 10:30 p.m. earlier today. Preliminary cause of death: Hypoglycemia induced lactic acidosis.

Pt received second dose of COVID vaccine on 01/20/2021 at 1430. At 1600 Pt developed a wet productive cough with coarse crackles. Pt ate dinner at 5 pm cough persisted. At 18:30 the nurse went to Pt's room to give him his medications. Pt still had a cough, denied shortness of breath. Pt was in a good mood and joking with staff. Pt asked to be shaved. At 19:45 Pt was sitting in the lounge and a CNA noticed that Pt was pale/white in color and clammy. 02 Sat was 85%. Respirations were labored. Pt was placed on 4 L of 02. Increased to 5 L via face mask and 02 sat was 89-90%. Ambulance was called at unknown time. Pt arrived at Medical Center at 2120 and was pronounced dead at 2127.

On Saturday, 1/16/2021, Patient went to the grocery store. Upon her return, she indicated she was experiencing N/V and some throat swelling. Patient subsequently collapsed and expired before she could be brought to an emergency room. During investigation by Coroners Office, it has been reported that Patient may have gotten some takeout food while she was out. Labs are pending and the Coroners investigation is ongoing. Spouse believes that her death was caused by the vaccine.

No immediate reaction. Patient-reported deceased four days later on Jan. 19, 2021. As of this date cause of death is unknown to our clinic.

unknown. Event occurred after leaving vaccination site

presented to ED 1/9/21 with abdominal pain, progressive worsening weakness and fatigue and new onset A fib with RVR likely due to hypertensive urgency . Patient progressed clinically with severe hypoxia and transferred to ICU and started on BiPAP; progressive decline with decreased urinary output with uremia likely secondary to sepsis. Concern with patient worsening clinical decline, palliative care had been consulted on end of life care. Patient expired 1/17/21

Narrative:

Fever, Tachypnea, HYPERtension, Tachycardia & HYPERglycemia Narrative: Was inpatient overnight in a telemetry until. DC with diagnosis of DM and CHF

1/11 asymptomatic COVID Positive test Narrative:

Narrative: Symptoms: & Cardiac Arrest; Death Treatment: EPINEPHRINE

shaking, altered consciousness Narrative: One day after pt received his first covid vaccine, pt experienced upper extremity shaking leading to ED visit and subsequent hospitalization with concern for seizure. Examination and labs were not consistent with seizure. He had features of lewy body disease and parkinsonism. Labs were significant for leukocytosis, but pt had no other signs/symptoms of infection or findings to indicate a source of infection. Pt referred to Neurology.

Patient diagnosed with COVID on January 9, 2021 after being exposed to family member that was under quarantine in the same household. Admitted to the hospital and was discharged on January 14, 2021 with home hospice. Patient passed away on January 18, 2021

Patient passed away on 01/18/2021

Patient died unexpectedly 5 days after receiving vaccine (1/10/2021).

Patient deceased on 01/17/2021

Death; This is a spontaneous report from four non-contactable consumers via a Pfizer-sponsored program Corporate (Pfizer) Social Media Platforms. A 78-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration, on 28Dec2020 at a single dose for COVID-19 immunization. Ongoing medical history included Alzheimer's Disease, encephalopathy, hypertension, acute kidney failure, urinary retention and recent urinary tract infection (UTI), all from an unspecified date. Concomitant medication included acetaminophen (MANUFACTURER UNKNOWN), bisacodyl (MANUFACTURER UNKNOWN), bupropion (MANUFACTURER UNKNOWN), escitalopram (MANUFACTURER UNKNOWN), hydrocodone bitartrate, paracetamol (HYDROCODONE/ACETAMINOPHEN), loperamide (MANUFACTURER UNKNOWN), ondansetron (MANUFACTURER UNKNOWN), senna alexandrina (SENNA PLUS), vitamin d3 (MANUFACTURER UNKNOWN). The patient had no known drug allergies. The patient experienced death on 30Dec2020. The vaccine was given on 28Dec2020 with no adverse events and no issues on 29Dec2020. The patient

died on 30Dec2020, at approximately 2:00 AM. It was unknown if an autopsy was performed. It was unknown if the event was related to the suspect drug, the administrator marked as natural causes. No follow-up attempts are possible; information about batch/lot number cannot be obtained.; Reported Cause(s) of Death: Death

Pt died 4 days after vaccine, no known reaction to the vaccination

Death, which I believe is unrelated to vaccination

Narrative:

Death - Hospice patient with metastatic CA admitted to facility and received vaccine during stay. No adverse sequelae noted from vaccine administration, but reporting as required because pt died 7 days later. Narrative: Reporting this event because patient died 7 days after receiving vaccine in the facility where he was in hospice care for metastatic cancer. Vaccine was administered by protocol without complications. The patient had been asked and denied any prior severe reaction to this vaccine or its components and gave permission to receive it. No vaccine adverse sequelae were documented after the immunization as monitored for 15 minutes nor in facility notes for 7 days after the immunization. The patient's death was felt to be due to underlying terminal illness.

Pt on hospice in facility for severe cardiomyopathy unable to perform interventions received vaccine without adverse sequelae died 5 days later. Reporting as required. Narrative: Reporting as required patient death 5 days after immunization with Pfizer vaccine. However, no adverse sequelae were noted to the vaccine in the 15minute observation period, nor in the days following the immunization related to the vaccine. The patient denied any prior severe reaction to this vaccine or its components, and the patient gave verbal consent to receive the vaccine. Patient had been in the facility on hospice since 11/18/20 for severe decompensated HF and newly diagnosed cardiomyopathy, unable to perform interventions, also LE ischemic wounds with very poor potential to heal due to advanced PVD.

Narrative: Temporary restriction on driving until further evaluation due to symptoms of seizures.

loss of consciousness; respiratory distress Narrative: Patient tolerated his 1st dose of the COVID-19 vaccine well, on 12/16/2020, and received his 2nd dose on 1/6/2021. Patient had some mild clinical decline the past few days prior to 2nd vaccination, with a decreased appetite and some increased fatigue per nursing report, but no significant changes. He experienced nausea on the evening of 1/6/21, which was effectively managed, but by early morning he spiked a fever of 102.9 with a sat of 86.1%. He continued to deteriorate from that point on and died 1/7/21 @13:20. Clinically, the presentation was most consistent with an aspiration pneumonia.

Death on 1-5-21

Death 1-15-21

Note: Submitting a report to VAERS does not mean that healthcare personnel or the vaccine caused or contributed to the adverse event (possible side effect).

C/O Headache

felt warm, hot and face and ears were red and flushed.

within 15 minutes progressive light-headedness leading to near-syncope and diaphoresis. After 20 minutes symptoms subsided.

Pt felt wave come over body @ 1218 starting in head and going down. Bad taste in mouth, tingling in body , legs, back , across stomach, BP 150/100 P 120@ 1219, EMS activated. BP 120/80, P 80 Pt alert and oriented, Pt declined transport and Benadryl. Symptoms come and go, pt feels better but then bad taste in mouth starts, shaking of hands, tingling starts again in stomach and back. @ 1300 pt requests Benadryl, 25 mg administered. Pt notified family by phone of circumstances and family in transit.@1324 BP 120/80, P 84, tongue tingling and pt reports smelling chemical smell. @1345 Pt complained of mouth itching, EMS activated and will transport to Medical Center. Pt oriented and transported at @13

"rPfizer-BionNTech COVID-19 Vaccine EUA 5-7 minutes after the vaccine Associate stated she did not feel right, mentioned chest pain. ""My chest feels funny. It feels like when you have really bad heartburn coming on"". ""I feel flushed like when you get contrast for a CT"". Pulse 90 BP 160/90 checked later 130/90"

Headache, body ache

Within a few minutes of receiving the COVID 19 vaccination, patient developed lightheadedness, shortness of breath, headache, and some nausea. She did get some redness to her neck and upper chest. No recent illness. Had elevated BPs ranged from 158/103 to 207/126 . HR ranged from 82-106. O2 sats always > 96%. Temp 37.1 C. Received Tylenol 1000 mg PO, Dexamethasone 10 mg IV, diphenhydramine 50 mg IV, famotidine 20 mg IV, ketorolac 30 mg IV, ondansetron 4 mg IV, and 1 L NS. Patient prescribed EpiPen and prednisone and discharged.

About 25 minutes after receiving vaccine complained of dizziness and being hot and nauseated. No difficulty breathing. No chest pain. B/P was 130/90 and was monitored. It went down to 124/80 after he started feeling better. He was wearing sweater over shirt and it was warm in building. Took sweater off. Cool wet cloth applied to back of neck. States he had only had a donut and cup of hot chocolate before receiving vaccine. Sprite and peanut butter crackers given. Became nauseated after eating peanut butter crackers Blood pressure monitored monitored. He laid on exam table for about 15 minutes. He felt

better. Stood up and walked to conference room for another 15 minutes. Stated he felt much better and was ready to leave. Coworker drove him back. Received email from him letting us know he had made it back and they had stopped and eaten pizza on the way. Received text from coworker that he was dizzy and seeing spots and that his blood pressure had been 120/80 and then spiked to 160/100. Coworkers taking him to ER at Hospital for evaluation.

At 12:55 pm 10 minutes following vaccine being given states feeling lightheaded and flush. Was sitting in the chair. Encouraged him to lay down on the floor which he did on his own. Feet elevated. BP 174/70 pulse 82. Denies any other complaints. Laid on floor for 15 minutes then sat in chair. Denies complaints. 1:15 pm was allowed to leave. BP 120/80 and states feeling fine.

Patient felt facial flushing, pounding in chest, burning and hot ears and blood pressure went up. Tingly in right arm and chest and hands. Symptoms resolved, after a few minutes but then returned. Patient sat with nurse during this reaction.

She claims she experienced tightness in the right side of throat and her tongue started tingling. Took her the Emergency Department, She decided to go and buy Benadryl

System was not populating immunization record, member denied having immunizations within last 14 days. Vaccine given, record populated and patient had anthrax on 12/10/20

Tingling of upper lip and cheeks, warmth in face, and itchy eyes Treatment: diphenhydramine 50 mg PO x1 Outcome: symptom onset within 15 minutes of vaccine administration. Symptoms resolved within 20-30 minutes of diphenhydramine administration.

I am a immunization nurse at this location. I gave 2 of the first 4 Covid vaccinations given at our location. Then I received dose # 5. It was easy. I did a couple of things and then returned to my desk. As I sat down, my arm started feeling very heavy. I was unable to send a text. I told staff that I was feeling funny and that I was going to the other room to lay down. Staff followed me and took my Pulse 100 and BP 164/ 82 (high for me!) . I felt shaky, but my hands were not shaking. Put a wet cloth on my head and laid there a few minutes, telling staff stories and laughing at my BP. When I sat up, my BP was 126/74 and pulse was 80. I stood up for a minute or two, then my legs got heavy and I sat down for a few more minutes. I went to the bathroom and came back to my desk, but was weak and tired. I ate and drank some fluids. Because it was snowing and I live 25 miles away, I accepted a ride home from a co-worker. I walked across the parking lot without problems and talked all the way home. At home, I was tired, but had a sandwich and talked on the phone. I would still describe myself as tired, but functioning.

1750- IM injection ot R Deltoid. She was sitting, and felt short of breath without wheeze or tightness in the chest or throat. She stood up, and then felt tunneling. Assisted to chair and floor. Pulse weak, skin flushed, sweating on torso. Face and Neck remained flushed and red. She refused epi at first. So we gave her benedryll 25 mg po with apple juice. She said she just had a big meal 30 min prior, but we checked her blood sugar- it was 85. 10 min after the first SOB feeling, it returned. BP was recorded as 160/100.

Pfizer-BioNTech COVID-19 Vaccine EUA Developed chills, nausea and vomiting beginning at 2 AM the night after receiving the vaccine. Potential fever as well (I don't have a thermometer to check). Symptoms have lasted over 3 hours thus far, still continuing.

Pain in deltoid muscle upon pressure at night. Hard to lay on the side of the vaccine due to pain in the arm

I received the vaccine @ 3:40 pm 12-15-20 and felt fine until around 9:00 pm 12-15-20 when I noted headache, nausea, no energy, overall not feeling well, and injection site pain. I did not have a fever. Symptoms still present @ 6:00 am 12-16-20.

Right sided facial/lip swelling. Started about 0200 on 12/16/20. Patient sometimes gets angioedema, so unsure if this is related but wanted to report

Patient received shot around 1pm later that night he started to experience chills, hot/cold, nausea, headache, extreme fatigue, low grade temp (99.1) Associate vomited several times the early the next morning. By the next day, day patient was vomiting less and was able to keep food down. Patient is feeling better the second day, experiencing some nausea.

diffuse rash at anterior and right lateral neck associated with feeling of warmth

Patient received shot and sat for 15 minutes, left and came back and reported she felt woozy. She felt dizzy. Patient stated she felt dizzy off and on while she was in clinic getting shot, patient left.

chills - 0730 body ache, headache - 1000 headache significantly worse - 1110

sore throat, headache, lightheadedness

"Pt. became lightheaded, and clammy. noted heart rate to be 51, oxygen saturation 100%. after sitting for a few minutes, she felt better, but then became dizzy and had some chest tightness and bilateral hand tingling. Pt. noted to have respiratory rate 22-26 with deep breath, but other vital signs were stable. (Blood pressures 108-138/70's to 80's) Heart rate remained stable in the 70-90's range, lungs remained clear to auscultation through out. No rash or swelling noted anywhere. No itching, no throat tightness. Pt. repeatedly stated ""I think I am having a panic attack"". Due to the continued complaint of chest tightness, pt. sent to the emergency department for evaluation."

redness around the injection spot, fever chills, Stomach Ache, Body Ache, Short of breath (walking up stairs), Headaches no appetite, Dry heating .

After patient received vaccine had localized reaction in left deltoid. Redness and firm to touch. Patient observed for additional time frame and redness lessened. Patient released home.

About 12 hours after the injection woke up and body was hurting all over, chills, body aches, felt feverish, temperature was 100.3F and really tired and hurting all over. Took Tylenol and returned to sleep. Woke up some hours later and took an Ibuprofen. rested for the rest of the day and now the only

side effects is a little soreness on her injection mark. No other symptoms. Only the first 24 hours after the shot.

Immediately after the vaccine, I got severely nauseaed, got a yucky metal taste in my mouth and got super lightheaded and hadnt even gotten up. The agent helped walk me to a chair and I felt really loopy in the head. After the 15 minutes, I got up and immediately felt the whole room was spinning causing me to have to sit back down another 15 minutes. Closing my eyes made the dizziness much worse. I was given juice, my sugar was checked at was 115. After about 30 minutes I stood and felt alot better. I went back to my assigned duties but was feeling super bad and my supervisor sent me home because they states I didnt look good. On the drive home I threw up and my PCP called in Zopran to help with the nausea.

"After patient received vaccine had complaints of being ""lightheaded and slightly dizzy"". Monitored vital signs and patient symptoms. Resolved after 20 minutes and patient was released to go home."

Left arm swelling of forearm, old L wrist tattoo because raised and lifted out of skin approx 3 mm, whole arm was itching with several red dots; reaction resolved within 8 hours without intervention body wide itching persisting now

Patient had sudden onset of nausea . Patient was laid flat on the floor and given and alcohol. Symptoms resolved and patient was released home.

Patient has a prior anaphylaxis reaction to Doxycycline. 10minutes after immunization, she developed sweaty palms and lightheadedness. No throat swelling or difficulty breathing. Placed supine, BP 160/100, HR 60-70, O2 97% RA. After a period of monitoring the symptoms improved. No intervention given.

Pain; This is a spontaneous report from a non-contactable physician. A 39-year-old male patient received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine), via an unspecified route of administration on 14Dec2020 at 12:00 (at the age of 39-years-old) as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. On an unknown date in Dec2020, the patient experienced pain. The clinical outcome of the pain was unknown. No follow-up attempts are possible; information about lot number cannot be obtained.

Bp of 85/44, nauseous, body aches, chills

I worked overnight after getting the vaccine. I felt really tired and came home and slept until 3 pm. When I woke up I had a dull headache and felt crummy. Decided to sleep the remainder of the day but no fever just was fatigued and had a headache. My arm was hurting at the injection site but the pain has sense left and the headache is gone also.

NORMAL ARM PAIN HOWEVER THE FOLLOWING WAS FELT REAL TIRED BARELY ABLE TO STAY AWAKE

I experienced a sore arm and could not lift my arm.

Swelling on arm. Placement lower than deltoid, 4 cm. treated with corticosteroids, antihistamines

Pt started to have a metallic taste in her mouth immediately after administration of the Covid-19 vaccine. She started to feel nauseous and myalgias. The patient was seated, given Zofran 4mg once and Benadryl 25 mg once. After 10 min patient was eating juice + crackers. Reports she feels better. A co-worker verbalized he would drive her home, patient agreed.

12/15/2020 5:00 PM Nauseas(worst) 5:30 Pm Headache 6:00 Pm Stomach Pain

PAIN AND EDEMA AT SITE OF INJECTION LEFT ARM WITH DECREASED RANGE OF MOTION LEFT ARM RIB CAGE PAIN ON INSPIRATION MUSCLE PAIN RIGHT AND LEFT THIGHS, WORSENING UPON AMBULATION MUSCLE PAIN AND TINGLING RIGHT UPPER EXTREMITY AND BACK

Following first dose, patient became hypotensive, pale, and diaphoretic. Denies syncope. Patient went to nearby emergency department at Hospital. Was monitored for several hours and was discharged in stable condition.

Chills, Body Ache, Fever

The employee experienced headaches the evening after receiving the vaccine. The next morning he experienced improvements in the headaches but developed chills, fatigue, and fever, all of which have improved somewhat by the afternoon when he reported these adverse effects to our employee health service. As he is recently recovered from COVID, a repeat COVID test may not be helpful. He was advised to call our employee health service and followup with his own doctor if these symptoms do not improve or resolve after 3 days.

Headache, onset ~45 minutes after injection

I got it about 10 am I went home I attempted to work from home for about an hour and had a headache, took a 3 hour nap and felt much better after waking up, I felt like I couldn't concentrate. I felt fine this morning 12/16/2020 and I went to work just fine. I don't have a headache and don't feel like I need a nap, my arm still hurts but that is usual. I called my provider and asked if I could take Tylenol, but they were unsure so I did not take medication

"@ ~5 min felt cotton mouth. Got up to ask if he could go early. Then at 10 min post injection, felt eyes feeling weird and he felt ""high"". As in lightheaded. @ 10 min, skin surrounding the eyes are puffy. Given 25 mf benedryl. No immediate SOB or wheeze. No lip or mouth or throat swelling. Taken to ED. Given IM epi 1:1000 0.3ml. Pepcid and more benedryll PO."

Fever , chills, Body Ache all over body, Joint Pain (worse in hips) Injection site swollen The PT cannot life her arm

Burning and itching at injection site

Soreness and swelling at injection site

.5 inch bruise at injection site, slight swelling, sore muscle, ibuprofen, ice bag,

Vaccinator Nurse noted upon vaccination there was bleeding from site and immediate bruising. Extended post vaccination monitoring to 30 minutes and asked patient to not leave before being reevaluated. Visual monitoring in post vaccination space by this RN. á Upon reassessment @ 1352 pt stated she felt the need to use her inhaler and chest tightness. Pt denies SOB and able to transfer independently to wheelchair. Pt began to cough and was immediately transferred to ED per FNP. á á Upon ED arrival, pt was transferred to back hall 9, report given to RN and assessed by physician. Vital signs 98% on RA, t- 98.2, HR 78.

Nausea, tremors, and decrease in HR. Patient taken to ED. No epinephrine injection administered.

Patient started to develop maculopapular rash and itching starting ~15 minutes after the vaccine administration. The patient did not report shortness of breath or other respiratory symptoms. The patient was given IV diphenhydramine 50 mg, famotidine 20 mg IV, and methylprednisolone 125 mg IV. The patient's symptoms resolved and was sent home with a Medrol dose pack and antihistamine.

redness, itching to face, armpit, and neck

Swelling and numbness at injection side. Increased blood pressure 199/99. Immediate headache. Workplace clinic called hospital ER, clinic administered Benadryl. Symptoms resolved.

The patient got a rash on the upper chest and neck approximately 3 hours after vaccination. The rash was self limiting and no treatment currently needed.

Pt presents to the ED for c/o L anterior chest wall pain after receiving covid19 vaccination today around 1030. Pt reports she received the first dose in the L bicep. Pt reports after she received that shot she started having L anterior chest wall pain. Pt states she doesn't have any chest tightness but does have stabbing pain to the L anterior chest wall. Pt denies any difficulty breathing or hives or any allergic reaction. Pt was hooked up to cardiac/sp02 and BP monitoring equipment. Medication: Ibuprofen Route: PO Dose:800 mg Patient tolerated medication well; no adverse reaction noted. Medication: Tylenol Route: PO Dose:975 mg Patient tolerated medication well; no adverse reaction noted.

Received Pfizer Covid Vaccine - Had fever of 102 and flu like symptoms. Took Tylenol and temp resolved to 99.

11 minutes after first dose of Covid Pfizer vaccine, patient became unresponsive, pale, diaphoretic with possible seizure activity. Patient dropped all belongings, leaned to the left side, with eyes rolling back in her head. Episode lasted about a minute. Patient could not remember what had happened. Vitals were BP 110/60, HR 64, RR 22. Patient was advised to go to ED for further evaluation but she refused. Patient was given a snack and an RN stayed with her for about 20 more minutes to monitor.

":1039: Responded to notification of potential adverse reaction after receiving COVID-19 vaccination. Pt had been escorted from observation area to emergency area with PA with c/o tightness in throat. On my arrival, pt was eupneic, p/w/d, ambulatory, NAD. á Vitals @ 1039: P72, 100% pulse ox on RA Vitals @

1056: P72, 98% pulse ox on RA, 112/78 seated. á Administered 25mg diphenhydramine po per PA @ 1050, pt swallowed with water. á Called 911 for EMS response @ 1103 per instruction from provider. á Vitals @ 1103: 98% pulse ox on RA, P74, denies shortness of breath or pain. á Off phone with EMS @ 1108, en route. á EMS on site @ 1115, report given to medic. á Pt left with EMS en route to ED @ 1116. á Report called to ED Charge Nurse @ 1121. Patient presented to vaccination clinic. Patient received her vaccination at approximately 1021. Patient reports symptoms onset at approximately 1038 with tightness of the throat and difficulty swolowing. She described it as a swelling of the throat sensation. She states she had a sensation moving from her head to her toes as in a ""wave "". Patient denied shortness of breath, chest pain denies nausea. Patient denies hives or rashes or pruitis. á á Patient was assessed and moved to the emergency area. á Her symptoms continued with some improvement. At this point time 25 mg of Benadryl was administered orally. Approximately 10 to 15 minutes after administration the patient developed numbness tingling around the upper lip, the right upper extremity. She denied shortness of breath or chest pain. She denied increasing severity of the throat sensations. á Pertinent past medical history: Reactions bee stings currently carries EpiPen. á She is not had any previous reactions to vaccinations. á á áAllergic reaction. á The patient symptoms seem to continue with the numbness tingling around the lips after administration of the Benadryl. Hand tingling of the right upper extremity also continued although it was decreasing. á Her symptoms of the tightness of the throat remain the same. She did not develop shortness or breath or chest tightness or pain. á At this time I feel be prudent to evacuate the patient to higher level care. á Patient was evacuated at 11:16 by ambulance service. á á á"

1-2 minutes later patient felt nausea, palpitations, and lightheaded

My symptoms started about 15 minutes after shot. Initially I felt slight dizziness begin in my head. Then I felt slight uncomfortable feeling in my lungs, throat, and tongue. They were very slight so I left the vaccine center about 25 minutes after injection. On drive home my lips started to feel numb as well as my tongue & throat. Arriving home very tired. BP 135/ 80 P70 R20 T97.6 Blood sugar 101. Slept for about 4 hours. Called in sick for 7PM shift. Too weak & tired.

""""Pfizer-BioNTech COVID-19 Vaccine EUA"": Acute onset of tongue swelling, throat tightness, and diffuse erythema approximately 5 minutes after receiving COVID-19 vaccine. Patient transferred to emergency department. Patient treated with Epinephrine 0.3 mg IM X1 dose, Dexamethasone 10 mg IV x1 dose, Diphenhydramine 25 mg IV x1 dose. Patient discharged same day with resolution of symptoms."

"When injecting the vaccine fluid, the vaccine administrator noted about 4 drops of liquid that leaked from the area of the syringe tip / needle hub connection. This particular dose was administered by a pharmacist who has experience administering vaccines. In speaking with a few other nurses who administered COVID-19 Pfizer vaccinations at the same clinic (this was the first clinic day), the consensus was that they all did not like the syringes/needles provided by Pfizer. It was a shared opinion that they felt ""cheap"" and ""flimsy"". Going forward, our site is not going to use the Pfizer supplied syringes/needles but will be using our own syringes and needles for vaccine administration."

I inserted my NuvaRing birth control on 12/14/2020. I have the Covid19 vaccine on 12/15/2020 at about 8:30am. The injection site was mildly sore and that continued into the next day. I woke up on 12/16/2020 feeling a little off and it progressed throughout the day. I felt a headache that I knew was turning into a migraine, threw up a few times (this is normal for me when I get migraines), and started having hot flashes. My temperature never went above 98. After sleeping a few hours and taking some Excedrin migraine I was feeling much better, though still a little sickly, by 4pm. I really think this is due to my migraines (which I get roughly once a month) even though it was a day later than normal.

Patient marked that he had received the flu vaccine 7 days ago. This was missed on screening procedure and patient received the vaccine today. Contacted the CDC and instructed to enter a VAERS report.

Patient was feeling nauseated in the morning prior to coming to work and prior to receiving vaccine. He had a banana thinking he would feel better. He then received the vaccine and felt progressively worse experiencing diarrhea, weakness, and malaise.

Patient complained of feeling dizzy, anxious, shortness of breath. Did have some pain with injection. Did have mask on while waiting standard 15 minutes.

Associate received vaccine at 12:15 pm and was monitored for 15 minutes. After 15 minutes, associate went to check out table. While at check out table, associate fell to ground and was experiencing seizure like activity. Supportive treatment was administerd and associate was transferred to ED.

Dizziness that lasted for about an hour. Weakness, extreme fatigue lasted the rest of the day.

Feeling flush and wheezing when walking.

Patient was in observation area after admistration of covid vaccine. At 15 Minute mark patient stated throat felt tight and like it was closing up. Assesment of patient showed tongue PWD, vital signs as follows. 97.6, 118/72, 66 pulse and 100% pulse oxygenation. Observed patient for 15 minutes more, gave patient water and monitored for full 30 minutes. Breathing normal at this time. States feeling better. Discharged and advised to monitor throughout night and if worse go to emergency room. Patient agreed and stated understanding.

Fatigue, nausea, muscle aches

Redness at injection site

Headache, body aches, low grade fever (99.3 F)

Severe muscle aches Diarrhea Headaches Feverish Nauseous Left arm super sore Sore throat

I developed a new rash on my torso and have had three bouts of diarrhea.

Redness to injection site

myalgia, joint pain, local site pain

Within and hour and a half of receiving developed tinnitus in both ears lasting 6 hours. The night after receiving vaccine also developed orthostatic hypotension and started to pass out but caught myself with an assisted fall. Fever(102 F with temporal and oral thermometer) body aches/sweats/general malaise lasting close to 24 hours after receiving vaccine. Fever/aches treated with acetaminophen.

Immediately after injection of vaccination her left deltoid started swelling. Complains of pain at injection site. No other complaints. Applied ice. She took Tylenol and Benedryl. Stayed 30 minutes after vaccination without further complaint.

Patient received covid-19 vaccine. 20+ minutes later patient states she began feeling flushed and nauseous. Patient states she look at her injection site, and it was hot and red. Local reaction approx. 2 inches x 2 inches. Dr. ordered 25 mg oral Benadryl. Vitals stable at 1840 133/88, 66 for pulse and regular, SPO2 99% on room air, respirations 20. Patient continued having complaints of light headedness and nausea. 1850 119/79, 74, 99% RA. Dr. states patient may depart from clinic if able to sit up and walk out, patient given instructions go to ED in symptoms progress. 1857 120/82, 70, 99.4. Patient's face becomes flushed and hot on left side, patient states she is shaky, and does not feel well at all. 1905 patient transferred to ED on 2L O2 for further evaluation and workup. Narrative ER Medical decision making narrative: Accu-Chek was obtained noting a glucose to be at 80. She received IV fluids as well as Solu-Medrol Benadryl and IV Pepcid. She also received IV Tylenol as she developed a headache while in the emergency department. Headache resolved and she was able to ambulate without assistance. Requested to go home states she felt much improved near normal. Clinical Impression: Adverse reaction to drug Patient Education: Anaphylaxis (ED)

Patient feeling very anxious before and after vaccination. Described having difficulty swallowing water shortly (~15 min) post vaccination. Patient was tearful but breathing normally. Walked under her own power from the pharmacy down to the Emergency Room for anxiety over anaphylaxis. Given dose of Vistaril in ER.

Local pain and swelling of the injection site

Local Pain and swelling of the injection site

Started with onset of fatigue and disorientation shortly after receiving the vaccine. Several hours after the disorientation got worse, a headache came on and my whole body aches fatigue is bad. I feel like the flu just hit me.

"Allergic reaction with facial swelling, eye tearing, ""itchy"" throat"

Systemic rash, dry cough (causing cough); 650mg Tylenol every 6; 50mg Benadryl to start then 25 mg every 6, Pepcid 20mg every 12 hours; rash is slowly resolving; throat still very dry with dry cough

Nausea started about 8 hours after getting vaccine and progressively got worse over 12 hours

Day 0 of injection that evening , experienced fevers, chills, rigors, malaise. Day 1 morning experienced nausea

60 minutes after receiving the vaccine the patient became very dizzy and was unable to walk. After a couple of hours dizziness lessened and patient was able to ambulate.

"Patient presented with feeling of ""headrush"" dizziness, tachycardia to 130's, itching to neck, visible hives to face and neck."

Hives within 3 hours lasted 12 hours. Left Arm edema and erythema 24 hours

Extreme fatigue, felt very warm all over body for 14 - 16 hours, exceptional pruritus on head and back, all joints are exceptionally achey

Patient left the vaccine clinic after waiting 15 minutes. While driving home, she began to feel clammy with a tightness in her chest and throat. She reports that it felt harder for her to breathe. She describes the onset as 20-30 minutes after vaccine was administered. She returned to the vaccine clinic where she was given diphenhydramine 25 mg PO, and her blood pressure was ~130/100 mmHg. She reports that she is usually normotensive. Patient was observed for 30-45 minutes, and she reports feeling better.

NAUSEA, CHILLS, MUSCLE PAIN, WEAKNESS

02:45 PM walking , dizzy, rapid heart rate, mild chest pain. Directed to ER in hospital, CT Chest -- normal, EKG -- normal, Lab test-- normal. Xray Chest results -- basilar atelectasis, Hyperinflation of lungs. Blood pressure 171/109. No treatment given in ER -- f/u with PCP 12/18/20. 08:00PM nausea, headache, vomit 1x. 10:00PM fever 104.00; Tylenol extra strength dose. 12/17/20 6:00am temp 99.00, Tylenol dose extra strength; body aches, fatigue, mild headache.

caller reported Flushing, redness around face and nauseous. Advised that Number for IMT (Incident management Team)will be activated. Caller declined. Advised to return to observation room where shot was given. Caller stated she would. Called her 5 minutes and left a message to call back if symptoms also persist or worsens

Injection site swelling and pain

Stomach crump & vomiting

DIZZY, SLIGHTLY EVEVATED BLOOD PRESSURE

left arm soreness/pain tender to touch/palpation

"After receiving the injection the patient stated ""my throat feels funny, similar to how it has felt in the past when I have had a reaction."" Pt. transferred from the vaccine clinic location to ED."

Patient reports of itching immediately after vaccine, dizzy, feeling of flush. Medical directive given for itching that include OTC antihistamine (Claritin). Incident Management team activated for dizziness and feeling of flush.

Pfizer-BioNTech COVID-19 Vaccine EUA Fever, chills, severe body aches. Fever resolved with ibuprofen

0749 - tingling in body, scratchy throat for 10 minutes, flushing

Patient was given to co vid injection- developed numbness and tingling inside bicep- speech- slurred speech- tongue speech- tongue not swollen- feels like novican. Takes lisinopril, novolog jardiance, lansoprazole, and mirena.

0752- numbness and redness left arm (inj site)

throat dryness and scratchiness, numbness. hoarse coughing

Headache, Left arm and shoulder pain

Headache, fatigue, muscle aches, nausea, sweating

shortly after patient received vaccine became flushed, bottom lip went numb, vitals were in normal limits. 911 was called emergency staff came and patient went to ER to be monitored.

immediate burning upon injection, VS stable

Swelling of hands follwed by angioedema

Papular, pustular rash on back occurring approximately 6-10 hours after injection of vaccine.

"While waiting the 15 minute after vaccination the Patient noticed a ""tingling"" feeling in throat about 5 minutes after vaccine was given. Time: 0930 - Oxygen Saturation was 98% Pulse Rate 100. Patient stated that the feeling went away and then came back. Time: 0938 - Again vital signs were taken BP 156/88 Oxygen Saturation 100% Pulse Rate 83. Time: 0942 - 50 mg of Benadryl PO were given with water at this time. Patient was taken to ER for evaluation."

Dizziness, headache, chills

Pfizer-BioNTech COVID-19 Vaccine EUA. Injection site pain, headache, tiredness, muscle pain, chills and fever. Took acetaminophen, no longer have fever after 12 hrs.

Patient stated she started to feel a burning sensation in her chest about 7 minutes after receiving injection. Lasted about 5 minutes, then left.

Medication error - reached the patient no harm, additional monitoring to preclude harm. A nurse (RN) diluted new vial of vaccine at 10:41 am. In the midst of adding diluent to vaccine vial, a patient arrived at our vaccine station. After drawing up and administering the 0.3 ml vaccine the RN looked at the vial again and noted that it was almost empty. She became concerned because she had just mixed a new vial and the amount of fluid remaining was not at the expected level. We immediately stopped and reported this to an employee who contacted pharmacy. We notified the patient that there was a discrepancy and had him wait for > 30 minutes to watch for any reaction. (APRN) called him at 1:30p to check on him and apprise him of the possibility of receiving higher than recommended concentration of vaccine. He stated he felt fine and felt no unusual symptoms.

I was tired and took a two hour nap

Headache, fatigue, temperature of 100.3. Lasted about 8 hours.

fever, cough,chills,body aches, weakness, loss of smell

rash - treatment: acetaminophen and diphenhydramine

fatigue, soreness, headache occurred the night after receiving vaccine (approx. 8 hours later) lasting into the following day. I did not take any medications for this .

pt developed chills, nausea and vomiting. Reports > 10 episodes of vomiting total. Went to lunch and continued to have chills and vomiting. Also developed chest pain - described as burning and heaviness. Denies any shortness of breath. CT negative for any changes. Chest X ray normal.

SWEATY, NAUSEA, DIZZY, EYES GLAZED OVER, NOT TRACKING RIGHT, STARTED MORNING AFTER SHOT

Morning after injection: mild fatigue, arm soreness; later in the morning-headache then chills, muscle aches, joint pain and low grade fever (99) and nausea/loss of appetite. These persisted for approximately 12 hours then cleared completely.

12/15/2020 615 received vaccine 2pm belly pains, relief 'not like normal bowel movement', 'urge to go' 5 belly pain, relief self'not like normal bowel movement', 'urge to go' 8-10 pm body chills, covered with 3+ blankets 10 pm body chills subsided 12/16/2020 fatigue; not exercise; 5miles per day (only able to walk 2 miles) Flu vaccine; 'pretty sure it was 09/2020'; Unknown brand

Patient received the vaccine. During the 15 minute observation period she developed chest heaviness, arm tingling, and throat tingling. BP elevated at 169/79. The patient was sent to the ED and evaluated. Diagnosed with more anxiety type symptoms. Discharge from ED stable.

17 minutes after vaccine, suddenly had a , crushing squeezing chest pain, very severe lasted 45 seconds. after 45 seconds continue to have moderate chest pain, light headiness, diaphoretic, very hot. NO fever, elevated BP. Mild to moderate chest and light headiness for about 3-4 hours and it self solved.

She had received a shingles vaccine on 12/10/2020.

I had a headache, body aches and fatigue.

Patient complained of vision disturbance confusion dizziness, chills, clammy, no trouble breathing. Nausea, Patient stated she did not have any breakfast. gave patient diphenhydramine 25 mg and EMS arrived to take her to the hospital.

After receiving vaccine patient started complain of vision disturbance, confusion, nurses started he was slow to respond. Nurses also documented that he was acting the same way the day before due to UTI. No SOB . no signs of allergic reaction

started feeling nauseated, had her sit until feelings resolved.

Patient reported to CNA that they felt like they soiled their pants. CNA confirmed that patient did not soil themself and transferred patient to the restroom. While the patient was on the toilet attempting to have a bowel movement the CNA reported patient had 10 seconds of tonic clonic behavior and then went unresponsive and then back to tonic clonic behavior. This happened 3 times prior to getting patient put back into his bed. Patient went unconscious after last episode while on bed for a more extended period of time while a STAT page was called. Physical Therapist and Aid sternal rubbed him and he had gasp and woke up. Prior to and immediately following the episode his vitals were within normal limits. Neuro exam was unremarkable after patient came to. When he woke up he knew his name, date, and day of the week. He was only confused to where he was. Patient was agreeable to be transported out. EMS was called and transported the patient to Hospital. Patient displayed no seizure activity or neurological deficits in ER. Patient had a CT scan, which came back normal. Virals remained within normal limits and laboratory values were noncontributory. He was diagnosed with a UTI due to the presence of hematuria associated with a syncopal episode. Patient had a Foley catheter upon admission to the nursing home. Patient was administered Ceftriaxone at the hospital and discharged back to Nursing Home on Omnicef the same day. Patient is back at nursing home facility and has not displayed any additional signs of seizure. He is stable and Foley catheter has been removed. Facility spoke to wife who reported that patient did not have a seizure history.

Fatigue, migraine, muscle fatigue on site, diarrhea.

Approximately 11 minutes after receiving the vaccine, the patient complained of shortness of breath, tingling in arms and hands, numbness and tingling in legs and feet, and was observably shaking, with no complaints of swelling in throat or other signs of anaphylaxis. Patient was brought to ER in same facility via stretcher and was examined by staff there. ER report states the patient presented with shortness of breath and what appeared to be a panic attack, with fast breathing, slight flushing, and shaking. Per ER report, the patient was treated for an acute anaphylactic reaction, with clear lungs and given an EpiPen shot in the right thigh. IV was initiated and given a fluid bolus, solu medrol, famotidine, and lorazepam. Labs and a chest x-ray done and reviewed. After treatment, patient found to be stable and was discharged home at 4:42 pm with orders for famotidine, albuterol inhaler, and epinephrine pen.

The nurse was tapping the syringe to get all the air out and the needle popped out of the vaccine vial and stuck to the sticker that was on the vial. 0.3ml of the vaccine was discarded with the syringe into the sharps box.

I woke up at 6:15am had a terrible headache, low fever 100.1. I took Tylenol for the headache and fever. Throughout the day exp muscle aches and joint pain. I also exp hot/cold flashes and fatigue. Around 6:00pm on 12/16 started to l feel better and was able to return to work on 12/17.

I took tylenol for fever and headache and rested, left side lymph nodes were swollen on 12/16/20 which was the worst day, and has gotten better today 12/17/2020. Did not go to the doctor.

Caller stated at 11:30 a.m caller had right arm pain at injection site and headache. 12/17/20 headache and arm paid has subsided.

Fever (37.8 ¦C) and muscle pain.

Headache, right retroocular pain, exacerbation of rosacea Tx. acetaminophen Duration: 3 hours

12/15/2020 Around 7:30pm, I started to itch on neck and face. Progressed to scalp, stomach, back and whole body; ears, top of head to bottom of toes. Called critical care healthcare staff; 1 25mg benadryl Had nausea, fatigue, hip and joint pain 12/16/2020 Still itchy not as severe as 12/15/2020. Still joint pain and achiness. Nausea was a 8/10. 12/17/2020 feel better. About 80% . Mild itchiness. 'letting it run its course' and haven't taken any other benadryl since 12/15/2020. Joint and nausea has subsided. Flu shot 09/2020 Second dose of Pfizer shot is scheduled for 01/05/2021

~30 minutes after vaccination, patient reported lightheadedness, difficulty swallowing, SOB, feeling flushed, pallor, bilateral arm tingling, brief chest pain and tremors. Symptoms lasted approximately 30 minutes and then resolved. Benadryl given after resolution of acute symptoms. Reported a metallic taste in her mouth immediately after receiving the COVID vaccine (dose #1). Had uneventful 15 minute recovery period immediately after vaccination.

2 hours later pain in arm approximately 4-5 inches. Was not able to utilize left arm on yesterday. last night experienced muscle aches and chills. Taken Tylenol and rested. This morning experienced a really bad headache.

"Individual received vaccine on 12/17/20 at 0815. Began with feeling faint and ""spinning"" at approx. 11:00 am, reported resolution of symptoms at approx. 11:11 am on 12/17/20."

"Stayed for 15 minutes after the vaccine given and no reaction was noted and she left. States she got into her car about 20 minutes after the vaccine and started to ""itch"" all over and noted ""red bumps"" on the back of her neck. She had a flushed face by the time she arrived home but remained afebrile. Her itchiness is better but only concentrated on the back of her neck on 12/17/20 when she reported the reaction to Employee Health Services. She denied any further issues today."

I have a sore arm and I am experiencing severe back pain, nausea and a headache that comes and goes.

arm felt hot to the touch, felt arm heavy very difficult to move the arm, felt feverish, took temperature but no fever, but hot to the touch, lots of chills, nausea, body aches. Took some tylenol and at night it started getting a little better. This morning the injection site is red and is sore but I can move my arm again.

chills, headache, weakness, fatigue

stated her lips started to feel numb, like she was at the dentist. lips did not appear cyanotic.

about 1 1/2 hour after receiving it I felt a pain and numbness down left arm into pinky and ring finger. That only last about 2 minutes. Then the pain radiated to left side of neck and head and headache is still there at 1pm.

Caller had vaccine and at 12:30 at night caller had extreme paid in left arm and had to take Tylenol. Next day caller stated pain had subsided.

Employee states that there was confusion at the time of vaccine injection, and that she was possibly given a second injection right after the first. approximately 45 minutes later she experienced headache and dizziness and had an observed syncopal episode. She was taken to the ER, evaluated for MI. Was found to be stable and was discharged.

I WOKE UP WITH DIARRHEA AND A CONSTANT HEADACHE THAT HASNT LEFT

Headache at base of skull near spinal cord 3 hours after dose given

12/15/2020 I felt terrible with muscle aches, shivering, chills, fever was 102.8,I took tylenol and ibuprofen (alternated) 24 hours after initial fever I ceased meds and fever was still 101.5, this morning I was 98.6. The course of the fever was 36 hours total

Around 630pm I began to have a really bad had a bad headache, feverish and body aching. Tenderness in the injection site area which eventually turned into full body aches and was tired. No vomiting or nausea. No redness at the site or injection site issues

Muscle ache, fatigue, drowsiness, brief confusion, bilateral headache, onset 11 AM, duration 2-3 hours

Persistant cough, dyspnea, sweats, myalgias, mental staus changes and diarrhea, still resoving

"1145: Patient complained of minor left eye swelling. Vital signs 99%, 83, 141/80. 1155: Vitals rechecked 1155 100%, 79, 112/80. Patient has new complaints of itchy ears, facial ""heat"", and slight tingling in fingers. 1200: 25 mg of oral Benadryl given. 1211: per RN, patient states symptoms are resolving. 1230: Patient still feels slight eye discomfort, all other symptoms have resolved. Patient states she feels comfortable leaving vaccination clinic, her son will be taking her home."

Headache , dizziness, neck pain, left flank pain, fever 100.2 , chills,fatigue and muscle aches.

I noticed the injection site was sore, swollen and warm. As the day progressed headache, fatigue, joint, legs aching and feeling heavy tires. Also had a fever of 101.2.Around 9:30 pm on 12/16 started to feel better fever was down.

12/15/2020My arm was really sore at first, and then my arm was worse the next day on 12/16/2020 as the morning went on my temperature felt like it was going up and down I felt body aches and felt really tired I had covid in June and it wasn't as bad as when I had it in June but it was still pretty bad, I also had a headache, I took tylenol and my fever broke but after a few hours my headache was worse and I started to take tylenol and ibuprofen. 12/17/2020 Under my left arm my lymph nodes are swollen but I feel much better and will go to work today 12/17/2020

40 min after shot experienced dizziness, feeling like was going to pass out, not coherent, BP high, fast heart rate, light headed. Got chills, freezing cold, shivering, and later in the day my ears were ringing. Extremely fatigued.

Approximately 10 minutes after receiving the vaccine in the left arm, the patient began feeling lightheaded and had some chest heaviness. They became diaphoretic and at this point blood pressure and heart rate were checked. HR was elevated to 90 bpm from patient's baseline of approximately 60-65 bpm. Blood pressure was elevated at 150/100 mmHg. Pt was provided water and symptoms resolved. Patient was monitored an additional 30 minutes and did not have any recurrence of symptoms. Blood pressure and heart rate returned to baseline.

Patient felt flushed, heart racing. Had irregular rhythm. Transported to Emergency Department. Treated with epinephrine. EKG performed, having pre-ventricular contractions. Checked in to ED for further evaluation.

Fever, severe body aches, severe chills, still have symptoms this morning although less severe.

Patient came to workplace clinic 12/17 @ 1215 saying she had a reaction to the COVID vaccination. She stated she took ibuprofen in the morning for the headache, however, rash was still present. N/V on 12/16 at night. Patient reported no throat swelling or SOB. Rash on injection site (left) arm and chest. Patient received Benadryl 50 mg po x 1 dose and Tylenol 500 mg po x 1 dose. After Benadryl and Tylenol, patient felt better and was able to go back to work. recommended to go home and rest.

12/16/2020 episode of abdominal cramps I had a BM episode of loose stools and soon after that within seconds I started profusely sweating on my forehead and felt lightheaded and very weak, My wife noticed how much i was sweating my body was cool and clammy, episode lasted at least 5 mins if not more so I just laid down until I started feeling better. Once symptoms subsided I took 1000 mg of tylenol, Heavy head throughout the day.

Myalgias, headache, neck pain

Injection site soreness started about 3 hrs post-injection. By that evening I was experiencing body aches & chills. I took Advil 400mg with dinner and felt okay for about 4 hours. As soon as the Advil wore off, body aches & chills returned. I did not take anymore Advil that night. My sleep was restless with body aches, chills, & pain at the injection site. I took my temperature during the night and was afebrile. I woke feeling tired with a mild headache. I took Advil after breakfast and currently feel okay.

About 5 minutes after the vaccine developed chest tightness, increased work of breathing, palpitations and severe dizzyness. Transferred to the ED where i received oxygen, IV benadryl, IV fluids and monitoring. Released after about 4 hours and continue to take benadryl 50 mg PO q 4 hours. Also developed red facial rash (unknown time) Pain at injection site began the morning after the injection.

tachycardia, flushed,low grade fever

My left arm was very sore and very painful to move and ached.

Throat swelling, raspy voice, tachycardia, itching, anxiety, rash

patient felt jaw pain, a strange taste (unable to describe), and numbness in her right arm patient was monitered and symptoms resolved within 30 minutes of vaccine administration

Nausea, fatigue, body aches, joint pain, malaise

40 year female received Pfizer-BioNTech COVID-19 Vaccine today Patient reported prior h/o severe allergic reaction to influenza vaccine with eggs preservative. She has received flu vaccine w/o egg w/o problem. Due to her prior history of severe allergic reaction/ anaphylaxis to another vaccine, in this case flu vaccine with eggs, we should proceed with caution. She was told we could defer vaccination until more information becomes available. She opted to proceed with receiving Pfizer-BioNTech COVID-19 Vaccine and be observed for 30 minute observation period. Patient developed throat tightening approximately 20 minutes after vaccination. She received EpiPen within 1 minute of symptoms and was sent to ER immediately in wheelchair by nursing staff. Patient was evaluated in ED and was hemodynamically stable. She was given IV benadryl and was stable throughout observation

"1204 Patient became flushed and started saying she was having a difficult time ""catching her breath"". She then became tachycardic (upper 90's- low 100's). 1205 Benadryl given (25mg). Physician called down to clinic. Vital signs obtained and showed increased BP (145/90) and pulse. 1214 Patient verbalized she was feeling a little better. Monitoring continued until 1245, vital signs were improving and patient no longer had symptoms. She was released at 1252 but encouraged to seek medical attention if she developed new symptoms or had symptoms reoccur."

At 24 minutes after vaccination, pt experienced chest tightness, shortness of breath, cough, flushing, and rash on chest and neck.

woke up the next day and felt nauseated, could not stand up, my heart started racing, I had to lay down, felt cramping, extreme fatigue, felt overall sick, and the pain at the injection site. No fever. Just lasted that day. Feel better today.

during the administration of vaccine patient developed a wheal at the site on injection. Pressure and message reduced the wheal.

Today I have really bad stomach cramps and diarrhea. Yesterday I had a temp 101.2 with tylenol, chills, joint pain and really bad headache

Caller stated after injection at bout 9pm caller had severe headache with nausea and pain at injection site . Caller stated this morning she felt a bit better.

Pt showed for Covid Vasc #1, received the immunization in left deltoid. minutes later, felt numbness, in arm, the a lump in the throat. Denied SOB, or Dyspnea. Patient the stated weakness in the legs. Assisted to the restroom, x 1. no difficulty. after 30 minutes and no relief from symptoms, patient was wheelchaired over to urgent care, and treated there. Patient was able to leave urgent care on her own, with no problems Patient transferred to urgent care for evaluation. Left from urgent care on her own

Employee had tingling sensation in Right upper extremity, and heaviness in bilateral lower extremities 5 minutes after receiving vaccine. These symptoms resolved approximately 2 hours after they began

Patient states she got a headache 30 minutes after taking the vaccine. Checked on patient 4 hours later, still complaining of a headache.

Pain at the injection site and the whole arm felt sore. Felt like a pressure behind my eyes, very tired, extreme fatigue.

1215 pm on 12/16/2020: pfizer covid vac in left arm Poor nights sleep with left arm pain at injection site 500am on 12/17/2020: stood up to get ready and immediately started to dizzy. Then immediately threw up and had darker green diarrhea. Once that finished I had the sweats and felt cold with a subjective fever until around 9 am with continued nausea. Symptoms resolved 11:40 AM.

"Patient state, one hour after vaccination, ""I got the warm feeling, I got hot"" Temp taken at 2 hour, no temp. Temp taken 4 hours later, no temp."

Chills, Body Ache, Hard around the injection

12/15/2020 I was tired, body chills, pain in left arm but was all very light until 12/16/2020 headache was more severe

Immediately after the injection the tips of my finger began to go numb my hand started itching my throat started to go numb and itch and I got 25mg of Benedryl symptoms got worse so they had to give me in IV injection of benedryl which made the symptoms a litter better. I was released and when I got home I went to sleep. When I woke up my body felt like I had been run over by a big truck. I took my temp and it was 99.8. I laid back down and decided to sleep it off and woke up this morning not feeling any worse but not any better. My hands got red from the rash and is still a little red.

After receiving the injection, patient felt flushed and lightheaded. Began to feel like heart was racing and chest tightness. The patient's heart rate was checked, the patient was provided with Tylenol and water, and observed for an additional 15 minutes. Symptoms resolved during this time.

At 11:15am, patient received first dose of SARS-CoV-2 vaccine. At 12:00pm, patient began to develop a rash and had mild edema noted in the uvula. She did not have difficulty breathing/swallowing/speaking. She was given prednisone 50mg x 1 and diphenhydramine 50mg x 1 in the ED.

Headache

1450 COVID19 vaccine given. 1503 Patient verbalized a racing heartbeat. 1504 Vital signs obtained, BP & HR were elevated. 1507 Physician paged. 1509 Patient reports feeling much better. 1511 Physician arrived to evaluate. 1516 Patient no longer had symptoms. Vital signs improving. Verbalized understanding to seek medical attention if symptoms reoccur or new symptoms begin. Patient left.

Dr.; the following day 12/16/2020, I woke up feeling more fatigue then usual with a migraine. Severe with nausea and light sensitivity. AE occurred about 4 hours. Resolved with Advil and Zofran. Missed work 12/16/2020. 12/17/2020 feel back to normal

Sensation of swelling around the mouth and throat felt funny

Allergic reaction to vaccine +1 more Dx Referred by MD Reason for Visit Progress Notes PA-C (Physician Assistant) ? ? Physician Assistant Cosign Needed á Patient was seen at COVID Vaccine Clinic today for her first dose of the COVID 19 vaccination. She denied any history of previous adverse reactions to vaccines. á She was given the Pfizer-Biontech (lot: EH9899) vaccination in the left deltoid muscle. á During her 15 minute waiting period after the injection, the patient began to experience oral tingling (upper lip and then into the lower lib) It then progressed to the tongue and she reported tingling to the tip of the tongue and further back to the middle of tongue. She thought there might be some mild swelling to the tip of the tongue. She denied rash, hives, welts, difficulty breathing, difficulty swallowing, wheezing, throat tightness, hoarseness, stridor, itching, lightheadedness, dizziness, facial swelling and lip swelling. á This Staff member was notified of patient reaction and she was then assessed in the emergency bay area. á PMH: Hx hypertension but did not take her medication today. Patient had recovered from the COVID-19 virus about 2 weeks ago. á Vitals Time 1130 BP 170/90 HR 86 s/r RR 14 nl O2 97 % á Physical Exam Constitutional: She is oriented to person, place, and time. She appears well-developed and well-nourished. No distress. HENT: Head: Normocephalic and atraumatic. Right Ear: Hearing and external ear normal. Left Ear: Hearing and external ear normal. Eyes: Conjunctivae are normal. Right eye exhibits no discharge. Left eye exhibits no discharge. No scleral icterus. Neck: Normal range of motion. Cardiovascular: Normal rate, regular rhythm and normal heart sounds. Pulmonary/Chest: Effort normal and breath sounds normal. No stridor. No respiratory distress. She has no wheezes. She has no rales. Musculoskeletal: Normal range of motion. Neurological: She is alert and oriented to person, place, and time. No sensory deficit. Gait normal. Skin: Skin is warm and dry. She is not diaphoretic. Psychiatric: She has a normal mood and affect. Her behavior is normal. Judgment and thought content normal. Cognition and memory are normal. Vitals reviewed. á á Treatment included antihistamines. Patient was given 50 mg of benadryl at 1138. á Vitals Time 1147 BP 160/100 HR 90 S/R RR 14 nl O2 98% á Response to care: Patient states the upper lip resolved but the lower lip and tongue sensations remained but did not worsen. Patient was recommended to go to the hospital given her sudden response with concern of tongue swelling. Patient did agree to this. COVID staff was made aware that the patient would be leaving her SUV in the parking lot. á Patient was transfer by Response team to the hospital at 11:53 AM. á á

Pt underwent 15 minutes observation and felt fine during that time, while walking back to work on the way to work unit noticed tingling on the L side of her lower lip and a few inches back along jaw. It persisted so she returned to the vaccine clinic for evaluation. She was evaluated by a physician and had a normal cranial nerve and motor exam other than diminished sensation CN5- no change in appearance of lip. There was no other reaction at vaccination site or change in symptoms during a further 30 minute observation period. She was released back to work. Checkin after a few hours the tingling had improved.

On the night 12/15 exp body aches typically how you feel when having a virus, no fever, no gi symptoms. The following day I had fatigue and one point had chills, body aches. Then took Motrin on night of 12/16 and felt better on 12/17.

Began to feel weak, felt as though going to faint, became cool and clammy, BP 100/70 P 46, O2 Sat 100% on room air, no loss of consciousness. Taken to ED - noted patient did not eat prior to getting the vaccine

Light headed, felt faint. Vitals remained stable. Did need to lay down for approximately 30 min. then sent to ED for evaluation

I had pain at the injection site, swollen, body aches, and headache. It eventually just went away on its own. Did not take anything for it. Arm feels better after using it. Now I am just tired.

On day after vaccination: Left arm soreness, chills, headaches

sudden onset of rinorrhea 5 minutes after receiving vaccine. then itching near ears, 5 minutes later had diffuse itching a rash, was sent to ED. There was evaluated for mild shortness of breath and hives on wrists. Did NOT et epi but did get benedryl and steroids, discharge home

Two minutes after vaccination, she reported itching at the site. Upon assessment, red hives started to develop. Dr. came and assessed patient. Benadryl 50 mg. PO and 2 puffs Albuterol administered by Rapid Response Team RN. Tightness in chest, lightheaded, lungs clear throughout, itchiness in left arm. Resolved within 15 minutes.

Muscle aches , Joint aches, cold sweats, chills, Stomach Pain, Diarrhea

tingling in arm at the time of admin down into fingers which faded over 15 mins and then soreness in arm

Last night I was slightly nauseous, tired and full body aches and today I am just tired and still suffering from the full body aches.

tingling in lips no treatment

headache, red raised area at injection site, 100.6 fever, fatigue, muscle aches

Itching all over the body

12/15/2020 little bit of a headache at night and took an ibuprofen, intermittent nausea the next day, around 530 pm 12/16/2020 fatigue joint pain chills, I had a fever but I did not take my temp, nausea at 9pm I took ibuprofen and this morning 12/17/2020 I woke up fine.

Immediately after the injection, site turned red, I got hot and began sweating profusely. This lasted about 10 minutes and resolved.

Within about an hour headache and mild pain at the injection site, around 4:30/5PM all other symptoms hit: chills, fever, fatigue, runny nose and diarrhea, joint and muscle pain, very sweaty and clammy skin

Paresthesias of lateral tongue and throat, subjective swelling of tongue and throat, subjective shortness of breath

Caller stated that headaches occurred at 12 in the afternoon and fatigue set in through out the day. Caller took Tylenol and Advil with no relief. Caller stated 12/17/20 headache and fatigue went away.

Patient may have received undiluted Pfizer COVID-19 vaccine 0.3 ml= ~120 mcg

Headache , fever 100.8, chills, Fatigue, body ache . Nausea

Swollen tongue, scratchy throat, rash, tachycardia, and raspy voice

Morning after he got the shot....Wave of severe fatigue, had to lay down as he thought he would fall over. Temperature went up a 1/2 degree celius. Went back down later that day. 12/17/2020 2:34 am he woke up with rigors and chills, went away in 3-4 min. Had abdominal pain later during the day.N

2 1/2 hours after the shot, I felt pressure building in my head, my eyes felt bulging, my throat felt tight, and I started having an asthma attack

Symptoms- light headedness, dizziness while in the 30 minute observation window, EE reports she drank water and immediately felt better. EE also endorses mild HA shortly after. EE endorses symptoms completely resolved by 1:30 pm. Called vaccine support line at approximately 3:43 pm to notify us for our records.

During COVID vaccine administration being held at Medical Center, vaccine was administered by Health Department staff on 12/17/2. At 1:30 pm, during observation, patient stated he was having mild chest pain that was not there prior to vaccine. Client walked to observation room, blood pressure taken 169/89. Patient rated chest pain 1/10, described it as random sharp pain. In ER observation room, client was offered EKG which was declined. Patient was then offered to check in through ER for monitoring, patient also declined. Continued to monitor patient until 2:00 pm, at which point patient stated chest pain had subsided and he requested to go home to relax. Encouraged to return to ER if chest pain returns.

Severe dizzy spell about 5-10 following injection, helped to the floor, this lasted approximately 30-40 minutes after start of symptom. Hot flashes and visual disturbance lasting into following day.

12-16 I was nauseous, I received the vaccine and walked to my department, I ate a graham cracker and didn't subside the rest of my shift at 130pm and went home and ate lunch took Tylenol laid down, at that time my arm started to hurt at the injection site. And when I woke up later that night around 5pm and was feeling better kind of tired but good. Coworkers could tell I didn't feel good. I felt like I needed to have a Bowl movement and urinate more than usual

woke up at 3am with diarrhea and nausea . Woke at 6 am with fever of 101.7, joint pain, Headache and fatigue any myalgia

Fatigue and headaches 12/14/2020 about 12pm , Caller took Tylenol and advil with no relief and next day pain had subsided.

I had headache, muscle fatigue, nausea, stomach pain, severe joint pain in the shoulder where I received the injection. I got Covid tested yesterday afternoon to be safe and I'm waiting on the results.

Chills nausea sweats headache

Patient reported feeling fine for the first 15 minutes after the vaccination was given then reported itching of her face excluding her forehead. Patient was given 25mg IM diphenhydramine. Pulse ox was taken and read within normal limits. Within 5-10 minutes after the diphenhydramine was given patient reported itching involving her arms, facial flushing but no shortness of breath. An extra dose of 25mg IM diphenhydramine was given and an IM EpiPen.

Facial swelling, slurred speech, taste in mouth (medicine like), heart palpitations, rash to chest and face.

Joint Ache , Dizzy, tickly throat, Tiredness,

"Patient complains of ""tingling sensation down arm radiating to the hand"" Patient given 25 mg PO Benadryl."

COVID vaccine administered to patient. She began to have lightheadedness and dizziness. She disclosed she had not yet eaten for the day, except for a glass of milk. Writer brought her to an exam table and had her lay down. After 5-10 minutes, she was given a banana and two small apple juice boxes. She then laid back down. After another 5 minutes, she complained of headache and slight phlegm development in her throat. Dr. was called to evaluate- after an assessment, she asked for a BP. Writer completed the vitals and found her BP was 113/77. 5 more minutes passed. Dr. advised that since her situation was not improving and headache and phlegm appeared to be getting worse, patient should receive epi and go to the hospital. Writer administered 0.3mg/0.3mL of epi and drove patient to the Emergency Department of Hospital. She was there for about two hours before being discharged. Symptoms largely resolved by the evening.

Patient reports chest heaviness, muscle aches, loss of energy. No fever or chills noted.

Pain in right arm , Pain in shot site

Patient with tachycardia and elevated BP about 20 min following vaccination; O2 sat okay; sat down for 15 min and symptoms resolved without treatment

Patient is suspected to have received 0.3mL of undiluted vaccine (150mcg vs 30mcg). Patient reported having a dull headache 3/10 pain scale since yesterday afternoon post vaccination. Patient also reported soreness in her right arm down to her elbow. She did not experience any other symptoms.

12/16 It's hard to know because I have a fever but I work on the COVID unit and there has been an outbreak, chills, fatigue, and the thought of moving to take a shower I feel in pain

"Heart rate increase, flushed for about 20 minutes. She has an internal monitor/defibrillator. States ""it feels like when they do a dvice check."""

about 15 minutes after shot, pt had itching. After another 15 minutes the itching resolved and patient left facility

12/16/2020 Pain in the left deltoid uncomfortable to elevate and abduct my arm, it feels better today but it hurt yesterday to even elevate my arm to the steering wheel of my car

Pfizer-BioNTech COVID-19 Vaccine EUA within the first hour of dose, facial numbness on right side of face that migrated to lips. Within 2 hours of dose, nausea.

Patient experiences palpitations, dizziness, and hypertension within 10 minutes of receiving the vaccine.

Patient reports it started as a tingling, pain and burning in the elbow and travelled up the shoulder and up the chest and to the heart. Pain felt like a cardio thump . Grabbed the epi. Sitting forward. Talked Dr. Doctor stated to sit back and uncross legs. Initiated slow breathing. Pain subsided to a tolerable amount. Not short of breath but tachycardic. Still dizzy. Stayed an hour sitting position, after injection. Felt there was an irritating sensation around the heart. Left and walked back to clinic. 10 minutes after arriving to the clinic, dizziness, flushing , came back and irritation around the heart was still noticed but tolerable. 2 minutes after, voice started cracking and drank some water. Intensity of dizziness increased and overall symptoms also intensified. Returned to COVID immunization clinic 15 minutes later. Patient was moved to direct observation in a chair. Given oral benadryl. Instructed to stay and would evaluate if new interventions would be deemed necessary. Benadryl helped. Symptoms were relieved in 15 mins. Patient has been in the clinic under direct observation for about 3.5 hours.

I got the injection on left deltoid and went to sit doe town. seafood allergy started to get hot, flush nasal passage way got really dry and got headache, face and mouth tingling. The headache felt like a rubber band around my head and continued to get hot 20 mins. When I got up to walk out felt light headed. Then went to the clinic dint feel right couldn't focus, temp was 100.Also exp gi problems had loose stool. I took Tylenol and Motrin for headache/fever and also on 12/17. Had to leave work early on 12/16 and was able to return on 12/17.

Headache and, limited motion to the Injected arm

Fever 102, nausea, headaches, muscle pain, lightheaded, chills

Right ankle swollen within an hour of injection. Felt like sprain. Still swollen but pain better today. Took naproxen.

elevated heart rate 102, flushed, cold, tingly fingertips

Pharmacist was diluting doses of vaccine for vaccination clinic in hospital. After dilution of 3 vials, the compounding pharmacist passed off to the on coming pharmacist. The on coming pharmacist grabbed one of the empty vials of vaccine and added diluent to the empty vial. 6 doses were drawn up and delivered to the vaccine clinic with only diluent in the syringe. The pharmacist in the clinic noted the number of syringe doses exceeded the number possible from the amount of vials used and sequestered all vaccine doses in clinic. It is possible some of the patients in the first hour received diluent instead of vaccine but is not known for certain. The pharmacist at the clinic kept the record of all the patients in the morning clinic. Would you recommend any actions prior to the second dose for these patients? Is there any utility in antibody testing the identified patients prior to administering the second dose? Have parameters been established for titter? Please provide direction.

I work night shift so when I got home 12h after my injection and at approximately 11:00 (am) my back hurt but not terribly. When I woke after sleeping today at 4:00 (pm) I experienced joint pain in my bilateral elbows, bilateral shoulders, neck, lumbar spine & bilateral knees. It's mild pain and I will not be going in for an MD appt. It does hurt a little more if I bump into something.

"1658 Patient reports feeling lightheaded after receiving COVID vaccine. VS obtained, BP & HR are elevated. 1700 PA called 1702 PA arrived Patient remains lightheaded with some palpitations but denies any trouble breathing. 1711 VS are improving 1716 Patient states she starts feeling better but then gets a new wave of lightheadedness with ""fogginess"". Monitoring continued. 1741 Patient starting to feel ""extra lightheaded"" 1742 Benadryl given per PA 1748 Patient verbalized a headache 1818 Medic called because BP & HR have not improved after 1 hour of monitoring. 1825 Medic team transported patient to the ER"

Immediate swelling at injection site, approximately 1.5cm diameter and raised about 1 cm

PAIN AND REDNESS ON INJECTION SITE.

Patient developed hives, facial swelling, throat swelling/itching, and nausea approximately 13min after vaccination while in observation. Patient immediately taken to Emergency Department where epinephrine was given IM in the left thigh followed by 125mg IV solumedrol, 50mg IV benadryl, 1000mL NS, and 20mg IV famotidine. Hemodynamically stable throughout ED course.

I had arm pain. Yesterday I had a hot flash with throwing up and diarrhea.

Approximately 5 minutes after receiving vaccine I noted an intense flushing and burning sensation from my waist up followed by tachycardia with heart rate in 150s elevated BP 150/100. These symptoms subsided after approximately 10 minutes but were then followed by a ?cloudy? feeling in my head as well as tingling in bilateral hands that lasted the rest of the day but had resolved by the next morning. The next morning I felt very well until 2 pm when I had a short period (approximately 2 minutes) of elevated heart rate (120s) that then resolved.

End of monitoring period, when staff asked how he was feeling he said he was having palpations. Nursing checked his HR and associates HR was 100-120BPM. But denied chest pain and SOB.

Soreness to arm , Couldn't lift arm above shoulder

Fever of Tmax 100.5, chills and headache 24 hours after receiving the covid vaccine

Left arm pain. Painful enough it awoke from sleep when I would roll on it. It is tender to touch. However no limit to range of motion or use

Within 10min patient first experienced feeling hot and tightening of throat. Patient visibly sweating on forehead. Patient expressed feeling extremely flushed. No meds given per patient request. 30 min post-vaccination, patient now feeling very cold, throat feels better but still a little tight, and a little dizzy. No nausea.

After vaccination in the medical office building adjacent to the hospital, the hospital employee felt palpitations (within 30 minutes of shot). Employee went to the ED at the hospital and was evaluated by medical personnel. Employee was SOB but did not have difficulty breathing. No other untoward reactions were observed. All other ROS was unremarkable. Sinus tachycardia of 140bpm observed in the ED, repeated ECG was sinus tachycardia of 119bpm, no other abnormalities. IVF, 50mg IV diphenhydramine, 40mg IV famotidine, and 125mg IV methylprednisolone given. Symptoms of palpitations and SOB resolved. Discharged with instruction to return to the ED if any symptoms returned.

Elevated temperature, muscle pain, tiredness

TINGLING AROUND LIPS, MONITORED FOR ADDITIONAL 15 MINS. (TOTAL OF 30MINS), PATIENT STATES TINGLING RESOLVED. REPORTED HEADACHE BUT STATES SHE HAD IT ALL DAY.

Approximately 10 minutes after vaccine administration, patient reported wheezing and coughing. Patient received epinephrine IM, IV Benadryl, IV solumedrol and racemic epinephrine SVN. Patient never developed a rash, hypotension, swelling of the lips, mouth or tongue, other GI side effects . Per ER attending and admitting physician, this reaction seems to be a clear exacerbation of the patient's tracheomalacia. The patient was more responsive to racemic epi SVN as opposed to IM epi. Patient admits that psychological stress may have been a component of her symptoms. The admitting physician does not consider this to be an anaphylactic reaction to the vaccination.

I received the vaccination on 12/14 no problems 3-4 later sore arm. After went home next day on 12/15 had a sore arm went to work as normal. At work left early felt tired went to bed early around 8pm. The next day on 12/16 overslept important morning meeting reported to V-safe was feeling tired, mild headache and had severe fatigue. On 12/17 felt much better not as tired returned to normal and no headache.

Joint Pain , tiredness, Body Ache . Injection site pain, fever

5 minutes after I received the injection, I experienced a mild headache and metallic taste in my mouth, with very slight dizziness for a couple seconds. I reported the mild headache and taste disturbance to the RN in the Covid vaccine room before I left for her information. I stayed 15 minutes , then walked to

my car. I sat in my car, then began to feel cold, dizzy, and my heart began to race. I walked back to the Neurology clinic where I work as an NP, and sat in the Neurologist's office, who observed me to be pale and sweating. I continued to feel dizzy with tachycardia for about 7 minutes until this resolved. The only symptom remaining after this was a headache and metallic taste.

Around 4:15PM, employee's arm felt very hot and extremely itchy. Light pink rash on left upper arm around injection site. No respiratory symptoms. She received diphenhydramine 25mg IM; 15 minutes later she stated her symptoms and rash were improved.

1. Left arm very sore, could not abduct more than 40 degrees, hard time sleeping, lasted for about 26 hours 2. Elevated temp to 100.2 F with chills and myalgia, lasted about 8 hours on second day 3. Diarrhea and indigestion for 2 days

About 20 minutes after the injection, the arm i received the injection in became very cold, changed color like I was not perfusion to the limb. This was gone in about two hours. Woke up eye lid continually twitching.

numbness to right ear and in front of ear. Also right ear feels plugged/underwater sound, Very sore left arm injection site.

Loss of taste

After an hour I got vaccinated, I started to feel nauseated and started throwing up. Theres pain and heaviness on the injection site. I had a headache as well.

Patient reported she was pregnant at time of screening. Patient confirmed that her and her OB/GYN discussed the COVID19 vaccine and determined it was the right decision for her to receive the vaccine. Upon receipt of the vaccine, she stated she was feeling flushed, nauseated and felt she was going to pass out. The vaccine clinic team took her to the ED for evaluation and monitoring.

Palpitations, shortness of breath, lump in throat

Racing heart, itching throat. Heart racing resolved in 45 minutes, Itching throat never worsened and resolved after taking Benadryl and sleeping. Woke up 12/17 feeling fine, but also has a golf ball size knot and redness at injection site.

6 minutes after receiving the vaccine I became lightheaded. I was the worst for about 1-2 hours after the vaccine but then symptoms improved some. 11 hours later I am still mildly lightheaded.

Headache, fever, malaise, body ache

I developed moderate to severe pain in my deltoid (of injection) that lasted 48 hours. I would describe the pain as 8/10 and moderately affected my ability to use my right arm on 12/16/20. I reported the side effect to VSafe, who called me and asked me to submit a VAERS.

Soreness injection site Headache Prickly sensation of skin Weakness/fatigue Stomach pain/nausea/ loss of appetite

Noticed Arm pain at bedtime on the day of the injection. Soreness lasted approximately two days.

Warm flushing feeling within about 10-15 seconds of injection, as well as metallic taste in mouth. Repeated on an off for the next hour. Taken to ED of hospital. Noted right arm mild rash distal to injection site and on chest, mild to moderate nausea.. IV Bendadryl 50mg given, IV Solumedrol 125mg, IV Pepcid, IV Zofran. Discharged home with PO prednisone x 4 days. PO Pepcid and Benadryl PRN

10:00 am received vaccine @ medical center right side of mouth felt strange on the way home. 13:00 pm right side of mouth continued to feel strange. Looked in mirror and noticed uneven smile, right side of mouth drooping. 13:35 pm messaged my primary care MD. And called Nurse triage. 14:00 pm Nurse triage advised me to go the emergency room ASAP. 15:00 pm @ Emergency room. Stroke code called, labs, CT, MRI completed. Diagnosis Bell's palsy. Went home with steroid and anti-viral. Symptoms are improving.

tachycardia, HR up to 130s 1 hour after vaccination. Tachycardia while sitting down. Lightheadedness. Tachycardia improved but still100-118 while at rest for hours

SOB, tingling

Nausea, myalgia, injection site pain, malaise, diarrhea, chills, joint pain, headache, nasal congestion,

40 min after injection my throat and tongue started to feel weird and tight, pharmacy at my work hospital gave me 25 mg Benadryl and 650mg Tylenol. At about 1 hr 45 min after injection my throat got to the point of so swollen and itchy I couldn?t swallow. I went to nearest emergency room hospital they administered decadron orally, Pepcid P.O., and Toradol via IM.

I received 1st dose of the vaccine at 4:30pm on the 15th, felt well and at my baseline. The morning of the 16th (~1030), I woke up with my face and cheeks swollen and mildly red. I then took 50mg Benadryl and 10mg zyrtec, and iced my face (1 zyrtec in the morning, another at night). I began to see improvement in my swelling. The morning of the 17th I took another 50mg of Benadryl and my face is back to it's baseline.

Headache - centralized at front of head, from temples to forehead; no treatment taken; resolved after a nap; lasted about 4 hours

Patient reported that she started to feel unwell immediately after the vaccine with some nausea. She presented to the Emergency Department where she was treated by myself approximately 17 hours vaccine administration. She was having vomiting, diarrhea, diffuse rash, and throat discomfort. She was successfully treated for anaphylaxis and was able to discharge to home.

Fever and chills that started approximately 24 hours after injection lasting for approximately 8 hours.

hot flushing feeling, light headed, legs heavy gave patient a chair to sit and candy symptoms resolved by 11:36

Seizure approximately 24 hours after vaccination

vasovagal response - dizziness and nausea which lasted about one hour after injection - resolved with supine position and dry cereal

Immediately after administration felt a strange sensation on nostrils and mouth that dissipated after the initial 15 minutes. Then I started with mild itching in the next arm and neck. About 30 minutes after administration my eyelids became swollen. No shortness of breath or tachycardia. I received Benadryl and solumedrol at ER. Stay at the ED for about 2 hours and left home. After that I felt strange for a while and could not sleep at all. The next morning everything was fine except for mild left arm side of injection pain.

Headache. Aleeve X2 taken Thursday 12.17 at 2p. went away after several hours. Have another headache this morning

Hives at the injection site 2-2.5 hours later extremely itchy and bumpy, self limited to the upper arm, resolved 3 hours later only intervention was ice as uncertain if Benadryl or steroids would have blunted an immune response

COMPLAINS OF NUMBNESS TO TIP OF LIP WITHIN MINUTES OF ADMINISTRATION. DENIES HISTORY OF ANAPHYLAXSIS. TRANSFERRED IMMEDIATELY TO HOSPITAL ED

5-10 minutes after vaccination, vasovagal syncope: pallor, diaphoresis, dizziness, tunnel vision, nausea, weakness, tingling in arms/legs, BP 103/69

undiluted dose given

soreness in right hand...seems to go away as i start to move my arm

undiluted dose given

Event happened outside of the ER at a clinic and not witnessed by any hospital staff. Patient reported dizziness, shortness of breath, headache, chest pain, sore throat, hoarse voice and tightening in the throat and chest minutes after vaccine administration. Treated with IM epi on scene by EMS. In the ED abtou 30-45 minutes after event, given IV normal saline, solumedrol, benadryl, and famotidine. Given PO potassium after labs for mild hypokalemia. She was monitored for about 4-5 hours total in the ED with complete resolve of symptoms.

severe, acute hearing loss and tinnitus in R ear.

Right arm soreness, headache, hot flashes.

Received the vaccine at 2:30 PM. Approximately at 2:50 I started feeling paresthesia of my left leg, approximately 1 to 2 hours later a progressed to my left arm. Around 8:00 PM it progressed to my right

leg, right arm, torso and face. I subsequently took Aleve. No significant shortness of breath, or weakness noted. This morning paresthesia continues but less apparent. It feels more apparent in my left side. I can no longer feel it on my torso or face.

Fever with max of 101.9, headache, chills, heartburn, cough, fatigue.

Breastfeeding toddler developed rash to torso, back, and cheek

Metallic Taste in the mouth; lasted for a few hours.

Chest pain and tighness, generalized with stabbing pain intermittently elevated blood pressure 180/95

She became diaphoretic, her throat felt dry and as if it was beginning to close. Rapid response was called and she was transported to the ER. She was tachycardic, experienced chest tightness, and shortness of breath.

Pfizer-BioNTech COVID-19 Vaccine EUA - Sore and sensitive right arm

fever, fatigue, injection site slightly red and raised

31 hours after the vaccination I woke up at 11:00 p.m. and had two and a half hours of alternating sweats and chills that went away with 1000 mg of acetaminophen and 600 mg of ibuprofen. I did not have a fever, my temperature was 98.8, and I did not have diffuse muscle lakes. this was similar to but much shorter lived in milder than my reaction with shingrix earlier in the year.

Fever of 100.2, joint pain and fatigue

Dizzy,Hives on neck and chest, body aches

Monitored 30 minutes in clinic, woke up at 930pm itchy hands/arms, then spread. No respiratory issues, but called to ED. Spread to thighs, and back of legs rash. 10:30 ED medicated with IV Solumedrol, Pepcid and Benadryl. Sent home with Prednisone, Pepcid and taper. Dr. spoke with this am and plan to pre-medicate prior to 2nd dose, but does approve. Monitor another 30 minutes . Rash resolved minimal on forearms.

pruritis of upper extremities. Erythema of bilateral palms and dorsal wrists

Severe headache, fatigue, muscle aches

Metallic Taste in the mouth lasting for several hours post vaccination

body aches, chills, right arm pain and some swelling which is migrating to right axilla and right breast

Headache, fatigue sudden onset at 10 am, resolved after acetaminophen

hives all over body. with swelling.. Red eyes.

Patient received two Pfizer-bioNTech vaccinacation on the same day by accident. Received both doses in a time span of 5 minutes apart. (Received both doses in left arm). Patient kept in observation room for 30 minutes after time of vaccination to monitor for any adverse events. Patient will contact nursing supervisor if any severe adverse events occur within the week.

About 5-10 minutes the vaccine I began to get tingling and a itchiness in the back of my throat , notified personnel and vitals were checked and stable. The tingling and numbing sensationent away and came back and benedryl was given. The symptoms came in waves of about ever 2-3 minutes so I was transported to ER and somumedrol was given was monitor for 1-1.5 hrs and the numbness and tingling sensation continued for about an 1-2 hours and finally subsided and was released to go home

Bleeding and significant swelling (marble size) at site immediately after administration.

Swelling, redness, warmth at the injection site starting approx 15 min after injection was given. Then severe itching starting in right arm, right side of head approx 25 min after injection. Then itching progressed through the entire body including toes Claritin 10mg taken approx approx 2 hours prior to inj Allegra 1 tab Diclofenac 50mg Tylenol 1000mg Pepcid 1 tab Solumrdrol 40mg IM All given at approx 8:30am Itching continued. Inj site reaction started to improve. At approx 9:20am Benadryl 50mg taken at 10:00am Benadryl and Pepcid repeated at 6pm due to return of itching Facial flushing and temp of 100.1 orally noted at 6am the next morning

Dry, Scaly hands - Bilateral

Pt with dizziness, bilateral arm tingling and hand sweating. Hands extremely cold. Vital signs wnl

Ear pressure followed by bilateral under arm soreness. Later in the day both arms warm to touch and felt swollen. Face flushed and overall body aches and inability to stay awake. 600mg ibuprofen and rest. Felt myself in morning except as expected left arm pain at injection site and a little left arm tiredness or weakness.

Sore at the site of injection, and sore.

Urticaria, pruritis, headache

PATIENT REPORTED FEELING TINGLY ALL OVER AND NOT RIGHT, placed in supine position, HR 120's, BP 186/96, RR 24, not diaphoretic, patient was transported to ER where she was given Zofran and IV Benadryl. She reports that the Benadryl helped immediately. She took an oral dose of Benadryl after being discharged home.

Rash - noted all over body - mostly trunk, neck, upper arms bilaterally - mostly macular with slight papular component. Significant itch.

Approximately 90 minutes following first dose of vaccine, developed severe headache, chills, joint pain and full body muscle aches. Continued throughout the night and were improved by next morning, but not fully resolved by the time of this submission.

None stated.

Gradually improving.

None stated.

Hypothermia with body temp of 95.0 F. Treated with heating blanket and covers.

"5 minutes after the Pfizer Covid-19 vaccine administration, the patient developed flushing, hives, felt warm and eventually short of breath. She started to wheeze and was wheeled into ER c/o ""I can't breathe while holding throat and thrashing with facial flushness noted. PT took 2 Benadryls and had several Epi shots. She was then discharged from the ER and later on that day, started to feel short of breath again. In the ED today she was audibly gasping for air, however had no wheezing, had a normal saturation and a normal blood pressure. She had taken another dose of her EpiPen IM and diphenhydramine 50 mg by mouth prior to coming. She was then admitted to the hospital for further observation. While on the floor, she started to feel short of breath again (about 9 am on 12/18/2020), which required an RRT . Patient received another dose of diphenhydramine IV, methylprednisolone 125 mg IV and several doses of IM epinephrine. She also required oxygen. She was then transferred to an ICU for further care."

None stated.

My symptoms started with bodyaches and fatigue. Quckly followed by a fever that reached 102.4. Later that night I had congestion, cough and headache. Woke up the next mornign with moderate/sever bodyaches, chills, cough and headache. Moderate fatigue as well. Had to miss work.

Entire left side of body muscle aches and joint aches. Started about 2 hours after getting injection and worse the next day

After I received the vaccine about 1 1/2 hours later I started experiencing a metallic taste in my mouth. I am also experiencing no appetite. Throughout the night I had to force myself to eat. I'm still experiencing no appetite and this is very unusual. The metallic taste is still present, but it is getting better

Treatment dugs:

Patient with a h/o syncope to vaccines, felt light headed and laid down on floor roughly 3-5 minutes after vaccination in the observation area. Patient pale, pulse regular in mid-60's, A&O x3, conversant. Medical assistance team called, bp 94/60, lightheaded after attempt at standing for 90 seconds. Transported to ED for observation.

Initial symptoms started in less than 5 minutes were tingling in the lips and tongue. Thickness feeling to the tongue. Progressed to hoarseness to voice that worsened. Received 50mg Benadryl chewable tablets. Symptoms continued to worsen. Epi pen injection in left thigh. 5 minutes later still no improvement and another Epi pen injection in right thigh. Monitored for 5 to 10 min and no

improvement and was taken to the ER. In the ED, received IV fluids, IV Benadryl, IV Decadron and IV Pepcid. Monitored for 3 1/2 to 4 hour and discharged home with 3 days of Prednisone 60 mg and Benadryl po every 6 hours as long as allergic like symptoms persisted. 12/18 morning still with lip tingling and Asthma like symptoms. Voice is still in and out of hoarseness

Slight tingling down left arm into left fingertips

None stated.

On 12/16/2020, approximately two hours after administration of Pfizer BioNTech Covid-19 vaccine, patient developed SOB and chest pain. Patient reported to ED where she was given fluids, diphenhydramine, ipratropium/albuterol nebulizer treatment, magnesium, famotidine, and epinephrine. Of note, patient has anaphylactic reaction to corticosteroids. On 12/17/2020, around 3:00 pm the patient reports to the ED at a different facility (one closer to her home) with difficulty breathing and sensation of her airway closing. Patient again was given epinephrine, fluids, ipratropium/albuterol nebulizer, diphenhydramine, famotidine, and was also given a dose of lorazepam. The patient now has stated that she had an anaphylactic reaction to a prior flu vaccine, however this was not listed as an allergy prior to administration of the Pfizer BioNTech Covid-19 Vaccine.

Patient experienced mild alllergic reaction starting at 4:19pm. The ER staff came to tend to the patient. The patient reported dizziness and weakness. Her vitals are as follows: BP 142/80, O2-99% on room air, Pulse-98, Resp Rate-18, Temp-97.3F. The patient was taken to the ER and received Benadryl 50mg IV and an Epipen. The patient's pain was 0/10. The patient was reported stable at 4:27pm.

Patient began experiencing itching and tingling in lower back and down right leg after leaving the facility (had waited the required 15 minutes). Drove around building and parked and came back in. No rash noted. Vital signs BP 157/73, HR 69, Resp.- 16, O2Sat- 98, Temp- 97. No obvious distress, Alert and Oriented X3. Grips equal and strong, no facial weakness and ambulating without difficulty. After 20 more minutes C/O tingling of lips. Consented to call 911. Assessed by EMS. Vital signs remained stable and patient refused to go to hospital. Called wife to pick him up. Patient required no treatment and left facility at 5:30 pm.

Employee presented to the Emergency Department for dizziness. Patient received COVID-19 vaccination today. About an hour and half later he started experiencing dizziness and lightheadedness. Patient was normotensive with regular heart rate at the time. Patient reports when he would get up to go patient room he would start to feel unsteady. Patient has history of orthostatic hypotension intermittently in the past. Patient reports he had some tingling to his bilateral hands.

12/16/2020-6:00 pm Fever 101.6 body aches 12/17/2020 1:00 pm Sick stomach, light headed 12/17/2020-5:00 pm Stomach cramps, diarrhea Light headed Cold sweats 12/17/2020-7:00 pm Extreme intestinal cramps, diarrhea Loose bloody stool Lack of appetite Light headed Cold sweats 12/18/2020 - 4:00 am Extreme intestinal cramps Loose bloody stool Nautious Lack of appetite Unable to sleep Light headed Cold sweats 12/18/2020 Intestinal cramps/pain Lack of appetite Nautious Light headed

NAUSEA AND VOMITING

Approximately 10 minutes s/p vaccination, employee became sweaty, c/o tingly hands, low BP, c/o nausea. Medical assistance team called, patient transported to ED.

Fever, chills, body aches, headache, injection site pain and swelling

Nurse call line recommended ER visit. Employee opted not to, drank salt water and gradually feeling better, although aches persist.

1 hour after administration of vaccine 0.3ml the staff member began to have a systemic blotching on skin and dry, severe cough.

around 2 a.m. patient woke up noticed weird smell in her nose, and tingling in her fingers and hands on left side and has headache

Pfizer-BioNTech COVID-19 Vaccine EUA Pin and needle feeling throughout body with flushing and hives. Mouth and throat felt tight with numbness sensation in mouth. Voice became very raspy and breathing felt somewhat difficult. Tachycardiac and Hypertensive Reported to the ED, received 50 mg IV Benadryl, 125mg Solu-medrol and 40 mg Pepcid, symptoms began to suside after about 5-10 minutes. Had report throat tightness at approximately 1700 and self medicated with Benadryl 2 times throughout the evening.

Patient began experiencing itching all over body 15 minutes after IM injection. Patient was given benadryl 25mg at 09:22. Benadryl 25 mg dose given again and pepcid 20 mg at 09:53. Patient symptoms are resolving at this time. Notified patient to inform primary physician of itching reaction.

After receiving the vaccine approx. 1 hour he notice redness ant itching at the top/middle of chest. Area approx. 3 X 3. Area was red and warm not hot and not much warmer than surrounding area. Denied SOB or swelling in mouth or chest. Denied itching elsewhere in body.

Pfizer-BioNTech COVID-19 Vaccine EUA. Patient felt dizzy and had elevated blood pressure. Pulse normal.

Patient was seen at COVID Vaccine Clinic today for her first dose of the COVID 19 vaccination. She denied any history of previous adverse reactions to vaccines. She reports that she also had a shingles and pneumonia vaccination on Monday 12/14/2020. She confirmed with both her PCP and transplant specialist that okay to receive all vaccinations. á She was given the Pfizer vaccination in the right deltoid muscle. á During her 15 minute waiting period after the injection, the patient began to experience tongue tingling and swelling specific to the left side of her tongue. She denied rash, difficulty breathing, difficulty swallowing, wheezing, throat tightness, dizziness and lip swelling. She reports similar reactions after receiving other vaccinations. States that those symptoms always resolved with time and never required any treatment. á This APP was notified of patient reaction and she was then assessed in the emergency bay area. á Vitals Vitals: á 12/17/20 1545 12/17/20 1555 12/17/20 1620 BP: 128/85 116/72 126/73 BP Location: Left arm Left arm Left arm Patient Position: Sitting Sitting Sitting Pulse: (!) 109 100

99 Resp: 12 12 12 SpO2: 99% 97% 98% Physical Exam Constitutional: She is oriented to person, place, and time. She appears well-developed and well-nourished. No distress. HENT: Nose: Nose normal. Mouth/Throat: Oropharynx is clear and moist. Neck: No tracheal deviation present. Cardiovascular: Normal rate, regular rhythm and normal heart sounds. Pulmonary/Chest: Effort normal and breath sounds normal. No stridor. No respiratory distress. She has no wheezes. She has no rales. Musculoskeletal: General: No edema. Neurological: She is alert and oriented to person, place, and time. Skin: Skin is warm and dry. No rash noted. She is not diaphoretic. No erythema. Psychiatric: She has a normal mood and affect. Her behavior is normal. Thought content normal. á Patient's health history, medications and allergies were reviewed. She denied any further symptoms and the tongue numbness/swelling resolved in 30 minutes. She specifically denied any difficulty swallowing or breathing. No treatment was required. Pharmacy responded and did advise that current recommendations include no other vaccinations within two weeks of COVID. Discussed with patient. She is advised to notify staff of this reaction when receiving her 2nd dose. Patient release after 45 minutes of observation. á

Felt lightheaded about to faint @0920 which resolved @930

Itchy throat and back of tongue, received IM epi, pt complaints unchanged <5 min after epi inj, received diphenhydramine, famotidine, prednisone (1 hr later), patient comfortable, throat symptoms improving (2.5 hrs later)

Within minutes of receiving the vaccine I experienced a metallic taste in the back of my throat (while I had mint gum in my mouth), dizziness, increased heart rate, labored breathing, and a floating feeling. These symptoms lasted no more than 10 minutes except the floating feeling lasted about an hour.

itching all over the body after 7 hours of administration of the vaccine lasted for a couple of hours headache, body aches, chills, sweating after 12 hours of vaccine administration lasted for 24 hours

She received her covid vaccine around 1700. She had a reaction that we monitored in the observation room for approximately 40 minutes. She was not feeling better so we took her to the ED for monitoring. She was discharged from the ED after an hour and a half. No intervention was needed. Her symptoms were feeling flushed/ anxious/ shaky, injection arm felt hot (was cool to the touch), HR was 117, BP was 143/96, which is high for her. We are recommending she reach out to her PCP prior to scheduling her second dose.

Treatment dugs:

Pfizer-BioNTech COVID-19 Vaccine EUA. 5 minutes after vaccination patient felt warm, light headed, left arm pain, and blurred vision. Lasted about 3 minutes and gradually was gone by 5 minutes.

Patient experienced generalized itching in face area 1 hour after injection. Itching spread to neck and chest area soon after. Patient was given benadryl 25 mg at 09:25. Given another benadryl 25 mg and pepcid 20 mg at 10:00 due to start of itching again. Itching has mostly resolved as of 10:15. Patient

advised to contact primary physician to notify them of vaccination and to monitor for any more adverse events after leaving hospital.

Headache, neck pain, vomiting

Dizziness within 10 minutes that lasted 30 minutes or longer. Waves of nausea for over 24 hours

Felt unable to answer questions possibly hypoglycemic event, felt something in back of throat, symptoms resolved after providing apple juice

patient called in to work today at 7:15 a.m. with fever and body aches

local soreness, muscle pain in both thighs, fatigue, runny nose

Eye redness, pain, swollen Face swelling Bilateral arms and hands swelling Rash SOB

started to feel tingling in arm received shot.

Patient developed flushing, red warm itchy rash on arms and trunk area. Happened approximately an hour after receiving vaccine. Was given 50mg IM of benadryl and symptoms improved after about an hour after they appeared.

Pt reported a lump in her throat 10 min after the injections. Pt thought she needed a drink of water. Pt reported to feeling fine and returned to work. Pt then reported to the ER with dizziness and lump in her throat at 2:18pm. Pt was admitted to hospital for observation overnight.

12/16- received vaccine at 6:44pm, 12-17- 0400am woke up with nausea/ vomiting and fever, had to call off work 12/18- continued to have nausea/ vomiting and fever until 10 am at which time symptoms and fever resolved

PAIN AND SWELLING OF LEFT SUPRECLAVICULAR AREA, LEFT LEG PAIN.

Felt a lump in her throat 5 minutes after vaccination. BP and HR elevated slightly, no swelling in lips or tongue, denies lightheaded or dizziness, Alert/oriented x3. Vaccination site WNL. Listened to lungs and heart (WNL). Lungs clear throughout and able to move air without difficulty. Within 15 minutes slight improvements in Vital Signs, decreased feeling of lump in her throat, no swelling in lips or tongue, site WNL, alert/oriented x 3. Listened to lungs and heart (WNL). Lungs clear throughout and able to move air without difficulty. 30minutes later 50% improvement of feeling of lump in her throat, cont. improvements in VS, no swelling in lips or tongue, Listened to lungs and heart (WNL). Lungs clear throughout and able to move air without difficulty. 75 minutes post vaccination back to normal, Vital signs back to WNL, Alert/oriented x3, no swelling in lips or tongue. Listened to lungs and heart (WNL). Lungs clear throughout and able to move air without difficulty. Resolved on own without medications

Initial within 10 minutes, redness and burning pain at site. Ice was applied and this went away, then about 25 minutes, itchy throat, trouble swallowing, mild confusion. Oral benadryl 50mh and solumedrol IM. Once again this dissapated after 30 minutes. 3 hours later, trouble swallowing, felt as if something

was in my throat, redness and flushing all over.fluid bolus, epinephrine I'm, iv benadryl, pepcid oral, and claritin oral, fluid bolus. 12 hours after getting the vaccine blurry vision, ringing ears, headache, benadryl, steroid, claritin all oral

"lightheaded; ""funny feeling"" in throat; systolic BP in the 80's; given famotidine and loratadine @ 12/16 (2 hrs later); pressure and heart rate improved greatly (3.5 hrs later)"

10 minutes after the vaccine I had sudden cold hands (the kind of inside cold like Propofol gives you), with palpitations and dizziness. Self limited in a few minutes. BP was 150/90 which is high for me. Similar episode but shorter and less intense within next half an hour. There was also a sensation of chest awareness (not pain, but a bit of tension, which I have experienced before with anxiety and put it on anxiety). After a while decided to go home and while walking I noticed a clear sensation of chest warmth. I decided to stick around the hospital a bit more, pondering about going into the ER. DRank 2 bottles of orange juice and headed home. Then on the way home I had 2 presyncopal episodes. The fact that I had not eaten all day and wasn't well hydrated might have contributed. However, that was scary enough that I called 911. By the time they arrived I was fine. DEcided not to go to the ER. I ate some, drank some, and took Benadryl 25 mg. The chest tightness got better. I still continued to experience waves of chest warmth/heat/burning sensation and chest awareness/ tension, coming on in waves and going away in a couple of minutes. I was obviously anxious by this time but I do not believe the warmth was anxiety related. I have had anxiety before but never with this manifestation. I was tired, slept like a baby and this morning I feel at baseline. Some soreness at injection site but none of that chest warmth.

Numbness and heavy feeling on the tongue and lower lip

ITCHING AND REDNESS ON INJECTION SITE, NEXT DAY GENERALIZED ITCHING. DIARRHEA.

Lightheaded, flushed

At 8pm I developed extreme itching throughout my entire body, inside my ears,throat eyes. No rash or hives no sob or swelling. Headache also noted. I took tylenol 1000 mg and at 9pm I took benadryl 50 mg. I woke up 12-18-2020 with less intense itchiness but it was still present, not my throat or inside my ears. I took allegra 180 mg. At 1100 I developed a headache and took tylenol 1000 mg.

Patient was seen at COVID Vaccine Clinic today for her first dose of the COVID 19 vaccination. She denied any history of previous adverse reactions to vaccines. She does report a history of similar reaction that occurs fairly regularly after drinking beverages containing alcohol. á She was given the Pfizer vaccination in the right deltoid muscle. á During her 15 minute waiting period after the injection, the patient began to experience flushed, warm face and ears. She denied rash, difficulty breathing, difficulty swallowing, wheezing, throat tightness, lightheadedness, lip swelling and tongue swelling. á This APP was notified of patient reaction and she was then assessed in the emergency bay area. á Vitals Vitals: á 12/17/20 1450 12/17/20 1500 12/17/20 1515 BP: (!) 153/73 120/60 138/70 BP Location: Right arm Right arm Right arm Patient Position: Sitting Semi-fowlers Sitting Pulse: 84 79 78 Resp: 14 14 14 SpO2: 100% 98% 98% Physical Exam Constitutional: She is oriented to person, place, and time. She appears well-developed and well-nourished. No distress. HENT: Nose: Nose normal. Mouth/Throat:

Oropharynx is clear and moist. Neck: No tracheal deviation present. Cardiovascular: Normal rate, regular rhythm and normal heart sounds. Pulmonary/Chest: Effort normal and breath sounds normal. No stridor. No respiratory distress. She has no wheezes. She has no rales. Musculoskeletal: General: No edema. Neurological: She is alert and oriented to person, place, and time. Skin: Skin is warm and dry. No rash noted. She is not diaphoretic. No erythema. Psychiatric: She has a normal mood and affect. Her behavior is normal. Thought content normal. á Patient was observed x 35 minutes after receiving vaccination. All symptoms resolved within 20 minutes. No treatment was required. She reports some mild history of anxiety and questions if perhaps she was having a panic attack. She has medication to treat this at home if needed. She was observed x 35 minutes and then released. á

Lightheadedness, shortness of breath, chest tightness Needed to take Ventolin inhaler 2 puffs, Duoneb nebulizer, liquid benadryl Symptoms improved with medications. Felt very tired rest of day. Symtoms to relief was probably 1 to 1.5 hours

Fever, Chills, weakness, Headache. Fatigue. Onset symptoms 12/17/2020 to 12/18/2020. Highest fever 101.8.

"5-7 min after injection she felt flushed face and ""as if they were checking my pacer"" ""so my heart rate revved up a little"" She sat down and the feeling resolved within 15 min"

Dizziness, light headed, fatigue, easily winded, headache.

"Vaccine received 15:00 while at work at Medical Center; Around 19:00 started having intermittent ""hot flash"" feeling and general fatigued feeling. Got home from work (RN in ED) at 19:40. Took a shower and felt nauseous when I sat down to eat dinner. Declined to eat dinner and opted to lie down in bed instead, at 20:50. Awoke at 22:00 to urinate. Felt dizzy standing up, with cold-sweats and body aches. Checked temperature, 97.9 F. Went to the bathroom, drank some water, took 400mg ibuprofen and 325mg tylenol, and went back to bed. Awoke back up at 01:30am with abdominal cramping and nausea. 2 episodes of dry heaving, but no vomit. Awoke back up at 06:55am, GI symptoms resolved but bodyaches persist, as well as overwhelming fatigue. Checked temp at 07:25, 98.3 F. Employer notified."

Chills, body aches, headache

Had COVID-19 November

patient presented with a (L) hand numbness + coldness (ipsilated to vaccine) right after her vaccination symptoms resolved after a warm shower

Swelling locally in arm began within 12hrs. No systemic symptoms, started on dose pack (Medrol) antihistamines, Ice bag.

Right arm soreness, mild swelling, subjective fever, chills, bodyaches, headaches, loose stools x 2, 6 hours of duration, Treatment Tylenol

4:30pm pt noticed tingling & hot flash of face and neck- stiffness of jaw took 50mg of Benadryl. 530-6pm pt noticed the addition of numbness and tingling arms. Pt slept. Pt woke at 11:30pm and noticed that tingling was gone. Pt woke this morning and reports to feeling fine.

I have consistently had a positive ANA (anti-nuclear antibodies) test. Not positive for positive for lupus or rheumatoid arthrits. I wanted to let you know that. But after 15 min I started feeling some wooziness, and about 30 min later a headache, feeling like i was mildly drunk, shoulder (injection site) sore, chills, no fever, mild body aches.

Right eye fullness and blurry vision

I experienced after 40 or 50 minutes I felt funny. I felt fatigue, sleep and after that I felt a sharp pain from my neck to my upper back.

Within 10-15 min of injection, she was walking in the POD, waiting around to leave, but felt dizzy. Was instructed to sit down. People around her noticed a flushed face, she felt her HR increase (as a sensation, not measured) she rested and stay seated for about 10 min. While she was seated, her (she checked her own pulse) noticed it went from 55- 70.

FATIGUE, MUSCLE ACHES, JOINT PAIN, LOW GRADE FEVER 99.8

The patient began to feel itchy throughout the body, particularly both arms and the back. This happened 30 minutes after injecting her with the COVID-19 vaccine

Issues were similar to what I have experienced with the flu vaccine but a bit more pronounced including soreness at the injection site (moderate), tiredness (moderate), joint pain (moderate), headache (mild). The worst of the symptoms started on the first day post-vaccine and subsided about 36 hours later.

(1145) Left eyelid swelling 15 minutes after vaccination. (1155) b/l superior periorbital edema and erythema, b/l ear erythema and burning, and b/l hand tingling. (1200) Oral Benadryl 25 mg was given. (1230) symptoms improved and I was able to leave. While riding in the car on the way home started to have chills w/ goosebumps and nausea in short waves. Took an nap b/c my chills worsened and slept until 1630. Work up b/c of worsening chills, shivering, chest tightness, nausea, b/l hand numbness and tingling, right foot burning and stinging, and constant throat clearing b/c throat felt thick. Called the nurse on-call number provided in vaccine packet and was transferred to virtual care and report was given. Medical team advised me to go to the ED. (1900) Arrived at ED and temp was 101 and the chills, numbness, foot burning, and chest heaviness were worse and my eyes were burning and heavy. I was given oral Pepcid and an IV was started. After an IVP of Benadryl and Solu-Medrol I experienced severe burning starting in my head, neck, chest, and stomach. Then it felt like my veins were on fire all the way to my fingers and toes. This was followed by strong nausea w/o vomiting. I was then given IVP of Zofran and Ativan and NS drip. (1940-2020) Chills, burning around eyes, and vertigo continued other symptoms were improving .(2020) Provider returned and reported that labs were normal and I was probably having a reaction to the vaccine. (2035) Discharged from ED. Experienced chills, hand and foot numbness and tinging after discharge but was able to go to sleep.

Became hot and felt itching minutes after receiving vaccine. No swelling of lip or tongue or throat. No rash. No shortness of breath. ER doctor on site evaluated and determined this was not likely to be an allergic reaction.

sore arm at injection site, fever and chills, headache and felt stuffiness

extreme fatigue. Pt called in sick the next day for work.

"PATIENT FAINTED AT WORK THE DAY FOLLOWING HER VACCINE. BLOOD SUGAR AND VITALS WE'RE CHECKED FOLLOWING THE FAINTING SPELL AND WERE IN NORMAL RANGE. SHE WAS PASSED OUT FOR ""A FEW MINUTES"" PER WITNESSES AND WRITTEN REPORT. SHE SLEPT WELL THE NIGHT BEFORE. SHE WAS UNINJURED AS A COWORKER CAUGHT HER. AFTER HER VITALS WE'RE CHECKED SHE FELT WELL AND RETURNED TO WORK AND WORKED THE ENTIRE REST OF HER SHIFT WITHOUT INCEIDENT OR COMPLAINT."

CIRCUMORAL TINGLING

12/17/2020 patient reports an intense head ache with intermittent shooting pains that are debilitating. Patient also reports fever of 103.4 that is unchanged with use of antipyretics.

Vaccine recipient was administered the vaccine at 11:30 am and then around 1:30 pm started to feel dizzy with hives and itching to his arms. The vaccine recipient was sent to the emergency department for further evaluation. There was an erythematous macular/papular rash on bilateral arms. He was administered diphenhydramine 12.5 mg IV, famotidine 20 mg IV, and methylprednisolone 125 mg IV. After reexamining, the patient felt much better, no dizziness, no itching, and no rash. He was discharge to home at 4:57 pm same day.

chills, aching, fever, extremely cold feet

At 6pm patient's tongue was numb and the left side of their face was tingling. Patient felt like she had burnt her tongue and was trying to taste with it still. Around 11pm the numbness started to go away and she could taste things better. Today everything is pretty much normal.

The pain around the injection site progress to full body ache, head stuffed ness breathing though mouth and slight fever 100.1 took Ibuprofen. The next day sore all over, hard to walk and took Ibuprofen for 6 hrs. On 12/16 lost taste/smell, diarrhea, nausea .Then 12/17 continued aches and fever pt went to get a Covid test was results positive. This morning exp body aches and slightly gaining taste .Pt has been not able to work for 10 days since testing positive.

nausea, lightheadedness, and palpitations that occurred ~10 minute post injection with decreased blood pressures c/w vasovagal response, improved over a few minutes

Chills, low grade fever, body aches, injection site muscle spasm, burning sensation in the chest

Day 1 of shot: headache 10 hours after Day 2: headache, fatigue, joint pain Day 3: headache. Fatigue, joint pain Day 4: headache, fatigue, joint pain and low grade fever, diaphoresis Day 5: worsening headache, fatigue, joint pain Tylenol was obtained per bottle recommendation for pain on all days.

After injecting vaccine the patient began to fell heavy tongue, dizziness and nausea. Vital signs: BP:205/161 mmHg, R:21, 97% oxygen saturation

Approximately 20 minutes after vaccination patient c/o feeling lightheaded, hands tingling and feeling as if there was something in her throat.

Left arm and quad soreness, nausea, headache, light headedness, light sensitivity, dizziness, body aches. No fever nor respiratory symptoms.

Patient experienced heart palpitations. Pulse was 135 SpO2 99. Calmed patient to pulse 70. BP 132/84. Patient reported to feel better after 10 min. No other intervention needed.

weakness and body aches

After receiving injection 14-15 minutes after I started to get chest tightness. I took two puffs of inhaler and walked to triage room to be monitored for another twenty minutes. I took two more puffs of inhaler and chest tightness went away a few minutes after. No other reactions occurred and was cleared to leave after twenty minutes.

about 12 minutes after receiving the vaccine had a sudden onset of sharp headache while seated. When she stood up became lightheaded and dizzy and nauseous. She also had elevated Blood pressure p to 168/108. After 35 minutes her positional symptoms persisted with BP still elevated 159/102. No respiratory or skin symptoms. She was transported to the ED and had a head Ct which was normal, discharged with pain medications.

Additional to the symptoms previously reported I woke up with headache and thighs feeling heavy. Those are the remaining symptoms, the previous ones reported have subsided

on 12/16 i was given the vaccine at noon and finished my day as usual, I had a beer before bed and fell asleep at 9pm, at about 1am on 12/17/2020 I woke up with severe chest pain like something was crushing me, like a car being crush it felt like. I went to the ER at 3am and I was told I had a severe reaction to the vaccine. I had a weird taste in my mouth, cough, watery eyes, pain in all limbs, jaw pain and neck pain. I am going to get tested today 12/18/2020 for covid

"Pt was ambulating through hospital cafeteria at approx 13:50 when she developed sudden difficulty walking, gait ataxia witnessed by nursing staff. States, ""It felt like the floor was rolling and I couldn't stay balanced."" Pt diaphoretic, hypertensive. No other focal deficits. On arrival to ED, pt continues to have gait ataxia, but no ataxia on NIHHS assessment. Denies headache. Received COVID vaccine at approx 1 pm today."

PATIENT REPORTS BLURRED VISION LASTING 1 HOUR APPROX. 2 HOURS AFTER INJECTION. INJECTION SITE SORENESS ON 12/16/20 AND CONTINUES TO PERSIST; NO SIGNS OF CELLULITIS. GENERALIZED MALAISE STARTED 12/19/20 AT 1000.

First day right after the vaccine the left arm was extremely sore, the next day I felt like I had the flu. body aches , headache, knees aching , abdominal pain, could not eat, lots of chill, breaking out in sweats .

Diarrhea the day I got the vaccine and 1 time the day after

Metallic taste, chest pain, coughing or throat clearing, bilateral arm numbness

Metallic smell. Started about 10 minutes after vaccine administration and occurred intermittently for about 30 seconds at a time every 10 minutes for almost an hour. Adverse effect subsided after about an hour.

Injection site reaction. Mild localized redness and swelling. Reaction occurred on 12/15, the day after receiving 1st dose of Pfizer covid vaccine. Day 4 12/18 injection site is circular redness, approx 2.5 inches in diameter. Mild discomfort, not painful not itchy. Have been applying over the counter 1% hydrocortisone cream with some relief.

After the patient received Covid vaccine, she started experiencing itching. The nurse monitoring the patient noticed she was scratching. The patient continued to itch during the 15 minute observations period but no other adverse effects were noticed. The observation period was extended to 30 minutes and then the patient was released. An hour after she left the vaccination site she experienced an episode of vomiting which resolved. Her husband noticed her to be pale upon returning home. Later that night the patient was visibly shaking and had another episode of vomiting. All symptoms have since resolved.

Symptoms began 30 min after vaccinated was tired then HAd fatigue. Took Tylenol/Advil. Fatigue persists > 24 hours Sore @ vaccine site. No induration . nl appetite. Increased fluid intake. takes Allegra + Flonase regularly. Recent sinus surgery in Oct.

AT 0600 WOKE UP NAUSEA THEN DRY HEAVES THEN VOMITING, VOMITED NUMEROUS TIMES THEN HAD EXPLOSIVE DIARRHEA, TOOK 25 MG BENADRYL ABOUT 1 HOUR AFTER TO MAKE SURE I COULD HOLD IT DOWN AND NOT VOMIT

I experienced a fever of 100.7 with it getting as high as 101, I have joint pains and body aches and pain at the injection site. Kinda the same as when I had Covid. I was only sick one day.

Patient stated that within 3-4 hours of receiving the covid-19 vaccine he began to lose his sense of taste and smell. Patient presented to ER (12-17) with his arm was hurting, headache, weakness, back hurting, and blood pressure was up. B/P was 204/112; pulse 84;resp 19; temp 102.4; Covid-19 test- negative. He had no sob or cough. Meds given:Tylenol tabs 650mg x1, Toradol 30mg iv x 1; NS 0.9% 1000ml iv, Tusssionex 5ml x1; Lopressor 50mg po x1, Patient released at 10:23am

within 5 min, pt reported feeling dizzy and lightheaded. No loss of consciousness. Pt also reports having eaten M and Ms as only food today. Pt happened to have a pulse ox on self (is an RT). SaO2 96% on room air, pulse 94. Pt given some trail mix and water and began to feel better. Upon standing pt reported not feeling well again and returned to seated. Pt then began with jerky muscular movements of upper extremities and stuttered speech. Pt states that this is how her PNES presents. No loss of mentation or consciousness. EMT team called for transfer to ER. Pt alert and oriented on transfer

Cough Muscle Ache Fatigue Lethargy Run Down feeling Chills

Itchy, Chest pressure on a scale of 1-10 rated a 3 down to a 2 after 2 minutes. Nausea and lightheaded Requested EMS to evaluate so EMS was called and Allergist presented. Remained stable throughout entire event. Allergist recommended triptophase lab be drawn to ensure that this was an actual allergic reaction. This was particularly to prepare for 2nd dose. Because of this patient was transported to ED and discharge within a few hours.

I began getting a headache about 1hr after injection. I also got very fatigued for a few hours. I took Ibuprofen to help with the headache and I took a nap to help with the fatigure.

Site injection reaction: light swelling with raised bump to injection site arm, with tenderness to light touch. Hurt to move arm.

After I woke up next morning, experienced dry cough.

30 minutes after injection, pt experienced tiredness. About 5 hours after injection, patient experienced severe nausea. Woken up out of sleep at 01:30 AM with body cramps (legs, arms). Severe soreness at injection site as well. Pt also experienced headache and nausea today (12/18) after taking Zofran, with no effect.

The employee was vaccinated yesterday and today has a severe headache with vomiting

my symptoms were chills, fever, muscle pain, my skin hurt, fatigue, only treatment was tylenol and I went to bed

Immediately after injection I felt a tiny pinch in what felt like my heart. I happened 2 more times within seconds and nothing else after that. I did not report this to anyone since it happened so quick and was over within a minute. I did stay a few stay in the area where I had the injection just in case. After about 15 minutes I left because I felt fine. No other effects afterwards.

Round 5:30 P.m. I started becoming nauseas, I had a terrible headache , OTC Ibuprofen did not help, nasal congestion ,, Only slept 2 Hours Wednesday night.. the next day 7am stayed in bed all day , headaches, congestion was worse. Could not sleep. Feeling better today but I am super tired 10/02/2020 Was tested for COVID-19 . The test was confirmed positive the next day.

metal taste, left left ear

In between my shoulder blades and back feels like something is there. I've got worse exp headaches have history of migraines in the past. In August 2020 was exposed to Covid 19 headache was worse than now. In the past have seen neurologist for migraines and not exp migraine felt like this in 5 yrs. On 12/17 body pain, headache, and high grade, diarrhea(loose stool) and fever 101.7.After checking temp on 12/18 was 98.8.Pt had to miss one day of work on 12/17.

Employee waited for 15 minutes after injection in the Department, 40 minutes after the employee left she called employee health and was instructed to return to the hospital ED if she was able. Dr. and the ED physician evaluated her. She had peri-oral numbness, and some cheek numbness, no motor deficits. SBP was 200 in ED. Single dose of Catapress and then improved B/P. D/C to home. 12/17/2020 - AM mild chin numbness - everything else resolved. B/P remained stable 12/18/2020 - resolved

Caller stated that 12/15/20 had pain in the vaccination area , headache and exhaustion that lasted about 24hours

Sore muscle around site of injection, starting the day after injection

Patient reports 1 hour post vaccination symptoms: jittery, feeling lousy. 12/18/20 Am reported bodyaches, red/watery eyes, chills, and blurred vision. States she can see better in dark than in bright lights. Previously hx of COVID 19 illness November 2020. Took Tylenol and Allegra 12/18/20. Reports improvement in symptoms 12/18/20 12:40pm but continues to report mild blurred vision. Advised to seek immediate medical care if condition not improved or worsens.

Not all or limited to: anaphylactic reaction: Feeling lump in throat, tongue feeling funny with numbness, feeling of hard to swallow, throat tightness, shortness of breath, tachycardia, tachypnea, pressure, tingling, and numbness from head to toe, dizziness/lightheartedness, cough, voice changes.

metallic taste

Hx COVID in June, with resolved problems. By 4 hours after inj adm had flu like symptoms. Took Tylenol prior to vaccination & now with bed. Swollen & redness (L) arm: 76cm began within 6 hours of vaccination. Diarrhea, now resolved. Txt with steroids - antihistamines.

day 1: none day 2: woke at 0530 with chills, general malaise & body aches, took ibuprofen, went to work, continued with same signs/symptoms, afebrile at 1430 - 98.0 degrees, sent home at 1500 day 3: woke feeling better

1208- Flushed/warm, scratchy throat. lethargy, decreasing oxygen saturation, placed on 4L NC, EMS called 1211- Diphenhydramine 50mg, Solumedrol 125mg, Epi pen injector adult 1231- EMS arrived, patient transferred to ER on 4L NC, SP02 94%

headache, pain at sight of injection, body ache, upset stomach, fatigue

felt some skipped heart beats about 2 hours after shot and then my arm has started hurting at site about 4 hours after

metal taste for approx 3 min

Patient began experiencing itching on side of cheek about 10 minutes after IM injection. Itching began to spread to face, then on to neck/chest area. Patient given 50 mg of benadryl PO and famotidine 20 mg PO. Symptoms have resolved within 20 minutes and will be observed for another 30 minutes. Patient counseled to inform primary care physician of itching event and to follow up with physician if any new effects arise.

She received vaccine at 2:00 pm. Around 3 hours after injection began getting a rash on her face that spread to other parts of body. Felt some tightness in her chest. She took Pepcid and 50 mg of Benadryl. Rash and tightness in chest improved. Began to come back around 9pm. Took 1 more 50 mg of Benadryl. On 12/18 she reported to Employee Health. Rash was still visable . 1-25 mg Benadryl was taken. She reported she would take 50 mg of Benadryl at lunch.

Hives, scratchy throat but no swelling or change in phonation

Headache and increased HR followed by dizziness (room spinning), and throat tightening. Evaluation in vaccination clinic revealed tachycardia and elevated BP. Brought to ER to monitor throat tightening. Upon trip to ER (roughly one minute), experienced nausea. Experienced chest pain after being admitted to ER, roughly 20 minutes after vaccination. Chest tightness and throat swelling lasted for roughly about 30 minutes. All symptoms subsided with the exception of the headache about an hour after injection. Discharged from ER and went back to work. Headache continued into the afternoon, along with general weakness.

Pallor, Diaphoretic, dizziness

Patchy Maculopapular rash starting in bilateral upper extremities, then radiating to trunk. No itch,.

Pt. expereince immediate swelling below injection site.

Tightness in throat, throat swelling, tachycardia. Treated with epinephrine IM x 1, benadryl, famotidine, methylprednisolone,

Headache, increased heart rate (115) for approx 30 min.

Numbness 20min after vaccine & persisted rest of day then 12hrs later pain @ site. Then redness @ injection site 16hrs. 3cm erythema & swelling deltoid to deltoid.

I didn't eat after because I lost my appetite. I was nauseous with chills , sweating and vomitting and tired.

"Patient initially felt dizzy which resolved after a couple of minutes. Patient stated she felt better, just ""tired"". She went to her locker, felt dizzy and went to Nursing office at 10:57 pm via wheelchair."

"Approximately 4 minutes after administration, patient complained of ""tightness"" in her upper middle quadrant of her stomach, near the xiphoid process. At that time her HR was 140. At 1840, her HR was

96. At 1844, patient had a red, splotchy rash on her neck. Patient received 25 mg of bendadryl. Patient noted that she was sweaty and she felt slightly dizzy, particularly when moving her head side to side. At 1847, patient's HR was 80. At 1852, HR was 84 and at 1858, HR was 68. Patient stated she felt much better, dizziness seemed to resolve quickly per patient's report. She was able to ambulate and turn her head side to side with no further difficulties. Throughout the episode, patient denied nausea, shortness of breath, itching, urticaria or any other rash besides the redness on her neck. After discussion with MD, RN and PharmD who were present for the vaccine administration and reaction, it was determined this was more than likely anxiety and not an allergic/anaphylactic reaction."

Patient c/o dizziness immediately after receiving the vaccine. She walked from the vaccine station to the waiting area and alerted staff that she felt dizzy. No SOB, no rash, no throat tightness. She had a similar episode in October. Recently increased Lisinopril dose. She was laid down on a stretcher. Vitals were stable. Glucose=105. Transported to ER for further work-up. Dizziness resolved prior to transport.

lightheaded,dizzy,increased heart rate, increased blood pressure

lightheaded,dizzy,increased heart rate, increased blood pressure

After the vaccine I'm fine for 5 mins but when I reached my car I felt a weird taste it's not bitter but it tastes like the outside of an orange and I still taste it today 12/18/2020, it feels like I have sand in my throat and I keep drinking water but it is not helping, my arm is really sore and I have jaw pain,

Patient developed hives on lower back to the side and left leg. 25mg of benadryl tablet was given in ER and later a dose of 500mg tylenol was given by patient herself at home. The next day patient reported woke up with joints stiffness all over whole body . Hives has been diminished by day 2.

At about 4pm, started to get migraine, neck pain, both sides of head. Took Tylenol. I was at work, finished shift. 12/17/2020 - 12/18/2020 still have migraine, both sides; 'feels different'. History of migraines. If worsens refer to ER

"Shortly after vaccine felt dizzy; nurse gave me water and a granola bar to eat. Employee took a bite or two and then felt dizzy. Employee sat down and blood pressure taken 170/ 80 and then 10 minutes later B/P 200/90. Nurse manager came and recommended employee go to ER for assessment. Blood sugar was checked and employee states ""they were not low"""

Tired

C/O Chest heaviness approx. 7 minutes after injection. Pulse=60 B/P 172/82

"Patient is a very pleasant 62 year old gentleman with a history of HTN, hyperlipidemia who presented with left facial numbness and left UE numbness. He states that it is worse medially on his arm. Present in upper and lower face. He states it started around 730 am this morning. He also notes intermittent ""foggy"" sensation since Monday associated with some blurred vision that comes and goes. Denies focal weakness, unsteady gait, difficulty with speech and swallow. He denies f/c, cp, sob, rash, pruritis, n/v/d, edema. He did receive the Pfizer COVID vaccine yesterday"

"Patient reported ""don't do well with injections"", she was escorted to the wait area. She appeared nervous and denied symptoms. After ~10 mins she because anxious, reported feeling light headed to employees. Patient was assisted to gurney in supine position, O2 applied via nasal cannual by employee, Patient calm and appears in no distess laying supine. She was observed for additional 30 mins. She voiced no complaints and was asymptomatic. She was discharged without difficulty or incident. Patient was instructed to request laying down for second injection."

Tingling in lips and left side of face felt numb 20 minutes after vaccine. No treatment, resolved in 3 hours.

metallic taste in mouth, stomach cramps resolved after approx. 30 minutes, and chills

Body aches, nausea, headache I took ibuprofen and it helped the body aches and headache but the nausea is still lingering.

About 5 minutes after receiving the shot I had an off taste that lasted for a few hours. Around 5 in the afternoon my body started to ache and swell around my wrist. Went to bed and work up feeling not very sore. Around 1 pm I noticed I had a huge nodule on my elbow. I get them occasionally but this was the largest one has ever gotten. I could feel it through my sweater. Wrist and ankles still sore more that normal.

metallic taste, fever

Burning in neck and arms, flushed, and skin pain through arms and neck.

left arm paid, headache and fatigue that about 48 hours.

"She had seven (out of 10) occipital face ""pressure"" of her right neck face .With 30 minutes of observation, pressure improved to 3 (out of 10). She had unlabored breathing and stable vital signs."

metallic taste, tingling of tip of tongue

12/16/2020 woke up at 10 am and had severe body aches, chills and HA. Took Tylenol and Ibuprofren. The fatigue and chill came back later that day. Symptoms didn't go away till went to sleep. Felt better on 12/17/2020.

Was monitored for 15 minutes with no symptoms. On my way home around 810 my left arm felt numb with some tingling to my left hand. By the time I got home it was about 830 and my left lower face and jaw felt numb and a little off. My face was still symmetrical and it was just in the lower left area of my mouth and jaw region. I took Tylenol and when I woke up my face felt normal. Since then occasionally I still feel tingling in my left hand.

Vaccine recipient reported becoming slightly lightheaded at the end of their 15 minute observation period following vaccination. The recipient was awake, alert, and oriented. Vitals were within normal limits. The vaccine recipient was offered water. During re-examination, vaccine recipient felt better with no medical treatment and was able to be discharged from the vaccine clinic safely. Next day on

12/18/2020, the vaccine recipient was contacted for follow-up and reported they were no longer felt lightheaded and just had mild pain at the injection site that did not interfere with activity.

Localized soreness, redness and swelling to site. Ibuprofen for pain

left arm numbness and tingling, aching forearm

1225: 25 min after Covid vaccine pt started experiencing itching to her neck, waist and arms. Her left arm where the injection was given felt heavy and fingers were tingling. She also felt like her top lip was swollen. Pt was given PO famotidine and 25mg of Benadryl. Spoke with physician and he also wanted her to have 25mg IM Benadryl. 1236: IM Benadryl given 1245: Feeling better. Itching improved. Lip doesn't feel as swollen. 1250: Dr in room. Continues to get better-itching still improving. Lip no longer feels swollen. 1255: Pt able to return to work at the hospital. Advised to go to the ER immediately if she begins to feel worse.

I felt a little lightheaded about 5 min after receiving injection, but thought it was because I hadn't eaten that much earlier in the day and it was dinner time. Stayed in observation area for 20 min with no changes. 10-15 min into my drive home started to feel like the back of my throat was scratchy and slightly numb. Had the sensation that a cholresceptic spray had numbed the back of my throat. A few minutes later the numbness spread to my tongue and then lower lip. I never experienced trouble breathing or swelling or rash. I meet up with some nursing/paramedic friends. I took 50mg of benadryl and a pepcid tab both orally. My symptoms didn't worsen and seemed to have resolved when I woke up this morning around 6 am.

10 min. after vaccination, pt felt lightheaded, dizzy, and queasy. Intense fatigue & blurred vision 20 min later.

Vaccine injection went fine it did not hurt at all, but I sat down for observation and within 2 minutes I felt mildly dizzy and then brief chest pressure and a wave of nausea. The chest pressure went away quickly but I was more flush then usual, about 15 min in my eyes felt watery and itchy. Went to ER to be observed, EKG came out fine. 118/72 HR 68 . Everything was fine. No meds prescribed, just observation, stayed about 90 min in observation by the time I eft I was just mildly nauseated. By the time I arrived home, 2 hours later all symptoms were resolved.

"at 12:55 pm ""enormous hot flash"", became diaphoretic, chest tightness, immediate need to have BM, ""uneasy"" feeling. Waited 40 minutes, then went to ED. No meds given. 1 Liter IV fluids given. VS monitored and within ""normal"" range. Cardiac enzymes and other labs drawn and within normal range. Released to self after 2 hours. Returned to work next morning."

Pfizer-BioNTech COVID-19 Vaccine EUA. Itching and redness on the chest, back and side

rash on face, chest, abdomen, warm and itchy skin blurred vision Itchy throat Took 50 Benadryl orally 2 hour post injection around 9p,.

Hives on trunk, thighs, and arms. They were very sore and itchy. Took two 25mg benadryl and the hives cleared up in 2-3 hours.

Caller stated that about 4:00 in the morning 11/17/20 she had chills and fatigue lasting about 8 hours.

Fever 101, Headache, body aches, increased heart rate 140-160, chest pain.

Tachycardia to 130s Fatigue, low grade fever

metallic taste

Patient experienced some facial swelling while in the observation area. Patient didn't realize there was any swelling until he looked in the mirror. He also reported feeling a little flushed and light headed. No diaphoresis noted. EMS called to assist, asked him allergic to anything, he said no known allergies but suffers a lot from seasonal allergies. I offered, and he took one 25 mg PO Benadryl with water @ 11:32 a.m. EMS took @ 11:33 BP: 160/110, HR 70, R 16, Pulse Ox 97% he said this BP was high for him. Second reading @ 11:44 BP 144/104, HR 62, R 16 Pulse Ox 97% Third reading @ 11:48 BP 130/88, HR 64 R 16 Pulse Ox 97%, vitals back to more normal for him. Glucose 77 @ 11:42. We kept him for 30 minutes post vaccination, and he was said he was feeling fine, no additional symptoms, swelling above eyebrows decreased and no more flushing symptoms. EMS offered to take him to the hospital, he refused said he was a physician and was feeling better after given the Benadryl.

Within 5 minutes of receiving the COVID vaccine, patient experienced face numbness, flushing of face, lightheadedness, nausea, elevated heart rate, elevated blood pressure. Patient had premedicated with 25mg benadryl 25 minutes prior to receiving the vaccine due to having had previous adverse reactions to vaccinations. At 1010, 15 minutes after receiving the COVID vaccine, patient was given Benadryl 25mg PO. She was then evaluated and monitored by her primary care physician.

Shot at 8:24, at 1700 left arm , injection site pain 6/10. 20:33 sharp joint pain to right knee and left great toe. Then over the next 30 minutes start to have chills, no fever and joint pain 9/10 to bilateral knees, hips, shoulders, elbows, wrists. 22:00 extreme fatigue as well. Slight HA 3/10. had difficulty falling asleep but once I did, was able to sleep thru the night. This morning Joint pain 5/10, fatigue 6/10 and HA 1/10. No chills or fever. injection site discomfort 2/10

28 year old female complained of feeling flushed and ?foggy? at 2:06 pm. Patient was placed on stretcher in the Fowler?s position. Vital signs taken: BP 141/91, HR 71, RR 16, 02 99% on room air. PERRL. Lung sounds clear, CV- regular rate and rhythm. Was directed by MD to give patient Diphenhydramine 50 mg IM. Medication was given in the left deltoid at 2:11 am. Patient tolerated well. VS re-checked at 2:13 pm- BP 134/92, HR 72, RR 16, 02 98%. Patient stated she was feeling drowsy and dizzy after diphenhydramine injection. Patient requested water and was given water at 2:15 pm. She then complained of feeling feverish. Temperature 99.4. VS re-checked at 2:16 pm BP 134/73, HR 72, RR 16, 02 98%. Patient continued to be monitored with improvement in her symptoms, vital signs as follows: VS at 2:22 pm BP 133/91, HR 72, RR 16, 02 98% VS at 2:28 pm BP 129/96, HR 72, RR 16, 02 98% At 2:34 pm patient stated that she was having some difficulty taking deep breaths. Stated she was not

short of breath. Denied chest pain. MD was called over to assess patient as well. MD evaluated patient and patient?s symptoms improved. Was instructed to continue to monitor patient. VS at 2:35 pm BP 129/96, HR 73, RR 16, 02 98% VS at 2:58 pm BP 124/90, HR 70, RR 16, 02 98% At 3:04 patient stating she was feeling better, but was drowsy from the Benadryl. VS at 3:05 pm BP 117/80, HR 69, RR 16, 02 98% 3:10 pm Dr examined patient with ok to leave for home. Patient agreeable with plan. Educated on red flag s/sx and when to call 911. Instructed patient that provider will call her tomorrow for follow-up. Patient left clinic in stable condition with boyfriend driving her home.

I was at home night of 12/16 ex headache, chills upon checking temp 99.3. My arm was swollen and couldn't move my arm .I took Ibuprofen 400 mg and went to sleep. On 12/17 felt like flu symptoms and voice raspy sound and took 400 mg Ibuprofen. Then 12/18 today felt better and gaining voice back.

Headache that began at 8:00 pm on the night that the vaccine was given and mild pain and swelling at the injection site. Headache has not gone away (and she does not describe as a migraine).

"Within 2 minutes after injection, patient started to feel very hot and with increased heart rate. Pt states that she feels ""tingly"" and is tearful. Pt denies difficulty breathing. Patient then started to have a red blotchy rash on her neck and chest. No redness at injection site. Pt brought to Emergency room for evaluation/observation. Pt able to talk in full sentences. Pt states that she has a history of anxiety and has gone into SVT because of anxiety in the past. Pt received steroids in ER."

After the shot I felt dizzy, sweating profusely, felt throat tightness, my heart was racing. They gave me an epinephrine shot in the leg and I was sent to the ER at Hospital. By the time I got to the ER m symptoms were gone. They did monitor me, put me on oxygen and hooked me up and around 2:45 I got up to use the restroom and they did not have to hook me up anymore. I took the day off because after the Benadryl and epinephrine I just feel groggy for about 24 hrs.

metallic taste

Tingling lips and tongue. Symptoms have started to resolve on their own.

"Patient reported being nervous about getting her vaccine. Denied any current medical issues on her pre-vaccination questionnaire. During her observation period. Patient stated that she felt her ""throat was closing"". Pt assisted supine. Epinephine and Benadryl given IM. Emergency protocol implemented. Dr. present. No hives, wheezing, or swelling noted. After treatment pt stated she is getting worked up for WPW syndrome. VS stable. Pt transferred to ED for monitoring 1040."

About an hour after vaccine, felt itchy inside, watery eyes and congestion - treated with 25 mg Benadryl. No anaphylaxis

I received my vaccination in my left deltoid. 3 hours post-vaccination I developed swelling around my right eye. Vision was in fact. No other symptoms, I did not take anything to treat it. It is still present 1 day later, but seems to be improving on its own.

5 min into the vaccine my heart began to beat faster. 30-40min later I began to have heart burn (mild midsternal chest pain) that lasted 3 hrs. I also have mild body aches and pain at the insertion site.

Headache, sweats, low grade temperature (99.3), fatigue, and myalgias. These resolved within 24 hours with two separate doses of 650mg tylenol, but the fatigue persisted for 48 hours.

12.17.20 around 2:00pm, my stomach started cramping, I had diarrhea, started cramping up really bad, got home and had diarrhea episode 5-9:00pm. Body felt hot, i did not have a thermometer to check my temp. Woke up around 6 am, and had another cramp and diarrhea episode, and had one every other hour. Today, 12/18/2020 from 10am -3:30, I have not ate anything. Last episode has been at 11:00am. I am scared to eat and I am still experiencing cramps. I have the feeling of nausea that comes and goes. I had to miss work due to the events of my illness.

12/17 at 2?3 pm- Had a mild headache that progressed to severe within an hour. Became diaphoretic, felt dizzy, nauseated. Had GI distress and vomiting episode. Medicated with Tylenol and slept for 8 hours. 12/18 feel back to normal. No fevers

The patient began experiencing a fever of 102.7, body aches/back pain, fatigue, and headaches the next morning after receiving the vaccine. She denies any respiratory symptoms. She tested positive for COVID19 on 12-01-2020. She was advised to remain off duty for 3 days, which accounts for the time period that these adverse effects have been observed per CDC data. If symptoms worsen, she was instructed to please follow up with a physician and to quarantine according to CDC guidance.

injections site pain, chills, headache, nausea

Symptoms developed the night of the vaccine. Fever, 100.1, Joint pain, Muscle pain, headache, dizziness (intermittent), chills, feeling unwell, currently taking Tylenol, still has symptoms. Will send to physician

Right ear felt hot and had metallic taste. Felt shaky

I felt a little bit dizzy and tasted like saline in my mouth. I kept feeling dizzy, like I had a brain fog and felt lightheaded and nauseous, I started having tunnelling vision, my BP as high, I got confused and nauseous, had headache and was sent to ER to be observed. Had fever last night and still feel weird and still have headaches, treating it with tylenol. Took the day off from work since symptoms did not subside.

Recipient felt hot and described 'lump' in throat feeling for about 3 minutes

Pfizer BioNTech COVID Vaccine EUA -- Nurse gave undiluted 0.3ml dose of vaccine out of vial without diluting it

Pt with h/o of multiple environmental allergies plus latex. Received vaccine at 1115am and reported itching eyes and itching ears at 1129am. She was escorted via wheelchair to the ED for f/u treatment.

metallic taste

Excruciating headache upon waking up 12-18-2020 at 0800 along with vomiting . Took Tylenol and Fell back asleep for 4 hours which I never do. Feeling very tired today but functional.

Took the vaccine at 2:55 pm on Dec 17th. Went home at slept at 8:00 PM, felt fine. Woke up at 12:00 AM feeling low-grade fever, tired, mild headache. Took 15ml day quill 40 minutes before going to doctor's office at 2:30 PM on Dec 18th. Calculated temperature was 100.5 at the entrance. Heart rate was 122 inside the office. No treatments/medications given yet.

"Itching to hands, feet, ears. ""Tight"" feeling to skin of face. Given Zyrtec and solumedrol"

Patient reported feeling hot shortly after receiving her vaccine with an itchy arm. We provided and ice pack and laid her down on a stretcher. Patient became slightly erratic and we proceeded to wheel her down to ER. ER summary below. ED Course: Patient's pertinent past medical, social, family medical history were reviewed from both the nursing notes and the electronic medical record. This is a 27-year-old female with a past medical history as above presenting with a chief complaint of concern for urticarial rash in anaphylaxis following a COVID-19 vaccination. á I did speak with Occupational Health who stated that this patient is well-known to the hospital, stating specifically that she becomes very anxious with vaccinations/needles and breaks out in hives on previous injections. This information was given to his after her initial presentation. Patient had already been removed provided epinephrine given concern of possible anaphylactic reaction given her area, diaphoresis, pruritus and diffuse urticaria. á I was called into the room multiple times as patient continued to ask to be discharged. I did have multiple conversations with her in regards to need for continued monitoring given possibility of anaphylactic reaction. She feels that this was due to her anxiety and states that she is completely asymptomatic and at her baseline at this time. She once again is asking to leave. I did discuss my recommendation for continued monitoring as well as the risks of leaving without continued monitoring. The patient is able to choose, communicate and make choices clearly and understandably. The patient is able to understand risks, benefits and alternatives of therapy explained by myself. The patient can make a logical and rational decisions according to my assessment. The choice made by the patient is consistent with the patient's values and is consistent with character and decision capacity in the patient's past, according to friends and family present. There is no impending medical risk to this patient to warrant my holding the patient against their will. á Patient will be discharged in stable condition at this time with strict return precautions and instructions for close outpatient follow-up. She was provided EpiPen given possibility of anaphylactic reaction in the future.

R arm numbness, tingling sensation and rash

"Caregiver received first dose of Pfizer COVID-19 vaccine. After 10:00 minutes of observation phase, patient c/o lips tingling and ""on fire"". Lips not swollen, denies SOB, skin WNLs, denies difficulty swallowing. MERT called. Patient assessed, states tingling 8/10, no other symptoms. Patient given bottle of water and tolerating that fine. Allegra 60mg ordered and administered at 8:52am. Patient statedwas at a 2/10 10 minutes after getting the Allegra. Patient drinking water without difficulties. Patient remains without further symptoms, lips still 2/10 with tingling. Outpatient labwork ordered. Left at 1000

ambulatory to outpatient lab. Educated her to notify administrator of her symptoms prior to her second vaccine."

28 year old female returned to observation clinic at 11:18 am stated that she was feeling flushed again. She stated symptoms are similar to her symptoms she had yesterday. States symptoms started 5 minutes after returning to work and donning her PPE. States she had the COVID-19 vaccine at 9 am on 12/27/20. She states she feels like she has ?flu-like symptoms?. Patient was placed in wheelchair. Vital signs taken: BP 118/80, HR 108, RR 22, 02 98% on room air. PERRL. Lung sounds clear, CV- regular rate and rhythm. Patient was wheeled to the audiology room to be monitored with provider and MA. VS re-checked at 11:28 BP 121/88, HR 88, RR 18, 02 98%. Patient began to complain of feeling feverish and ?foggy?. VS at 11:35pm was 127/91, HR 97, RR 20, 02 97%. Patient was given Diphenhydramine 50 mg IM. Medication was given in the left deltoid at 11:36 am. Patient tolerated well. VS re-checked at 11:38 pm- BP 118/82, HR 104, RR 22, 02 98%. At 11:40 lung sounds clear, HR regular. VS re-check at 11:48 BP 132/65, HR 71, RR 16, 02 99%. Patient stated she was feeling better.. Consulted with Dr. who also evaluated patient. Ordered CBC and CMP. VS at 11:53 BP 122/90, HR 82, RR 18, 02 99%. At 11:58 lab tech came and drew CBC and CMP. Patient tolerated well. VS re-checked at 12:15 pm BP 109/75, HR 91, RR 20, 02 99%. Dr. ordered EKG at 12:22 pm. EKG NSR. Labs resulted and were unremarkable. Patient stated she was feeling much better. Was assisted to the bathroom at 12:28 pm. VS re-checked at 12:32 pm BP 108/74, HR 86, RR 20, 02 99%. Dr. reviewed EKG and labs and orders to release back home. Patient agreeable with plan. Educated on red flag s/sx and when to call 911 Patient left clinic in stable condition with co-worker driving her home.

Vomiting, lightheadedness, floating feeling, nausea, tachycardia within 15 minutes of vaccination

Vomiting, lightheadedness, floating feeling, nausea, tachycardia within 15 minutes of vaccination

12/16/2020 @7:00pm caller started feeling flush with hives and nausea. Caller took Ibuprofen and next day got relief.

Dizziness, Rapid Heart Rate

Hot, flushing, tingling, metallic taste, pounding heart rate.

aproximately 10 minutes after vaccine taken, I developed problems with my vision. I had double vision, and Kaleidoscopic vision with floaters in both eyes . Lasted about 30 minutes. Did not keep me from reading or walking. no pain.

Nausea, vomiting x 3, and hyperglycemia (BG: 350s) 30 to 60 minutes following 0.3 mL IM injection of Pfizer-BioNTech COVID-19 vaccine in the left deltoid.

fatigue, headache

Shortly after receiving the vaccine I experienced a warm sensation near my sternum. The sensation was internal and radiated from my left side to my sternum. I also felt slightly dizzy, but it eventually resolved. In the evening (7:00 pm) I felt fatigued and experienced headaches, body aches and pain in my left arm.

It was painful to move my left arm and difficult to put clothing on. It is still painful today (12/18/20), but I'm managing it with Tylenol.

metallic taste - like pennies

severe flushing and complaint of hot ears. tachycardia on monitor

Flushing, hot flashes, elevated heart rate and high BP (never have a problem with that), Evaluated at the ER and received Benadryl immediately. After coming home (discharged around 1:30), felt fatigued and started with a mild headache. Also joint pain in my hips and my knees. Woke up this morning pretty fatigued and with headache feeling better this afternoon. Still have a mild headache.

Tongue swelling, seen in ED and discharged. Works in hospital ICU and will continue to monitor during shift.

Patient felt flushed with tenderness at the vaccine site. Patient remained under observation for 1.5 hrs and then felt well enough to leave without further care.

After the vaccination I got really fatigued and nauseous but it resolved the next day

Itching on arms, face, back, eyes. Mild raised rash on upper back. Face flushed.

Dizziness started 30 min after vaccine administration last for a few hours, also started feeling palpitations and noticed pulse to be 100-110s. 6-8 hours after the vaccine I started feeling chills and myalgia and some chest tightness. The next morning woke up with chills and rigors and severe body ache that made me unable to go to work. The entire day I have felt fatigue, abdominal pain and nausea. Taking Tylenol and my Salbutamol inhaler helps me.

"Pt was being observed in hospital for reactions per Dr orders due to Pt's history. Pt reported ""itchy"" feeling at 9:50am. At 10:20am Pt reported generalized ""itching provider notified at 10:34. 11:05am Pt received Benadryl at this time Pt had itchy watery eyes and generalized itching. 11:50 Pt sleepy but ""itching better"" dr notified and Pt returned to Assisted Living."

Patient felt dizzy approx 10min after vacciantion. Patient drank some water and layed down for 15min and sx resolved.

Tongue and throat swelling about 30 minutes after receiving vaccine. Took Claritin about 15 minutes after onset of symptoms. Symptoms mostly subsided about 1 hour after taking Claritin. Slight throat swelling and difficulty swallowing until a dose of Benadryl was taken the following day.

Swollen lips Nerve pain -sciatic Body ache Fever Headache Chest tightness Back pain Rib pain Cold then hot in waves Burning eyes Swollen lymph nodes in throat Joint pain Kidney pain Short of breath Fatigue Trouble sleeping Mental focus off

Palpitatations, shaky, lightgheaded, irregular heartbeat

Tingling in left arm, hand and fingers

Approximately 15 minutes after receiving the Covid-19 vaccine, I started to feel a tingling in my throat. It prompted me to repeatedly try to clear my throat. I then felt a sensation of my throat getting tight mildly restricting my airflow. Next my throat became sore. I experienced pain when swallowing. I then became hoarse and lost my voice for about 8 hours. Currently (19 hours after receiving vaccine), I am still experiencing a sore throat, but all other adverse effects have since resolved.

At 10 minutes post vaccine developed itching. Then became flushed and dizzy, then developed diffuse hives.

Caller stated that after vaccine about 12 in the afternoon she felt nausea, fatigue and a headache. Caller took the Zofran and slept for 20 hours and felt better.

Patient received IM vaccination. Was observed for a period of 15 minutes with no symptoms and was released. Had no symptoms but started developing numbness and tingle sensation in left arm. Patient felt cold sensation in left arm. Patient is being monitored for signs and symptoms in observation room. Will council patient on reporting to primary care physician. Will continue to monitor patient until resolution of numbness. Currently, patient does not feel any coldness in left arm anymore and is starting to feel normal.

"5 Minutes after vaccine, patient said she started feeling really hot and nauseous. All vitals stable. No other symptoms at that time. 15 minutes later, she said she was feeling ""out of it"" and it was hard to re-call names, she had a metallic taste in her mouth. Attending doctor on duty came to assess patient, emergent care was not deemed necessary. Vitals remained stable. 30 minutes after vaccine, she said her joints were starting to get achy. Since we are a pediatric hospital, I told her she should be seen at a higher level of care facility, she refused. She was monitored for 2 hours, after that she was better. At 12:30, 2 hours after vaccine, she said she was felt much better and her mind was much clearer and her other symptoms were much better. At 3, she said all her symptoms were gone, she was just tired. She got into contact with her Lyme Disease Specialist and they said it sounded like an autoimmune reaction, but they would still like her to get the second dose in 21 days. I will remain in contact with patient to ensure she does not have other adverse effects."

Patient became light headed and dizzy, patient stated often reacts this way after injections. Minimal po intake prior to immunization. Patient laid flat on the floor, drank 10 ounces of water, 4 oz. Orange juice. BP went from 94/50 to 108/62 ten minutes after first measure. Prior to leaving BP was 110/64, pulse 64 and patient reported no symptoms. Patient refused transfer to ED and felt fine prior to leaving after 30 minutes of observation. She left in care of two co-worker RNs feeling asymptomatic and ambulating independently.

patient got hives on the left arm that began 5 minutes after vaccination on her right arm

Fevers, Chills, dizzy body aches, pain and swelling at the injection site

About 1.5 - 2 hours after receiving the vaccination I felt very dizzy and disoriented. This was around 11:00. Around 2:00 I was still feeling disoriented, so I went to report it to my doctor. They took my blood

pressure, temperature, and observed me for 30 minutes. My nurse had reported that my BP was high. After 30 minutes they took my vitals again and my BP was still high. Today on 12/18 I got my blood pressure done at 10:30 AM and my nurse had reported that my BP was still fairly high. 144/88. They then took my BP manually and it was 138/82.

She felt a little warm in the chest and stomach area. She felt her heart was racing. She didn't have shortness of breath or difficulty swallowing. She felt it was the same reaction as when she had her TDap vaccine

She felt a little warm in the chest and stomach area. She felt her heart was racing. She didn't have shortness of breath or difficulty swallowing. She felt it was the same reaction as when she had her TDap vaccine

Tachycardia, chills, nausea, and light headedness

diffuse itching immediately after injection

Dizziness, numbness and tingling bilateral legs and arms, developed after 5 minutes of vaccination. Vaccine at approx 1:00 PM, 1:05 dizziness, 1:07 numbness and tingling legs, spreading to arms. Denied SOB, chest pain.

Itchy all over body.

Metallic taste in mouth

Body pruritus, generalized, diarrhea Treatment: Benadryl 50mg Solumedrol 125mg Pepcid 20 mg

Swollen lymph nodes, sore throat, flank pain, aching joints, dizzy, feeling faint, fatigue, back pain, diarrhea

PT RECEIVED COVID VACCINE. WAITED THE REQUIRED 15 MIN OBSERVATION TIME. AFTER THE 15 MINUTES PT STATED SHE NOTICED SOME LIP SWELLING AND THROAT TIGHTNESS. PATIENT ALERTED STAFF. PT ASSISTED TO SITTING POSITION. PT REFUSED TO LAY DOWN. BP AT 1233 WAS 160/102 HR 99. PT VISABLLY SHAKING. PT STATED NO DIFFICULTY BREATHING. PT ADMINISTERED 25MG IM BENADRYL PER EMERGENCY ORDERS AT 1235. BP BP AT 1238 WAS 150/91 HR 80 SAT 96. CALLED TO PATIENT. NO INCREASED SYMPTOMS. PT WAS TOLD TO STAY TO BE MONITORED FOR FEW HOURS. RECHECKED PT AFTER 15 BP 151/76 HR 90 O2 100% ON RA. AT TIME OF THIS ENTRY PATIENT NO LONGER COMPLAINS OF FURTHER SYMPTOMS AND IS IMPROVING.

Throat tightening and patient started to tremble 30 minutes after vaccination. Also became tachycardic. Patient was treated with methylprednisolone 80 mg IV x 1, famotidine 20 mg IV x 1, and diphenhydramine 50 mg IV x 1.

Fever (temp 101.1) and headache for 8 hours

Flushing of face, mild headache, blotchy skin on truck (front and back), upset stomach Gave Benadryl 50mg at 11:15am Symptoms not progressing

Angioedema

nausea, headache, rash, hot all over

1020 Dizzy and lightheaded after she sat down for observation time. After 5 minutes complained of tongue tingling. No SOB , no swelling of the throat or lips. Vital signs normal. Injection site , no swelling or redness noted. Water was given to drink , no adverse reaction. 1040 Tongue tingling resolving. Vital signs normal. 1100 All symptoms resolved and she was released to return to work per Occupational Health Nurse.

5 minutes after receiving vaccine I felt like I was going to pass out. They took me to the ER. Heart rate went up to 160 at one point. Was given steroids, Benadryl, and Pepcid and that helped. This helped and then heart rate went up again. Tremors and BP was up.

diaphoresis, pallor, nausea, vomiting over 20 minute period

Metallic taste, headache

Rash and tingling lips approximately 40 minutes after Pfizer-BioNTech COVID-19 vaccine 0.3 mL injected IM into the left deltoid. Presented to ED to report symptoms. Symptoms mild enough that patient did not want to have any interventions. She just wanted to report them for tracking purposes. Instructed to return in symptoms worsen or if new symptoms develop. Patient did not return, so assuming no new or worsening symptoms.

Rash and tingling lips approximately 40 minutes after Pfizer-BioNTech COVID-19 vaccine 0.3 mL injected IM into the left deltoid. Presented to ED to report symptoms. Symptoms mild enough that patient did not want to have any interventions. She just wanted to report them for tracking purposes. Instructed to return in symptoms worsen or if new symptoms develop. Patient did not return, so assuming no new or worsening symptoms.

I initially had to sit down for about 15 min and felt my mouth dry, my tongue was kind of tingling, not swollen. I was checked for anaphylactic shock. I felt like an adrenaline shock, and felt my heart racing, my BP was high - stayed in the ER for an hour for observation. I felt the same kind of sensation when I had COVID in July. This morning, had chills early in the morning around 1AM but it is all gone now.

Hives, itching, warmth on bilateral face and neck and chest. Tachycardia. Facial swelling.

Chest tightness, sob, tachycardia Treatment: Benadryl 50mg Solumedrol 125mg

Patient reported numbness and tingling on the tongue 5 minutes after receiving the COVID-19 vaccine, she has a history of anaphylactic reaction to sulfa, epi pen administered at 13:50pm. Took by ambulance to emergency room at 14:10pm today

Shingles-like rash on torso and back with burning sensation and nerve pains. This began approximately 30 hours post vaccine administration. Patient has not yet received treatment for this rash however intends to go for treatment in the next day.

Vaccine recipient reported bilateral hand tingling (paresthesia) in fingers shortly after vaccination. Vaccine recipient was sent to the ED for further evaluation. She reported to be also feeling anxious. She was alert and oriented to person, place, time, and situation. No focal neurological deficit. After re-evaluation, her condition was improved/stable and was subsequently discharged to home the same day. Followed up with the vaccine recipient the same day. They are resting comfortably at home and reported that symptoms have resolved.

pt reports approx 4-5 hours after injection, low grade fever (Tmax 100.4), +emesis/vomiting, generalized body aches. pt reports resolved as of 3:00 pm on 12/18/20.

12/16/2020 five hours after the injection Pain at the injection site no redness or swelling, intense soreness, shortly after severe chills, shaking, without fevers, myalgia every muscle in my body was sore and heavy feeling and was difficult for me to walk or move and had to hold on to things to walk, intense fatigue I should not have tried to work and 36 hours later I felt better, I never felt hot and this morning 12/18/2020 I felt recovered 90% with mild lower extremity pain

local erythema and raised skin at site of injection measuring 5x4x1cm, non tender, mild warmth to site. No pain, loss sensation, no loss strength, no LAD axilla or chest, normal ROM, no tenderness to this site. NO constitutional symptoms and the patient was unaware of a local skin reaction.

"About 20 min after injection she reports feeling flushed, heart racing. Face, neck chest and upper arms are red and warm to touch. Initial Vs-198/106, HR 113, SpO2 100% on RA. Lungs CTA. Given 25mg Benadryl with HR decreased to 100 and BP 161/92 after 25 minutes of observation. Left after 30 minutes of observation to return to work, stating ""I feel much better""."

Individual started to feel light headed, tongue felt numb, felt hot. Skin had some light-red blotches around collar-bone.

Patient reports rash and burning sensation to face and some discomfort at neck. Claritin and ibuprofen OTC and if any worsening symptoms, instructed to report to the ED.

Pt complained of dizziness. Headache pain 7/10. flushing and fatigue. BP was 207/120. Pt sat down in treatment, She took 650 of APAP. She eventually had to lay down. Eventually she seemed fine but was recommended to got to the ER. Pt went to ER, got a ketorolac shot, and BP was down to 130/100.

Radiating pain to neck and back. Felt like a flare up myalgia. Also headache, nausea and feeling very dizzy .

Dazed look with nausea and dry heaving; staff standing near her said she looked green

Body Aches, Headache, Congestion, Fever, Right Eye Swollen

10 minutes after the administration of the vaccine, the patient complained that she felt very hot. She was visibly flushed and diaphoretic. She developed nausea. At 1532, BP 142/94, P88 and O2 sat 100%. She was given cold water to drink and monitored. At 1540 BP 144/93. Applied cool compresses to forehead and neck. Patient continued to drink cold water. Continued to monitor patient. No further nausea. At 1555 BP 135/87. Stated that she felt much better but still felt a little off. No longer flushed or hot, no longer diaphoretic. At 1604, stated feeling even better. BP 119/87. Walked around a bit with patient and she stated she felt ok. No further symptoms. At no time did she have any rash or respiratory issues.

A few minutes after vaccine was given patient notes numbness in L thumb then L arm felt heavy and slightly numb; This resolved completely within 30 min

"Patient described ""pulse like stinging"" at injection site shortly after injection and continued through the 15 minute observation time."

Patient felt light headed; tingling all over body which resolved within 30 min

Rash and itchiness

About an hour after the shot my face felt flushed and itchy. When I looked in the mirror I saw raised, bumpy rash on both cheeks, left for than right side, on both ears. I took benadryl and tylenol - for my itch and generalized malaise. Next morning rash spread to my neck and left antecubital. Rash on my arm continues to spread and is as itchy as poison ivy.

sob, nausea, malaise, vomit, chest pain, throat tightness

numbness in left jaw; seems superficial; feels like local anesthetic

Couple of hours after started feeling body aches, chills, subjected fever, never had a response like that to a previous vaccine. Took some advil, feel about 95% better now.

"Upon conclusion of the 15-minute observation period, when asked how he was doing, he said he felt fine but that he noticed a ""tingling sensation"" of his left (injection) arm and left leg. He was offered the option to stay for further observation, but repeated that he otherwise felt fine. He was contacted on 121820, and he reported resolution of symptoms without intervention."

12/16/2020 I experienced severe body aches and chills, severe headache, and I had a low grade temp about 95 instead of 96, I did have dizzyness about an hour after the shot and I developed a cough about 6 hours after shot, fatigue and wore out from the chills and body ache I alternated ibuprofen and tylenol for 24 hours. Today 12/18/2020 the cough is gone and I feel better

Resident became short of breath 7 hours after vaccine, went to hospital, was COVID+

Woke up the morning after the vaccine with light headedness, chills, body aches, headache, nausea.

"A 56 year old FEMALE who has been waiting at monitoring area after Covid 19 vaccination, provided called to evaluate patient c/o: Chief Complaint: Patient was being checked at 1039 for final 15 min wait time after Covid-19 vaccine. Patient states she is feeling light headed and nauseated Doctor was informed. Took patients vitals. 11:06 patient was put on 6 liter of O2 with face mask 11:08 patient was out on to 4 liters 11:10 patient states ""I'm feeling better, flutter in my stomach"" 11:17 Doctor instructed RN to give Solumedrol (IM) injection to patient 11:22 Patient states ""I'm having a heartburn feeling, tightness in my chest. I put patient in a sitting position. 11:31 Patient states ""I'm feeling better"" 11:35 Employee came and gave patient solumedrol injection (IM) RT Deltoid @11:36 11:41 Patient states ""I'm feeling better, heartburn is going away slowly, I can breath now"" 11:49 Patient states ""I'm feeling better"" 11:50 Doctor states ""I will be putting in an order for epi pen for patient and she can pick that up from pharmacy when she leaves"""

Racing heart rate, 101 at rest, palpitations

chills, muscle cramps, headache, and low grade fever 99.8

caller stated that she had fever, chills, vomiting, diarrhea and fatigue. Caller took Tylenol and slept for 20 hours and awoke this morning feeling rested.

extreme runny nose, occurred immediately after injection

Body Aches, Headache, Chills, Congestion, fever started on 12/18/2020 at 0300 AM Itching - right after injection given Benadryl and pepcid 15 min after the vaccination

Dizziness, nausea, dry mouth; felt hot; later developed chest tightness sour taste in mouth; rapid heart rate; tingling on same arm vaccinated (L arm) some numbness in same arm L arm; felt shaky for 15 min; Blood pressure elevated

I had a fever of 100.5 and migraine and a sore throat.

Severe headache onset, mild muscle aches, and fatigue starting 6am, the morning following vaccine, diminishes with ibuprofen and Tylenol but does not go away. Still ongoing at 4pm the day following vaccine.

tachycardia, flushing, severe hives on arm received vaccine, dizziness, palpitations

Day following vaccine, fever, sob - went to hospital, COVID+

severe body aches, rigors, fever, headache, joint pain,

metallic taste, sob, joint pain, cephalea tx: solumedrol 125mg Benadryl 50mg

Throughout the day following vaccination, I have felt extremely sleepy, fatigued, with generalized muscle soreness.

developed itching, nausea, light headedness - required transfer to the ED for observation

Head felt like she was swimming, headache, heaviness in chest, lump in throat, BP spiked then dropped, Fainted - was given benadryl by mouth and Solumedrol IM

Patient developed shortness of breath, cough, chest tightness, and tachycardia

"A 54 year old FEMALE who received Covid 19 vaccine today and c/o ""lightheadedness and puffy/itchy throat a few minutes after injection"" while was on monitoring area after vaccination. Nursing note:11:16 I was told by co worker that patient was going to need vitals, so I took vitals notes given to me: throat tingling/tightness, light headed, nausea, allergic to aspirin 11:17 staff gave orders to RN to give Solumedrol (IM) to patient. she took patient information to get medication 11:26 patient states ""I'm feeling okay"" 11:32 patient states ""I'm feeling good"" 11:37 RN gave patient solumedrol (IM) injection to patient on left deltoid @11:38 11:42 patient states ""my left arm hurts"" 11:47 Patient states ""my left arm is really hurting after that injection"" pain scale 10/10 11:50 staff states ""I will be putting an order in for epi pen and to pick up at pharmacy"""

blister at site of injection tiredness tx: tylenol

Patient received injection at 14:05 at 14:12 he reported not feeling well. Patient was diaphoretic, clammy, pale, described the inability to see, had difficulty following commands. Patient transferred to gurney with max assist and transferred to E.R. Patient symptoms resolving during transport. Left patient in E. R. care at 14:15.

pain at injection site mild, nausea and vomiting, body aches, migraines,fatigue

Headache, body aches, fatigue, malaise, chills starting about 12-18 hours after. Symptomatic relief with Tylenol 500 mg PO q6h helpful. Symptoms were self-limited by 48 hours post-vaccination.

Rash started on scalp and then trunk and arms. itching all over body

I felt kind of like daze and light headed 10-15 min after the vaccine. The remainder of the evening felt fatigue also felt pain at the injection site on left arm . On12/16 left arm was still hurting and wasn't able to participate physical activities couldn't go to the gym.

Pt received Covid 19 Vaccine on 12.18.20 at 10:46am in Right Deltoid. Pt presented to the ED at 1:50pm with suspected throat swelling. Denies itching, redness or tongue swelling. Treatment: Epinepherine 0.3mg SQ- 1:55p Benadryl 50mg/IV- 2pm Methylprednisolone 125mg IV- 2:02p Pepcid 20mg IV- 2:06p Discharged at 3:53pm with all symptoms resolved. Pt prescribed an epi-pen

Notes 12/18/2020 á á á á Subjective No chief complaint on file. Encouraged to eat and drink prior to next immunization. á

Red neck and face 10min after injection lasting 15-20min Short episode of self resolving tachycardia

throat swelling, heart palpitations, trouble swallowing

Moderate left arm pain throughout the whole arm, feeling cold in the arm. The patient has normal pulses, normal motor and sensory function.

My left arm has had pain and still hurts today. It's hard to use it to dress and undress. I got a fever that would not come down and the worst heachache that felt like a migraine and I never have ever had one before, body aches, joint and muscle pain, fatigue and I couldn't stay awake , nausea, upset stomach with diarrhea within 10 or 15 minutes of getting the vaccine. It felt like a really bad flu that lasted 8 hours.

Patient received COVID-19 Vaccine 12/17/2020. Upon waking 12/18/2020 around 8am noted swelling, itching, and redness in face. Denies any shortness of breath. Patient seen in clinic and given benadryl 25mg at 1230pm. Symptoms improved.

Patient came over and advised me he felt like his throat was swelling and he was having a little difficulty swallowing. He was able to drink water which he thought helped. He was given Benadryl 50 mg IM. Symptoms resolved completely.

chest pain on right side immediately after vaccine administered. nausea, headache, right side neck stiffness

Pfizer-BionTech COVID 19 Vaccine EUA. Received injection one in right upper arm. One hour later started to experience some nausea and mild headache. Within several hours later, headache throbbing, nausea worsening with vomiting. Eight hours later, right arm throbbing, pain going up and down arm. Hand and fingers throbbing. Pain in back of head, neck and down back into right hip. Nothing relieved pain or nausea. Tried ice packs, cool rags, motrin, tylenol, maxalt, zofran. 24 hours later, still have symptoms, not as violent, but pain and throbbing continue and unable to eat or drink anything.

nausea, low grade fever, weakness

Shortness of breath and throat tightness 45 minutes after injection

metallic taste, could not swallow

65-year-old female received COVID-19 vaccine at the Urgent Care Center. She waited around 15 minutes after the vaccine and had no reaction. About 10 minutes later while in her car she noted a numb feeling of her tongue and that the tongue felt swollen but was not necessarily swollen. She subsequently felt that her lips were tingling and had swollen feeling. She returned to the facility and was given an EpiPen shot at around 10:15 AM. Patient was transferred to ED via ambulance. Gradually the symptoms resolved and was discharged from the ED in stable condition

Patient experienced redness, itching at the injection site with tingling through fingertips within about 10 minutes of receiving injection.

"t 3am she woke up and noticed some facial tingling on the ride side that felt like ""pins and needles"" - she reports like ""when you get a numbing shot at the dentist"". She also had some right arm and right leg tingling. She reports the leg tingling as ""normal"" as she has a hx of sciatica. She she woke up for the day then this morning the tingling in her arm/leg had resolved. She had coffee and cinnamon roll then started to clean the hou also had inner eye lid with itchiness. She began to have mild chest tightness so she took her inhaler - Albuterol and she took Claritin."

Light headed and flushed

c/o chills, nausea, hypertensive (170/100), flushing of face, redness and blotching of chest and neck

Dizziness sense of throat swelling

body aches, very tired

Patient felt like he was going to pass out. Reports this is normal and occurs when he gets shots or labs drawn.

20 min, c/o slight burning and itching to R arm, declined vital signs. Sx resolved and requested to leave.

"Pt complaint: ""heart racing, hot flash, feeling like fainting if I stand up"" approx. 10 mins post 16:30 vaccine admin. RN & another RN checked pt's vitals & BS. 16:45- BP 130/105, HR 160, O2 100%. 16:48- BP 148/93, HR 96, O2 98%. 17:00- BP 123/86, HR 68, O2 100%. 17:20- BP 122/86, HR 97, O2 92%. BS 83 @17:15. Pt received H2O, ice pack & elevated feet on chair. Pt noted symptom resolution & MD evaluated & walked pt back to work site."

carpopedal spasm of both hands immediately following receipt of vaccine

Vasovagal response

"Patient recieved first dose of covid-19 Vaccination on 12/18/20 at 11:49 am. Went into observing area and at 11:54 felt hot flush that moved upwards from chest to top of head. Vital signs taken 98.9, p117, bp 172/95, 100% oxygenation per pulse ox. Repeated blood pressures 128/84. Patient states that she is always in 90's systolically and 60's diastolically. The whole time patient stated that she had a ""cold""

feeling throughout the chest area. Pulse fluctuated from high 80's to low 100's, Patient stated she also had a "" lump in her throat"". Decision was made to transport her to the ED via Wheelchair where she was assessed and dx of Adverse reaction to the covid vaccine. EKG, CBC, BMP, Troponin 1 with high sensitivity done as well as a chest Xray. All tests within normal range and patient discharged home with orders to follow up with primary care physician as soon as possible."

1759 BP 135/79 HR 78 Reports feeling woozy, like she just gave blood, hands shaky, lunch was eaten at noon, brownie eaten mid afternoon 1800 8oz water given and 8oz of orange juice and granola bar 1809 Associate reports feeling better- less woozy, less shaky 1818 B/P 134/57 HR 77, no rash, no swelling, no respiratory complaints; dr evaluated associate and offered ED for continued support and associate declined.

About 5 minutes after receiving the vaccine, recipient reported tightness in the arm he received the vaccine. Five minutes later reported feeling light headed and tightness in his throat. Blood pressure taken--142/80 with 102 pulse. Reports no difficulty with breathing. Respirations easy and nonlabored. SaO2 99%. After reporting to healthcare provider, instructed to give Benadryl and call 911. Vital signs @ 3:30pm 139/81 with 79 pulse, temp 97.6 SaO2 100% Paramedics arrived at 3:35pm Recipient refused transport. Agreed to be escorted to ER via shuttle. Arrived at ER @ 3:53pm

Dizziness

The patient received the vaccine and reported shortness of breath, pallor and feeling that her throat was closing. Patient was given 25mg PO Benadryl and brought to the ED. On arrival patient continued to report feeling tightness in throat but states that she is breathing well.

headache, chills, and fever at 102

Severe headache and body aches beginning 20 hours after vaccine, lasting 3 hours.

Individual started complaining of an itch in her throat and felt some degree of lymph node swelling on the right side. Collective symptoms include: anxiety, flushing, short term paresthesia, right sided facial swelling, difficulty swallowing, right sided facial droop, medicinal taste. some slurring. Individual was taken to the ed in house, triaged, treated and released. Reporter is not privileged to details of treatment, but aware of release within hours of being seen.

Lightheadedness, numbness of bilateral lower extremities (below knee)

A 35 year old FEMALE who presents to monitoring station after getting Covid 19 vaccine, after a few minutes c/o lightheadedness, no other accompanying symptoms. Discussed with patient current symptoms, only lightheaded, no other accompanying symptoms. Initially HBP. Provided PO hydration. Patient recovered after a few minutes. Discharged to her working area w/o symptoms. Advised to return to ER if any headache, increased lightheadedness, chest pain, asthma exacerbation, abdominal pain, N/V. Employee agreed understanding instructions.

Patient complaint of rash,hives,difficulty breathing and swallowing, wheezing, throat tightness, hoarseness, itching and feeling light headed less than 10 minutes after receiving the vaccine. Patient received Benadryl 50mg IVP, Pepcid 20mg IVP, 0.3mg epi IM. EMS arrived and transported patient to ED. In ED, patient received second dose of 0.3mg epi IM. Patient monitored in ED for approximately 4 hours. Epi drip started and plan to admit patient for observation.

Patient complained of chest tightness, L hand tingling and throat tightening less than 10 minutes after receiving the vaccine. Patient received Benadryl 25 mg IM and NS IVF. EMS transport to ED. In ED,

Solumedrol 125 mg IVP and Famotodine 20 mg IVP. Patient monitored in ED for approximately 4 hours. Discharged home on Prednisone.

Fever Chills Fatigue Nausea Headache Sore injection site

5 minutes after shot administered, became very hot and flushed. Felt tingle in throat. Turned bright red. Sent to ER. Throat tingle subsided after about 30 min. No anaphylaxis. Given Zyrtec for slight itchiness

12/15/2020 Strong diarrhea 1x. 12/16/2020 felt 'not right'. temperature 99.3,99.5. took tylenol. headache. Temp went down. Felt weak. 12/17/2020 tylenol, nausea, light headache 12/18/2020 Felt the 'most weak'.

Described numbness to left side of face, inside of mouth and leg and arm. Arm and leg numbness quickly dissipated but left facial numbness continued.

Patient began feeling numbness/tingling in left hand. Began to feel nauseated, dizzy, flushed, and light headed. Symptoms would come in waves. Felt shaky. A few nurses and pharmacist on duty came to assess her. Heart rate was 110, SpO2 was 99. Assisted her into a wheelchair and brought her to a separate room so she could lay flat and elevate legs Checked blood pressure, 122/58. 10 minutes after reactioni started heart rate had lowered to 87. Once she was laying down she did not experience any additional dizziness, flushing, or nausea. After she sat up for a couple minutes, ambulated in the hall with nurse she was released at 6:20pm and a friend drove her home.

-Received COVID vaccine 2:15-2:30 pm -Felt fine during 15 minute observation -Came home (about 25 minute drive) -Put on new plastic gown to help 88 yo father sit up in his hospital bed. He was clean and dry. -As I was fiddling with the blue plastic gown, I felt mild itchiness on right forearm and started scratching. -I looked at right volar forearm (supine position) and noted about 6 raised 2-4 mm blanching bumps with central darkening (like a small scab almost) - 4 below antecubital fossa, one in the actual fossa and another one immediately proximal. Mild itching, nothing distressing. -Lesions still persisting (To Dec 18). I am not scratching/taking anything for it. Lesions are visible. -No other family members (including father) with any skin rashes, no bed bugs, spouse who also lifts/cleans elderly father has no skin rashes -Evening of Dec 17 and persisting to mid day Dec 18: mild sore throat, nasal congestion, mild myalgia, fatigue, subjective fever but when took temp- no fever. Then all of a sudden, the sore throat/nasal congestion, myalgias, tiredness abated all around 3:30 pm. Skin lesions still present. -All of these symptoms were mild. -Again, skin lesions on right volar forearm persist.

15 minutes into her event she begin to feel tingling and numbness, the left side where she received the vaccine became very colder, the associate blood elevated to 148/88. The associate normally have low blood pressure. by 18:45 the tingling and coldness went away.

Presented with periumbilical pain to emergency department (patient works at Medical Center). Admitted to hospital for small bowel obstruction. Labs were consistent with dehydration (Hct 55, Cr 1.25), as well as CRP 1.10. A CT Abd/Pelvis identified proximal dilation and fecalization of small bowel, with a transition point in the left lower quadrant. Distal to the transition point, the small bowel appears

thick, with hyperenhancement and inflammation progressing into the cecum. General Surgery was consulted and patient admitted to hospital for management of this small bowel obstruction.

Headache; treatment ibuprofen and excedrin; improved most with excedrin

Large painful rash over injection site of right shoulder. Sever upper arm pain over injection site.

About 3hrs after administration (1800) pt presenting with bright red rash covering bilateral arms, hands, face, ears, neck, stomach, legs. Reporting pruritus on rash sites, inside mouth, inside ears, inside nose. Rash red in color, raised, splotchy, and warm to touch. Patient took OTC diphenhydramine 50mg at approximately 1815. As of 1930 pt reporting no relief in symptoms. No reduction in rash sites observed. Pt at this time has not sought professional medical treatment.

Lightheadedness, nausea, dry heaves and lump in throat

rash appeared at site of injection, very painful, hot to touch, hard, with rash spreading to torso

"Patient stated she waited the full 20 minutes downstairs without any reactions, however started feeling itchy and swollen shortly after, which prompted her to come up to the caregiver health office. An RN visually assessed patient and patient was not SOB and able to speak in full sentences. Patient states she felt as if she was ""about to have a panic attack"" because of a possible reaction. The RN prompted the patient to go down to the ED if she felt she was having a reaction to the covid vaccination. Patient checked into Medical Center Emergency Department"

21 hours post injection patient feeling body aches, arm soreness at injection, headache, and short of breath with exertion

Chills, malaise, fatigue, muscle and joint aches, left shoulder pain at and around injection site, mild fever: 99.6; took Tylenol. Haven?t taken temps when feeling at worst. Second day symptoms continues, but not as bad. Temp 99.5 second day.

Severe arthralgias, myalgias, headache, nasal congestion noted within 12 hours

Itching started immediately, throat tightness SOB in about 10 minutes with hives on chest

Rash and severe itching/burning sensation on face and neck began the night after vaccine received. 2 days after vaccine primary doctor gave a Kenalog injection.

PVCs, tachycardia from 6:30pm to 12:00am. Took diphenhydramine, omeprazole, acetaminophen at 8:30pm. Went to sleep at 11:30. Heart rate normalized. PVCs continued. All symptoms resolved by 4am on 12/18/20.

At 4pm I began having chills. By 5:30 I began having body aches. I took my temperature at 6pm and it was 100.4. I rechecked my temp at 7:30 pm and it is 100.8

PATIENT HAD WEAKNESS/UNEASINESS (MALAISE) PATIENTS SYMPTOMS RESOLVED BEFORE LEAVING

Patient noted abdominal cramping and then later today vaginal bleeding. LMP two weeks ago.

Headache, not feeling well, slight nausea, dry throat No treatment at this time

Chills, severe headache, body ache, malaise. Recommend ibuprofen and tylenol. Testing for symptoms lasting longer than 24 hours

Pt started tonight with hives on the back of his neck. When talking to patient, he states he developed one on his arm that was spreading quickly. Encouraged to take benadryl and seek medical attention.

anxiety, palpitations, and HTN

Immediately after vaccination, pt had arm, neck and facial pain, which improved, but did not go away. Rash developed on her abdomen this evening. Recommended benadryl and close observation for anaphylaxis and medical attention if it continues to spead.

Severe Headache, sweating, ice and time

Physician 16 weeks pregnant; Administered at 7:45pm, went to observation area; experienced tachycardia; HR: 107; BP: 148/88 O2: 100% approximately 20 mins after injection; Appeared flush. Water offered, transferred to room for isolation; drank 2 bottles of cold water; offered additional medical care; denied need; rested for 1 hr after vaccine; HR: 80s; O2: 100%. Spouse picked up for transfer home; referred to PCP for any additional needs.

The day of vaccination, this employee did not experience symptoms. She woke up on 12/18/2020 with paresthesia to R side of face, that became progressively worse, and is now on the entire R side of her body. This employees face has a slight droop and asymmetric smile on the R side.

Within 5 minutes of receipt of vaccine, reddened ears and reddened blotches on chest appeared. No worsening after 10-15 minutes, but after 20 minutes appeared to worsen, and transport to ED via wheelchair initiated. Pt treated in ED with epinephrine, solumedrol, Benadryl, famotidine and 1 liter of 0.9% Normal Saline IV on arrival time to ED.

Patient reported feeling lightheaded after vaccination around 1111AM. Patient pale in color and sweaty. Patient instructed to lay down. Feet were elevated. MD called over to assess patient. Radial pulse weak. 911 called at 1112 AM. Blood pressure assessed to be 100/76. Patient began to feel better. Water given to patient. EMS arrived to assess patient and vital were reassessed by EMS. Patient confirmed feeling better and was released from EMS care. Patient observed until husband arrived at 1155AM. Released from facility with husband.

Clammy, fever to 101, light headed, malaise, joint pain, fatigue

I developed pain in right first MTP joint at about 8 hour. No prior h/o gout or other arthritis in that joint in past. Over the next 30 hours pain intensified and was associated with swelling, warmth, but no redness. Limited range of motion d/t pain and restricted activity as a result. No other joint issues or arthralgias, myalgias, fever, chills arm pain at injection site or any other significant symptoms. I took 3

doses of naproxen 440 mg 12 hours apart and the swelling and pain are significant ly improved at about 50-60 hours after vaccination. I researched gout as this seemed suspicious and it is reported in the literature that vaccination is a risk factor for precipitating gout attacks which I have never experienced. It never reached the point of severity that I wanted to get arthrocentesis done to prove it was gout, but since this vaccine is new I felt it was important to report my experience.

Woke up at 1 AM this morning with a throbbing headache and inability to go back to sleep. The headache went away after 30 minutes, but I was still unable to sleep. I felt fine enough to go about my day as usual (working out, going to work, etc.), albeit exhausted.

10 minutes after injection developed numbness and tingling in left arm and left foot. Stayed in observation an extra 15 minutes and the returned to work. Symptom persisted for the day

Following COVID19 vaccine employee returned to work and began to feel dizzy/lightheaded/shakey. Went to ED for further eval.

tachycardic, site edema, shortness of breath, dizzy, and felt like her throat was getting tight. She got one dose of epi and 50mg of oral benadryl

Developed a migraine and became really fatigued approximately 8 hours after receiving dose and lasting about 36 hours.

All over warm feeling Dizzy Generalized weakness/Tingling

Rash on his back with welts, mild itchiness of the lips and mouth and no SOB.

c/o tingling of hands/ feet

Associate had hand numbness and tingling in her left hand, left arm extermity was cold. Blood pressure was elevated to 149/96, which is not normal for the associate. She was monitior for a hour. After being monitor for a hour, the associate stated that there is no more numbness or coolness in her left extermity, and no resiratory issue so she was sent home @ 19:50.

Had numbness and tingling in the upper extremities ,associated w/dizziness .

Extreme cramps, diarrhea

Had numbness and tingling in hands , and pain feet. Observed for 30 minutes given OJ. Departed on her own after reporting s/s resolved.

3 episodes of diarrhea after receiving COVID-19 Vaccine Refused Evaluation in the UC or ER and reported will see her PCP if symptoms continued .

Patient experienced an itchy mouth after the administration of her COVID vaccine. She has a known allergy to melon and bleu cheese. She has never needed epi for these allergies. We gave her 50mg of Benadryl and she began to have resolution of symptoms at the 30 minute mark-10 minutes after her Benadryl was given, so not likely in er system yet. Her VS are stable, sats 99 on room air, BP 127/84, HR

84. Our pharmacist weighed in and felt she would be safe to be picked up by her husband so he could monitor her. Our MD concurred with this plan. As of writing this email, we are still monitoring and will continue to monitor for another 45 minutes to see the effects of the Benadryl. We will deliberate with the ED MD on call prior to her release.

"Symptoms of generalized purities ,and rash on skin and taken OTC Cetrizine. 11:20 Escalating symptoms of abdominal pain w/vomiting ,tachycardia ,mouth dryness and >BP was given Epi. 0.3 injection. 11:27 am Benadryl 50mg orally. 11:30 Transported to local ER via paramedic. """

I had a persistent mild headache all day as well as moderate fatigue starting around 2pm EST.

Throat closing sensation, lightheadedness

Soreness, tenderness at injection site

flushing, nausea, vomiting, diarrhea, chest tightness. Gradually improving over subsequent 30min. Treated in ED with 1 liter IV fluid, ondansetron 4mg, acetaminophen 1000mg.

Associate started having arm aches and pressure. She also had right ear pressure. The associate started having generalize aches (myalga). The associate denied to be seen in the ER. The patient left @ 19:50.

Exactly 3 minutes post vaccine administration, I was sitting in the observation area ?the right side of my face started tingling (pins & needles feel), HR went to high 120?s. The staff in that area recognized I was not feeling right, they brought me water and oral Benadryl 25mg and Pepcid 20mg . I sat for approx 30min. My throat started feeling funny?scratchy and like I had a lump in my throat. I kept feeling like I needed to clear throat . At this time at staff took me to a monitored bed in PICU. They gave me another 25mg of Benadryl. Vital signs were stable after approx an hour. I was discharged to family.

Perioral numbness and anxiousness starting 11 minutes after administration and terminating approximately 1 hour later soon after presenting to the emergency department.

The individual developed a quarter size welt immediately after receiving the vaccine. Within the first 5-10 minutes post vaccination, the individual was complaining of pain at the injection site going down her arm, red streaks were visible from the injection site, and she did develop some difficulty breathing, which may have been related to the situation and the mask she was wearing.

unexplainable taste in mouth and burning in her nose.

4hrs after receiving the vaccine. Right arm was swelling, red rash/flushing skin present on arm, neck, abd, and chest. Delayed cap refill on right hand with cold extremities, pallor and purple dusky discoloration. Treatment was 50mg prednisone PO, Benadryl 50mg PO around 1630 At 1700 checked in as a patient to ED and clocked out as staff. Severe chills and muscle ache present no fever. Received 1L NS, IV Pepcid, IV Benadryl 50mg. Unsure of time d/t feeling fatigued Observed in ED till 1920, chills and redness resolved. Left with only localized swelling and slight redness to site. Was instructed to take several more days of prednisone.

noted scratchy throat and lip tingling and feeling puffy- though no signs of edema

urticaria on all extremities, chest, abdomen and head. Took PO 50mg benadryl at 2000 and awaiting outcome at this time.

Joint pain (pelvic at first, then all joints over next 24 hours), body aches, fatigue (and sore arm)

numbness of the upper and lower lips on the right side, numbness of the right side of the tongue

Pfizer-BioNTech COVID-19 Vaccine EUA Fever, malaise, chills, headache, body aches, weakness

received 1526, returned 1708 with hives on chest, short of breath, itchy head to toe. phone consult with physician, taken to ED for care

Dizziness immediately after when I stood up. Within fifteen minutes increased heart rate and breathing, shortness of breath, and lips having a weird feeling. At 10 pm sore throat and injection site soreness.

pain at injection site. Encouraged patient to medicate and warm compress.

RECEIVED REPEAT VACCINATION DUE TO USER ERROR/MALFUNCTION OF RETRACTABLE NEEDLE UPON INJECTING VACCINE., AND MAJORITY OF VACCINE NOT BEING INJECTED. UNSURE OF AMOUNT INJECTED ON FIRST ATTEMPT, SO POSSIBLY RECEIVED GREATER THAN RECOMMENDED DOSE.

"The employee received 1st Covid Vaccine today at 1804 1834: Patient complained of a ""severe headache and suddenly not feeling well"". She told staff she hadn't eaten recently and was given crackers and 120ml of orange juice. 1845: Patient was assisted from the chair to a wheel chair and moved her to a cot in the back of the conference center. Her vital signs were stable at T-96.9F-HR-87 RR-20 BP: 145/78. She was responsive to questions, but had trouble opening her eyes. She did complain of feeling very cold and blankets were placed on the patient. 1905: Vitals remain stable. Patient was only responsive with direction. She was flushed in the face for a short duration, 3-5 minutes. She denied shortness of breath or trouble breathing. Notified patient's husband she was going to be transferred by EMT to Hospital for further evaluation. 2300-Spoke to patient and husband. Patient was discharged home in stable"

Patient received the Pfizer Covid-19 Vaccine at 1918. 1950 Patient reports numbness and tingling to left arm. Patient denied allergies to any previous vaccines, food, or medications. Patient stated no significant medical history. 2000 Patient reports numbness, tingling, and cold temperature from left shoulder to fingertips. Capillary refill <3 seconds. 2015 Patient reports nausea-crackers and water given by staff. 2030 Nausea resolved. Patient reports numbness, tingling, and cold temperature in bilateral feet. Elevated legs and feet. Warm blanket given. Capillary refill <3 seconds. 2045 Patient reports numbness and tingling to right arm. 2050 Called IMT. Patient called husband to pick her up and take her to be seen by an adult physician at an outside facility. Patient transferred to vehicle by wheelchair in stable condition. 2315 Spoke to patient and she stated symptoms resolved and home resting.

severe headaches, body chills, fever, bone pain, joint pain, abd pain, vomiting, nausea, sweating so much my bed sheets were damp . note: all symptoms were so severe I thought I was going to have to call off of work the next day. symptoms lasted about 12hrs

HIVES ON BOTH ARMS, LEGS, AND CHEST AREA. TAKING ANTIHISTAMINE TO RELIEVE THE PAIN.

"I noticed my body temperature becoming warm approximately 1 1/2 hours after receiving the vaccines. I then noticed at 2/12 hours, I had a red, blotchy rash on my chest, neck, back, arms and abdomen. It was not itchy, I was warm and red. I did feel a slight fullness in my throat, but I was not short of breath. For treatment, I was given 50 mg of oral benadryl immediately. I was admitted to the emergency department and given 10 mg of IV decadron and pepcid (I don't know the dose). The redness dissapated at 1 hour after the decadron. And I felt ""normal"" without any side effects approximately 3 hours after the decadron."

Fever, chills, body aches, runny nose, fatigue

Around 0300, I was awakened abruptly by a sharp pain in my Right TMJ region. This happened 2 times. It felt worse than a dentist shot. Around 0430, I went to the restroom and notice my right nasolabial fold is less prominent than my left nasolabial fold.

I initially had tingling of the lips that started 40 minutes after the injection. I took Benadryl and Pepcid. Now the tingling has progressed to upper and lower lip swelling, consistent with an allergic reaction.

Injection site pain. General feeling unwell. Low grade fever. Tiredness. Headache. Symptoms ongoing. Planned treatment: rest and fluid replenishment.

At 1:51 AM started to have throbbing headache, chills, and muscle aches mostly at the injection site 4:30 AM worsening headache, lightheaded and fever temperature of 38.7. Took Tylenol 1 Gram. 5:30 AM headache improved but still have fever temperature 38.6. Took a shower

palpitations with HR in 120s bpm for 1 hour after vaccine was administered

Injection site IMMEDIATELY felt hot, felt flushed from chest up to face, felt throat tightness, got tachypneic, tachycardic and lightheaded/weak. Throat tightness diminished after less than 30 seconds. I was immediately attended to. Was hypertensive 160/110's, pulse 140's, SPO2 100%. Less than five minutes later I developed uncontrollable generalized intermittent rigors. I was given IM Benadryl at that time. I was transferred to ED approximately 10min after initial reaction. Throat tightness came back again while in ED, EpiPen administered. PO Famotidine and 1L IV fluids given. Rigors diminished but lasted approximately two hours. I was observed in ED for four hours, felt well, VSS, was discharged home. Once home approximately six hrs post inoculation I developed more intense throat tightness, radiating to right jaw, no difficulty breathing. It resolved on its own in less than five minutes. Developed a mild headache the next day.

dizziness, low blood pressure, tingling in legs, light headed shaky

Metal taste under tongue starts about 30 seconds after injection. At the beginning, the metal taste was strong, but gradually disappeared in three to four hours. The tip of tongue started to feel tingling, numb within two hours, the symptoms are gradually improving. The tip of tongue also felt swollen within three to four hour, but improving. The pain on the injection site was getting worse in two to three hours, but stable for next twenty hours.

After initial 15 minutes dizzy, seeing stars, pale hypotensive, shaky

12/18/2020 Patient developed a rash on forehead, burning sensation in the back of throat, and chest heaviness. Patient stated that she had similar reaction to a previous vaccine that she received. Patient was reluctant to go to the ED and refused to ride in wheelchair, but was walked assisted by staff. ED RN reported patient was feeling better approximately 1 hour after injection. FROM ED REPORT 12/18/2020 Had a vaccine about 10 minutes later she states she felt a little warm. A little tingly. Had some blotchiness to her forehead and chest. She reports that she also had some similar symptoms after receiving vaccines. These were short-lived. She presents now for evaluation. She denies any chest pain abdominal pain. No trouble breathing. Pulse ox on arrival is 100%. No abdominal pain Patient does have some papules to the forehead. She states this is chronic. It is little red. Cheeks are little red. I see no urticaria on inspection

left side chest pain, warm feeling on the inside, dizziness, feeling that she couldn't stand up without getting lightheaded, nausea. Gave patient a bottle of water and a chocolate bar. Sent to ED FROM ED NOTE: She states about 10 minutes after the injection she felt a warm feeling. A bit of nausea. She had a little chest tightness. She describes this as similar to IV contrast studies. This is resolving. She denies trouble breathing. Did have a little chest tightness on this persist. On the monitor patient has pulse ox of 100%. Respiratory rate of 18.

Within 30 minutes - Skin flush to hands and forearms. Denied shortness of breath or problem with swallowing. Declined Epinephrine. Monitored for 45 minutes then she was escorted back to work within the building. 15-25 minutes later stated she was having trouble swallowing and was jittery. She walked herself to the Emergency room for triage.

Local injection site reaction, mild soreness

15 minutes after getting the vaccine began itching that quickly developed into rash/hives to face, neck, chest, abdomen. At 20 minutes post vaccine developed severe leg weakness with lightheadedness, chest tightness, and SOB. 22 minutes out collapsed to the floor unable to bear weight due to leg weakness and had severe cramping and tingling in legs, still unable to move them. Was rushed to the ER from employee health and arrived approximately 30 minutes post vaccine administration at that time there was significant mottling to arms and hands with polar nail beds. Vital signs were stable, no strider. Given Solumedrol, Benadryl, and Pepcid STAT. Rash/hives and SOB improved, but legs weakness/tingling, cramping did not and noted purple feet with cyanotic nail beds and mottling to hands/ arms that would come and go. Rash/hives reappeared much worse 2 horse post meds to face, neck, and upper chest. Was given another series of Solumedrol and Benadryl and admitted to the hospital. I am now 19 hours post vaccine with improved but persistent leg weakness, now able to bear my own weight

independently and walk a few steps, but still having legs cramps and intermittent tingling to feet. Color has improved with resolved mottling/cyanosis. I continue to have hives reappear with scheduled Benadryl, Solumedrol, and Pepcid.

Low grade headache for 24 hours

The day I received the vaccine, 8 hour post inhection, I began to have numbness in both hands and it went up my arm on the injection site arm. Almost 24 hours after getting vaccine, I woke up the following morning around 4am to body aches, chills, low grade fever, nausea, numbness in both hands, neck stiffness, and excruciating pain in the arm I received the vaccine in (unable to lift arm). I began taking Tylenol, every 4 hours and zofran for nausea. The symptoms proceeded to get worse. At 3pm the same day I decided to go to the urgent care. I was febrile 101.2, tachycardia, hypertensive, I was tested for the flu- results came back negative.

Chills fatigue muscle aches and severe pain in arm beginning five hours after vaccine.

lightheadedness, elevated BP, hives, wheezing, hot flashes, pressure on chest

pain at site, metallic taste 1 hour after , headache, fever 100.5, body ache

Nausea and fatigue 6 hours after vaccination. Resolved at 24 hours post Vaccination.

Patient had episode of hypotension First bp reading several minutes after vaccination was 82/46, second reading several minutes was 88/57, several minutes later was 93/62, next reading was 112/79 and resolved.

Started having strong chills that lasted an hour and was sweating although I felt cold. Felt dehydrated and heart was reaching. Woke up in the morning and felt sweaty, had temperature of 100.9F axillary. Took Tylenol. Still having body ache and headache through all this.

I awoke to severe upper abdominal pain centralized in the midline, just distal to Xiphoid process, and radiating across abdomen at 2AM (Approximately 14 hours post vaccination). Pain was an 8/10 and felt like somebody was squeezing my guts. Pain was worse when laying down or sitting and completely interfered with any type of sleep. I?m a paramedic and didn?t seek treatment. Pain subsided for about and hour and I was able to sleep a little bit until it came right back and lasted from about 07:00 AM until now at 09:18 AM. The pain finally seems to be subsiding. No Nausea, vomiting or Diarrhea.

lol swelling , shortness of breath

Right Foot Pain - sudden onset/similar to gout pain, however affecting the entire foot region and not the large toe.

the day of the vaccine I felt site swelling on injection site. A day after the vaccine I started to feel a headache and fatigued. I also felt sore from the vaccine and had what felt like itchy throat

Severe hives, from torso down to toes first day, and upper body and arms as well second day.

Pfizer-BioNTech COVID-19 Vaccine EUA About 5 minutes after receiving the vaccine my heart rate increased and sustained in the 140s-150s for about 10 minutes, it then subsided. My jaw and ears felt tight, then subsided. After about an hour, I felt normal.

tingling, heart racing

10/17/2020 after the injection on Thursday I had a sore body, sore throat ringing ears joint pain, my self esteem was very low, my boss sent me home because my voice sounded so rough, I checked my temp around 100 and 101 and I took Panolol and it went down to 99. Fri I woke up with sore throat every time I take a breath I have chest pain sore body ringing in ears, chills and I went to the ER Friday 12/18/2020 they gave me some anti inflammatory injection and I went back home that day, they gave me a medical order to take a covid test today 12/19/2020. ER Dr gave me good results on tests.I have a headache and sore my body feels heavy but other than that I'm trying to avoid contact and staying at home until the results come through

slight fever 99.7 (normal 97.4) , allover body aches 4/10

nausea, elevated blood pressure, syncopal episode x3, ?? seizure

PATIENT EXPERIENCED RED HOT SWOLLEN AT INJECTION SITE BP 1 WAS 154/93, 137/81, REMAINS RED AND SWOLLEN SATS AT 100%, RECEIVED 50 MG BENEDRYL PO GIVEN 0956 .

Patient received vaccine at 18:16. Approximately 18:50 the patient complained of numbness and tingling around her bottom lip. Lips were noted to be slightly swollen and cyanotic. Speech was observed to be slurred. Diphenhydramine suspension 50 mg PO was administered. At 19:15 patient was noted to have hives on her neck, upper chest and upper arms which continued to become more prominent. 911 was subsequently called and epinephrine administration was advised. Epinephrine 0.3 mg IM was administered at 19:34. Improved coloration and reduction in hives was observed after epinephrine administration. Patient was transported to the ED.

metallic taste

Pt. received vaccine at employee vaccination clinic at 1pm on 12/18, and received phone call from patient at 6:20pm at the vaccination clinic on 12/18. Patient reported Redness on thighs, arms, chest, throat and face, no redness below her knee or on her trunk. Reported itching all over where there was redness. She described tingling and burning down her right arm (compared to nerve pain) and cold hands. Patient was on her way to store to pick up Benadryl, advised patient to take 50 mg of Benadryl and to report to the emergency room or call 911 if symptoms did not resolve or worsened to involve any difficulty breathing. Called patient on 12/19 at 8:30am to follow up. Patient reports worsening symptoms overnight including developing leg cramps in calves, restless legs, chills without a fever, and a scratchy throat. Patient called family friend (ER Physician)- patient was instructed to take 60mg of prednisone, 1 tab of zyrtec, 2 tablets of magnesium. She currently reports fatigue, scratchy throate and headache with other symptoms resolving around 10pm on 12/18. Instructed patient to call on call physician at PCP office for a predisone taper prescription.

metallic taste

Patient reported feeling faint and nauseous. Placed on monitor, oxygen saturation was normal. Rapid Response Team called. Patient reported feeling that tongue was swollen. RRT escorted patient to Emergency Room.

metallic taste

The evening of 12/17/2020 pain started in the left deltoid. Over night the muscles in the left arm contracted and would no release, a hematoma developed, and constant pain was through the entire left arm. The morning of 12/18/2020 the muscle contractions and hematoma were still present and tachycardia and fatigue developed. Highest heart rate at that time was 147 with a blood pressure of 148/82. Was a pt. in the ED and received benadry, dexamethasone, and pepcid. Swelling and muscle contraction subsided and heart rate was stable in the 100's. Later in the evening tachycardia and fatigue started again with the highest heart rate being 210 (when resolved nearly immediately with rest). Heart rate was 110-130 until I went to bed. Heart rate waking up this AM was 110bpm. Injection sight is slightly painful.

Pfizer-BioNTech COVID-19 vaccine. Nearly immediately with numbness and decreased sensation to left pinky and ring finger.

"Arm is ""burning"" at injection site, sometimes the pain increase to a ""stabbing"" feeling. Pain is a 5 on the 1-10 pain scale Patient did not want any pain medication. She will take some when she returns home if she needs to. Denies any trouble breathing. States she feels fine, but because this is a new vaccine she wanted to report her symptom. Patient asked to wait and extra 15 minutes."

I had fever 101.5 body ache chills malaise and fatigue they were all moderate, I could not work and that lasted 24 hours post vaccine and continued to 48 hours and got better and after 48 hours I just had a headache, fever and chills improved I just had a worse headache and I did a virtual urgent care visit on 12/18/2020 and didn't prescribe anything. I refused to take any medication. 12/19/2020 right now I have a moderate headache . I don't have fever anymore and can function.

Patient experienced tachycardia and diaphoretic. His heart rate was in the 170s. He was taken to the hospital emergency room. He had an EKG - results normal. Lab work was performed - basic metabolic panel and CBC. All results normal. Symptoms resolved - he was discharged. No further treatment needed.

8:10pm tongue swelling noted. 6:00am woke up with head to toe hives and migraine.

Pfizer-BioNTech COVID-19 Vaccine EUA Beginning approximately 10 minutes after the injection I felt increased anxiety and possible light headedness. This could have been anxiety about the injection and its short development and some unknowns. I felt quite stimulated through the evening on the day of vaccination and kind of tingly all over like I had too much caffeine (which I had not). The only real scary part was waking up the night of the vaccination with high anxiety, tingling, and an elevated heart rate around 100-120 bpm if I had to guess. This lasted about 1-2 hours until I was able to fall back asleep. I

am now two days out from vaccination and still have increased anxiety over baseline and some diffuse tingling/hyperstimulation.

Chest Tightness and shortness of breath

Sore arm - Tylenol temporarily relieved this symptom - continues through 12/19/2020 - milder Fatigue - Rest relieved this symptom20

Patient had tingling sensation to her right arm and right arm heaviness and dizziness that started approximately 1-2 minutes after receiving vaccine. She was also dizzy so sent to ER. She was given juice and monitored in the ER. Sensations come and go in different areas of the right arm. The lightheadedness resolved after a couple of hours in the ER. She was told to rest, increase fluid intake, alternate Tylenol & Motrin every 4-6 hours as needed for pain control and follow up with her PCP in 1 day.

Tachycardia on 12/18 at 4:10am

Immediately throat tingling (thought it was me being nervous) by an hour later started to get slight headache. By two hours I was losing my voice and exhausted, coughing, chills, dizziness. Jaw pain, throat lymph nodes swelling and painful to swallow, my knees and neck hurt to bend and move, weak and bilateral ear pain. Left work by 2pm and by the time I got home last night I was unable to breath well and extremely chilled with no voice and extreme headache. Took Benadryl and headache medicine and went to sleep. This morning voice still gone, jaw still tender to move, headache is slightly better, congestion, chest pain and cough, still weak, lymph nodes are no longer swollen. Neck and joints still painful to move.

PFIZER-BIONTECH CIVUD-19 VACCINE EUA, I RECEIVED ON 12/18/2020 0730AM, BY 1230PM I STARTED NOT FEELING WELL, WITH A SLIGHT HEADACHE AND NAUSEA. I TOOK TYLENOL AND ZOFRAN. THE HEADACHE CONTINUED THROUGHOUT THE NIGHT, AND PRESENT NOW. JUST TAKING TYLENOL AND ZOFRAN TO COUNTERACT THE REACTION

Patient received dose one of the Pfizer vaccine at 1150am and around 1230 begun to feel tingling in the right of her face/cheek. She then noticed significant swelling of the left cheek and bottom lip. She was taken to the emergency department and received steroids, benadryl, and fluids. She was observed for a few hours and then discharged. She was feeling well the same day.

Faint metallic taste with injection

Rash in the back and buttock area/ patient was treated with Decadron 8 mg Intramuscularly

was in waiting area and about 10 min after vaccine said she got tachycardiac and checked her heart rate on the apple watch and it was 140. She felt tunnel vision also did not alert staff in waiting area as did not want to call attention to herself. Symptoms subsided after 1-2 minutes. said she would have passed out if she stood up at the time. Went back to work and told coworker. Vaccine clinic staff called her this am and she is fine- no further symptoms.

Mild tongue tingling approximately 15 minutes s/p vaccination and palpitations with chest pressure approximately 40 minutes s/p vaccination (HR 150-170 x 5 minutes and intermittent PVCs after for approximately 1 hour). No treatment needed, s/s resolved spontaneously approximately 2hrs s/p vaccincation.

Chest pain, dizziness, headache. Received fluid and pain meds via IV at Hospital ER. Not admitted.

Sore throat Headache Fatigue

I received the Covid Pfizer vaccine. By 6pm 12/18/2020 I started having arm pain and pain lifting right arm as well as nausea. By 11:30pm on 12/18/2020 I started having joint pain in the hips and knees and shortly after body aches. Upon waking up at 7am on 12/19/2020 I still had previous symptoms as well as right underarm tenderness.

itchy palm - right

ITCHING AND HIVES ONSET 2 DAYS AFTER ADMINISTRATION OF VACCINE

Adverse Event: Joint pain in knees bilaterally within the first 12 hours after receiving injection. Right knee joint pain subsided after 24hrs. Left knee joint pain has been constant for more than 48hrs. Treatment: Extra Strength Tylenol 500mg x 2 q6hr and left knee joint pain has not subsided Outcome: Still left knee joint pain after more than 48hrs

R arm felt numb and cold during vaccination; 30 min following vaccine pt had nausea and lightheadedness

Itching and erythema to left arm that lasted about 2 hours. Sweating without feeling hot or ill relieved by ibuprofen at hour 3 and returned at hour 9 post vaccine. Self resolved at hour 12 post vaccine.

Tingly sensations all over body on and off, like crawling feeling for 12 plus hours. No shortness of breathe noted or blisters/break outs.

feels elevated heart rate, sweaty, dizziness

"Patient reported dizziness and ""adrenaline-like feeling"" during administration of covid vaccine."

fever and rash at injection site

Tingling/numbness of lips, tongue and Area surrounding mouth 15 minutes after injection. Swelling of right upper lip Confirmed in car mirror at 20 minutes. Returned to employee clinic and was evaluated by MD, escorted to ER. Was giving Benadryl and 2 hours later was given prednisone 40mg. Was sent home with 3 day course of prednisone and was told to take Benadryl before bed and prn.

Burning in eyes, excessive, bloodshot eyes

Swelling, erythema, extreme pain over vaccination site. Full body myalgias. Night sweats.

Pt received COVID-19 vaccine and approximately 4 minutes later patient began to feel flushed, racing heart, and faint. On exam, pt was slightly tachycardic with flushing to the face and anterior chest. Symptoms relieved after IV Benadryl. Symptoms improved after Benadryl with a resolution of racing heartbeat and flushing. Patient was then monitored for 2 hrs without recurrent in symptoms. Pt discharged home.

Within minutes of getting the vaccine I experienced warm facial flushing followed by shortness of breath and palpitations. Symptoms lasted less than 5 minutes. No chest pain. Some mild dizziness during event. I was able to breathe through the event and I still drove myself home 30 minutes after receiving vaccine. I took 1000mg Tylenol before bed and went to work later that day. I admit I initially thought I was just having some anxiety but I have never had any history of anxiety or adverse reactions to vaccines.

Patient reported racing heart, tachy 88-100, tingly lips following covid vaccination. Administering RN assessed, provided emotional comfort, provided water/snacks. Continued monitoring. Tachycardia did not resolve after continued observation. Patient escorted to ED by w/c for further observation. Patient discharged from ED in stable condition.

After injecting needle in the patient's arm, upon injection of vaccine, the vaccine started to leak from the hub.

Approximately 8 hours after injection: sore shoulder Approximately 10 hours after injection: body aches, joint pain, chills, HA, nasal congestion; extreme fatigue These symptoms continued from Thursday Dec 17 approx 10pm to this morning Dec 19 at 8am. I also had a low grade temp on 12/18 of 99.4 at 5pm. Today, Dec 19 at 11:13 am my R deltoid, arm, armpit, and side is still sore; other symptoms have resolved. Still experiencing fatigue; however I had Covid in September and have had residual fatigue since then anyway.

Patient is a CCU nurse who received the COVID19 Pfizer vaccine on 12/17/20. The following day she reported to work and that afternoon at 3:50pm had nausea, vomited x1, pale, tachy. Fellow coworkers provided basic care and then transported patient to ED when symptoms persisted. Patient evaluated in ED and later sent home.

I got my vaccine on the 15 on the 16th when i woke up I felt really hot and had weakness, and the next day I already had nasal congestion on the day of the vaccine but it wasn't bad then two days later I wasn't able to smell or taste it was very faint and thought it was a cold . So I went and got covid tested Thursday the 17 and the 18th I got my covid results and tested positive.

Resident short of breath approximately 10 minutes post vaccination. Staff noted that his baseline upon activity and transferring is generally shortness of breath. Resident wears 2L NC, O2 saturation was 92%, increased to NC to 4 Liters O2 saturation up to 96%. 170/80, heart rate 94, regular rhythm. Sent to hospital.

Received vaccine on right arm. Tingling and numbness on left side of my body from my lip all the way down to my foot. Tingling and numbers started two hours after vaccine was administered. Tingling and numbness are still present.

A Lymophoedema on the left side of the body, with 3mm eduration in the arm left, no erythema no suppuration o edema.

About 5 minutes after vaccine, patient noticed mild itching at injection site, small area of redness around injection site and injection site is warm. Denies pain. Offered Hydrocortisone Cream for topical administration to injection site, but patient declined. Patient stated she had some at home that she would apply if needed. Patient waited a total of 30 minutes. Site did not appear to change. Patient denied any further allergic symptoms.

Patient received vaccine 07:52 am at 08:11 am he reported hand tingling, we noticed some swelling to left hand. BP 143/94 sat 99% P-81, patient initially declined going to ER, administered Benadryl 25 mg by mouth per protocol at 08:21 am, repeat BP 08:23 139/96 P-84, sat 98%, 08:42 BP 141/97, P-92, sat 99%, 0843 noticed rash left forearm (not sure if there before) noticed after removing watch, patient agreed to Emergency Room check in, while waiting for ER check in patient had increased swelling, spread to forearm, notified ER intake nurse and transferred care to Emergency Room

patient felt hot, sensation of tingling in her throat, sensation of heart racing, heart rate was 130. Rapid response called, patient received epi pen injection and IM Benadryl, sent to ED For evaluation with subsequent discharge home.

Patient experienced dizziness and felt like she may pass out. Given a sip of water and felt better. Declined to be taken to the ED for further evaluation.

Pfizer-BioNTech COVID-19 Vaccine EUA PATIENT DEVELOPED HIVES ON INCISION SCARS ON HER RIGHT FOREARM AND CHEST AT 15 MINUTES POST VACCINATION. AT 24 HOURS POST VACCINATION, PATIENT DEVELOPED PETECHIAE ON INCISION SCAR ON CHEST AND LEFT COLLAR BONE.

Patient received covid vaccination number one; about one minute post vaccination, patient became very light headed. Upon taking vitals, patient tachycardic at 145 bpm; patient's neck turned red and splotchy; after about 60 seconds, the redness and splotchiness went away; patients blood pressure went up to 170's/90's and heart rate remained in the 130's sustained. Patient was given cold rag and water with no improvement; she was transported to the ED upon request

Pt presented to the monitor with c/o of racing heart rate (HR). Monitor referred pt to myself. Pt reports after feeling like her heart was racing she checked and noted a HR of 110. Pt was provided a seat in the more private monitoring location. Coat removed and water provided. 9:40am = HR now 6. Pt continued to be seated. 9:50am = HR of 80. 9:55 am = HR of 78. Pt has drank 6 ounces of water. No other changes noted on physical assessment. Asked pt to stand and no dizziness reported. Pt counseled to follow with her MD in anything was to happen and noted the V-safe information. Pt d/c.

extreme sleepiness approximately 5 hours after administration. Sweats and lightheadness/dizziness 6 hours after vaccine.

Patient felt sensation of being hot and heart racing, heart rate was 80 and pulse ox was 99%, denies resp symptoms, patient requested to go to ED to be evaluated, was seen in ED, observed, and discharged home

Headache

diarrhea at 0200 on 12/19 (~ 12 hours after vaccine), patient doing fine now ~ 22 hours after vaccine

Pt reports dizziness, nausea and vomiting

The vaccine was administered on the following date: 12/18/20áand at approximately the following time: 1pm á She reports that she didn't feel great after vaccine but thought just normal post-vaccine symptoms. She felt itchy and wheezing that evening. She took benadryl and felt better. á She woke up the next morning and her face was flushed and she felt palpitations. Went to work and checked her vitals, tachycardic to 120s-130s. About 11am felt lightheaded and was taken down to ER. HR was 150s. Has history of bee sting allergy and this felt like that. No Epinephrine but was given 25mg IV bendaryl and IV fluids (1L NS). Took another 75mg of benadryl last night and Allegra this morning feels fine. á From ED visit note: Vitals at triage BP 106/73, HR 95, RR 18, O2 100% EKG HR 104. Vitals with HR 77-95 No labs, COVID negative á The symptoms began the following morning after administration of the vaccine.á The symptoms were: tachycardia, lightheadedness, flushing, itching, wheezing The treatment of the reaction was:áá o Antihistamines:áIV and PO benadryl á Other medications taken on day of reaction:ááTylenol

Patient reported feeling lightheaded, dizzy, and anxious with early heart palpitations with covid vaccine administration. Patient observed and provided food and water, reported full recovery.

At 1:10 pm, I felt warmth all over my body, face, my heart started racing up to 109 per minute. I felt dizzy soon after. The nurse observing checked my vital signs and found my blood pressure to be at 190/92. After 30 minutes, my face and ears felt really hot, my face was flushed, eyes were hot. My temperature was taken and it was 101.3. At around 6:30 pm, I developed mild headache and body aches. The next morning, my left arm was sore.

Moderate headache upon waking at 0630; treated with excedrin and resolved within 4 hours. Sore arm - mild to moderate, started within 4 hours of receiving vaccine

Pfizer-BioNTech COVID 19 vaccine EUA Shortly after receiving this vaccine (about ten minutes or less) I felt tingling throughout my body for no more than 10 minutes. It lasted the longest in my legs. I didn't think much of it as it resolved in about 10 minutes and another woman said she felt it too. I am reporting because I have seen an article that medical center has halted vaccine administration due to workers experiencing this.

Began experiencing numbness/tingling in right hand and arm approximately 20-25 minutes after receiving vaccine. Nurse and pharmacist went to monitor more closely. Began to feel flushed, lightheaded, sweating. SpO2 99. Dr ordered 25mg diphenhydramine po. Placed in wheel chair and taken to ER for further observation.

10 min after receiving vaccine had symptoms - Tachycardic, BP elevated, chest tightness, flushing, mouth felt weird. Tongue felt strange but doesn't think it was swollen and then developed throat tightness. Immediately given 50mg PO benadryl and symptoms improved over 20 min. 90% improved at 60 min.

Started with a stiff neck with aches at about 9;00pm 12-18-2020 and it lasted about 3 hours. I woke up about 4:00am and my armpit, on the side of injection, was very itchy. I looked in the mirror and it was swollen and red lump in my armpit. I?m guessing lymph node swelling. It resolved about noon 12-19-2020.

Tingling of lips and throat. Received treatment with dexamethasone, benadryl

Slightly swollen rash around the mouth and between the eyebrows with small pustules, accompanied by itching. Around 18 hours post-vaccine (received ~6:30 pm 12/18/2020, noticed symptoms ~12:00 pm 12/19/2020)

Left sided facial tingling, achiness, and heaviness approximately 45 minutes after vaccination.

Nausea, headache, ill feeling, rhinorrhea, chills, cough, loss taste

None stated.

Pt reported not feeling; tachycardia @ 110 approximately 20 mins after vaccine. sweaty, BP WNL 15L O2 given to pt along w/ 10 mg cetirizine and 25 mg diphenhydramine

Patient reports she received at 1330 than was working and had a sudden onset of chest pain and became diaphoretic and skin appeared red/blotchy

None stated.

None stated.

Mild tingling in the body, mild lightheadedness, mild nausea, brief heat and tingling of lips, face, and ears, mild swelling of the upper lip

Immediate after pain in jaw and nausea. 24 hours after started with headache, general joint pain, cough, low fever, chills, fatigue.

pain at injection site, right shoulder/neck pain

"Employee of hospital received Covid-19 vaccine, was moved to respite area and began to ""feel flushed"" and had (2) syncopal episodes. B/P 160/93, HR =80, Pulse Ox-100%. Employee transported to the ED via stretcher."

Pt reported scratchy throat, itchy lips, slight rash on chest approx. 10 min post vaccination. 25mg of Benadryl given PO. Transported to ER for continued observation.

I started having chills before bed 12 hours after receiving vaccine. I woke up late morning (now 24 hours later)with a terrible migraine and continued to have chills. I went to the bathroom after I woke up and felt very nauseated and sick. I then started seeing black dots and felt very dizzy. Soon after my vision went completely black for what seemed to be about 5 min. I was shaking, having difficulty breathing and fell to the ground. My fiancT called 911 and an ambulance was on its way. The EMTs showed up and took my vitals. At this point I was able to see again and was sitting down. My blood sugar was normal along with my oxygen stats. My blood pressure was low while sitting and standing. I was starting to feel better and didn?t end up going to the hospital. I continue to have chills, body aches and a headache but so far no more blackening out episodes. It was the scariest experience of my life!

"Nurse injected the vaccine as she removed needle the employee started to feel weak and short of breath. The employee repeated said ""I am weak"" and ""I can't breath."" A rapid response was called, checked her oxygen level (94%). Due to employee stating she could not breath the team gave her a dose of epinephrine and started oxygen. Her oxygen saturation increased to 98%. They took a blood pressure - 150/88. EMS arrived and took her to local hospital for observation."

Tingling and numbness in bilateral lower extremities. Symptoms began 40 minutes after receiving vaccine (which was received on 12/18/20 at 10:50) and are still present at this time (12/19/20 at 13:35). I have not received treatment for it.

"stated she felt ""hot, dizzy, tingling to face"" HR 84, BP 129/84, O2 Sat 97% RA, temp 100.4. Taken to ER for observation."

I received my vaccine at 1615 down in our hospitals clinic, I work as a floor nurse, I returned back to my unit to resume work, I walked in to talk to my charge nurse and felt completely fine within a minute or to (approximately 15 minutes since the vaccine was given) my legs felt like very weak, they became tingly and extremely heavy, my face and chest felt warm and I had to sit down to drink water. The nurses working with me that day took my vital signs, my blood pressure was 157/101, heart rate 80-90s and temp was 97.5F. I notified the pharmacist working on our floor about my symptoms and he directed me toward the infection control line, the pharmacst on the phone directed me to go to the emergency department. When I was admitted to the emergency department via wheelchair, the pharmacist met me there along with the Emergency medicine MD, a neurological exam was done and general assessment. While I was in the ER my heart was monitored, my CBC with diff, Mag and BMP was monitored all of which were normal. I was given a 1L bolus of IV LR through an IV in my left antecubital. Gradually the tingling wore off over a few hours in my legs bilaterally however they still felt very heavy. I was admitted from approximately 1645 until approximately 1900 and returned home.

Right side nostril broke out into ulcer sores & throbbing after vaccine

Lightheadedness onset at 3 minutes (approximately) after the vaccine. Felt like I would be unsteady on my feet if I stood up. So kind of a dizziness/vertigo.

Flushing, rash, dizziness, lightheadedness, slightly elevated BP and heart rate

Patient experienced swelling underneath injection site immediately after administration

initial left arm injection site pain. Then developed quick onset ~22 hours after receiving vaccine of significant facial, torso, and upper extremity flushing and redness. No fever. patient felt nausea and vomited. Also experienced tachycardia and a headache. Patient used an ice pack, pepto bismol, and ibuprofen. Resolved in about 2 hours, but headache persisted until the next day.

Numbness to Lips , Teeth, Toungue, Face

1 day after receiving vaccine both of my hands became cyanotic appearing (blue/purple). Outside of minor tingling sensation, I did not lose feeling of my fingers/hand and my capillary refill was normal. My 02 saturation remained at 100%

Tingling injection side arm and face rash

5-6 hives on right hand and forearm on 12/19 at around 1100, took 25mg of PO Benadryl and went away. Intermittent tingling to right foot/ calf and hand (more to foot and calf) started 2100 12/18. Tender right axillary lymph nodes.

On day 3 after the vaccine, I had been experiencing sinus issues and toward the end of the day I experienced body aches, chills, sweating, shortness of breath, and tachy up to 175 last night when walking. It has been better today in the low 100s but still persistent with some shortness of breath, covid test pending.

Bilateral lower extremity rash

Patient presents after a near syncopal episode. Was at work when she felt dizzy, nauseous and flushed. Felt like she was going to pass out. Patient appears pale and uncomfortable, but nontoxic. She is tachycardic but blood pressure stable. Has a faint erythematous rash on her neck. Give IV Benadryl, IV solu-Medrol and IV fluid in Emergency Department. Basic labs were obtained and are unremarkable.

Redness; Hives; elevated HR and BP

Minutes after the vaccine, developed perioral numbness, tingling, mild difficulty swallowing. Complained of SOB and had marked diaphoresis. BP dropped to 87/50. Maintained sats 100%RA, lungs were clear. Has a hx of a vagal response after blood donation

Body ache, coughing

Associate states he started to have a fever this morning. Associate had a COVID swab performed at the COVID drive thru this morning and was told to call the hotline to report event.

performed 30 min observation, left to go back to work, said he felt like his heart was racing and looked at his smart watch and HR was 168. Upon arriving back at clinic, denies dyspnea or resp concerns. Reports feeling hot, anxious, heart racing, pt was sweating. HR 152 BP 150/100, Pulse ox 99%. Patient taken to ED to be evaluated.

Fevers to 104.8, myalgias, chills, rigors, fatigue, diarrhea

Signs of passing out. Then numbness and tingling in all extremities, lasting longer in the lower extremities (roughly an hour and a half) then felt as if a hair was on my body for roughly 8 hours, woke up with night sweats yet all resolved by 9am.

reported eye vision changes, flashes of light, and a headache. Was treated in the emergency room.

"Patient began to feel lighththeaded and ""woozy"" about 20 minutes after injection. No loss of consciousness, BP 118/78, HR regular, color pink, began to complain of ""sore"" on one side of throat, began clearing her throat frequently,"

Approximately half hour after injection patient reports tingling in tongue, heavy chest, SOB, slight difficulty swallowing and flushing in face, at that time HR was 44, O2 sat 99%, and BP 138/80. 50mg of oral benadryl was given at that time. Patients symptoms continued and 911 was called and at 4:30 epinephrine was instructed to be given IM via epipen. Approximately 5 minutes later EMS arrived, evaluated the patient and no visible signs of allergic reaction were detected. Patients HR and BP were elevated from epinephrine. Myself and another pharmacist remained with patient until approximately 5:30 and at that time the patient was going home. I called her at 6pm that evening and again 11 AM the following morning and no other allergic symptoms were noted.

Lightheaded, heart racing in initial monitoring station, placed supine, transported to triage via wheelchair. Initial pulse ox 98%, HR 76 at 1250, denied SOB, tingling, no rash. Pulse ox 98%, HR 91 at 1256, no SOB, tingling improved. At 1300, c/o lightheaded, fuzzy vision, shaky, some chest tightness, some throat tightness, increased saliva. Diphenhydramine 50 mg IM administered 1304. Pulse ox 98%, HR 92 at 1318. Solid food intake 1322. Continued lightheaded, bilateral arm tingling, still shaky, but less cold at 1327. Self-reported weight 130. 1339, throat tightness not resolved, no difficulty swallowing or breathing, pulmonary auscultation no stridor., continued body tingling, c/o throat tightness, Pulse ox 99, HR 96. 1343, continuous monitoring to Pulse ox 90%, HR 110. Medical director updated 1347, decision to move to ER and transport initiated 1352.

Pfizer-BioNTech COVID-19 Vaccine EUA: Patient experienced flushing and dizziness after administration of Pfizer-BioNTech COVID-19 vaccine with blood pressure: 143/90 mmHg and pulse 80 beats per minute. Cold pack applied and patient ambulated and drank water. Five minutes later blood pressure was 137/85 mmHg and pulse was 63 beats per minute and patient continued to report waves of flushing. Patient ate a banana and another cold pack was applied. After another ten minutes patient reported

feeling better but stated felt lightheaded. After an additional 20 minutes blood pressure was 123/76 mmHg and pulse was 78 beats per minute. Patient stated felt much better and was discharged from clinic in stable condition.

7 minutes after her vaccine she complained of tongue numbness which progressed to swelling. No wheezing, no rash, no nausea no vomiting. She was transferred to the ED for further management

Headache, dizziness, nausea, chills, chest pain, fatigue, injection site pain. Started about 2 hours after injection. Took Tylenol. Symptoms resolved within 36 hours

Left arm soreness around injection site that started about 3 hours after the injection and remained constant until the next morning. Fever (subjective as I did not have a thermometer at home) and chills that began about 14 hours after injection and last about 4 hours. Fever and chills resolved with 1000mg Tylenol.

Scratchy throat, lip swelling and numbness

After receiving the vaccine, I waited in the facility for 15 minutes as instructed by my company and the staff who administered the vaccine. When I left and got a few miles down the road, I started to feel my heart increase and I became short of breath. My heart rate was fast and pounding. My mouth started tingling and then I started feeling the tingling on my chest and neck. I started sweating and then started to panic and called 911 because I didn?t think I would make it back to the vaccination site or to the hospital in time. When the ambulance got to me I was still experiencing tachycardia, mild shortness of breath and tingling. The symptoms started to subside after approximately 20-30 minutes after they started. The paramedics assessed me and my blood pressure was 170/90 and HR was in the 120?s. I declined to be sent to the hospital due to my symptoms subsiding

I woke up with shooting pains/cramping running down the sides of my body/arms to the bottoms of my feet. It felt like a cramp but worse, kind of like nerve pain. I tried to walk it off but it persisted for about five to ten minutes. I had never felt that kind of pain before.

My blood pressure was 172/95 right after I took Vaccine, since then my BP was 155/100 last night , 147/101 this morning. I never had h/o high BP

10:30 am on 12/19/2020 Fever of 100.6 F, malaise, nausea, muscle aches, increase HR to 111 at rest. Tylenol 500mg taken

approximately 25 minutes past receiving the COVID vaccine I felt numbness in my neck and clavicle area. This resolved on its own after about 2 hours of receiving the vaccine

Within 10 minutes of receiving vaccine patient reported arm feeling tingly and numb which progressed to a squeezing feeling. Slight shortness of breath.

Anaphylaxis within 15 minutes of administration

I got the vaccine at 0750 in the morning and was fine right after getting it, my arm was a little sore no big deal, then by 0900 both arms were sore and my neck, by 1100 I had aching and chills, but I powered through because those are common symptoms by 1300 I had a headache, by 1500 I had some abdominal cramping, by 1600 some dizziness and nausea, 1730 diarrhea, 1830 more diarrhea and 1850 hives all over my chest. By 1900 my tongue felt heavy and tingly So I walked down to the ER. When I got to the ER I felt like I was going to pass out. By 2040 I was admitted to the ER and given Benadryl, Prednisone, Pepcid, and Zofran. I was Held for observation until 0300.

brief lightheadedness Pt arrived at observation area at 1500. Was informed she has a history of allergies in teh past so instructed patient to wait or 30 minutes in observation area. Around 1505, pt stated she was feeling lightheaded, near syncope. Advised pt to lay on ground. Vitals taken - BP 140s/90s, with HR 118, pulse ox 100%. After 5 min, pt stated she was feeling better while laying down. At 1515, vitals retaken with BP 120s/80s HR 90s. At 1520, pt sat up from floor still feeling better. At 1525 pt sat in chair feeling better and at 1530 pt stated feeling no side effects.

Right after I got the injection I felt my right hand tingle. I assumed it was because I was squeezing it so I dismissed that. However later around 7:45 my right side of my face felt like it would if I had gotten nova Caine and was wearing off kind of tingly but my face moves fine. I then read that other hospitals stopped the injections because of something possibly like this and I did begin to worry. The sensation is not strong it is only on my right side. My face moves ok just feels like when your foot goes to sleep but very mild .

Within 30 minutes of receiving vaccine patient reported feeling light headed, hot and heart palpitations. BP increased to 158/110, Pulse 100. Patient was CRNA working in ICU environment and was monitored by other staff present. Signs and Symptoms resolved over the following hour.

Several minutes after the vaccine, I noticed my arm going numb. It progressed up the side of my neck and down to my fingertips. The numbness lasted over an hour. Extreme nausea vomiting and fatigue started 12 hours later. Which hasn?t yet dissipated. It has now been 34 hours since vaccination.

Numbness and tingling in left wrist and hand lasting approximately 1 hour after injection

Numbness and tingling in left wrist and hand lasting approximately 1 hour after injection

Employee developed rash at site on left deltoid, that spread across upper chest. No SOB, Chest Tightness or Itching. Transported to ED on-site.

GI symptoms, loss of appetite, fever, body aches Between 10am-2pm day following vaccination.

Within 30 minutes of vaccine patient's left pupil was dilated greater than right and reacted sluggishly to light with slight fuzzy vision. No other signs or symptoms. Pt to follow-up with Ophthalmologist next week.

Approximately 30 seconds after the injection (which was painless), I suddenly developed tachycardia and felt like my heart was pounding out of my chest. My entire body was extreme tingling and I could

not feel my hands or feet. I also got a sudden strong metallic taste in my mouth. I thought I was about to fall down, but right before I was going to ask for help, the symptoms stopped as suddenly as they came on. I probably should have said something then, but I felt fine so I walked back to my unit. About 20 minutes after my injection, I then developed an intense hot flash and soaked my clothes with sweat. I sat down with cool rags on my head and this subsided after about 10 minutes. I have felt fine ever since, other than a little bit of a sore arm and mild headache (expected). I?m not sure if my tingling, heart palpitations, and hot flashes with sweating are expected, but I thought I should report it just in case it would be helpful for the manufacturer to know.

About 3 min post vaccination I experienced a transient sensation of warmth in my chest followed approx in a minute by tachycardia and a slight tightening sensation at the base of my throat which was transient - may 15-30 seconds. It recurred in a few min and I began to feel little lightheaded . With a 3rd episode of tachycardia only I felt more lightheaded and was taken to the ED in a wheelchair. My extremities felt cool with each episode as well.

high fever, chills, swollen arm, fatigue, nausea

Fever , muscle aches, joint pain, tiredness, headache Took ibuprofen 400 mg when temp reached 38.9C

Rach, tachycardia, palpitations, shortness of breath shortly after receiving vaccine - given epi, solumedrol, Benadryl. persistent symptoms the following day.

Reports becoming flushed shortly after covid vaccine. Then developed dizziness and was diaphoretic. Laid sown on stretcher. VS 128/84, 99/ 97.6, and sat 96% on room air. Observed and repeated VS x three. Was able to sit up and drink water prior to leaving observation area. Remained stable

I received the vaccine at 0915, was observed until 0936 and felt fine. While driving home, around 0949, began to feel heart racing/beating fast. I then felt very shaky and proceeded to get off the highway exit as the symptoms continued to worsen My daughter called 911 at 0953 at my request. No throat swelling, respiratory issues, or mouth or lip swelling. No rashes noted. I then began to feel sweaty and then became a little dizzy and proceeded to lean my car seat back. My daughter called 911 again as they instructed her to call if any new symptoms began prior to ambulances arrival. Ambulance crew arrived, I ambulated myself to the ambulance, felt a little lightheaded while walking. The feeling of my heart racing had started to lessen but still not normal at this point. Pulse ox was 98% on RA, no respiratory distress at all. I'm not exactly sure of what my HR was as I couldn't see the monitor but I believe they said around 100, I'm normally in the 60's. Systolic BP's were 138, then 120's, then 101 prior to me leaving ambulance. Finger stick was 140. I was in the ambulance for about 15 minutes and was feeling much better the last 5 minutes or so of that. I declined need to go to ER, my daughter then drove. I then went to a store and while walking around at 1105, began to feel my heart racing again but not as intense. Had slight feeling of being shaky but nothing like previously. After that, I have felt fine for the rest of the day. I took 400mg Ibuprofen for a slight HA around 1130 but not unusual for me, especially since the events that occured. I called the hospital where I was given the vaccine when I got home and informed one of the employee health MD's who requested I report this here.

Approximately 45min after the injection, I started feeling dizziness, palpitations and racing heartbeat. Another 15min after that there was red hives that broke out on my upper chest but no where else on my body.

Woke up Friday morning around 5:30am and had significant fever and chills (100.8F). In the morning fever, during the day increased heart rate. Took tylenol about 3 times a day. Felt burning up all day. Felt like I was on fire. In the evening about 6PM very nauseous, muscle aches, laying down uncovered and I felt like I was burning up. Went to bed early. No taste in the evening. This morning I feel pretty good other than no taste and a little bit of nausea.

Within 15 minutes of vaccination, developed mild headache. Was resolving when left observation area. Employee reported at 1:45 had developed right sided face and arm tingling and numbness and lips numb and tingling. Consulted with ED provider -Dr Plan to observe by Employee Health and refer to ED triage if symptoms do not improve. . Symptoms improving. Employee observed by Employee health and symptoms had resolved by 2:15 . No admission to ED

Morbiliform rash on torso Tiredness

Fever chills nausea which went away next day however now I have no sense of taste or smell

heart rate increased feels that it is racing,

I felt fine other than a sore arm but then Friday morning I woke up coughing and i had a 100F fever and about an hour later it was 100.6F. I had chills, shivering, headache, took tylenol, fever was down to 100F. Went to the local UC and had a COVID 19 test and was negative (rapid test). Today I woke up, no fever, a headache in the morning, but now it is gone, no fever at all today.

"Patient reported feeling sensation of ""warmth"" around 5 minutes post immunization. á Patient was escorted to waiting area and sat in seat within range of nurse site line. á RN later sat with patient 5 minutes later as she continued to have feeling of ""warmth"" / flushing. Patient given water and moved closer to nurse area. á Patient then shortly after c/o light headedness and now feeling cool. Remains alert / oriented. á BP: 142/80 HR: 127 RR: 20 SPO2: 100% á ICC called. Medic and Dr arrived for patient handoff. RN escorted patient to ICC with Medic and MD following. á Patient to finish visit in ICC for final dispo."

Myalgia, malaise

Throat closing, feeling faint, fast heart rate. Was taken to er, was given epinephrine as well as steroids. Kept me on er for awhile to watch me.

Chills, body aches, at about 10:30am on 12/19/20. Improved with 1g of Tylenol

On the evening of the vaccination at approximately 11 PM experienced tightening around the rib cage that lasted the night, went away in the day and came back the next night and some pain at the injection

site. Noticed a light rash at and below the injection site on the second evening. Rash continues on the 3rd day.

tingling in tongue, sore throat and deeper voice, heaviness in chest took diphenhydramine tablet, also took prednisone she is prescribed

20 minutes after receiving vaccination, tingling tongue. 'first sign for shellfish reaction', noticed tongue swelling. took 2 benadryl @130. at 1:45 took Albuterol, got to hospital / ER at approximately 2pm. Elevated BP, HR increase, lungs tight and 'barely diminished'. Epi @ 4:25 Albuteral @ 4:35 Prednisone @454 IV pepcid @5pm Tongue was still swollen but improved, lungs stable. Discharged at 6:10. Continued Benadryl and med pack. F/up appt w/ Allergist the following week;

Chills, aches, mild nausea and fever up to 100.8 for 6-8 hours. Headache and fatigue for 20 hours.

After receiving vaccination, right arm was swollen and felt cold to the touch, kept arm elevated to try to keep the swelling down and took hydroxine at night to try to help it go down. Still could feel my radio pulse, felt like pins and needles. Not cold anymore, now feels warm/burning sensation.

1) flushing, sweats, and dizziness 2 hours after dose #1. Resolved after about 15 minutes. 2) severe fatigue next day with poor concentration and forgetfulness 3) whole body palpable rash with redness, itching, and development of patches of petechiae

Approximately 8 hours after injection- headache and soreness at the injection site, fatigue, very mild sore throat. Headache and fatigue progressively got worse. About 24 hours after the injection noticed small red rash to the abdomen, progressively spread throughout the abdomen to to the truck. Rash looks similar to the chicken pox and is itchy at times.

12 minutes after injection, I felt flushed and dizzy. They hooked me up to a vital sign monitor which showed my heart increasing to 133 bpm, SaO2 98%. A manual blood pressure check was 168/110. My heart felt like it was pounding, I was hot and sweating. After 10 minutes or so, I felt increasingly dizzy and my vision started fading. VS still showed tachycardia and hypertension. It became difficult to swallow and my tongue was feeling fat. A Rapid Response Team was alerted, they started and IV, and took me to the Emergency Department. I became very cold and shaky. My hands and feet became a little mottled. They gave me 50 mg IV benedryl, 20 mg IV pepcid, a dose of solumedrol, and IM epinephrine 0.3mg, and 1 Liter of fluid. My symptoms resolved and I was discharged home a couple hours later.

Headache, dizziness, lightheaded, nausea, tired all lasting for a half hour after vaccination

Within 5-10 minutes after vaccine given, patient started feeling tingling of the hands and fingers. Shortly after, she felt the need to clear her throat because she felt like there was a furball in her throat. She drank some water, which didn't help. She then started feeling hot and became flush. She then felt her inner ear and tongue swelling. Shortly later, she felt chest pain and felt like she couldn't breathe. She was given IV Benadryl 50mg, IV dexamethasone 4mg, and IV Pepcid 20mg without symptom resolution. Epipen was administered by vaccine clinic staff, and the patient felt a little better. Her shortness of

breath continued and her chest felt heavy as she was transported to the ED. She also complained of blurred vision, which could have been due to Epipen administration. In the ED, the patient still felt that her throat was tightening up. She was given IV Pepcid 20mg, IV Benadryl 25mg, IV SoluMedrol 125mg, racepinephrine & albuterol nebulizer. By 2150, she felt better. By 2257, she did not have any more tingling in hands or weakness and she stated she felt she was back to normal. Patient discharged home in stable condition at 2336.

Patient presented to the emergency department at 8:45pm on 12/18/20 with lower abdominal pain, nausea, vomiting, and constipation that started approximately 2 hours prior to presentation, at approximately 6:45pm. Her labs were significant for a lipase of > 6000 IU/L, and a CT scan of her abdomen/pelvis was done that demonstrated evidence of acute pancreatitis. Given the fact that she does not have a history of heavy alcohol use, with normal triglycerides and no evidence of gallstones on her current admission, and no recent gastroenterology procedures, there is no clear etiology of her pancreatitis; concern for post-vaccination pancreatitis. The patient is currently admitted to the hospital, on hospital day #1 of her current condition.

12/18 0815 receive vaccine 2100 slight cough and very tired 2200 chills and chattering teeth; no fever 98.9F 2230 feeling very cold; went to sleep 12/19 0430 wake up with fever of 102.6F and headache 0845 still exhausted; fever 101.1F Stayed in bed most of the day 1730 get out of bed; temp 99.9F; notice slight rash on face across nose and cheeks ; slight redness and pain at injection site

Lower facial numbness, cheeks, lips, chin, decreased sensation similar to dental injection numbness. Lasted about 12 hours. I took 25mg of benadryl.

Minutes after the vaccine, C/o throat feeling dry and SOB. NO Diaphoresis. Breathing does not appear to be labored. Iv was started as a precaution. Pulse oxygen was 100%. NO meds given on scene. Taken to ED to be evaluated. Believed to be anxiety related.

Employee has history of allergies and was being monitored for 30 minutes. About 10 minutes the vaccine injections she began to feel faint. She was sitting at time and slide to floor and was unresponsive. The team begin checking vital signs and gave her a dose of epinephrine. A rapid response team and EMS was called. The rapid response team checked vitals: BP 100/60, HR 90, O2 99%, Glucose level-77. An IV was started and bolus of normal saline 500 ml given along with 50 mg of benadryl. Vitals checked: HR 108, BP-106/60, O2 93%-it was reported she was cold and shivering-hands were cold. Employee was calm, alert, and oriented.

12/17/2020, 15 minutes after vaccination started to experience tingling on forehead and radiated on left side of face, nauseas, light headed, HR increased, 'funny on tongue' , 'felt like going to faint'. The BP was 149/109. The medical crew tried to calm down. BP would not come down. Placed in gurney, administered oxygen, given a 'benadryl and some sort of shot' to slow down the reaction. Given rest of the day off. 'I slept for a few hours' and after 4 hours, my chest started to tighten, radiated to back 'tightness' , felt like heartburn. I didn't sleep that whole night, had to keep sitting with the tightness in the chest. By morning I was better, I went to work, took inhaler (flovent and albuterol). Headache at work, took Tylenol. At 12, I went to each lunch and felt there was a lot of mucous in throat / acid reflux

feeling ; 'felt full in throat'. I went in a coughing spell, 'bubbly mucous'. I couldn't talk, drank water, sat in car until I had to go back to work. I couldn't breathe when I walked back into work. At approximately 2:15 they rushed me to urgent care, 25 childrens benadryl, administered oxygen and omeprezole for reflux. I stayed with the oxygen till 4:45; BP 140/98 and slowly came back down. 'At same time, co worker was experiencing same thing that just had had vaccination'. My asthma 'kicked in', white blood count was elevated to 17. Work in urgent care and where i was rushed to. flu shot 2 months prior TB skin test one month prior; negative

Erythema in cheeks, right greater than left. No hives, no itching, MILD edema on right cheek I took Benadryl 25mg PO. Symptom persisting, but less than initial response.

Difficulty breathing, elevated heart rate, dizziness

10 minutes after vaccination felt lightheaded and dizzy, pulse 64 resp 18 - given water and put feet up. 15 minutes later better but still woozy - pulse 80 resp 20. 15 minutes later walked around pulse 72 resp 18 20 minutes later - still feeling dizzy wishes to go to ER - transported via wheelchair.

Within 1min after administration: Tachycardia, mental fog, dizziness Within 5min after administration: Tachycardia resolved, mental fog worsening, dizziness, muscle weakness Within 15min after administration: Nausea, dizziness, mental fog (feeling like an out of body experience), muscle weakness (feeling like my legs wouldn't support me). Two hours post- administration: Severe nausea and mental fog Six hours post-administration: Muscle aches and joint pain. Nausea and dizziness resolved. Soreness and muscle ache in arm with injection site. 12 hours post-administration: Diarrhea, increase in nausea, and vomiting. Dull headache. Tylenol taken. 22 hours: Fever (99.1F), chills, sweating 32 hours: Fever (99.9F), chills, sweating, muscle weakness, body aches, headache. Tylenol taken. 43 hours: Tested for COVID by nasal swab d/t recent exposure at place of employment and presence of S&S. Test pending. Fever 99.0F. Tylenol taken. Dull headache.

Tingling of tongue, tickle in throat Benadryl 50 mg IM given Patient taken to ED

Patient began reporting a feeling of light-headedness 5-10 minutes after injection. Also reported nausea and feeling clammy, as well as numbness and tingling of both her arms. She laid on the ground in reverse trendelenberg position with some improvement in symptoms, but upon sitting upright, symptoms returned. Patient was transported to the ED for 1 L NS IV bolus with improvement of symptoms and discharge.

Sore arm, Headache, Body aches, Severe fatigue, Abdominal cramping, Brain fog (disconnected feeling)

Covid 19 vaccine was given in my right arm subcutaneously. Was not looking when vaccine was given, felt administer rub my arm with alcohol swab, and pinch skin. Did not feel vaccine...however when bandaid was placed knew it was injected subcutaneously instead of IM. Took pictures immediately after.

muscle aches. resolved in about 8 hours.

"About 24 hrs after vaccine I had chills with NO fever. Strong headache which I could feel going down my neck into my back between my shoulder blades. I just had this all over ""I feel awful feeling."" Took Ibuprofen 800mg about 3 hours later. Went to bed and woke up in the middle of the night feeling better. Felt just tired the next day until about 2pm and a slight headache until about 4pm."

Patient received covid vaccine at 1606. At 1616, pt reported feeling lightheaded and tingly. Was assisted to supine position, BP 128/79, HR 62. Was monitored by administering and RRT nurse. At 1630, pt reported symptoms completely resolved. Pt discharged at baseline status.

"Felt dizzy and lightheaded 10 minutes after injection. Client drank some water and reclined in cot. BP 142/71 Pulse - 80 O2 Sat 100% Client was evaluated by EMS, and felt better after resting for 15-20 more minutes. Total observation time after vaccine 45 minutes. Client reports ""feeling more like myself"""

She report had vaccine in AM 12/18 then later that night developed fatigue, muscle aches, and head ache. This has worsened overnight and this morning 12/19 had new symptom of sore throat that has persisted. Given sore throat has been advised to follow-up with employee health prior to potential return to work.

Pt received Covid vaccination and reported feeling dizziness at 13 min mark. HR 70, regular. Consumed water and a granola bar and then reported feeling back to 100% baseline. Was discharged from vaccine clinic after 30 min observation period. HR 72

Chills and fever of 101.F

Low grade fever of 99.9F, body aches, chills and diarrhea.

induration and bleeding at injection site, immediately after injection. Bleeding quickly controlled.

Patient experienced a rapid heart rate measured at 100 BPM. Recovered shortly with no issue.

After administration of covid vaccination, patient c/o feeling warm and diaphoretic. HR 78, pt appeared slightly pale. No other complaints. Ice pack applied to forehead. Patient reports feeling better at 1840, O2 98% RA, HR 74 regular, BP 140/96

Bleeding at injection site immediately after injection. Bleeding was quickly controlled.

Tingling sensation to left hand, traveled up to elbow and upper arm. Then tingling sensation traveled to right hand to upper arm. Both shoulders started to feel achy. Then tingling sensation switched to pins and needles sensation. Later on the day, left foot noted to have tingling sensation. Symptoms noted around 11am to current time 7pm, and continues to have tingling, pins and needles sensations.

Received vaccine around 1700-1730. At 0300 the next morning woke up in severe gi distress. Abdominal cramping, diarrhea. No fever. I was sweating but I believe that was pain related. Diarrhea lasted until 0600. Then abdominal distention and gas persist. It is currently 2000. I am able to eat and keep food in but the pain is pretty extreme for a vaccine. Right now it?s a 5/10. At 0300 it was 8/10.

Intermittent Cough (new onset) I did not see it on the list of common side effects. Not sure if its of concern or not. Started approx 8 hrs after vaccine. Other symptoms I have appears to be normal such as site soreness, fatigue and mild headache. Just wanted to make you aware of cough. Day #1 still. Thanks!

Induration at injection site immediately after injection.

I feel dizzy and woozy, almost like I'm drunk. S/S started 20 minutes after injection. Also nausea w/o emesis, fatigue

Vomiting every 20 to 45 minutes from 8:30 am to 2:00 pm. Resolved after 2:00 pm.

Itchy throat 10 minutes after injection. No shortness of breath, no breathing problem, no cough, no difficulty with swallowing. no facial swelling. Client was evaluated by EMT. BP177/91 Pulse 91 O2 Sat 97% Client did not take all of her blood pressure medication today. She felt her symptoms resolved after drinking water and resting. Client was observed for 30 minutes after injection.

Pain in the injection site, felt tired and felt feverish but normal temperature

Bilateral ears because hot, red, swollen, blistered, and painful approximately 1 hour and 20 minutes after vaccine was administered.

Patient complained of tongue tingling/numbness and feeling of swelling at 6:58pm. No shortness of breath or other symptoms. Vitals at 7:01pm HR 89, BP 125/85, O2 98%. At 7:11pm patient still felt tongue as numb but not worsening and not other symptoms. Provided Benadryl 25mg. Patients HR 92 and O2 98. AT 7:25pm patient stated she felt fine and HR 95, O2 99. Patient released to husband to drive home.

I received the dose approximately 7:15pm. Within about 8 minutes of receiving the Pfizer COVID-19 vaccine I experienced pins and needles sensation on the left side of my body in my left arm and strong muscle pain in my left neck. I felt nauseous intermittently. The nurse stated that my skin looked a little blotchy on my chest. Joint pain in my left knee and left arm was intermittent as well as intermittent pins and needles sensation in my left ear and burning in my left fore arm. I felt somewhat lightheaded. This lasted for about 15-30 minutes on and off. The nurse measured my BP and oxygen saturation which were in acceptable ranges. I kept moving my arm to relieve the strong and at times painful muscle cramping sensation in my neck and massaged my neck. By about 8pm the light headedness and nausea passed enough that I could drive home. On the way home the left side of my throat felt thick and somewhat swollen but not enough to prevent me from driving or breathing in any way. At home I focused on drinking a lot of water and gently moving my arm to relieve the pins and needles sensation. After eating dinner and hydrating I felt some improvement and most pins and needles sensation and neck soreness/throat thick sensation was resolved by about 11 pm. I was able to rest fairly well through the night until 7am the next morning when pain at the injection side woke me up. Soreness at the injection site, headache, fatigue, nausea, and mild chills are what I noticed today which appears to be more typically expected from the vaccine.

Warm flushed feeling, racing heart, dizziness that started about two minutes after injection. It dissipated after about 3-5 minutes.

Right arm burning sensation as injection was started. Right arm soreness at injection site immediately. About 45 minutes after vaccine, new onset of facial numbness and tingling (in cheeks and forehead). Symptoms went away after about 10 minutes. Facial numbness/tingling returned 3 hours post injection for >30 minutes. Woke up the next day and facial numbness/tingling was still present and also included both sides of face. This resolved around 1:00pm. Headache and significant right arm pain continued. Took 600mg of ibuprofen which reduced pain. Saturday (today) mild right arm soreness.

9 minutes after administration heart started racing, heart up to 154, lightheaded, dizzy, felt like I was going to pass out. Informed the medical team. Heart rate came down to 130s, started having chest itchiness, neck rash, and facial hives. 50mg IM Benadryl given. Heart rate came down to 90s and hives subsided. Started feeling normal but out of it. Discharged home. Slept for 24 hours. Injection site pain/leg muscle pain/joint pain/fatigue for 48 hours.

Elevated heart rate Warmth Shortness of breath

At approximately 9pm the day of the vaccination I developed a very aggressive and pounding headache, I went to sleep at about 11pm. The headache progressed throughout the night and I could feel that I had a fever. At 5:45 the following morning I got up and checked my temperature. It was came back as 101.2¦F. I took 2 tablets of 200mg ibuprofen and the headache and fever subsided in about an hour and my temperature was within normal range. For several hours I felt fine, however in the early afternoon my body felt extremely fatigued and the headache was returning and I had a few bouts of chills. At 4:30pm this afternoon (the day after vaccination), I took my temperature again and it was 100.4¦F. I took 2 more 200mg tablets of ibuprofen and took a nap. Approximately 90 minutes later, I rechecked my temperature and yielded a 100.1¦F fever and still had a mild headache. As of right now, at 9:30pm the day after vaccination, I no longer have a headache nor a noticable fever, just minor fatigue.

Patient felt throat was scratchy, then became flushed and slightly itchy. A rapid response was called and patient was brought immediately to ED by RN. Patient stabilized without any treatment within 10 minutes. Blood glucose found to be 44, given glucose and improved. Cetirizine 10mg was administered for itching, patient instructed to restart OTC antihistamines and see PCP the next day

Numbness on the right side of face (not severe)

Erythematous facial and neck rash

On 12/18/20, I woke up with a fever of 103.6, so I took Tylenol and applied wet wash cloths to my face and body to cool down. I initially was successful, and passed the temperature screening gates at work. But later that day at work I needed to take Tylenol every 8 hours because my fever returned, and I spent the whole day working while febrile. I am a respiratory therapist, so I knew that my fever was Covid vaccine related, and not because I was infectious. I also experienced base of the skull headache, bilateral

eye orbital pain, and tachycardia on my pulse ox about 130 HR, probably due to fever. I also had joint pain, mostly of hip girdle.

Flushing, racing pulse, rash (stomach, back), faint, dizzy, nausea, feeling unwell

Arm pain, controlled by heat and massage, no adverse event

10 minutes after injection in my left arm The right side of my face felt numb and was tingling. It felt like my right eye was swollen (which it didn?t appear to be) also the numbness extended to my jaw Lasted about 15 minutes then slowly went away

1520 patient reported numbness of bottom lip. Had this response in past--2005 or 2006 with preservative in influenza vaccination. Has not occurred since with use of preservative free influenza vaccination. 1522 numbness to tongue. No swelling of oral cavity on assessment. Face symmetric. 1526 feels slightly nauseous. BP 122/82, HR 72, RR 14. 1530 Patient states still has numb sensation to bottom lip and little on tongue. Denies SOB, denies difficulty swallowing, denies pain/tightness/tingling. Speech is clear. Mentation unchanged. BP on retake 124/80, HR 70, RR 12. Patient refusing further eval and treatment at ER. Patient verbalizes last time she took benadry and zantac and was fine. 1545 Patient left building. Sister driving patient. Instructed patient on signs/symptoms to call 911. 1630--Telephone call to patient to check on her. Patient states she took benadryl and zantac. States bottom lip and tongue are still numb. Highly encouraged patient to return to ER and get evaluated by physician. Patient said she was fine but knew what to do if needed. 1800--Telephone call to patient to check on her. Patient states she feels much better and is inquiring about second dose. Informed patient that we would follow up with her next week regarding next steps.

Chest tightness Hot flash for 1 minute Tight throat High heart rate 120s-130s

Chills, body aches, headache, nausea

Vaccination given at 12:50 12:54?started feeling lightheaded. Sitting in chair in observation waiting area. RN present in observation area. 12:55? feeling not right. Water given. Feeling nauseated. 1302?unable to hear BP via manual cuff in chair times 2 Lowered to floor and feet elevated 1305 ?88/54, 60 HR still nauseated and lightheaded. 1309?911 called 13:10?felt she was improving. Nausea better. 104/66, 68 13:12?110/68 HR 68 13:15?felling better. Sat up on floor. 98/50, 88 13:18?EMS arrived. BS 98. BP 112/72 Refused to go to ER by ambulance. Medics left. 13:25? RN and RN assisted patient to wheelchair. After talking with patient she did agree to going to ER to be seen by physician. Wheeled to ER and care assumed by ER team. Patient never lost consciousness and never had change in mentation. She always maintained conversation and orientation. She states didn?t feel sick enough to go to ER. Patient was discharged from ER to home.

Arm soreness, headache, fatigue

28 hrs after vaccine, woke up with tinnitus R ear, partial hearing loss R ear - went to Urgent care - Dr diagnosed with right sensorineural hearing loss with left side unrestricted hearing - prescribed prednisone 60mg a day x10days. Audiology test to be scheduled next week.

Puritic rash with multiple sites of itching all over patient's body. Lasted for about 30 minutes after onset of symptoms. Given 50mg Benadryl after initial onset of itching & 125mg of Solu-Medrol 10 minutes later.

Reports sharp, frontal chest pain worse with deep breathe/movement. began 25-30 minutes after recieving Pfizer's COVID-19 vaccination. 11:20am Vts: BP 109/54, P83, Sat 98%on RA. Exam: Alert, in NAD. airway no swelling, wide open. talking and sitting comfortably. No dyspnea. Hrrt RRR no murmur. CTA c/l. Left sternal border around rib 5 tender point reproduces her pain. Laughing and talking. Repeat bp at 11:30 109/63, P 79. Respirations 12 and normal.

Angioedema, hives, tachycardia, shortness of breath

Fever and myalgia. Temp 101.2 Left arm soreness to the point of unable to raise left arm

102F Fever since 12/18, chills, fatigue, body aches, vomiting, swollen neck/lymph nodes, severe headache. Self-medicated with Tylenol

Immediately (no delay) after injection, tingling in arm followed by flushing of face and subjective SOB, no wheezing noted, face and anterior chest with uniform erythema, no hives. Epinephrine administered immediately by vaccinating nurse. No further development of symptoms. Developed some palpitations and chest discomfort - normal EKG. Discharge home after 6 hour observation, no recurrence of symptoms.

Pfizer-BioNTech COVID-19 Vaccine EUA 12/17/2020- 12/18/2020 First day into overnight: temperature that ranged between 99-100.5 F. severe body aches, chills, extreme skin sensitivity, slight rash on right arm near injection site and on right breast, right arm pain significantly increased, fatigue, cough, temporary confusion, joint pain, nausea. 12/18/2020 Second day: Fatigue, slept for most of the day but still did not feel rested, nausea, arm pain, joint pain, headache 12/19/2020 Third day: Felt better but still drained and slightly short of breath. Joint pain, slight headache and side of face pain.

Pleurisy and pleuritic chest pain..sharp stabbing pain in left chest with every breath.

Fatigue, myalgia, chills, HA persistent for three days now

Menstrual spotting around 8:30pm the same day of vaccine injection. This was outside of my menstrual cycle. Occurred 1 time.

I was monitored for 15 minutes and felt completely fine and left the location. On my way home approximately 25 minutes after my vaccination I felt a tingling and numbness in the back of my throat. I decided to call the center and let them know how I was feeling. They suggested I return. During the 10 minute ride back the tingling and numbness had progressed to the back of my tongue. Once I arrived there they continued to monitor me and my symptoms remained stable with numbness in my throat and back of my tongue. I was not having any difficulty breathing and felt otherwise fine. There was a concern that the symptoms would progress and they initiated EMS. I was taken via ambulance to Hospital where they continued to monitor me and check my airway.. In route to the hospital I was

hypertensive with a BP of approx 190/100. I did not ask what my heart rate was. I was surprised my blood pressure was so high. They said it was probably because I was nervous however I was not feeling nervous because I knew since I could breathe I really was fine, and sending me to the hospital was simply out of an abundance of caution as this vaccine is new. Upon my arrival they took my blood pressure again and it was 140s/80s I believe with a heart rate of 106. My O2 sat we?re in the upper 90?s throughout the situation. My blood pressure tends to be in the 110s/70s with a heart rate in the upper 60s to mid 70s. So it was surprising to me that I was hypertensive and tachycardic despite not feeling like my heart was racing or that my blood pressure was high. I felt completely fine other than the numbness in the back of my throat and tongue. Since the symptoms remained stable and there wasn?t really anything for anybody to do they did release me. Between 6:30 and 7 PM I noticed the tongue numbness was subsiding. By 8 PM my throat felt completely back to normal.

12-18-20 at 0900 nausea and dry heaving started. 0920 felt freezing cold. 1000 feeling cold intensifies. 1000 headache begins. 1100 headache worsens. 1115 full body ache grows in strength. By 1200 body pain and fatigue increase. By 1300 headache and pain all over body maxes out at 8/10 on pain scale. For the rest of the day couldn?t warm up. Headache, body pain, and feeling cold lasted the rest of the day and throughout the night. 12-19-20 at 0730 headache extreme, body pain fading, feeling of cold not as intense. By 12-20-20 at 0600 only headache remains. feeling of cold, nausea, and body pain are gone.

Red rash on back, arms and legs. 101.2 oral temperature. Joint pain, bruising

Approximately 2-4 minutes after injection I began to get hot. Once sitting down I noted my hair under my hat was sweaty. Noted elevated HR at this time (did not check). No sweating anywhere else. Not clammy. I have a history of anxiety...was thinking that maybe I got hot due to room temperature / size and then my mind reacted. Symptoms started to settle around minute 12 - 15. Sat in my truck for a few minutes after the 15 minute holding time. Started to feel back to baseline. I have had no issues since. Again, thought it was anxiety however I did talk to my Aunt who experienced similar symptoms after her injection. Decided to report. No chest pain No SOB No angioedema No rash or hives No swelling

Dizziness, fever, nausea, pain at injection site, inguinal lymph node swelling, chills, generalized weakness Took 2 acetaminophen 500mg, but to no relief, symptoms passed on their own.

Pain in the injection site for several hours (probably 5 hours or less), with a pain scale of 3/10. Pain is manageable, can still use the affected arm, no pain medication taken.

acute, mild pancreatitis, associated with symptoms associated with Nausea and vomiting and abdominal pain. Patient's symptoms started 1 day after her vaccination.

"After 3-5 minutes after injection felt anxious, shaky, lightheaded and stated he ""felt off"". Patient in chair and notified observation staff who notified POD manager RN. Patient stated he had not eaten today, given water, peanut free snack and room temperature made cooler. At 1535, patient states all symptoms are resolved."

Coughing, chest tightness, decreased saturation, itching forehead and back, rash on upper back

Patient received vaccine at 0845 and left after the specified 15 minute waiting period. At 0940, the patient returned to the vaccine clinic stating that he was short of breath and his throat felt tighter than before. Arm examined and no hives or redness present, patient denied itching and hives. Patient denied that throat tightness was getting worse. PharmD and RN present and took vital signs and called house manager. Verified NKDA and then administered 25mg of PO diphenhydramine. Pt then transported via wheelchair for further workup.

Patient received COVID 19 vaccine at 1636 12/19/2020. Patient returned to clinic at 1733 complaint of throat closed and hard to clear. Patient had declined observation period and returned to work. Vitals 131/79, HR 90, 97.7 F, 98%, RR30. Complaint of dyspnea and palpations and occasional chest pain. Patient states history of asthma and hypertension.

Patient received vaccine 5 min prior, then left lightheaded, nausea, put head down, sat back up got worse then felt jittery and heart beating faster. Patient assisted to stretcher, cool cloth applied and vitals taken. Patient reassured and education given about vaccine and side effects.

Patient complained of tingling lips and tachycardia. BP 159/90 HR 105. RRT called. Patient transported to Emergency Department.

Within 5 minutes, started feeling very tired and dizzy, leaned head back trying to relax. Approximately 15 minutes after vaccine had seizure lasting up to 15 seconds possibly. Brought to floor carefully. Then had small second seizure (about 5 seconds in duration). Difficulty Breathing immediately. Then extreme trouble breathing/stopped breathing , given 0.3 mg EpiPen in right thigh, gasped and began breathing again. Checked pulse (80 b/pm) then waited about 3 minutes and EMTs arrived. BP was 140/90 ish. Both higher but not terribly high.

5pm: quick hot sensation with associated increased HR, hot sensation went away after a few seconds and HR returned to normal shortly after 5:15 pm: slight tingling in tongue, lasted only a few seconds and then went away no other side effect since, except for a slightly sore injection site.

Enlarged lymph nodes on axils initially walnut size then progressed to golf size edema/lump on Left breast

Stomach ache and slight achiness

Left arm pain.

I am an employee of Medical Center. I went to Hospital for my vaccine since it was only 5 minutes away from my house. At 5:00 PM I received the vaccine. 10 minutes after I noticed my throat felt tight and as if it was closing. This felt similar to the reaction I felt when I had morphine in Jan 2020 (that I am allergic to). I notified the nurses and they watched me for 10 minutes. It then stayed the same. They brought me back to their tent area and gave me 50 mg of benadryl. I immediately felt relief. However, maybe 3-5 minutes after the throat closing sensation came back. They then had to take me to the ER. I was then put on fluids, steroids, pepcid, and ativan. I was released after they watched me for a couple hours.

sore throat

The patient first started to feel really warm. The patient felt like her head was swimming. Then the patient had chills. Her vital were prefect.

Low grade fever 99.1 Severe myalgias Headache

Nasal congestion, headache, fatigue, 2-2.5 inch swollen, red, firm area @ injection site

two hours after getting the vaccine i had nausea/ vomiting and body aches. two days later i am still having body aches.

"Patient screened prior to vaccination for previous history of allergic reaction to other vaccine or injectable medication. Patient confirmed past history of ""numbness of lips and tongue"" secondary to iodinated contrast media. Patient was counseled and instructed to wait 30 minute observation period following vaccination. Following the injection, within 15 minutes the patient reported feeling flushed and heart was racing and felt that their throat was closing. Patient was triaged in the vaccine observation area with HR in 120's and BP of 182/60. Upon evaluation by the hospital's rapid response team she was administered 12.5 mg IM diphenhydramine and transferred to our ED for further evaluation. Upon evaluation by ED provider no additional treatments were administered and her symptoms abated. She was discharged home in stable condition without any further complications as those noted above."

Severe arm pain x2 days - injected in shoulder not deltoid Sudden onset of chills, severe shaking, shortness of breath, 02 sat = 89% that lasted 15 minutes (took Tylenol 1000 mg immediately). This occurred about 1.5 days after injection

SOB, fever,headache,body aches, chills,feeling unwell,tired for over 24 hours than on Saturday 2 days later developed injection site pain swollen lymph node under right armpit with severe pain

"28 minutes after PT. received vaccine she told RN on duty she felt funny""heart fluttery"", , light headed, dizzy B/P 190/110 HR 70-80,98-99% RA per facility RN. 0932 182/105, HR 60-70, 99% RA per RN 0945 Continue to monitor 180/95, HR 60-72, 99%RA blood glucose 90(PT ate breakfast) RN @ bedside chair 0954 119/91, 99% RA , 60-73 HR feels better but has headache 10:00 ambulance called10:08 208/96, 68-76 HR 99.24% 10:13 Ambulance arrives,report given 40 Medic 10:20 210/112 per EMS monitor HR80 100% RA 10:28 Loaded onto stretcher left with EMS"

40 hours after receiving the vaccine I am experiencing dizziness.

On 12/18/20 @ 2:58 PM, the patient experienced a really bad headache directly after received the vaccine. Her heart rate elevated 135 with heart palpation. Her BP was 178/92. She was very dizziness, short of breath, her had a hives all over her chest.

Approximately softball sized rash developed on LUQ and with additional around left flank area approximately 2 hours after injection. The redness/rashes went away spontaneously after another 2

hours. During that time, a little discomfort in left side of throat, but no change in lung sounds, uvula or any other respiratory concerns. Later in the day (approximately 4-6 hours), baseball sized redness presented on triceps bilaterally and splotchy redness on lumbar area (about 2-3 areas). Redness/rash is still present on both triceps the next day 22 hours after injection.

Fever of 102 F that developed within 12 hours of vaccination and resolved within 24 hours of onset.

Fever 102 Sinus congestion dry cough runny nose body aches

Patient is a pleasant 83 y.o. female pediatrician with history of Sjogren's, hypothyroidism, hyperlipidemia, hypertension who had been at Hospital to get her Covid vaccine. 30 minutes after doing so she reports being in the lobby and about to walk upstairs and feeling fine. The next thing she knows she wakes up on the stairs with her nose and face bleeding surrounded by healthcare team. She denies any precipitating symptoms such as chest pain, shortness of breath, fevers dizziness, headache. She reports feeling well otherwise in the last few days. I did a thorough bony palpation exam including spine and he only point of tenderness besides on her face was the area above her right ankle. She does not have a history of syncope or collapse

Patient had vaccine at 1330 on 12/20. At around 1815 she began experiencing heart palpitations. She presented to the ED and she was found to have a heart rate in the 130s. EKG showed junctional tachycardia. She was given 6mg of adenosine and an EKG was repeated and showed sinus tachycardia. Eventually her heart rate decreased to the 70s-90s. She was noted to have a potassium of 3.4 which was repleted. She was admitted overnight for observation. In the morning her potassium was normal and she remained in sinus rhythm. She was discharged later that afternoon.

Headache, fatigue, nausea, tachycardia, muscle pains, chills, subjective fever and subjective shortness of breath

Swelling and redness at injection site, swelling of lymph nodes in the same arm as injection site, painful

"Employee reported chills, shaking, dizziness ""like you feel after you faint, spacey""."

Patient became lightheaded. Felt palpatations. No shortness of breath.

Metallic Taste

Numbness and tingling throughout body

The patient experience tightness of her chest. She was hook up to be monitored. Her BP was 185/91. Her heart rate was 122. Her O2 level was 100. The nusre notice swelling at the area of the site with mild erythema (redness).

Most severe symptoms was injection site soreness initially, followed by overall myalgias, chills, and fatigue. Recovered in 2 days.

Nausea, initial SBP is 155/87 and heart rate 101. Repeat BP was 134/84 and heart rate 94.

Anaphylaxis type reaction, stridor, treated with 02, epi pen, moved to hospitals ED

8am EE noted fanning herself, states she feels warm but just got off nights. Ice pack given for neck. 8:03 C/O itchiness on chest, heart racing, neck and chest with mild redness. No SOB or tightness in throat. RN notified and came to assist. Left arm vaccine injection site asymptomatic. EE refused Benadryl. BP 143/105, P81 PO 100% 8:08am Continue to feel itchy on chest and neck BP 153/91 P-76 PO 100% continue to refuse Benadryl 8:10am Benadryl 25mg po given, juice and crackers 8:14am BP 151/86 P-65 PO 100% changed to reclining chair to elevate feet, no tightness in chest or throat. 8:20am EE c/o left arm tingling/numbness down to fingers, denies CP no SOB, states it is like she hit her funny bone. BP 151/86 P75 PO 100% RN notified and evaluated her. 8:35am EE feeling cool. BP 131/88 P-69 PO 100%. EE states she feels like the Benadryl is working , redness less on neck and states she feels more relaxed, continues to have left arm numbness. 9am EE states she feels better, a little itchy on neck but no redness. BP 123/87 P 73 numbness decreased and almost gone. OK to go home per RN and instructed to take Benadryl when she gets home and to call the Covid vaccine hotline if needed or 911 if any resp. distress or CP. Requested her to text or email RN when she arrives home. EE states she understands. RN states she heard from EE and she is home. RN

slightly elevated temp (99 deg), chills, body aches, headache over 18 hrs period

Immediately after the vaccination my arm got super sore. On, 12/17 at 10am while at work I developed a 99.1 fever, chills and severe body aches all over called Employee Health and management and was given a COVID test which was neg and was sent home. I took 600 mg motrin and around 8pm that night I began to feel better. I previously had symptomatic COVID in July.

12/19- nausea & headache. 12/20- bodyache, sore arm & headache

8:33am EE states she feels flushed and heart racing. BP 141/83 P-96 PO 100% Refused Benadryl. Denies SOB, chest or throat tightness, no itchiness. RN notified. 8:40am C/O warmth, no itchiness, no SOB, no tightness in chest or throat. BP 137/81 P-77 PO 100%. 8:50am 138/83 P-65 PO 98% abdomen with some light rash. 8:55am Benadryl 25mg given per RN 9:05am BP 129/87 P68 PO 100% c/o left eye feeling warm, no redness. 9:30am BP 127/84 P69 PO 100% denies heart racing, feels fine, Instructed to take Benadryl again if has reoccurrence and to call the Covid vaccine line or 911 if any resp distress. EE states she understands. RN

Patient states my lip feels like it is swelling, patient lower lip with swelling noted. Patient assisted to Emergency Dept via W/C 02 sat 99%, B/P 150/88, HR 99

12/17/2020 Woke up at about 7am, pain at injection site, swelling. At end of day, started to have extreme HA and joint pain. Tried to sleep as much as possible. But 12/18/2020 felt even worse. Was unable to report to work. Mgr recommended the rapid test for Covid on 12/18/2020. *drive up test. Didn't want to take tylenol to mask fever. Rested friday and sat. Felt better 12/19/2020. Symptoms were mild to moderate. Temp highest was 37.9 12/20/2020 'still feel warm', body aches, joint pain, headache are 'still there' but 'more tolerable'.

Recurrence of the exact symptoms I had when I had COVID in March, 2020, but less intense and for only one day. These were severe fatigue and wet cough. No fever. It was like deja vu, but only lasted 24 hours. No other new symptoms.

Started feeling confused. Stated felt like she was drunk. laid her down on the gurney progressed to abdominal pain, nausea and vomiting. Light headed confused, tingling in legs. Sent to the Emergency room

swelling at site of injection, fever 102.3F, muscle ache, chills

30 min, c/o feeling light headed, BP 129/71, 98% RA, HR 66, R 16. Sx resolved.

Increased Fatigue on day one after 1st dose. mild Left axillary lymphadenopathy. Axillary swelling, and tenderness radiating into left breast and very mild into left anterior neck. . 2/10 on pain scale. Constant Dull discomfort. Not really worse with movement. Axillary lymphadenopathy and tenderness more noticeable on day 2 after receiving 1st dose of vaccine. NO SOB, dyspnea, fever, change in heart rate.

Patient became very flushed and ee stated she was not feeling well. BP: 156/96-176-96 HR: 80-98. Patient states this was not normal bp. continued to monitor pt and noted to have reddened rash on face. Patient to ED for further evaluation.

9:50 am patient states she does not feel right, feels funny, leaning over in chair, denies SOB no CP c/o of heart racing, NKA RN and RN summoned to help. Patient laid down on floor. BP 192/103 P-112 PO 100%. Eyes noted to be pink, denies itchiness. RN called 911, advised not to give Benadryl. 9:55am BP 178/99 P-119 PO 100% patient continue to feel heart racing but no SOB, chest or throat tightness. 10am BP 177/100 P-114 PO 100% continues to be A&O x3 no resp. distress 10:03 EMS arrived and took her to the ER. Patient states her 15 min observation time was up at 10:05am. RN

Woke up out of sleep and felt very warm, and a tingling sensation which started mid thoracic region which then traveled up to base of my neck and then spread bilaterally to both arms and hands; was brief and then just dissipated

30 min, c/o L hand (btw 2nd and 3rd finger) swelling, no pain, no itching.

Nausea- started about 48 hours after injection. Began with a feeling of slight motion sickness and progressed over the next 12 hours to be severe enough to cause vomiting. Nausea only present when standing and improves when laying down.

30 min, c/o slight numbness, tingling at injection site arm (L) vitals taken WNL. Sx resolved.

Initially started as numbness of the lips, then progressed to angioedema (swelling of the lips) with face itchiness. Then progressed to throat tightening and swelling feeling, consistent with anaphylaxis.

shortly after receiving COVID vaccine, patient complained of arm hurting with shooting pains down to her elbow and fingers. Patient started shivering, HR 129, BP 131/78 o2 sat 98%. continued to monitor

employee. physician at side 800mg ibuprofen given. Patient hr down to 111 and bp 135/97. Patient refused evaluation in ED. was released and escorted by physician out of department.

Very painful to injection site that woke me up the night of 12/17 into 12/18. Became febrile at 100.5F oral Friday 12/18 with body aches, joint pain, extreme fatigue, skin hurt between 4-5pm. 600 mg ibuprofen helped, however became flushed and sweaty. Saturday 12/19 woke up feeling fine. Around 3pm, body aches started again with bilateral hip pain, extreme fatigue, sweating. Temp was 101.1F oral at 7:15pm. I took 500mg acetaminophen and 600mg ibuprofen. Today, again woke up feeling fine at 9am, felt asymptotic. On the way to work at 10am, became sweaty/fatigued/body aches again. At work, 10:45am temp was 99.6F oral. I took 500/600 of Tylenol and ibuprofen.

Experiencing decreased sensation in bottom lip. No decrease in function. No facial droop. Just decreased sensation/numbness. Started on the second morning after the vaccine. No exposure to known allergies.

Injection given 07:58 am, at 08:12 Patient described feeling dizzy, was diaphoretic V/S at 0812 178/99 Temp 97.0, 0813- 182/101 P-112, O2 Sat 98% on room air Respirations within normal limits, alert oriented, patient described feeling a little shortness of breath able to speak in full sentences, transferred to gurney and taken to Emergency Room, skin pale. While waiting for intake patient stated shortness of breath was feeling a little better, repeated BP 0827- 146/94 care transferred to Emergency Room

Within 5 minutes of receiving vaccine, Pt.t started to feel shaky and nauseous, became tachycardic, however patient stated she rushed to get here and was not sure if that was the reason. Pulse at this time was 100. She felt she was going to pass out. I got water for the patient and also gave her peppermint candy, after about 10 minutes she didn't feel she was getting worse but she didn't feel much better. She did not want RRT called. I gave 25mg of Benadryl. Within 5-10 minutes after the Benadryl she started to notice symptoms improving. After 20 minutes patient is standing and no longer feels she is going to pass out. Patient called her husband to pick her up.

Patient stated he didn't feel well after receiving vaccine. Patient stated his throat felt funny, BP 186/94, HR: 117, o2 99%. Patient went to ED for further evaluation.

at 1am after vaccination, woke up with body aches, couldn't sleep, restless till 0430. Woke up with mild congestion, cough, fatigue, lt. arm sore at site. Body aches continued throughout day. Contributed it to shot. Slept good Friday night, woke up Friday with mild cough, congestion, fatigue, runny nose, sore throat. Tested for COVID Friday morning with Binax and was positive. Symptoms have worsened since then; loss of taste and smell. Has had temp as high as 101 on Saturday, low 99's on Friday. Chills, SOB, and fatigue. on Saturday

12/18/2020 scrotal pain. Evening onset of rash 12/19/2020 Rash lower lumber, left butt cheek, scrotum and penis. Took picture and sent to Consult with infectious disease. Doctor deemed rash to be SHINGLES and prescribed Valtrex. By evening, rash had progressed all over and pain associated with shingles. 12/20/2020 Stable but rash is still prominent. Consult over tele

Pt is currently breastfeeding. Pt reported having 4 clogged milk ducts. 3 on the same side as injection and one on the other. All have resolved at this time through breastfeeding and pumping. No other symptoms.

I had aching muscles, headaches, diarrhea, nausea, pain in my arms and legs and vomitting.

12/19 1000 developed chills, 1230-body aches, nausea, and headache, fever 101.5 (self reported), 1300 fever increased to 102 (self reported), fever then increased to 106 (self reported). Pt reported dizziness. Visited ER. Fever 100.8 on arrival. Patient reports taking PO advil, tylenol, and benadryl. Used ice packs at home to decrease fever. TX in ER with IVF, tylenol, and zofran. D/c from ER. OHN f/u 12/20-patient feeling better, resting at home, denies fever.

headache and nausea around 2am...throwing up...reso;ved by 2:30am

Patient complained of tachycardia. Dr. examined the patient who stated he had a regular rhythm. After one minute of sitting, he felt better. After sitting for another 5 minutes the patient stated he was feeling tachycardia again. Denied any dizziness or lightheadedness. Dr called down to the ED. Patient escorted down to ED where they did an EKG and discharged him.

Approx 45 minutes after injection, patient reported generalized itching. Patient was given Zyrtec 10mg. Itching continued. Patient was given Diphenhydramine oral. Itching resolved.

Reactivation of HSV2 virus, outbreak on left buttock/flank and related lymphnode tenderness, flank pain, body aches, malaise.

The patient was well prior to vaccination (12/17). The day after, he felt mildly unwell and had a low grade fever. The following day, he had a fever of 102. He received 1L of fluid at Urgent Care and had a BP ion the 80s. Shortly thereafter, he felt palpitations and developed AF. He came to the hospital where he was tachycardia to 200 bpm and hypotensive to SBP70s. He received aggressive fluid resuscitation (4L), IV metoprolol and was started on empiric Abx. Within several hours, the HR lowered, BP increased, and AF spontaneously converted to sinus. He had no dysuria. Curtures so far have not shown growth at our hospital. Urinary culture from urgent care has reportedly shows 20k gram positive cocci.

Approximately 15 hours after getting vaccine, the morning after, noticed slight tongue discomfort. Feeling slight swelling of tongue, noticed scalloped appearance. Noticed for about 24 hours, seems to be mostly normal now. Did not take any medication. Was not in any distress really, just seemed to be an uncommon side effect and thought I should report. Only medication allergy in past was keflex many years ago and was described as serum sickness and treated with Prednisone.

15 minutes after injection. Tachycardia, Diaphoresis, mildly hypertensive, facial flushing, waxing and waning symptoms

Headache, injection site pain, blurry eyes, hoarseness, sore throat

Tingling in face shortly after dose for approximately. Symptoms resolved after eating a meal.

Symptoms: light headedness persisting 3 days after administration, high BP occasionally

102 temperature started around 11pm on the 17th. Fever went back to normal evening time on the 18th- treated with ibuprofen. Body aches started same time as fever and lasted until the 19th- treated with ibuprofen. Severe fatigue started the night of the 17th and has lasted until the 20th. Severe headaches started the night of the 19th.

A slight small itchy rash in left hand that stopped itching pretty quickly

Received 1st dose of Pfizer vaccine on Left Arm at 1630 on 12/18/20. Within 8 minutes of receiving vaccine, tongue experienced numbness and tingling. At 9 minutes post administration, symptoms intensified. And at 10 minutes post administration throat was scratchy was a tickle. At 12 minutes post administration notified Pharmacy and Employee Health Workers. By approximately 1650, health care professional administered Benadryl 50 mg IM to Right Arm. Observed. Symptoms decreased but then intensified to include numbness and tingling in lips. Transferred to Emergency Department for observation. Received decadron 10 mg IM to Right Arm at 1915 due to symptoms not resolving. Discharged from ED with prednisone course. Discharge diagnosis Angioedema. Symptoms decreased approximately 6 hours post administration of vaccine. On 12/19/20 at approximately 1425, experienced tightness of throat, with numbness and tingling of tongue and lips. Took over the counter Benadryl 50 mg p.o. at 1440. By 1520, symptoms intensified with hoarseness in voice with coughing spells. Returned to Emergency Department for observation. Noted to have rash on chest in ED. Received Pepcid 20 mg in ED. Discharged with instructions to take Benadryl 50 mg p.o. every 6 hours, famotidine 20 mg p.o twice daily, continue taking prednisone, and received prescription for epinephrine auto injector. Emergency room physician wrote to return to work on 12/22/2020 with follow up with Employee Health on 12/21/2020.

Petechiae - very mild on proximal area of right thigh. Noted two days after vaccine. Appears to be resolving.

Periorbital edema upon wakening that resolves throughout the day but reappears the next morning

Patient reported onset of mild headache immediately following injection of vaccine. Resolved after 30 min observation.

The patient expericence lightheadness, flushed, heart palpation, and chest tightness. Her vital are BP 119/54, 62 heart rate, O2 was 99. The patient was monitored until the symptoms went away. It all passed within 20 minutes. The patient was walked to her car by employee.

Patient reported onset of slight headache immediately following vaccine injection. Resolved at time of dc after 30 min obs.

Swollen lymph node on right side of neck the morning after receiving the vaccine. Telehealth appt with PCM who prescribed 800mg ibuprofen. Took 200mg motrin for swelling because i have not had the chance to pick up prescription. The following day, swollen lymph node continued and broke out in hives approx at 1300. Went to emergency room and was given an oral steroid (dekadone?). Prescribed

prednisone, claritin, and Benadryl. Have taken 1 claritin a day. Hives have disappeared within 5 hrs of oral steroid. Swollen lymph node persists and has enlarged. Painful and swollen past the jaw line. Will return to ER today for pain and continued swelling as directed by ER.

Burning at injection site, then elevated heart rate, flush, and light headedness. I was kept and observed for another 30 minutes at the hospital and everything returned to normal. Then, I developed severe dry mouth and congestion, post nasal drip, headache, and nausea. I drank 3 liters of water with continued dry mouth, intermittent feelings of flush and light headedness for the next 3 hours, but no fever. After that subsided, I had only chills and headache that were resolved by the next morning. Now I have only arm soreness and mild fatigue.

"Felt an initial ""cool"" feeling all over immediately following vaccine injection, this resolved immediately as well."

After the vaccine I immediately got a mild minor headache which passed pretty quickly. At around 9pm I noticed a bump at the base of my neck on the top of my right collar bone. I reached out to Employee Health Nurse and my PCPs nurse who agreeed it could possibly be a swollen lymph node. Today I am currently monitoring this bump and if it doesnt desolve I will reach out to my PCP in the morning.

Patient reported numbness in lips immediately following vaccination, resolved within 15 mins.

I have nasal congestion, loss of taste and smell and fever.

Pt reported feeling light headed following vaccination, resolved after 15 mins.

12/18/2020 morning I started to have runny nose, achy 'like coming down with a cold'. Late evening and early morning 12/19/2020 tender lymphnodes, same side of vaccination. As of 12/20/2020 barely palpable anymore. Temperature was normal. I took ibuprofren and tylenol; 12/18-12/19. Congested, nasal drip ' 48 hours of feeling worn down and achy'. Flu shot in October 2020

Patient received vaccine and became dizzy, nauseous, and hypertensive and was taken to the emergency room.

Light headed, cold clammy skin, pale, cold sweats and numbness to left arm where she received vaccine.

Mild dizziness followed by jitteriness and heart pounding. Increased blood pressure. Lasting for about 1-2 hours.

Received vaccine, waited 15 min. Walked to car. side of face went numb, dry mouth. Patient walked back to vaccinate location. Pulse 115, O2 Sat. 96.

Extreme fatigue, generally unwell, body aches, headache, abdominal pain, nausea, ear fullness. Near syncopal episode the morning after the vaccine.

Tachycardia (150?s), dizziness, shakiness, flushing beginning 5-10 min after injection. Lasted for approximately 45 min. Approx 24 hrs after injection, developed a rash on torso?bilateral arms, chest, neck and back.

Malaise on 12/19. Right (collateral) axillary lymphadenopathy about 1 inch in diameter noticed on 12/20 (today).

Red spot about 1 inch in diameter with swelling and warm to the touch. Muscle soreness around injection site. Still present two day later with no relief as of reporting.

Painful, Tender and redness next to injection site (not directly on). Red mark approximately 2 inches in height and 1 1/2 inches wide

Diarrhea (5 hours post-injection), duration 48 hours Fever (11 hours post-injection), duration 6 hours Feeling of lump in throat (24 hours post-injection), duration 24 hours

Itching; Hives; Patient declined Benedryl ; took Claritin with some relief

About 23 minutes after the vaccination I started feeling tightness in my throat, began coughing and wheezing and had SOB, was taken to a secure area and given 25mg benedryl and they waited a few minutes and gave another 25mg of benedry. I was given an EPI pen injection in the left thigh and was given an albuterol enhaler to help with the breating. The symptoms resolved after the EPI and the albuterol and I was released from their care

Felt flush and throat started to get scratchy and started to get tighter and was having difficulty swallowing about 4 minutes after vaccination. Continued to get more flush and laid down. Rapid response was called and taken to the emergency room.

I had an existing mild rash after I ate crabs on 12/18/20. I never had allergies to any food. My rash got worse 6 hours after receiving dose yesterday. Both ears are swollen and red. Rashes behind ear look like hives, welt-looking. It spread to my neck and upper back area. Took Benadryl and it slightly improved. Also applied Cortisone cream. Took Zyrtec as well. Slighty better. It's been 24 hours since injection.

Fever, chills, fatigue. Occurred at noon 12-19-2020. Sent home from work (ER RN) and had covid test.. awaiting results.

I had sneezing and a cough.

Injection arm very sore by 20:00 day of vaccine. Awakened with body aches at 03:00 and chilling. No fever. Went to work (frontline healthcare worker) at 08:00 but left work early (14:00) for worsening body aches moderate joint pain and increasing fatigue. Polyarthralgias and myalgias intensified as did chilling. By 10:30, abdominal pain had begun. And diarrhea had begun. The next 12 hours were continued intensity of abdominal pain (diffuse intense cramping), and severe myalgias and poly arthragias. I took additional naproxen (440mg w good 16 hours from am dosing at 07:00). I was unable to do any thing but try to rest between bouts of diarrhea. Nausea developed (moderate) but no

vomiting. No fever despite intense and unrelenting chills for about 24 hours. Continued fatigue into post vaccine day 2 (12/19/20) but improved pain and resolution of GI symptoms. On 12/20, only mild polyarthralgias of hands, arms, low back, knees, feet, and hips.

Patient took 50mg Benadryl prior to injection at 1300. She also took Xanax at 1000 prior to injection. Immediately following the vaccination, patient reported onset of slight headache and tingling lips. No SOB. O2 100%, HR 80.

Persistent headache which started night of vaccine, unrelieved with Tylenol, continues today (12/20). Fatigue which has gotten worse, to today where I struggled to function and had to call in for tonight?s shift at the hospital.

Headache, body aches, injection site soreness.

for 2 days continues fever upto 104 chills rigors sweating myalgia extreme fatigue . i am a physician by profession i had covid in may 2020 and had antibodies igg checked in september

Chills, throwing up, runny nose

Sensation of tightening in throat and sensation of difficulty swallowing. No rash. No dyspnea. No stridor/wheezing. Vital signs unremarkable. Suspect globus sensation. Plan observation until resolution or progression to anaphylaxis.

Slightly after injection I began to feel light headed, flushed, dry throat, and increase in heart rate. I was monitored after for about 15 minutes which the symptoms seem to have resolved on their own. No treatment was needed. I didn?t think much of it until I realized some people were getting same side effects.

Within 24 hours , headaches nausea, muscle and joint pain. Approximately 24 hours facial rash/hives , itching and puffiness. Within 48 hours rash spread to neck and chest , day 3 rash/ hives continued, headache and body aches improved, urgent care visit started on Mederol pack with dx of allergy to COVID vaccine. With steroid dosing facial rash some improvement. Occasional headache no unusual body or joint discomfort above baseline

12/17/2020; 1158 am had injection. at 2pm, noticed trunk itching around waist, abdomen, back. No visible rash. mild soreness and redness to injection site on left deltoid. 530/6pm developed SOB, rash is now visible, non raised, very itchy trunk. Took 10 mg Zyrtec. Went to ER nausea, vomiting, moderate to severe abdominal pain, flared angina and chest pain with the shortness of breath. ER; DR. CONTINUED WITH BENADRYL 50MG 4-6 HOURS, DUE TO ONGOING ITCHING. FAMOTIDINE 20 MG 2X/DAILY Had flu shot between 09-10/2020

Sudden onset of fainting sensation . Followed by dizziness moderate shortness of breath lightheaded ness panic tingling in hands feet top of head headache distress.

Thurs 12/17 : aching in left arm infection site. Later evening : ?flu-like ? symptoms Fri 12/18 : 04:30 am : vomiting , headache, Started work at 06:00 am. - continued nausea, chills/ warmth (but no fever) Around 1:00 -small pupils (but dilating) , increased weakness, & dizziness begins. No appetite. Slept all evening. All vitals normal range. Took 2 capsules (200 mg) q 6 hr. Sat Dec. 20 : weakness in am . Increased appetite.

Constriction of airways, rash/hives and o2 sat low (80?s). Used pt albuterol inhaler, no relief. Coughing and wheezing continued. Staff escorted me to ED where I was give IV Benadryl and solumedrol. Within 2 hours post-vaccination I was ok to leave.

Nausea, diarrhea lasting approx 12 hours

Patient with symptoms of severe myalgias, low back spasms, fevers, chills, headache, SOB since Saturday. Treatment included intravenous fluids, Tylenol, magnesium repletion, frequent reassessments, infectious disease consultation in the Emergency room.

Numbness in face and tongue, feeling of tongue swelling and touching the back of my throat, difficulty swallowing with need for more effort and more swallows. These symptoms started about 45 minutes after the injection and got worse. I went to the urgent care and received Benadryl, Pepcid, and an IM Solu-medrol. The PA said he did not see any edema and I had a patent airway so they monitored me and sent me home with an epi pen in case symptoms worsened. Symptoms started improved approximately 2-3 hours after receiving the medications and the epi pen was not needed.

Ventricular tachycardia. Defibrillator paced me out of rhythm. I have had my ICD for 3 years. This is the first abnormal rhythm I have had where it delivered a therapy to abort it.

Had full body numbness and tingling about 6 minutes after administration, while waiting in observation area. Felt lightheaded, dizzy. Laid down, symptoms resolved about 5 minutes after, except bilateral Upper extremity tingling. This resolved after an hour, with tingling then localized only to left arm. This also resolved within 2-3 hours from time of administration (estimate)

12/16/2020 7:20am After the injection few later I felt my chest started to hurt gradually increased the pain and started to have palpitations it lasted hour and thrity. Vital Sigh the time of the event BP 138/80, HR 78, RR 24, Sat 99%. I was sent to ER they blood samples, EKG, Chest X-ray and monitor my heart rate.; all was normal. The same day I was discharged home.

Patient reported metallic taste in mouth, slight tightness in upper chest. Observed chest tightness deceased over 20 min. Metallic taste almost gone. 30 min. almost all gone. Benadryl 50 mg. given at 25 min. condition improved. Instructions given to patient re-symptoms worsen, S.O.B, etc, husband driving patient home.

Within 10 minutes of receiving vaccine, I experienced shortness of breath, irritation in my throat, felt flushed and was dizzy. I was immediately transported to the emergency room where I received benadryl and was monitored.

3pm developed sore throat and rhinorrhea. Concerned that I was positive, left work and scheduled symptomatic test next day. Noted on home pulse ox that my heart rate was in 140s (otherwise vital signs were normal and I was afebrile). Symptoms got better and after pushing fluids I was able to get my heart rate under 100 by end of the day. 12/20 woke up heart rate 140s now down to 105 at time of reporting. Sore throat and rhinorrhea are getting better but tachycardia is concerning and I am worried I may have developed an arrhythmia as my Apple Watch consistently marks my rhythm as inconclusive

Throat closure (angioedema/anaphylaxis) requiring ambulance transport to Hospital emergency room and stay IV infusion of Benedryl, solumedrol, and Pepcid with excellent results. Observed twelve hours, then discharged.

Approx. 10 minutes after vaccine administered I became suddenly tachycardic while sitting in a chair. Heart rate up to 140. I started to feel some chest heaviness with some difficulty breathing. Felt like my heart was galloping. Was transported to ER and monitored for 2 hours. I was orthostatic with talking, and walking. Heart rate to 135 walking to the bathroom despite having had a liter of IV fluid given. I was discharged home with instructions to follow-up with my doctor. I have an underlying problem with exercise intolerance with elevated heart rates. It seems that the elevated heart rate made my symptoms worse. Otherwise I have just a mild headache and mild fatigue. No previous adverse reactions to vaccines.

patient vaccinated, waiting the 15 min, left clinic. in 30 min. Sudden onset of Headache. 38 min. Horse voice, Cough. eventually improved. Reported reaction at 1pm.

After receiving the vaccine I was fine. Wednesday afternoon I had a headache and at night I started feeling my sore throat. Thursday night the sore throat felt like it was on fire. I started having fever (100.2F) and it felt like I had step throat. Runny nose, headache, next day Friday the sore throat and fever was gone and right now I just have the runny nose. I was screened for COVID on Friday and it was negative.

"Slight rash/redness along face and neck and upper torso; hypersensitivity on scalp, face, upper torso (borderline painful tingling on head/face/arms, chest). Even clothing rubbing against the skin ""hurts"" a little."

Patient recieved first dose of Covid vaccination to left arm and was being observed in observing area. Patient noted that the lymph nodes in her neck, on the left side were very raised and swollen. She stated this happens after her flu shots but this was much more pronounced at this time. She has no medical history at this time. Patient was seen by Md in the room Dr who stated she had no issues noted. She was watched for 30 minutes and released with advise to follow up with her primary care physician.

Swollen upper lip Rash and itching on back And legs Took benadryl

20 to 30 red blotches on my upper torso and arms

Approximately 20 hours after receiving, I had normally pain at the injection site. The day after receiving the vaccine I started having a dull headache, Chills, fatigue, mild nausea and vomiting once (all mild to

moderate symptoms). It is tolerable and normal for most vaccines; mild enough to not seek treatment at this time. I?m expecting it to resolve in the next 48 hours. If it gets worse, I will seek treatment. I?m only reporting these side effects to help people in the future, due to it being fairly new. I will be getting my second dose if my symptoms resolve within a few days.

Within 45-60 seconds of receiving the vaccine, I experienced acute-onset of tachycardia of 130-140s BPM. For context, my resting heart rate is 65-80. At first, I assumed it was anxiety, however, I had no preconceived notions or negative thoughts regarding the vaccine. I took slow, deep breaths and performed a vagal maneuver which did not lower my heart rate. I took two Claritin pills, thinking this was a mild allergic reaction. 30 seconds later, I tried to vagal again and successfully slowed down my HR to approximately 100-105 BPM. The tachycardia resolved after 10-15 minutes.

Pt stated she felt dizzy/lightheaded while on her phone nearing the end of her observation period. She got up to leave stating she thought she just needed fresh air and promptly returned to the observation area with dizziness and palpitations. This was 45 minutes roughly post vaccine administration. B/P and heart rate were elevated. Pt began feeling short of breath and a rapid response was initiated.

Recieved vaccine and sat to be observed. Noted flush from chest up to head of heat and then racing heart as well as increased blood pressure. First set of vitals @ 0445 pm 97.7, bp 167/89, hr 74, r 20 . Pulse felt fast but was normal per assessment. Second set of vitals @ 0458. 97.7, p68, BP 141/93, hr 92, O2 97. Pulse higher. Md saw him and stated was ok to discharge with follow up with primary care MD. Discharged at 5:10 pm.

Metallic taste in mouth

Elevated blood pressure Dizziness and heaviness in legs Went to Er to be monitored and sleep Lasted about 6 hours

Neuropathy in arm resloved on own.

Less than 24 hours after getting the Pfizer Covid vaccine, pt experienced severe tinnitus and moderate hearing loss in R ear. Seen by me in urgent care with demonstrated hearing loss, which progressed the next day. Diagnosed with acute sensorineural hearing loss in consultation with Ear, Nose and Throat specialist, started on high-dose steroids, referred to audiology. It is unknown if this reaction is short-term or long-term, but if it persists long-term it would result in disability.

Metallic taste in mouth

Myalgias, low grade temperature, injection site pain

Headache, feeling tired, temp of 100

Developed rash that itches on trunk, bilateral arms and bilateral legs 2 days after received Pfizer Covid vaccine #1.

Relactation

Lymphedema right underarm and breast Treatment- ice, ibuprofen, acetaminophen, light massage and light exercise

Sore deltoid muscle starting 10 hrs after injection lasting 24 hrs. No treatment required. Menstrual cycle 3 days late as of today. Negative home pregnancy test. Menstrual cycle is normally very regular.

About two to three minutes after the Covid vaccine was administered in the vaccine clinic at my hospital where I work, I began to experience pre-syncopal symptoms (mostly light-headedness and nausea). I stood up to get help and walked to the back of the auditorium where they were observing us for 15 minutes post-vaccine, and due to standing and walking, I became much more dizzy and lightheaded and then sat down on the floor and was eased to a lying-down position on the floor by a nurse as I briefly lost consciousness. I regained consciousness very quickly (maybe 10-20 seconds, but I'm not sure) and was taken care of by a set of nurses who noted me to be hypotensive and pale, with I think a bit of a lower heart rate, though I'm not sure what my vitals were exactly. They had me then stand to do orthostatic vitals and I was orthostatic. I was too dizzy to remain standing and felt very nauseas so I was taken to the ED (in the hospital where I work) to be observed. I had a normal EKG, blood glucose, and urine sample there. After having some juice and lying down, I felt better but was very cold and had some chills. After a little over an hour, they released me from the ED and it seems to have all been an episode of vaso-vagal syncope. I've had vaso-vagal responses before, but not in response to a vaccine since I was about 13, so I was surprised by how quick and severe the vaso vagal response was. Later in the day, I felt better but was fatigued and had a headache. I also had a lot of pain at the injection site. The day after the vaccine I felt tired and had a headache, and for part of the day a mild sore throat. Now two days after the vaccine, I feel much better, and the arm pain is more mild.

About 5 minutes after the injection I felt lightheaded/ presyncopal lasting about 5 seconds. I had several more episodes of the same symptoms over the next hour. My vitals were checked after the first episode and my pulse was 130 with blood pressure 179/99 and oxygen sat was in the high 90?s. I was taken on a gurney to the ER. I was told my blood pressure and pulse improved a few minutes after the initial episode and I was observed for 2 hours with resolution of my symptoms.

"Patient alerted team to feeling dizzy and left neck muscles tight 5 mins after arriving in recover area. Recovery RN assisted patient to bench area to lay down. Vitals signs obtained (stable but patient states BP runs low, no rash or hives, color pink. Patient lied down for approximately 30 mins. Felt better, denies dizziness. Left neck remains ""sore"". Patient has boyfriend at home to watch her, was advised to call 911 or primary care if any reaction after leaving."

Swollen Lymph node in right neck supraclavicular area and diarrhea.

- 1121: Patient reported being light headed. Patient stated it might be because of the excitement of getting the vaccine. Patient has a history of hypertension, arthritis (remission). Patient has a history of Bell's palsy and takes medication for that. Patient stated normal B/P normally 130s/80s.

In the first 24 hours I had soreness of the injection site and from hours 18-24 I was quite fatigued. Around 36 hours post vaccination I developed local swelling and itching, hive like in appearance

surrounding a skin nevi on right upper abdomen. Redness, swelling and itching improved some with Pepcid, Claritin and topical steroid.

Pt was found lying on cement at base of steps. Recovery RNcalled outside to the back. Patient was alert & oriented. Stated that he fell and landed on the cement walkway. Complained of left food pain and said he heard a crack when he fell. 911 was called per patient's request. Was able to talk inside with assistance and Vitals obtained (stable). Noted swelling in posterior back of ankle, pain with palpitation. Ice was applied. 911 arrived and taken to hospital

Pt reported feeling light-headed after 15 minute monitoring period post vaccine. BP 146/94 Left arm. Pulse 68, regular rhythm. SpO2=99 Offered water to drink and continuing monitoring period with pt sitting in recliner. Pt has spouse able to drive her home when ready. Pt reports no known allergies. 1743: BP 144/92, pulse 77, regular rhythm. Resp rate 14, SpO2=100 1755: BP 139/87 (101), Pulse 64, regular rhythm, Resp rate = 16, SpO2=100. 1800: Pt stood without any dizziness, steady gait. Pt reports no further light-headedness and feels comfortable leaving monitoring area. Instructed pt to call EMS with any concerning symptoms once at home. Husband will drive pt home.

Day following vaccine, throbbing pain developed on opposite arm/shoulder, leading to decreased/limited range of motion.

"Immediately after the injection my right shoulder felt ""odd"" and seemed to be popping and clicking more than usual. I experienced severe pain of the shoulder joint about 4 hours after the injection. At this time I took 400 mg of ibuprofen and the pain was eased by about 50 percent after about an hour. The next day I went to work without any medication and could barely lift my arm without severe shoulder pain inside the joint. The muscle did not feel too bad. Mobility of the joint was possible but limited by pain. I mostly used my other arm to adjust the position of my right arm. After work that day I took 800 of ibuprofen and went home to bed. I felt better the next day but took another 600 mg of ibuprofen to get through the work day. Same for day 3. It is now approximately 80 hours since the injection and my shoulder joint is still fairly tender and stiff but improved. I fear possible SIRVA because the shot seems to have been delivered fairly high on my arm. I do have a history of rotator cuff issues with this shoulder but it was never as painful as it was on the day of the vaccine and the shoulder has been well for the last two years. I received the flu vaccine in the same arm a few months ago with no problems."

received COVID-19 vaccine on 12/19 at approx 1750. At 1804 pt c/o headache, racing heart, itching, and shakiness. Vaccine Commander called rapid response team (RRT). Upon arrival of RRT pt c/o increasing sx. Pt escorted via wheelchair to ED.

Approximately 10 minutes after the vaccine was administered, reported starting to feel light headed, sweaty and nauseous. Then reported throat was feeling tight and RN on site reported hearing change in breathing. RN administered EpiPen and called 911. EMS responded and transported to ED. ED record shows resolved symptoms. No rash, edema, difficulty breathing. In ED was monitored and discharged. Received no medications or additional treatment in ED.

3 minutes after injection felt flushed and a rapid heart beat which self resolved within a few minutes .

Patient developed flushing, diaphoresis, tachycardia approximately 7 minutes after injection into L deltoid, while waiting under observation. The symptoms resolved spontaneously after approximately 3-5 mintues. Patient was then observed for 45 more minutes and felt fine the entire time. Upon leaving to have her spouse pick her up, patient developed symptoms again while walking out of the building. Patient was then taken to the emergency department for further monitoring. Telemetry and further observations for 4 hours revealed no further abnormalities and the patient was discharged home with no more issues.

None stated.

Fever chills myalgia

left sided facial, ear, and neck paresthesia. Felt similar to numbness after dental procedure. Initially felt my ear become hot and then touched it and noticed it felt numb. Then feeling spread to side of cheek and jaw and down the side of my neck on same side. Same side as injection. Onset was about 12-15 minutes after injection, immediately prior to being told it was ok to leave the observation area. Seems to have resolved almost entirely 1.5 hours after injection, though ear still seems to have slightly abnormal feeling.

Within a few minutes of taking the vaccine, my lower lip began swelling. I was moved to the emergency department of Hospital and monitored and treated for four hours. Then I was released. At around 1:30 p.m. I felt my skin singling and started having difficulty breathing. Since I was no longer at my work (Hospital) I went to the closest hospital. This reaction was much worse. My husband drove. My heart rate increased. I was released at around 6:30 pm

I had no reaction following the vaccination. The next day I had very mild soreness at the injection site. The next morning (about 36 hours after the vaccination) I woke up with fatigue and a sore throat. I had breakfast and about 10 minutes later I vomited everything (projectile vomiting, no nausea or abdominal pain). An hour later I had episode of severe watery diarrhea (just one episode). Felt very weak so I decided to sit down, stumbled to a chair, and then proceeded to have a syncopal episode with about 4 minutes of seizure like activity (witnessed, I don't remember that part). Decided to go to the ER, where I had labs, EKG, CXR, head CT scan, MRI and EEG. I was admitted for 24 hour observation, all the tests were normal.

None

Soreness at site of injection

Patient was sitting in a chair approximately 20 minutes after vaccine administration when she became pale and quiet. Monitor asked if she was ok, and she said she was itchy on her face and that her feet were really hot and hives were noted on her cheeks and forehead at 1803. She was moved to a bed with help from other staff and the rapid response team was called. Her blood pressuree was noted to be 155/101, HR-115, O2 sat 99% on RA at 1807. 50 mg IM diphenhydramine administered to L arm by RN. Patient txported to ED for further evaluation.

Sharp pain left arm starting the morning of Dec 19th that worsened throughout the day, limiting active range of motion. Fever started in the late morning, and by that evening my temperature was 102.7. By the morning of the 20th my fever has resolved. L arm soreness improving but not gone, and still feeling fatigued throughout the day.

"Prior to injection, patient stated she was nervous and gets dizzy with shots and cries, but will be fine. Consent given and injection given in L arm. Second after injection, patient stated that she wants to be a pediatrician when she grows up, and then said ""Wait! I am not making sense..."", and her head dropped back slightly and the nurse held her head and asked the monitor for help. Both nurses carefully lowered patient to the ground without incident. She started jerking and then started crying. Others arrived and began taking her blood pressure and provided ice packs. The rapid response team was called, and they checked vitals which were all WNL. After approximately 20 minutes, patient felt good enough to stand on her own. Approximately 20 minutes after that patient felt good enough to leave under her own power."

Sore arm, 12-18-2020, low grade fever (99.2), cough and some chills 12-20-2020 am.

Generalized Rash all over upper torso with feeling itchy. Apparent to RN at approximately 15 minutes post vaccination. Patient (Health Care worker/employee) did not seem aware until it was brought to his attention. 15mg Benadryl administered and sent to Emergency Department for observation. No further symptoms occurred and patient dismissed.

Left sided chest pain Lasted for 10 min Awoke me from sleep

Hives, initially on wrists and arms, chest, then on face (very itchy), chest tightness

Tachycardia, dizziness, headache, vomiting, flushed, cold sweats

Left 2 finger, tenosynovitis, felt most back of hand, worse with extension/flexion second fingers has lasted >24 hours, better with motrin

Sweating profusely, dizzy, throat closure, hard to swallow

My symptoms started 30 minutes after the injection. My throat and tongue started to get very itchy and scratchy. I had to keep clearing my throat. My throat felt thick with secretions.

12/19: After injection: Minor pain at injection site (L deltoid) After 30 minutes: Mild headache and single episode of feeling lightheaded (lasting few minutes): drank juice and water After 1 hour: Additional mild lower back/R buttock pain After 4.5 hours: Moderate L deltoid pain and stiffness, moderate headache, moderate eye pressure/pain, mild body ache, fatigue, moderate dull lower back pain, severe sharp and dull R buttock/leg radiating pain: limping After 6 hours (and retuning home): Symptoms continue to progress, and noted moderate swelling around eyes 12/20: Moderate swollen lump and stiffness to L deltoid, moderate headache, mild/moderate body ache, moderate fatigue, mild swelling around eyes, moderate eye pressure/pain

I am the patient submitted this form, but also a physician. Within 3-4 minutes of receiving the vaccine, my left arm felt heavy/weak, and then began to tingle (full arm paresthesias). This was followed within probably 30-60 seconds by a sense of lightheadedness. Then acute tachycardia, heart pounding (I estimate around 130 BPM). I did deep breathing. Tachycardia was brief, lasting probably 2 minutes. Symptoms slowly got better. I was observed with vitals. All normal, except BP was high (140/90). Arm felt not entirely back to normal for about 30 minutes. Dull soreness in upper arm, left posterior neck/shoulder has persisted since vaccine.

Migraine Nausea Dehydration Low grade fever Fatigue

Had a numb left hand about an hour after vaccination that lasted about 5 minutes.

nausea, fever, chills, aches

12/18 received injection 12/19- woke up at 0700 with fever, spine pain-Lumbar region into the coccyx. Pain radiates down into hip joints and down bilateral femurs. Low grade fever most of the 19th. Nothing higher than 101. Arm soreness at the injection site, not bad, just sore. 12/20- fever broke around 11:00 am, still having this weird bone pain in my lower spine and both legs. 8:00 pm, no fever, arm soreness gone. Still have the low back and leg pain.

Experienced achy muscles, low grade fever, hot and cold flashes, and head ache. Very sore at the site of the injection.

#1. Injection site pain---3 hours after injection, starts injection site pain, progressivly worsening and last for 48 hours. difficult to raise the left arm #2. chills/low grade fever--started around 9 pm 12/18/20, received by Tylenol and ibuprofen, reoccurring after 6 hours, it lasted for about 36 hours #3. severe headache--feeling pulsating pain, starting around 9 pm and relieved by Tylenol and ibuprofen, but reoccurring after 4-5 hours, lasted about 36 hours #4. body aching, especially the lower extremities, coincidence with fever/Headache

Body aches Low grade fever Fatigue Loss of taste

Pfizer-Bio Tech COVID 19 Vaccine EUA #18 Facial flushing, facial warmth, fever 101.4 (post 650mg Tylenol) headache, dry mouth, loss of appetite

Pfizer-BioNTech COVID-19 Vaccine EUA Chest pain starting evening after vaccination and continued through 12/19/20. The chest pain is described as dull/heavy and continued to get worse so was advised to go to the ER. I went to the ER at 7pm on 12/19/20 and had 2 EKGs and blood drawn. It is 12/20/20 today and I still have constant mild chest pain with times that it feels moderate.

Developed Hives about 30 minutes after getting the COVID vaccine. Was given vaccine at 815 am, arms had a burning feeling and hives started to develop. Was also feeling very anxious and hyperventilating. I had no swelling or shortness of breath. Went back to vaccine clinic immediately and there they administered EPINEPHRINE at 846 am. Started to calm down around at 849 am. Burning feeling in arms started to go away and hives started to disappear. Was then taken to the ED department to be

monitored. Because I have had an recurrent hives after EPINEPHRINE, I was given Benedry IV, Solu-Medrol IV, and Pepcid IV. I was also sent home with a prescription for Prednisone as well as an Epi-pen. I am feeling much better now. Hives have not come back, yet. Fingers crossed they don't!

Woke the night following the vaccine with a fever of 100.4, body aches, a headache, and sharp pain at the injection site that made me unable to move my arm. I was unable to sleep or move around without fatigue. These symptoms continued throughout the following day and ibuprofen had little effect. My fever broke after a Tylenol PM and on the second day following the injection the other symptoms started to alleviate.

I had tachycardia within the first 5 minutes of receiving the vaccine. Heart rate increased to 151

Severe facial flushing (redness and burning warmth) radiating to ears and neck beginning suddenly about 48h after receipt of vaccine and has continued without relief for 10 hours. Tylenol and ASA taken after symptom started did not relieve the flushing or burning discomfort. Not accompanied by any other symptoms. No rash present. Felt fine up until the flushing onset at about 48h mark. Feels as how I?ve heard patients describe niacin flushing (I have personally not ever taken niacin).

"About 3-5 min after injection I felt tingling and warmth/flushing in my entire left arm and anterior chest, upper back and achy pain in my left upper trap- felt like a warm IV running through my arm. Associated with tongue tingling. Symptoms lasted about 10 minutes with the exception of the achy upper trap pain which lasted a couple hours - being a health care provider I associated these symptoms with anxiety/excitement about receiving the vaccine but subsequently developed other unexpected symptoms. Over the course of the next several hours noted metallic taste and transient extremity tingling (all extremities) also with some extremity and facial itching - no rash. Now >24 hours after still have the intermittent and transient extremity tingling (most notable in LE's and feet, but also in arms) and skin itchiness/prickly sensation though improved. Had one episode this afternoon (~28 hours after vaccine) of lightheaded, nausea, chills and profound sensation of extremities being ""heavy"" - felt like pre-syncope - which resolved in about 30 min with rest, hydration ."

1.5 hours post soreness at sight and left elbow fold; fatigue, left arm weakness, left neck stiff, right face numb, mouth numb more on left side similar to novacaine wearing off from dentist. Numbness and weakness lasted 30 minutes. Soreness over 24 hours. Friday evening generalized aches and chills. Saturday all day aches, chill, low grade fever. Slept late afternoon due to exhaustion for 4.5 hrs. Sunday morning sweat and slight fever. Sunday evening site slight sore only.

Began having body aches on 12/19/20. Today 12/20/20 feet and hands began to swell badly. Took Benadryl, not effective.

Within minutes of receiving vaccination i had blurred vision, rapid heart rate, extreme nausea, rapid heart rate, shivering but a warm sensation that started in my abdomen that went into my chest. I became blotchy on left arm where injection was per nurse and my eye started to roll back in head per nurse. I was rushed down to Er where i was given water zofran and Benadryl and steroids. BLood pressure was high and pulse was elevated. Was sent home a few hours later w Epi pen and steroids to

take over the course of four days. After coming home i developed at headache and fever and severe leg pain and fatigue that last until Saturday the 19th around the evening. I?m feeling better today Sunday the 20th. My main concern at this point is the arrhythmia and sometimes having shortness of breath.

A very bad headache that kept me awake all night and was making me nauseous

Bottom lip numb and lower jaw and throat tight

Dizzy, tired, weak, nausea, joint pain. I am resting and still feeling the effects. But slowly getting better.

Pfizer-BioNTech COVID-19 Vaccine EUA

Tachycardia, nausea, tingling

Rash, Headache, sore throat.

Previously diagnosed with COVID 19 11/7/2020 and had a mild residual cough that was improving and almost completely resolved. Post vaccine this cough recurred. The presentation and frequency increased and was similar to that of when I was actively infected. This cough has worsened over the days following the vaccine.

Pfizer-BioNTech COVID-19 Vaccine EUA Woke with very swollen and numb upper lip. Took Benadryl and Acetaminophen. Symptoms have greatly reduced over the course of the day.

Pfizer-BioNTech COVID-19 Vaccine EUA Pain at injection site Fatigue Felt ?feverish?

12/19/2020 in the evening Started with frequent flatus . Then stomach cramps early in the morning of Sunday 12/20/2020 at 4am following with diarrhea. Took Imodium 2 tablet after first loose stool. Then another 1 tablet with the second loose stool. Diarrhea continues intermittently. Took another anti-diarrheal medication: Pepto-Bismol Liquid form. Since then diarrhea slowed down.

Metallic taste

shakiness, tachycardia, breathing feels tight - went to emergency dept

syncope following vaccine

Pfizer-BioNTech COVID 19

rash across chest. numbness tingling across arm (injected arm). Bendadryl & solumedrol given, returned to ed the next day with tightness in throat & trouble swallowing - Benadryl & solumedrol given - improvement

Night sweats and fatigue on 12/19/20-Current

Severe right ankle monoarticular arthritis that woke from sleep. (did experience flu-like symptoms ~36 hrs after inoculation but these were short-lived). Unable to weight-bear despite high dose NSAIDS. While have hx of mild enthesitis, have never had these symptoms before.

left arm itchiness, observed patient itchiness did not worsen patient went home

I started having chills at 3pm At 10pm that night, I developed a fever, continued chills, body aches, fatigue, and nausea

Experienced angioedema approximately 24 hours post inoculation. Administered 50mg oral Benadryl with no response. No respiratory distress.

Morning after injection patient reported bilateral rash with some itch from elbow down

felt hot, lightheaded, nausea

Headache for 1 day Severe nausea lasting more than 3 days

Patient stated that 45 minutes after receiving the vaccine he became dizzy and foggy, requiring the individual to sit down for a period of time as they felt unsteady on their feet. No treatment was given, patient decided to have spouse pick them up and go home.

Headache, sore throath

"Approximately 14 minutes post vaccination -- developed numbness and tingling in L arm and ""swelling"" in throat. Denies antecedent illness, allergies, medication use. Member was observed for 1 hr and 45 minutes. No dyspnea, wheezing or chest pain. BP 142/100, P 98, SpO2 98% on RA. Released to home after symptoms largely resolved."

Left axillary enlarged lymph node. The lymph node has increased in tenderness and size

Hives and Throat Swelling - treated with epinephrine and steroid

STRONG PERSISTENT HEADACHE GENERALIZED MYALGIA BACK PAIN UNQUANTIFIED FEVER WEAKNESS

"Within 15 minutes, patient experienced itchy, tight throat ""felt like a tickle in throat"". Airway remained patent. No rash/hives."

Approximately 29 hours after my first dose of the Pfizer COVID 19 vaccine I started experiencing right axillary pain that was accompanied by swelling. Lymph node enlargement was not felt. Symptoms are still present at the time of filling this survey out.

Chills, sweats at night time Body aches Headache

Patient report itching and rash of the neck, upper arm and upper back on Saturday 12/19/20 . 50 mg of Benadryl taken on 12/19/20 and symptoms resolved on 12/19/20.

12/18/2020 ALMOST IMMEDIATLY FELT CHEST TIGHTNESS, RIGHT SIDE OF FACE ITCHY, BACK OF THROAT AND TONGUE WERE ITCHY, LIPS WERE TINGLY; 'FELT LIKE SOMETHING WERE WRONG'. CONTACTED CLINIC AND SPOKE TO PHARMACIST; RECOMMENDED BENADRYL. DID HELP RELIEVE

SYMPTOMS. 4-5 HOURS SYMPTOMS CAME BACK, TOOK MORE BENADRYL. AS OF 12/21 SYMPTOMS HAVE NOT COME BACK. FLU SHOT 10/29/2020

Left arn deltois with swelling hardness and redness at site ~ circumference 3 inches painful non-puritic

Left arn deltois with swelling hardness and redness at site ~ circumference 3 inches painful non-puritic

Left eye puffiness, left eye paresthesia Tx benadryl, solumedrol, head ct scan

Started feeling hot and flush pretty immediately felt dizzy very shortly felt throat closing, like I had a golf ball my throat and my heart started heart racing. Staff provided medical treatment immediately put me on a pulse ox and my heart race was up, kept monitoring me. Pretty quickly I started feeling better in about 10 min. No tests were done or meds administered. After about 10 min all was better I just feel tired and a little bit dizzy. They monitored me about 30 min - I received gatorade and was observed for about 30 min and they let me go since I just felt tired.

1. Severe chills on first night 2. Body pain and ffatigue 2nd snd 3rd day 3. Severe Radiating pain in arm of injection from day 4th and 5th continue

Employee woke up the next day with conjunctive hemorrhage of the left eye

Started with a rash to left hand and rest that spread to bilateral upper arms with scalp itching

Day 1: palpitations, dizziness Day 2: headache, redness, swelling, itching on vaccination site; GI disturbance Day 3: vaccination arm had paresthesia, heaviness, almost stroke-like symptoms; the symptoms started suddenly ** treated in the ER; IV steroids- for possible allergic reaction; tpa- for the stroke-like signs; halfway through the tpa, I felt an improvement with the arm

+ fever (Tmax 100.4), last documented fever at 10:00 pm on Saturday (12.19.20), generalized body aches, swollen L axillary lymph node, + ?knot? in L arm at injection site, endorses redness and warm to touch at injection site

Ear pressure and swelling on same side as injection

Patient refers that about 45 minutes after vaccination felt with frequents palpitations . This episodes repeat during the course of the day. Note: I was notified by patient after he was vaccinated, that he had plans to travel by airplane on Dec 18,2020.When patient call me notifying his symptoms I advised him to report to nearest emergency room for evaluation .

At 9PM I started having rigorous chills,body heat/aches. I took two Extrastrength Tylenol, went to bed. One hour later the chills stopped but the heat/aches continued for several hours. At 8:00 AM I took two more Tylenol and had no more problems.

headache unrelieved by Tylenol or ibuprofen

Within 10 minutes after the injection my left shoulder began to itch was super red and hot. I notified them and per policy I was transported to the ER and was given IM 50mg benegryl, 40mg oral

predinosone and I was monitored for another 1.5hr. 1/2 after the benedryl I still had the redness and flush in the neck and chin area the chest area redness had cleared up. I was released with a prescription of benedryl for 4 days to take every 8hrs for the symptoms. I continued with the benedryl for the next day and the symptoms subsided a little so I stopped taking the benedryl and I continued to take the prednisone.

12/18/20 10pm nausea with vomiting lasting one hour 9 pm headache, persistent and continues today at 12/1/20 at 8:30 am 8pm diarrhea lasting 2 hours

So I got up from the chair to go to the other room to be on the 15 min observation. I started feeling a little weird within a minute. A sharp shooting numbness in my jaw and my head felt a little dizzy, and a burst of heat in my spine. I felt off and sat down and took my BP and my BP was 185/80. Within a couple of minutes I was at the walk in clinic where they monitored me for a couple of hours. The jaw experience went away but I still felt a little shaky. I also had a numbness/tingling in the face and jaw. They gave me a Benadryl injection and it did not resolve. They gave me prednisone it felt a little better (about 30min) afterwards. They checked my airways and it was ok. I had elevated BP but within a couple of hours it was ok . They discharged me since I felt ok and a friend drove me home. Symptoms were better next day but in the afternoon I felt the numbness again on my lips. They decided to prescribe me medro and I started taking it since Friday evening. I still feel a little head ache and like I am a little sick. The headache is still lingering. Left side of my face since yesterday I have a stiff neck. It is like a pain in my face.

Patient stated that she started with cough, runny nose and no fever, she has a hx of alleriges and normally takes Claritin

0845 received injection 0900 started to have palpitations and feeling of ?jittery? BP 132/88, HR 98, RR 14 0912 states feeling better. BP 126/82, HR 88, RR 12 0915 palpitations resolves, states feeling ?normal?. Patient left clinic. Instructed S/S to report or seek medical attention.

Fever 102.4, Headache, Joints, Muscle aches, lymph node swelling, generalized soreness at site anticipated symptoms but more severe lasting more than 48 hours. Taking Tylenol around the clock. Tylenol did not help at first but feeling somewhat better now. However, lymph nodes still swollen and hurting.

on 12-20-2020 complained of arm soreness, muscle aches, low grade fever and cough for 24 hours.

No soreness of injection site until next date, 12-19-20. Slight soreness at injection site but woke up with body aches/pain, very stiff neck and head on left side of body, migraine type headache. Extremely fatigued. Symptoms were throughout entire day. Was flushed in the face that early evening, took temperature, normal, 97.9. Took 3 Alleve every 3 - 4 hours throughout day. Felt best for that date about 8pm. Woke up on 12-20-20 with headache still but overall felt much better though did have some upset stomach with diarrhea. 12-21-20 feel fairly well. Went to work. Left arm still slightly sore. Slight stiffness in head and neck with slight headache still remain.

Patient refers that on December 18,2020 developed headache (left side) and pulsatile pain in left eye, also generalized body ache associated with hot flashes . She took Iboprufen , Relafen and Acetaminophen with improvement for about one hour and pain later returned. If condition worsen she was advised to go to the nearest Emergency Room.

Symptoms started at midnight 12/16/20 and ended approximately 5:00pm 12/16/20, body aches, extreme fatigue , sore throat, sinus congestion, headache , pain and redness at injection site.

Approx. 5 minutes after receiving the shot in my right upper arm, my right hand and fingers felt like they were asleep - numbness & tingling. I had use of the hand but it felt like something was blocking the sense of touch and fine motor skills - touching fingertips to fingertips, were impaired. Situation lasted for about 24 hours before appearing to resolve. Sense of touch in fingertips still a little odd but hand is fully functional at this time. Thank you.

Pfizer-BioNTech COVID-19 Vaccine EUA 2 hours after injection: body aches and chills (duration approx. 8hrs) 9 hours after injection: nausea and vomiting 18 hours after injection: severe heartburn, nausea, and vomiting 24 hrs after injection: nausea and all over body soreness 48 hrs after injection: mild nausea and arm pain at injection site 72 hrs after injection: no symptoms present

on 12-20-2020 arm soreness, muscles aches, low grade fever and cough for 24 hours.

HEADACHE INFRAORBITAL PAIN GENERALIZED PRURITUS

9:11 am received injection 9:15 cool feeling from left arm injection site radiating to abdomen 98% on room air pulse 111 bp 141/89 9:21 cool sensation dissipating in arm. Cool sensation in stomach. Benadryl 25mg IM administered. Localized rash at left injection site. Pulse 111 100% on room air 9:27 still an intermittent cool feeling in stomach

Became unable to swallow and mouth got dry. Was given Epinephrine, Benadryl and Famotodine. The symptoms subsided within 2.5 hours.

light headedness, claminess, parasthesias of the hands and feet, worked night shift and day shift. no treatment

12-28-2020 body aches especially back pain, dizziness, headache and fatigue for 24 hours

Headache, fatigue, vomiting

"Patient described Hive, approximately 3 inches in diameter on her left thigh, Intermittent fever and ""Bone Aches"". Patient reported taking OTC analgesic and antihistamine. Otherwise did not seek Medical Attention."

Within 15 minutes of receiving the vaccine, patient began complaining of rapid heart rate. RN came over to monitor, and found HR @130 BPM. Rapid response/medical emergency was called. Refused further medical treatment. Stayed 5-10 mins longer than the 15 minutes recommended observation period, and felt better before leaving.

rash on neck and chest, felt flushed

symptoms started 8:00 pm 12/16/20 as of 3:00 pm on 12/17/20 she still had symptoms, headache, body aches, chills shortness of breath and fatigue. 12/21/20 RN called patient the symptoms have all resolved at this timel.

12-28-2020 body aches, back pain, dizziness, fatigue and headache for 24 hours

Began complaining of dizziness shortly after getting hte vaccine. She did not eat anything since the day before. Gave juice and a granola bar. Shortly after finishing food, began complaining of her heart feeling fluttery, a medical emergency was called. She was evaluated and found to be tachycardic. Refused further medical treatment, then ate lunch, and returned to work. She was observed on site for an additional 30 minutes beyond the 15 minute observation period.

About 8min after the vaccine I got a severe headache on the top of my head and was at a 10/10 and dropped to a 7/10 after a few moments and finally went away on its on. I was very flushed and hot. I was laid down and given ice pack. Started feeling a littler better but experienced riggers and was transported to the ER where I was given benedryl, fluids and was monitored for a few hours. I was released but for the next 2 days after I was super tired and laid around and slept for 2 days. Today I am at work but I feel very tired and fatigued

Chills, Muscle pain, headache, joint pain, tiredness

Rash shortness of breath

Pfizer-BioNTech COVID-19 EUA After receiving the vaccine, during observation period (about 10 minutes after the dose administered), patient became tachycardic and nauseous. Patient was brought over the the ER at 7:05 am with non-intractable viomiting with nausea. Ondansetron inj 4mg IVP x1 given at 7:40am, at 7:45am P 135/95; P 105 ; R 20; WBC 16.2 Patient felt better, tolerating PO, asymptomatic and discharged home at 8:34am

Patient began to complain of feeling dizzy. Was found to be anxious, flushed and tachycardia. Was asked to lay down. Medical emergency was called to respond. Patient refused further medical treatment. Continued monitoring for an additional 45 minutes after receiving the vaccine, and left in good condition.

"""Pfizer-Biontech Covid-19 Vomiting since Saturday."

difficulty breathing, paresthesia, dizziness. 1.5 hours after vaccine worsening dyspnea, tingling in fingers and toes, felt like a ball was in her throat, previous anaphylactic reaction. Pepcid, benadryl, solumedrol with continued worsening epinephrine IM give. O2 sat 81% room air, O2 provided with increase sat to 100%, second dose of epinephrine 0.3 IM. Weaned of O2 and discharged with prednisone.

Needle retracted during vaccine administration and some spillage occurred. It is estimated that this person received about half the prescribed dose.

Complained of nausea, and feeling light headed. Turned very pale then got extremely flushed after. Complained of feeling warm and hot. Vision turned a little blotchy. Stayed for longer observation. Felt better when left vaccine clinic.

FELT DIZZY ABOUT 20-25 MINUTES AFTER SHOT, GIVEN GATOR AIDE AND REMOVED MASK IN AREA WITH NO OTHERS ...FELT LIL BETTER ITS BEEN ABOUT AN HOUR AND HALF STILL FEELING LIL DIZZY OR OUT OF IT BUT OTHERWISE OK.

Approximately 12 hours later, I started experiencing shortness of breath and felt my airway was closing off. I immediately took 25mg of Benadryl and monitored signs and symptoms.

Approximately 12 hours later, I started experiencing shortness of breath and felt my airway was closing off. I immediately took 25mg of Benadryl and monitored signs and symptoms.

"Staff member stated that she had an allergic reaction ""after the vaccine""...unsure of time frame and was still at work. She has a rash, hives and swelling around eyes....no immediate anaphylaxis. She verbally described her incident. Was treating with Benadryl (even though there was a stated allergy

from 2013), then followed up with her family doctor, for steriod therapy on 12/18. She has not communicated with me further or have any absences from work at this time."

Felt Flush, Elevated Blood Pressure, Nausea, Tight Throat

"I was ok for first 15-20 mins post vaccine and was sitting in chair and calling family and friends When I stood up I felt 'funny""- kind of hard to describe I walked around and mostly felt ok but not hundred % but didn't feel dizzy but didn't feel 100% myself either I checked my radial pulse and it felt normal and there was no BP machine there to have a check done I left hoping to feel 100% soon I walked to my car in the parking lot and started driving home Around 200 yards from the hospital I felt weird warm rush like feeling through my whole body Knowing that anaphylaxis can occur at this stage I panicked and turned car around and went directly to ER to be checked out My BP was not low and I was observed for short duration and discharged home then- vitals were taken almost half an hour post vaccine Further records can be sought from ER as they should have reported this as well I also had arm pain/malaise and low grade temp of 100.5 at home for 24 hrs that resolved subsequently The initial symptoms within first half an hour made me file this report"

Felt dizzy

Pt states she felt short of breath, had a hard time catching her breath, and fatigued.

Pt states she felt short of breath, had a hard time catching her breath, and fatigued.

Right side of lower face and lip began feeling numb. No drooping or issues with movement. Numbness continued from about 830p on 12/20 and is still present at the time of this report.

States after receiving vaccine, reported tingling/electrical felling in legs & arms. 4 hours after, rhinorrhea. At 48 hours after vaccine started having nasal and head congestion. States body aches X 12 hors but improved at 48 hours. States is feeling better with body aches now, is also having HA x 24 hours. Is having them moderately, also noticing fatigue at 12 hours after injection,

Low grade fever T-max 99.6F lasted about 12 hrs. broke with Tylenol. L arm soreness - improving but still ongoing (today day 4) after injection. Additionally have injection site reaction - red tender firm lump at left arm approx 2-3cm - slowly improving but still present. Now being more itchy. No drainage.

Lymphedema, Right Axillary and Right Neck.

Fever and chills 100 F for 2 days, Body ache injection site pain for 2 days Injection site itching 2 days

dizziness 5 minutes after vaccination. no other symptoms released after 35 minutes. completely resolved

12/15/2020 30 minutes after vaccination, started to taste a metallic taste; lasted 24 hours ;'like chewing on tin foil'. Pain at injection site 48 hours. 12 hours after vaccination, joints hurt, left hip is 'excruciating' . 72 hours later, joint paint dissolved. But the left hip, the pain is awful. Taking motrin, muscle relaxers, physically walking with a limp, cannot bend over, have assistance with sit or stand. Had COVID19 in

05/2020. Same hip pain when had COVID. Went away after 3 months. 'Hip pain now is 5x's worse than when had COVID'; debilitating; constant pain. appt with PCP 12/30/202; xrays, mri, etc. May go to the ER if worsens but Chief Officer Urgent care for COVID19 and cannot take the time away.

nausea right after vaccine Sore arm at the injection site. I could not lift my arm, chills, could not sleep, body aches, headaches,

Patient/Employee became dizzy 15 min after covid vaccine

Rash on chest with a burning sensation, bruise on lower leg, applied hydrocortisone on rash. Leg still showing some bruising, Rash is mostly gone now, but burning sensation is still there.

Friday night same night of vaccine. Arm started aching and hurting. After my shower, my whole arm was in pain. Pain then moved all the way to my back. I took two tylenol, and it calmed it down. At 3 am, it started hurting really bad, I had to take a lortab - a stronger pain med at 5am that morning. Around 10am, my whole back started hurting, and that evening, it still was hurting. I ended up taking 3 lortab that day. The pain went to my neck. On Sunday, I ended up taking two lortab . All together, I took 5 lortab to ease pain from this vaccine. I was scared that I was getting another blood clot from the feeling of the pain. I am still just sore. NOTE: I am on blood thinner

palpatations increased heart rate, slightly hypertensive 20 minutes after vaccination resolved on own

I felt extremely hot, headache and dizziness - pressure on left temple and top pf head - next day had diarrhea.

Throat and chest tightness following vaccination- went to ER and received epinephrine, solu-medrol, benadryl, famotidine, and EKG due to tachycardia.

Fever, body aches, migraine, swelling/redness/warm/hard lump at injection site, nausea. Symptoms started approximately 6:00pm 12/18/20

injection site pain, tiredness, severe headache, muscle pain, chills, injection site swelling, nausea, not feeling myself, difficulty breathing, fast heartbeat, dizziness and weakness in lower extremity and excruciating lower back pain. Immediately after vaccine was given, I got the side affects. Felt a little better for 2-3 hours and then it hit me hard again and lasted till the next day. Currently my arm is swollen.

Headache

12/16/20- body aches, chills. congestion, stuffy, runny nose, occasional cough from drainage, fatigue
12/17/20- congestion, stuffy, runny nose, some cough and drainage.

Developed hives/welts on her torso, chest, arms and legs. The hives hitch. Taking Benadryl and topical antihistamine lotion.

intense arm pain, migraine, nausea & vomiting

Pfizer-BioNTech COVID-19 vaccine EUA On Friday December 18th at 2:45 p.m. I received my first dose of the vaccine. After the injection while waiting in the observation area, I noticed my arm felt cold and felt weaker. I was able to move my hand and did not have tingling. I was cleared to leave after 15 minutes. While driving home approximately 35 minutes after the injection I had a quick onset hot flash (felt like it came from my left arm which is where I received the injection). Then my heart started pounding. I noticed my heart rate was climbing. It topped out at 170. I was having difficulty in breathing but that was related to my heart rate. I pulled over and called 911. I felt as if I was going to pass out. After 2 minutes or so my heart slowed and stayed at a rate between 120-130. I never lost consciousness. I canceled the ambulance and felt as if I could drive home. 30 minutes later the episode happened again. All the same symptoms as the first. The pounding felt harder and it was slightly harder to breath until the rate came down again. Again, I felt as if I was going to lose consciousness but never did. Each episode lasted about 2 minutes from hot flash to slower heart rate. This time the ambulance came. No rash. No hives. No swelling. BP-160/90 HR-120-130 Sinus Tachycardia on a 3 lead EKG I did not need transport to the hospital. I started feeling much better around 5:00 p.m. The coldness I felt in my arm was gone. My arm no longer felt weak. The hot flash, rapid heart rate and faint feeling did not return. I am a Paramedic with the Fire Department. Provided the Vaccine to EMS workers. I received my vaccine at the: Fire Department December 18, 2020 Injection time 2:45 p.m.

Have swollen lymph node on right side arm pit. Got vaccine on right side of arm

Facial flushing, bright red and itchy splotches over the face, arms and chest. Had diarrhea for 24 hours. She took a Benadryl and got relief of symptoms.

The patient reported the following symptoms approximately ~24 hours after receipt of the Pfizer BioN-Tech COVID19 vaccine: tachycardia, dry mouth, and itching between the toes and behind the ears. The patient stated she took oral diphenhyramine with relief of symptoms.

Headache, Fever, Chills, Loss of Smell, diminished taste, Nausea & Vomiting, Diarrhea

Itching began approximately 30 minutes after vaccine was administered. Itching started on the right arm and then the left arm and then the legs. Redness on the arms was noticed. Redness on the chest, but no itching on the chest.

Patient complained of light headedness, stated right arm cool, and bad taste in mouth. BP 123/80 initially. Pt stood up and became light headed BP 154/90 HR 76 SPO2 98%. RRT called. Pt transported to Emergency Department.

Pain at injection site. 24hrs after injection site, my left arm started hurting and painful to the touch. At 48 hours, the injection site is very raised and red. It's approximately 3inches long by 2inches wide. It's very sensitive to the touch and very hot. I went back to the medical clinic and was told to draw a circle around the site, and watch for further spreading, apply an ice pack, and submit this reaction to Vaers.

Patient reported feeling lightheaded, dizzy, tingling, itching, hot feet bilaterally, racing heart, and feeling flushed. Increased BP and heart rate were noted. This reaction lasted approx. 15 minutes.

Employee began experiencing tingling in roof of her mouth, watery eyes and itchy throat. She was taken to ED for further evaluation and treatment.

Runny nose, congestion, loss of smell for 36 hours

*Pain at injection site; 10 hours after injection; lasted 48 hours *Myalgia, primarily in shoulders; 12 hours after injection: lasted 24 hours; Ibuprofen 400 mg *Chills; 14 hours after injection; lasted lasted 15 minutes *Joint pain (hip, knee): 12 hours after injection; lasted 24 hours *Diarrhea; 72 hours after injection; lasted 6 hours; unsure if related

within 12 hours: sleepiness (very), pain at injection site & around to muscles in right shoulder; slight pain in moving injected arm above 45 degrees, slight generalized muscle aches.

12/16/20 awakened to an unusual headache and feeling more sluggish. Checked temp and it was 100.4. Supervisor notified and advised to get COVID testing. Throughout the day 12/16/20 temp stayed 100 and I developed body aches, arm was very tender at injection site. 12/17/20 afebrile and HA nearly resolved.

1505 right eye heaviness, BP: 114/61, 02 saturation: 100%, HR:74, pt sent to ED

One hour after receiving vaccine, my entire body became bright red and hot, the thick black lines on my tattoos on my right arm became so hot they felt like a burn and became raised, and the lymph nodes in my neck became swollen. My skin was hot to touch for the next 20 hours. The next 4 days I felt very lethargic. On Sunday (day 4), I developed a rash to the front of my abdomen that was in clear lines not extending to my abdomen. The rash also spread to my anterior neck. My hands also became bright red within an hour of the rash developing. This all disappeared with in 2 hours. My arm was extremely sore until I woke up yesterday morning (almost like I never received the vaccine). On Sunday as well, I had diarrhea and extremely painful gas. This stopped by 1600 Sunday night. Today, Monday, I feel generally back to normal other than mild lethargy.

Employee reported itching to roof of her mouth and numbness to right side of her throat. She also had elevated HR of 113. She was taken to ED for further evaluation and treatment.

Felt Flush and hot around 3 min after vaccine given. Had a slight taste change that lasted for a second. Heart rate, normal 60s, increased into the 80s.

Aches, fever, large swelling in left armpit

Headache, dizziness, muscle aches (head, neck, shoulders). Onset 5 minutes after vaccination. Symptoms resolved within 30 minutes.

"Pt received the COVID Pfizer vaccine at 1324 and at 1335 pt c/o feeling anxious and flushed. Pt VS: 143/94 91 18 99% AA. Pt admitted she had not eaten before coming in for vaccine. Pt put in recliner chair and taking water and rice crispy treat without difficulty and symptoms resolved. Pt kept for continued monitoring. 1350 pt c/o of ""not feeling right"" and that she was going to pass out. Pt layed

back in lab chair; 02 at 2L per NC applied. B/p 140/100 HR 127 02 sat 100% pt pale, cool and shivering; pt c/o she didn't feel right. Benadryl 50mg IM given at 1351 and 911 called. Pt had no hives, No itching lungs clear, HR 103 and 02 sat remained at 100%. Continued to monitor pt: VS 1400 140/90 103 18 100% on 2L/NC. Pt reports no NKA, Meds: Esterace VAg Supp started 4 days ago Levothyroid 75mcg po daily Pt has never had reaction to medication or vaccines in past. Pt still c/o feeling week but better--held off on Epi since EMS had arrived 1400. Pt transferred to ER in stable condition. 1405: ER called and report given."

left sided non positional chest pain. seen in ER . Was treated with Toradol and resolved. Negative work up in emergency room. for cardiogenic or pulmonary causes.

pain and itchying over L cheekbone, HTN Solu-Medrol 125mg IVP, Benadryl 50mg IVP slowly, Lisinopril/HCTZ 10/12.5mg PO symptoms resolved in 2 hours of observation and management

Reported tongue tingling and increased heart rate from low 90s to 130. No airway compromise resulted and tongue tingling resolved after 1 hour.

runny nose, chills, diarrhea, shortness of breath, HA tiredness and chest pain

Symptoms started early morning hours following the shot, chills, extreme body aches, extreme headaches, fatigue to the point that it was difficult to get out of bed. The skin on certain areas of my body are very sensitive and have a tingling sensation.

Employee reports 20 minutes after receiving vaccine she began to have pain across neck and shoulders, stiffness, nausea diarrhea, headache, body ache

Itching. Was given Benadryl PO by Walk-in clinic. Observed for 4 hours. Sent home with family member.

Sudden onset of intense rush of heat through body, intense increase in heart rate and inability to swallow, trembling and shaking. Employee was in car, returned to hospital ER. ER administered fluids, and diphenhydramine.

12/17/2020 VERY ORGANIZED. Pt sitting in observation area. c/o L arm whole arm aches and pinky finger feels numb on outside. does have feeling, can move fingers equally, blood flow to finger with blanch test slightly slower. no redness/swelling noted on arm. no bleeding under bandaid. not improving. no s/sx distress. (dizzy, SOB,) directed to ED (where pt works) for assessment at 0810. Pt will complete workers comp form.

fever and chills for approximately 3 hours on 12/16/20

Received Pfizer COVID-19 Vaccine in right arm. 1 hr later noted left sided facial tingling lasting 48 hrs.

Fatigue, night sweats, chills, body aches

None stated.

Palpitations - patient stated he may have anxiety attacks when getting shots. Patient sent to ER for evaluation

Itching

Clammy, flush, dizziness, syncope, tachycardia

1845: hand numbness HR: 102, shaky, reports last meal was 3 hour previous 1904: HR:72, feeling better and requests to go home, decline further care

The day of the vaccine I had a sore arm. The next day I woke up extremely tired, weak, like I was in a mental twilight zone, no sneezing no coughing, notice on the right lower lip a little herpes, very little

about 2mm wide 3-4 mm long,, never had it in that location before, the blister is gone. Mild nausea, headache and joint pain (intermittently) for about 24 hours.

sx: itching treatment: Benadryl, pepcid & solumedrol.

tiredness, body ache, nausea

12/18/2020, 11pm, swollen itchy hands duration 7 hours, 12/19/2020, 6am swollen itchy hands and feet duration 5 hours, 12/19/20, 12pm body rash/arms, legs, abdomen duration 2 hours, 12/19/20, 3pm B/L UE lymphadenopathy duration 3 hours, 12/19/20, 8pm, injection site/L arm/shoulder/L clavicle swollen duration 3 hours.

Received vaccine around 7pm on December 18, 2020 and worked the midnight shift. Went to lay down during the day of December 19 and stated joints and body were severely achy way beyond normal. Did take a narcotic for pain control with no relief. December 20th symptoms had resolved.

Ten minutes after receiving the vaccine she experienced throat tightness and numbness and tingling of her extremities. She was seen in the ED and given oral pepcid and benadryl with relief of symptoms within an hour.

severe body aches, chills, left arm pain, red, warm and swollen lump at injection site

12/21@11:50-Caller stated that he had vaccine at 9am and had a seizure about 4am the next morning. Patient also had slight head. Caller stated that he is feeling better no medications were given .Caller had Cat scan and EEG. Caller has follow up 12/22.

"COVID vaccine was administered by local health department in hospital setting. Approximately 10 minutes after receiving the vaccine, the patient reports feeling ""weird,"" short of breath, heart racing, dry mouth, & anxious."

Patient reported tingling in tongue for ~30 minutes following vaccination. Monitored for 40 minutes and left clinic without symptoms.

Patient reported twitching to right eye and a warm sensation 5 mins after injection. Resolved by 10:41am.

Pfizer-BioNTech COVID-19 Vaccine EUA I received the first dose of the vaccine at the end of a vaccination clinic during which I had been administering the above vaccine. I completed screening, received the injection and waited under medical observation for about 20 minutes post-vaccination. Approximately 10 minutes after leaving the clinic (30 minutes after receiving the injection), I experienced a sensation of facial flushing, palpitations, a sense of anxiety, mild chest tightness, and lip numbness that spread into my face. I did not have any shortness of breath, tightness of the throat or any apparent swelling of the lips, tongue or face. The above symptoms lasted about 10 minutes and gradually dissipated over the next hour.

Do no suspect that vaccine caused patient condition and resulting inpatient admission. Suspect patient had COVID-19 at time of vaccination, but had not developed symptoms yet. Here is timeline: Patient went to ED on 12-18-2020 at 22:51 with complaint for fever and shortness of breath. Patient ended up testing positive for COVID-19, 12-19-2020 00:09, but was not symptomatic at time of vaccine. As of 12/21/2020 12:04 pm, patient is still inpatient and on comfort care/hospice.

Arm soreness. Small bump at injection site.

About 15 minutes after the injection employee reports her throat began feeling tight and she was having some trouble swallowing.

5 minutes after (4:28 pm) receiving the vaccine I experienced dizziness and nausea with stiffening of my neck on the left side. After laying down for a while I felt better. When I got home I wasn?t feeling right so I took it easy (6 pm). Last night I couldn?t fall asleep because I was very achy and weak with a sharp pain in my chest. This morning (5 am) I woke up feeling dizzy, with cold sweats and general malaise.

Patient endorses hx of vasovagal reactions with vaccines, patient reports slight lightheadedness 1-2 mins after injection, patient denies syncopal episode and reports feeling better during the ?observation? window. 12/19: upon awakening, noticed redness and swelling to injection site. 12/20: Patient reports improvement of redness and swelling at injection site. 12/21: Patient endorses at time of wakening red rash (blancheable per patient), mildy pruritic to L side of chest wall. When patient called (at approx. 10:35 am), reports rash has now become ?generalized.? Patient denies changes in hygiene products.

Pfizer-BioNTech COVID-19 Vaccine EUA: Vaccine recipient has a history of losing consciousness after administration of injections and drawing blood for laboratory work. He stated that he did not have issues after his recent seasonal flu vaccine. After administration of the COVID-19 vaccine, the vaccine recipient drank some orange juice. The APN who was monitoring him after vaccination watched him become unresponsive shortly after. The APN raised his legs in an attempt to stimulate him and check his pulse. A CODE-10 (Medical emergency for outpatient, visitors, and employees) was called. Vaccine recipient regain consciousness and refused to go to the emergency room for follow-up. The vaccine recipient felt better, checked out of the vaccine clinic, and walked out on their own.

During the 10 minute observation period, patient developed tightness in chest as if she was having an asthma attack. Assisted to stretcher where she used her albuterol inhaler. Her SaO2 was 99% RA. After 10-15 minutes, she began to feel better.

pain at injection site malaise muscle aches fatigue

"patient felt ""very hot at 10:05 became flushed, skin was reddened all over. waited 10-15 minutes improved went home and developed red blotches all over. took benadryl po at 1100 am at home and symptoms resolved. tc to client today 12/21/2020. he is fine at this point."

severe joint pain, starting day 3 after and worsening since then

On 12/18/20 the next day at ~0830 he experienced SOB, heart palpitations, and fever. He was taken to the local hospital via ambulance. He was tested for Covid-10 at hospital. Unknown result. Discharged from hospital around 1545.

Pfizer-BioNtech COVID-19 Vaccine EUA: Pt brought up after rapid response to COVID vaccine. Pt c/o throat itching, back itching, hot, and flushed. Denies diff swallowing at this time. Upon arrival to ED, AOx4. NAD. Flushed/WD. GCS 15. Ambulates independently with steady gait upon arrival. Pt. has documented allergies to Latex, ciprofloxacin and Amoxicillin-pot Calvulanate.

Shortness of breath and cough started about 24 post vaccine. Symptoms continued and slightly worsened over next 48 hours.

Patient associate stated later that evening she felt her heart was racing, she felt dizzy and had chills. This patient stated the evening she received the shot she developed a headache. Patient took advil and felt better

39-year-old female with history of ADHD, anxiety, melanoma presents with palpitations. Patient received a Covid vaccine today and started having palpitations, lightheadedness, shortness of breath and feeling flushed a few minutes afterwards. Rapid response called and patient taken to ED for assessment. Patient denies facial or oral swelling, rash. patient denies any recent fever, nausea, vomiting, cough, diarrhea. Denies chest pain, abdominal pain. Last menstrual period end of November. Has allergies to Bactrim and clarithromycin. Presentation concerning for possible vaccine reaction, no anaphylaxis. EKG and labs within normal limits. Patient was rehydrated in the ED. Patient was discharged home on same day (12/20/2020). Pt alert and oriented x 4. Pt ambulated out of ED with a steady gait in no apparent distress.

Headache, nausea, tiredness, feeling unwell and injection site pain. Warm to touch injection site, raised lump on left arm.

Numbness un lower lip. Soar throat Headaches, patient allegedly took Maxal 10 mg at 9:00am. Erythema in the neck area.

Caller stated @ 10:15 am and about 5pm that afternoon nausea, itching and welts on the face and burning the ears. Caller took 50mg Benadryl. Once at hospital she received Decadron injection 4mg. Caller slept for two hours and symptoms had dissipated.

"Approximately 12 hours after receiving my Covid vaccination, I experienced onset of severe pharyngitis and BL earache along with severe swelling of the glands in my neck and jaw. I developed a severe headache, photophobia and BL eye pain. I developed lesions and ulcerations on the skin surrounding my mouth. My lips cracked and developed blisters and ulcerations. I developed intra-oral and buccal lesions and ulcerations. I developed nausea and severe diarrhea. Severe myalgia, skin sensitivity and fatigue. Later in the day on 12/19/2020, I developed changes in my sense of taste and smell. Everything had a metallic or ""coppery"" taste, and my sense of smell was diminished. The next day, 12/20/2020, the disturbances in taste and smell worsened. The symptoms were severe on Saturday 12/19/2020 and Sunday 12/20/2020, and have begun to improve today--Monday 12/21/2020. No further skin or oral lesions, blisters or ulcerations, and the existing lesions are now healing. Continued diarrhea and GI upset. Other symptoms are improving."

Muscular pain, general malaise Treatment: Famotidine, Acetaminophen

Fingers started tingling , progressing to numbness ascending up the left upper arm. Symptoms started approximately 10 minutes after receiving the vaccine in the same arm.

Pt left triage vm, said she received the Covid vaccine Thursday, on Sunday began having frequent stomach cramps that have not eased up. She is at work today, but is nauseas, still having frequent stomach cramps

Complaints of tingly in left leg, warm feeling all over body. This happened one hour after vaccination. Tingly resolved, but leg is still sore.

Patient reported metallic taste in the mouth immediately following vaccine, dissipated after five mins.

Severe soreness at injection site, uncontrollable shaking and chills, severe joint pain, muscle aches, heaviness of limbs, migraine like headache, abdomen bloating and weakness all within 12 hours of vaccination. Continued off and on over next 48-72 hours although symptoms were more mild within 48-72 hours.

Patient states that she is experiencing a headache, low grade fever 99-99.7, neck and shoulder soreness and is 12 weeks pregnant.

Muscle soreness at sight of injection

severe abdominal pain experience 2 days post vaccination of dose 1 of 2. Diagnoses with early acute appendicitis on Friday December 18th and had a laproscopic appendectomy on Saturday December 19th.

Had dose #1 at 1620 and started feeling itchy on her head and face about 1700. Face red. No difficulty breathing. Given 25 mg benadrly po. Observed and improved. Returned to clinical unit as a patient care tech about 1745. At about 2200 she started having swelling in her face and lower lip and tingling in tongue and left upper and lower lip. Taken to ED in our Facility. Given benadrly 25 mg, famotidine 20mg, and prednisone 60 mg all PO x 1. No difficulty breathing, or swallowing, no wheezings or angioedema of mouth or throat. Sxs improved . diagnosed with allergic reaction. given instructions when to return. Given instructions for Benadryl and famotidine otc use. given script for prednisone 40mg x 5 doses. DC at 12/19 /20 at 0144 to home. 12/21/20 1000 this rn called patient at home. She is doing much better with redness in her face and itching in her back and face. No swelling or rash. Last had benadryl last night. has been taking multiple times a day for the itching. had famotidine x 1 on 12/19. She has not filled the script for prednisone. I told her if she could tolerate itchiness tomorrow w/o use of benadryl she could work her 1600-2400 shift. I will discuss her taking covid vaccine #2 with Medical Director for Employee Health, Dr.

Approximately 10-15 minutes after receiving COVID-19 vaccine, patient reported itching, tingly feeling, face appeared more flushed. Seemed anxious due to history of allergic reactions and reported slight shortness of breath. Treated with diphenhydramine 50 mg po and epinephrine 0.5 mg IM and transported to Emergency Department. Observed in that area and released a few hours later as symptoms resolved.

Vertigo. No treatment required. Resolved spontaneously.

Joint inflammation with pain, developed knot at injection site with severe pain for 3 days

One hour after vaccination had warm feeling all over face, not flush and did not have fever. Lasted all night long and patient was also nauseous. She then stated she had numbness along left jaw, this

happened hours after vaccination. The next day she felt better, nurse told her if it happens again or doesn't resolve follow up with PCP. The following day, associate felt better.

GENERAL MALAISE, CHILLS, LEFT ARM PAIN, INFRAORBITAL PAIN, NAUSEA. SYMPTOMS LASTED 1 DAY.

Patient complained of fluctuating tachycardia between 110-150BPM after waiting about 10 minutes after receiving vaccine. Patient skin was hot and moist to the touch. Facility RN escorted patient to ER where she was seen. More information is not available at this time.

2 day post vaccine right arm is red, swollen, hot and itching. Site was initially painful on day 1. Also night of vaccine had generalized itching which was relieved with benadyrl.

Lip swelling within 24 hrs

Shortness of breath, tachycardia

1830 began experiencing numbness and tingling to R arm, the nurse there evaluated associate and noted equal movement/strenght to both arms. 1840: reported feeling better and requested to leave.

Patient had sudden onset of tachycardia - heart rate 120s - 140s. Felt lightheaded.

The patient pre-medicated with oral diphenhydramine because she had an allergic reaction to another vaccine in the past. The patient developed some upper body redness and slight eyelid swelling, and she continued to treat with oral diphenhydramine until symptoms resolved.

Patient received Pfizer COVID 19 vaccine last Thursday 12/17. Admitted today (12/21) with bleeding and low platelet count - working up for ITP, TTP. Given recency of vaccination and no known contributory allergy or medical history, physician thought potentially associated with vaccination.

Dizzy, headache, blurry vision, fatigue

Pfizer-BioNTech COVID-19 Vaccine EUA Fevers Muscle Aches Joint Pain Sweats Headaches

"Patient experienced tingling in left fingers and hand that progressed to ascending numbness up the left arm and up the left shoulder and left neck area up to under the left ear. Patient feels like there is a ""lump"" in the throat that she has experienced during dental work when mouth is numb. This occurred within 10 minutes of vaccination. Symptoms progressed to feeling of having fluid in the ear approximately 50 minutes after vaccination."

one hour post vaccination, patient had tingling on left face. Near ear to jaw line radiating to neck. Lasted one hour then resolved.

On 12/20 at 9am started having left sided facial numbness, tingling, flushing. Near syncope episode (tachycardia, diaphoretic, blurred vision) around 1130am. Took Benadryl seemed to help. On 12/21- around 7a near syncope episode, tachycardia, diaphoretic, facial flushing, itching. Took Benadryl- improvement in facial itching, decreased heart rate.

REDNESS ON THE UPPER LIP, SCALE AND ITCHING IN THE AREA.

Rash on chest pounding headache fever of 104 left side rib pain elevated heart rate 106

The shot site was swollen for two days after the injection. I had nausea, dizziness, and tiredness. Three days after the injection (today), I had shakiness, extreme fatigue and felt like I was going to pass out.

started to develop injection site soreness on the night of vaccine then by 10am the next day was having all over body aches, nausea, headache which continued to get worse and by 3pm that day had nausea, vomiting , severe body aches and cramping all over, fever, headache, and a hard warm lump at the injection site. was applying heat to cramps and taking Tylenol which was not helping much for body aches, did not want to take ibuprofen due to nausea. by noon on the 3rd day most of it was resolved

Patient described feeling numbness under the right eye. The numbness radiated down the right side of the face. Patient reported that the numbness subsided after 2 minutes

"Right arm with 2.5-3"" long 1.5-2"" wide reddened, warm to touch, developed the day after vaccine. Seen by OHS rec. Ice, Benadryl, Antihistamine. Today she returned with decreased swelling & redness."

Started 15 minutes after vaccination and it lasted for 30 minutes. Tingling arms and fingers and heaviness in shoulder. Resolved.

Employee reported redness and swelling to Right Wrist. She also noted itching to left neck/back area. Employee was taken to ED for further evaluation and treatment.

Approximately 30 minutes after COVID vaccine administered, patient reported tongue swelling/itching sensation to tongue and roof of mouth. This lasted about 15 minutes and resolved on its own without treatment.

Patient experienced nausea and fatigue a couple of days after getting the vaccine

Significant Cervical/thoracic joint pain and stiffness which referred to R shoulder girdle region, limited cervical ROM to the R. Dull, achey pain in area even without movement. Took acetaminophen and tumeric for anti inflammatory, use of heating pad and then biofreeze cream for analgesic purposes. By next morning pain and stiffness centralized back to spinal region and R shoulder girdle was pain free with normal ROM. Same treatments used again.

Mild Edema Left Side of Face

injection site pain, slight fever, tiredness, headache

Patient received Pfizer vaccine dose 1 IM in L deltoid per portcol. During 15 min post vaccine monitoring, patient developed a cough, SOB, diff swallowing and hive like rash within 10 minutes of vaccine administration

chills, body aches, skin hurt, nausea, lack of appetite and diarrhea (along with sore arm)

24 hours after injection developed muscle aches and fatigue. Approximately 36 hours developed severe vertigo with nausea. Headache present. Continued 12/19 to present. Taking Dramamine for symptoms which on 12/21/2020 is helping with vertigo and nausea. Fatigue, headache and muscle aches continue 12/21/2020.

at 1805; associate c/o lightheaded and noted to be diaphoretic. BP was 138/92 with HR 85 and room air sat 98%. at 1830; reported feeling better. BP 127/83. HR 76. room air sat 100%. at 1845: felt better 143/101 1905: discharged to home. BP 136/92

Soreness in arm

Rash on arms and legs . resolved after taking a dose of Benadryl

fatigue

The reaction to the shot was that she had alcohol taste, nausea, wretching, and a rapid response team was called and she was taken to the ED.

"Pfizer-BioNTech COVID 19 Vaccine 42 y.o. female had just received her vaccine when she became very lightheaded, was placed on a stretcher and brought to ED further evaluation. Patient has hx of rheumatoid arthritis.á Stated that she has not eaten since earlier this morning, did have some nausea vomiting earlier that is now resolved, feels that it was related to ""an adrenaline rush just prior to her vaccination.ááUpon arrival to EDáshe is denying any headache, fever, sweats, chills, cough, shortness of breath, angioedema, chest pain, palpitations, vomiting, edema, claudication, urticarial.á Diagnosed with near syncope."

"Approximately 10 to 15 minutes after vaccination, patient reported feeling dizzy with slight headache. Also reported tingling starting on the left fingers and hand that progressed to tingling (not numbness) up both arms and both sides of the upper body. Body felt ""weird"". Headache progressed to a ""pounding headache"" with pain in the eyes because the headache is ""so bad"". Patient reports feeling tired and ""drained"". Patient being frequently monitored by nursing staff."

fatigue, weakness

The night of vaccination patient had a metal taste in mouth and lost all sense of taste. 12/19/2020 she developed a fever, body aches, and chills. 12/20/20 Continued to be febrile, then was told to follow up with PCP.

fatigue, muscle soreness and weakness, headache, nausea

I had heart palpitations and extreme fatigue for 48 hours.

Fatigue, mild fever, joint ache, muscle ache, headache, eye pain (had underwent LASIK recently, date of vaccination was LASIK POD#18, but that eye pain had entirely resolved at least a week ago, now recurring), mild chills. (Instructed by employer to include this in Item 18: Pfizer-BioNTech COVID-19 Vaccine EUA)

5 in red spot underneath the injection site

Approximately 15 minutes after injection, patient reported nausea/vomiting, difficulty breathing, being clammy and having numbness/tingling in the L side of face and L arm. Cold packs were applied, BP 165/104 obtained at that time, O2 sats 99% on RA. O2 via facemask applied. Sats continued in upper 90's throughout event. Rapid response called at onset of symptoms. They connected to monitor upon arrival. HR maintained 70's-80's throughout event. At 2304 BP 165/102, HR 85, patient reported feeling better. At 1108, BP was 159/100. Patient reported feeling well enough to go home at that time and did so.

"Pfizer/BioNTech COVID 19 vaccine EUA C/O ""heart coming out of chest"", itching, and hot feeling approximately 10-15 minutes after injection. She took 25mg Benadryl PO one hour before vaccine. Was given 25 mg oral Benadryl at 1410. HR and blood pressure returned to normal and pt was released within 20 minutes of reaction."

Hypertension (220/110) and shortness of breath after Pfizer-BioNTech COVID-19 0.3 IM injection in the right deltoid. Presented to ED within 6 minutes of injection for evaluation. Symptoms resolved within 10 minutes in the ED except BP remained in 160s/90s. Blood glucose, CMP, and ECG normal. No medications given. Patient asked to leave following resolution of symptoms.

general malaise and abdominal discomfort after vaccine, three days later started with facial rash and fever Treatment: Famotidine, Benadryl

The night patient got vaccination she had abdominal pain, muscle aches and sinus congestions. She was also exposed to a positive covid 19 case and is going for testing 12/21/2020.

"I have had symptoms of a low grade fever on and off and a cough has developed that sounds like ""whooping cough"" . This is the 4th day. Is this normal or does it get better . do you need to see a dr??"

Felt achy, headache, neck sore, possible low grade fever, tired, chills occasionally. Treated with motrin and rest.

Approximately 10 minutes after the vaccine, patient became tachycardia hr 110, diaphoretic, and pale. Felt back to normal around 12:30 pm. Patient did not develop any additional symptoms until Saturday evening around 5pm when similar symptoms developed but milder.

"Approximately 30 minutes after receiving the vaccination, patient reports itching started on left arm, then the head, then both arms and then lower back. No redness, erythema, or hives. Itching progressed to the ears and throat started to feel ""sticky/funny"" within 1 hour of receiving the vaccine. Diphenhydramine 50 mg and Famotidine 20 mg administered. Itchiness resolved 15 to 30 minutes after receiving diphenhydramine and famotidine. However, lips and tongue feel ""tingly""."

Slight difficulty with exhalation. Denies difficulty with inhalation, swelling of face or throat, palpitations, rash, or dizziness and weakness. Advised to continue to monitor. Strict UC/ER precautions advised.

1813: reported feeling nauseated and was noted to diaphoretic. HR 110. BP 142/82. Room Air sat 100%. 1830: reports feeling better HR 89. BP 141/75. Room air Sat 100% 1840: symptoms resolved. associate sent home per request. HR 86 no interventions done.

Fever, chills, body aches 24 hours. Continues 72 hours later to have swollen axillary lymph right arm. Pain at injection site.

Hello to all. Patient reported feeling dizzy right after sitting down for the 15 minute wait period. I asked her if she would like to lay down. I took her in the side room to lay on the hospital bed. Her bp was 177/115. She is a physician and so is her husband. He was with her. He suggested we had a bad cuff , and he wanted a manual one. Staff went to the ER to retrieve it. Her husband took her BP and BP was elevated with the manual cuff as well. I provided juice and water for the patient and got her rags. Her blood pressure stayed elevated for the whole 30 minutes she was there. Her husband wanted to know what I had to give her. He wanted lisinopril 5mg. I explained that we only had benadryl and epipens for allergic reactions. He decided to take her home. He stated he would give her one of his blood pressure pills and that she would be fine. She was able to get up and walk out without assistance

Approximately 30hrs. post vaccine I experienced hearing loss in my right ear. I could hear very little and it became worse within the next few hours. 12hrs after this began, my hearing came back and I then acquired a ringing in my right ear. This progressively lessened, and about 24 hrs after the initial hearing loss started, all the symptoms dissapated.

flushing, felt dizzy. given Benadryl 50mg and resolved in 15 minutes

During the 15-minute observation period the patient became flushed and began complaining of a headache. She then went unconscious and had tonic-like activity for approximately 2 minutes. The patient subsequently stopped the seizure-like activity and woke up but was confused and was acting in a postictal fashion. She was evaluated emergently upon arrival in the ED and noted to have an altered mental status. Physician noted that this does not appear to be an allergic or anaphylactic reaction. There was no evidence of rash and lung sounds were clear with no wheezing. Subsequent CT showed a diffuse subarachnoid hemorrhage and patient was transferred to the Medical Center for further treatment.

Approximately 2 hrs 30 min post administration I experienced mild parasthesia in my left ring finger and pinky finger and mild left arm muscle weakness and mild lady hand grasp weakness. This episode lasted about 40-45 min, self resolved completely with no intervention.

Woke up middle of night, severe muscle aches/cramps, chills/fever, debilitating headache.

Patient reported feeling dizzy shortly after the vaccine. Symptoms resolved after she laid down and we got her a drink.

Pt experienced temp of 103.8 at 3am on 12/18/20. Temp decreased to 100 on 12/19-12/20. As of 9am on 12/21 temp was 99.3. On 12/19 pt began experiencing diarrhea, cough and stomach pain. Cough and stomach pain continued to report of 12/21. Pt had COVID + test on 10/11/2020. She stated that it was as if the symptoms she had in October were back.

Patient presents to the emergency department less than 20 minutes after getting her first COVID-19 vaccine, feels like there is a tickle in her throat, patient has some blotchy erythema on the front of her neck and chest. Patient very hypertensive on arrival here to the ED. Patient was given IM epi 300 mcg, was also given Solu-Medrol 125 mg IV, Pepcid 20 mg IV, and Benadryl 50 mg IV. Patient reexamined at 9:45 AM, states that symptoms are better. Blood pressure actually has improved down to 172/91. She no longer has the erythema edema on the front of her neck and chest, feels as though symptoms are improving. We will continue to observe patient here for the next 2 hours after epi. Pt. asymptomatic by 1230. Discharged to home and advised to not get the second COVID-19 vaccine shot in three weeks.

tingling in throat, rapid heart rate, flushing

Fatigue and shakiness in diabetic patient. Fingerstick blood sugar showed low blood sugar of 49 three to four hours after vaccine. Patient reports no other changes in diet or routine that morning. Issue resolved on its own with eating.

Patient endorses feelings of ?tired? approx. 30 minutes after vaccine. Patient reports he went home after his work day and reported feeling more and more tired. Patient reports he ordered dinner with his girlfriend and at approx. 20:00/21:00 reported bilateral swelling to lymph nodes in neck, and feelings of his ?throat closing up.? Patient endorses, ?I felt like I was having a panic attack.? At approx. 22:00 patient took 3 tabs of Benadryl and 2 tabs of acetaminophen and noticed improvement and then went to bed. Patient reports improvements in symptoms but persistent bilateral lymph node swelling in neck throughout the weekend. Today (12/21): Patient endorses increased lethargy, persistent bilateral lymph node swelling in neck and + sore throat. Patient denies fever. Patient took 2 tabs of Benadryl at 10:00 today while at work. Patient called PCP today while at work describing symptoms and advised to leave work and to get COVID tested. During call with RN, patient is awake/alert and in NAD acute respiratory distress. Pt endorses able to move air freely, no SOB, and difficulty breathing. Patient reports scheduled telemedicine appointment tmw am. Patient denies recent travel of self or girlfriend, and denies known covid exposure in community or workplace.

Rash in pectoral, shoulder and back area.

GI : nausea, dyspepsia. Headache, Myalgia

I developed vertigo and it is bad when I lie down. The room is spinning It started the night after the vaccine and it has not gone away. I feel the motion sensation all day. It feels like I am drunk all the time.

General malaise, nausea, chills, headache

Patient was in observation. She stated she saw the room take a shift. She then got a headache in the back and on the top of her head. Her heart was also racing and she was dizzy. We got the patient some juice and her lay down. Symptoms resolved other than headache. She reported it was still 5/10 when she left.

Pain at injection site after 6 hours followed by malaise, fatigue, upper body muscle soreness, chills, feeling hot which started 12 bourse after the shot and lasted till 3 days after shot. Partially improved symptoms with ibuprofen 600mg but short lasting.

Tingling on right side of lip and right of face. Felt like numbness from local anesthesia at dental office. Felt like throat was a little numb. Numbness has mostly resolved approximately 1.5 hrs after vaccination. Some lingering tingling on lips at 1 hr 45 mins post-vaccination.

48hrs after vaccination I developed axillary lymphadenopathy in my R axilla (same side vaccine was given.) Injection site is well appearing- glands remain swollen and painful.

Started having bad headache the day after shot. Also very bad fatigue. Now on 12/21/20 I?ve had a very severe migraine with visual aura.

Flu like symptoms: Headache, Muscle Ache/Soreness and Fever. Pt is currently taking Tylenol/Ibuprofen at home to treat. Will continue to monitor pt closely. If symptoms don't resolve soon, will have patient to come to hospital for further evaluation.

Pt expressed feeling tachycardic, jittery, shaky, site edema, shortness of breath and dizziness. Pt received epipen 0.3 mg IM injection x1 dose and benadryl PO, responded favorably and transported to ED for follow up care.

I had a fever of 101, body aches, fatigue, nausea, dizziness. Did not see a doctor. I am feeling better now.

Tingling, numbness down Left arm. Hot flushing across chest and left side.

Pfizer-BioNTech COVID-19 Vaccine EUA: Allergic reaction after receiving a COVID shot. Pt reports a rush of dizziness, diaphoretic, nausea, and near syncope. Pt appears pale but alert and oriented upon arrival. Patient was given IM epi, IV Solu-Medrol, Benadryl, and Pepcid, placed on a cardiac monitor. He was given 1 L of normal saline. Patient observed here in the ED for almost 8 hours. He has been persistently tachycardic; Admitted as inpt. for observation. Discharged from inpt status on 12.18.2020 @ 2152.

11started with intense itching in scalp and neck54:received COVID vaccine, within 3 min she felt flushed, dizzy and heart rate increased. 1205:she felt less lightheaded and heart rate was slowing 1208: she felt intense itching in scalp and neck 1215:itiching increasing, given Benadryl 50 mg IM 1245: itching not as intense, but itching had moved to arms, trunk and legs

Tongue felt thick, tingling in extremities, shortness of breath. Given 50mg Benadryl, 20 mg famotidine

Shingle like symptoms on left side of scalp/ face/ neck/ left arm and left torso.Extreme sensitivity to touch/cold/heat on affected side.Left neck muscles sore and aching.

Right when the patient sat down at observation she stated she was flushed and got hot in her head. She said her chest felt funny and her tongue was tingly. Her blood pressure was 169/95 and heart rate was

100. She stated she was nervous. We kept her in observation for 30 minutes. All symptoms resolved by the time she left.

Symptoms began 12/18/2020 at 9pm with severe fatigue and chills. Woke up at 0030 12/19/2020 with severe shaking chills, headache, body aches, dry cough and nausea, temperature spiked to 103.2 @ 0230, took 600mg Motrin and 500mg Tylenol but fever stayed at 103 until 0600 and slowly came down to 98 by 0900 12/19/2020; symptoms were resolved except for fatigue until approx 5pm 12/19/2020 when fatigue increased and chills came back with headache and body aches, fever spiked to 102.3 and lasted until approx 9pm after taking 600mg Motrin and 500mg Tylenol, I was able to sleep well Saturday night. Woke up Sunday 12/20/2020 at 0730 feeling well but within an hour I developed a dry cough and shortness of breath with exertion and noted elevated heart rate (90-120bpm). This lasted all day. At 3pm 12/20 I began to get fatigued again. I felt very clammy and flushed and checked my temperature and it was back up to 101.6. Fever came down to 100 by 7pm and stayed there until approx 930pm. I woke up this morning feeling slightly better. I still have a cough and shortness of breath

The day after at 1 am exp chills, low grade fever, nausea, headache and fatigue. After Tylenol after 24 hrs the symptoms was better. I was able to to return to work.

The vaccine was administered at 1130 without immediate complication. At approx 1800 the pt began to develop symptoms of general malaise. At approx 2200 the pt developed a fever and chills. Initial oral temperature was 101.3 The pt has continued to have a fever and general malaise since the injection, now for almost 5 days.

Tightness in back of throat. Received 50 mg Benadryl.

Employee complained of feeling lightheaded. She reported blotchy spots on neck and chest; tingling to back of throat. Employee was taken to ED for further evaluation and treatment.

Patient began experiencing bilateral leg weakness, chills, shortness of breath, and headache

Edema in left side of face, hand, knee, and shoulder.

Pt reported roof of mouth itchy, body itching, ears ringing and felt fullness/clogged, headache. Benadryl 50 mg PO provided with additional monitoring and resolved.

Patient states that evening of vaccination she started to have pain and swelling radiating from injection site to shoulder, up neck to under eye area and then across left clavicle. Patient states that jaw was sore. Following morning, the patient experienced joint and muscle pain and a headache (similar to when she had COVID in Oct 2020). Patient also had a cold sore occur 24 to 48 hours post vaccine. Patient called pharmacy on 12/21/20 to report ADR and pharmacist recommended contacting PCP as well.

injection site sore, sluggish, stomach pain

Nausea and tingling in hand

Several running nose that wont stop, Headache, and red watery eyes .

Arm soreness, I had dinner and maybe it was the food I ate, my stomach really hurted and lots of pain. I laid down and rested and next morning my stomach pains were gone. My arm was still hurting a lot the next day, not anymore.

After 15 minutes of monitoring post injection, I developed itching to left shoulder with diffue hives to shoulder and chest

dull headache in beginning became intense with nausea and diarrhea for 3 days, pain at the injection site.

12/17/2020 12:30 PM -- Nausea, severe; fever 101.00, fatigue, pain at injection site for 3 days ending 12/20/2020. Nausea and fatigue still persist. Employee Health at vaccine Facility site provided prescription order for Sofran to patient pharmacy of choice; patient has has no relief with prescription.

12/16 - 11AM VACCINE RECEIVED 12/17- 6AM HANDS SWELLING SEEN 12/18 - 6AM EYELIDS AND CHEEKS SWELLING SEEN

"Chest and back pain, and then ""limbs went numb"". Couldn't lift glass of water. All limbs were weak and shaky."

Rash on arm morning after injection at injection site

Developed fever to 100.5, body aches, swelling at the injection site.

Patient felt a sudden rush of tingly feeling from chest down to arms. Did resolve, lasted a few minutes.

Patient emailed 12/21 and described on set of annoying, cool tingling sensation of lower extremities that began last evening. Writer called patient to obtain more information about symptoms. States is experiencing an annoying, cool, tingling sensation in lower extremities that is hard to describe. Reports it feels almost like it's asleep, but cool. The symptoms began in the lower extremities and is now into the hips. Says has had difficulty sleeping due to the symptoms. States is able to walk, and not experiencing any shortness of breath. Instructed to notify her provider right away or report to the Emergency Department for evaluation and treatment.

39 yo male employee with history of Covid 3/2020, and SVT s/p ablation x 2 (2002, 2008) who came to hospital S/P Covid vaccination for recurrence of SVT. Given 50 mg IV benadryl prior to arrival to hospital. Prior to discharge had recurrence of SVT to HR 170. Placed in Obs overnight for telemetry monitoring. No events overnight. No dyspnea, fever, body aches, or hives. Discharge patient home with follow up with MD for possible holter monitor.

Body aches; chills; fatigue; sore arm lasting 48 hours post vaccination. Resolved with Acetaminophen

Noted headache just over an hour after receiving vaccine. No fever and subsided after about an hour. Awakened 12/19 with a headache that was relieved by Advil.

2 hours after injection patient experience hives on upper torso, and mid and low back. Hives started spreading on the neck. Patient had NO shortness of breath. Itching on left knee. Patient given oral benadryl and then 30 minutes later received 20mg of pepcid. Patient cleared of hives by that night but reoccurred Saturday afternoon with a mild case of hives on the neck. Patient took dose of benadryl. Patient does have a few small areas of redness noted on right arm.

Sinus tachycardic with rate in 130s, dizziness, hypertension 138/92. Symptoms began 20 minutes following vaccination and resolved after 30 minutes.

12/18/20 4 hrs after injection redness& swelling at site started. 12/19/20 severe fatigue, muscle/ joint aches, severe migraine with nausea, dizziness, started at around 11am at 1pm chills started& lasting through 12/21/20 1450. Headache at a pain level 8

Fever of 100.6, chills, nausea, fatigue, pain at injection site. Started 24 hours after injection, lasted about 12 hours.

Started with slight headache and sore arm, felt tired and diarrhea about 5 hours past vaccination - 3 bowel movements within 1 hour. That night around 1:30AM (next morning) I felt a little itchy all over with a throat irritation and I took some Benadryl. Just itchiness and sore throat, no fever. Had pretty bad fatigue on the 17th and had nasal congestion, cough, chills, sneezing. I worked on the 17th but felt terrible throughout the day. Got home and I could not eat anything , could not hold anything on my stomach. On the 18th at night woke up with sweats, no fever, dry cough, nausea. Chest discomfort (minor chest pain - was sure was not cardiac, could be acid reflux). Woke up with nausea and irritation and intermittently felt fatigued and would feel better, throughout the day. Also felt back pains on the 18. That same evening I felt a little better and then on the 19th I had some shortness of breath. I then decided to go to the UC on Saturday the 19th and got a COVID test. Sore throat was gone but still feel back pain and nausea. Around 11PM on the 19th I got itchy again in my arms and chest. Also got chest pains and took a Pepcid and Benadryl. On the 20th I am feeling a little better, still have a cough and some stomach upset and headache (in the AM). About 1:30PM diarrhea came back again. Had it 2X and low back pain and abdominal pain and also chills. There was a time I could not take care of my kids I just had to stay in bed (19 and 20th - I spent in bed most of the day). My heart rate has been good. The evening of the 20th I felt a little bit better and able to eat a little bit easier. This morning felling a little better. Had diarrhea this morning and a headache that I can't get rid of. Took Tylenol but it has not helped. Also low back pain.

sore arm lasting 72 hours post injection.

Patient had warm to touch injection site and experienced headache. Gave water. Patient felt better but still symptomatic.

Swollen tongue, racing heart, lightheaded

The patient was sitting in a chair and began feeling flushed, scratchy throat, and tingling in bilateral arms. Treatment included 25mg Benadryl by mouth at 1851, repeat dose at 1902.

Developed chills, body aches, swelling at vaccine site. Improved after 2 days. She did have COVID in April 2020.

Leg pain, back pain, chills, fever, headache. Unable to walk or stand still for more than a minute. Unable to sit upright back pain travels to mid back.

Left knee pain when standing up

Pfizer-BioNTech COVID-19 Vaccine EUA. Symptoms: shaking, chills, sore arm, fever: 101 beginning at 11:30pm. Took Tylenol Extra Strength prior to bed at 2am. Woke up with headache and fever of 99.4 approximately 6 hours later and took more Tylenol Extra Strength. Felt tired during the day. Rechecked temperature at 8:00pm (12/19) and fever remained at 99.4 , but did not take Tylenol.

Patient experienced Temperature increase to 99.3 oral; increased blood pressure 136/94 with dizziness about 30 minutes after injection. Blood pressure remained elevated for about 2 hours; normal blood pressure 112/64 for this young man. Vitals were taken every 30 minutes. BP and temp 134/84, 99.5 140/92, 99.1 128/92, 99.1 112/76, 97.8 vitals prior to patient leaving. Dizziness improved and patient taken home by friend. Dizziness continued. Patient taken home and told to report to ER if symptoms return

Dry Cough, Fatigue, Arthralgia, Low Grade Fever.

15 Mins after I started noticing tightness in chest, tongue swelling , heart rate 130 , 25 mg of Benadryl,, irregular heart

I developed a temp as high as 101 degrees. Terrible headache that lasted for 5 days Muscle aches Fatigue, Weak (I did have covid on March 27- was ill for 3 weeks. Had antibodies still present when tested in August) Chills alternating with sweating

12/18/2020 10:30PM body aches, chill, left arm pain. 3:00 AM pain in arm 800mg Tylenol. AM next day, arm still sore . 12/20/20 midday discomfort in l armpit. 11:30 12/20 swelling in l armpit. 9:00 Ice swelling of l armpit -- Tylenol. Some swelling persists at area of l armpit.

"0650-Within 5 min of vaccination: Lightheadedness, dizziness, ""floaty"" feeling, cleared after sitting 15 more minutes. 0900-Returned to clinic, after vaccination : recurrence of lightheadedness, sudden onset of HA 6/10 (no migraine aura), nausea and 2 episodes of watery stool, diaphoresis. No rash, no Shortness of breath, no difficulty swallowing, no throat swelling. 1000- taken to ED for continued monitoring: given Zofran 4mg SL, Benadryl 25 mg PO, Pepcid 10 mg PO, Tylenol 975 mg PO , ibuprofen 600 mg PO. DC'd from ED at 1335 with Zofran for continued nausea. Other symptoms resolved."

I developed a rash on both arms right away.

c/o of tingling and burning to right side of face and lips Covid Vaccine injection was administered. Pt. She also states develop a small blister inside her lower lip. She denies any SOB or swelling to face and throat she states has allergies to red dyes and has a hx. of DM, HTN, Anemia and breast CA. VS were taken BP

154/90 , 02 sat 100 %, HR 56. Pt. had some water and walked to the restroom, she stated was feeling much better, and said her husband was driving her home. BP recheck again 139/89 pulse 62, sats 100. She left via walking without any difficulty.

Patient said that she felt sick while in observation. She ended up dizzy, shaky, and a fast heart rate. We got her to get a drink and lay down for a bit. Her initial bp was 143/107 with a heart rate of 108. After resting for some time, she felt back to normal.

c/o problems swallowing despite drinking water. Sat pt in chair, VS taken and monitored. Epinephrine IM given when pt c/o problems swallowing worsening. 9-1-1 called and responded but pt declined escort to ED because he stated he was feeling better after Epi so instead I and patient transport escorted pt to ED via wheelchair.

Dizziness occurring approximately 4 hours after receiving vaccine. Patient presented back to vaccine clinic. Blood pressure lower than patient's reported normal blood pressure. Close monitoring by nurse. Blood pressure increased during monitoring period.

Vaccine recipient reported experiencing numbness, tingling of the arm after receiving the COVID-19 vaccine. Vaccine recipient thinks that the vaccinator most likely hit a nerve when administering the vaccine. The vaccine recipient went to the emergency department for further evaluation. The vaccine recipient was monitored, felt better, and was discharged to home subsequently the same day. On Monday, I called the vaccine recipient to follow-up and they report that they no longer have the numbness or tingling.

Developed fever , cough, congestion 1 day after vaccination.

12/16/2020 I had a fever at night I woke up with fever and chills and body aches and I also had a pretty bad headache, it lasted throughout the next day 12/17 I took tylenol and just felt tired, my headache was also off and on it just depended when I took tylenol

Patient felt some dizziness 15min post vaccination, itchiness behind both ears, some nausea, tingling feeling all over body. Pt denies worsening of symptoms 10 minutes later, reports itchiness behind ears feeling slightly better. Does report an area on abdomen feeling itchy as well as random spots on both legs. Pt agreed to 50mg of Diphenhydramine, tabs, PO 20 minutes after first sx developed. Lot# 205355, exp. 05/2023, NDC 0904-5306-61. Patient was monitored for an extra 15 minutes post medication, was feeling better and had her husband outside waiting for her to drive her home. Advised to continue to monitor sx and call PCP with new sx or for emergent sx, go to ED. Patient denied trouble breathing, chest pain/tightening, trouble swallowing throughout whole event.

39 yo male with history of Covid 3/2020, and SVT s/p ablation x 2 (2002, 2008) who came to urgent care S/P Covid vaccination for recurrence of SVT. Given 50 mg IV benadryl prior to arrival to urgent care. Prior to discharge had recurrence of SVT to HR 170. Placed in Obs overnight for telemetry monitoring. No events overnight. No dyspnea, fever, body aches, or hives. Discharge patient home with follow up with EP MD for possible holter monitor.

Flushing and lightheadedness

Patient became dizzy, vital signs -10:32 am 162/101, P-96, sat 98% on room air, hot clammy, blurry vision, heart palpitations, repeat vitals 1036- 171/102 P-85 sat 98% on room air, transferred to Emergency Room 10:43 am

Thursday night at around 11pm I lost control of my right arm. Friday I spent the day in Urgent Care doing CT scans and MRI scans of my brain and body and also did some blood work. All test came back negative. It is now Monday the 21st and the mobility in my right arm is extremely limited and I am slowly regaining the use of my right arm.

Weakness; fatigue lasting about 1 hour.

"""felt like throat scratching"""

One hour post vaccination my top lip felt tight. On inspection my buccal mucosa of my top and bottom lips were swollen greater on the top lip. My soft palate felt numb as well as my tongue from the tip to middle. My nose was also slightly swollen. 24 hours later the I have a slight swelling of areas mentioned with the exception of my nose. I was instructed to take Benadryl on the day of the event 25mg x 2 doses. the day after 12/21 I was given Claritin 10mg x 1 dose and Famatodine 20mg x 1 dose by mouth.

10 minutes after injection started to feel hot, developed a headache and nausea. had blood pressure taken and it was elevated along with heart rate in the 120's. Started feeling itchy and short of breath, along with red and blotchy on the arms and face. Was transferred to the ED and given IV fluids with Solu-Medrol, Benadryl, and Famotidine and released 1 hour and 30 minutes later with a prednisone prescription.

The evening of 12/16 my headache begin at the next day fever of 103 stayed for 7 hrs took administered Tylenol exp chills, body aches, and rash on face around the eye spread to right side of nose, side went to hand area lasted from 12/17 to 12/21.The headache started effecting my neck contacted my PCP on 12/19. I went to ER on 12/19 ran tests CT scan check for clots negative, lumbar puncture and chest X-ray was fine and dint exp respiratory problems. I missed 3 days of from work 12/9 to 12/21.

Day after the vaccine I had body aches, fatigue , headache and temp of 101.5

Patient had swelling of tongue 45-60 minutes after vaccination. Received PO benadryl. Had eyelid and facial swelling requiring IV Solu-medrol. Monitored for short period of time in emergency department and released. No further symptoms.

Sore arm, could not sleep on it about 8-10 hour post vaccination.

Spontaneous hives on face, Associate does have a hx of spontaneous hives and has been seen by allergist. Had an episode in January, February, May and October of spontaneous hives. Hives noted 5.5 after vaccine and about 1.5 hours after taking Advil

She was sore at injection site later on day of injection (12/20) that developed into whole body muscle aches the next day (12/21). She also reported a cough started on 12/20 and this has persisted and slight Shortness of breath started 12/20 that has become worse today 12/21 where if she is moving around she needs to stop and take a few breaths. She denied any feeling of life threatening shortness or breath or need to go to ER. She has been instructed to contact employee health prior to coming back to work given cough/SOB not typically a reaction to vaccine.

"felt lightheaded and a ""little off"" after doing errands at lunch about 2 hours after taking vaccine. BP was 190/110 while at work and was sent to the ER. BP there was 209/125. Was given Nifedipine CR 30 mg at 17:49. Discharged from ER with primary care follow up on 12/21. BP 4 months prior to vaccination was recorded at 168/110 at office visit."

6 min post injection felt cold, lightheaded, HR increased to 155, and became flushed.

"c/o ""I can't breathe, feels like my throat is closing"" VS taken. Pt crying, breathing rapidly possibly hyperventilating. Epi IM given, VS taken. Hospital emergency activated. Rapid team arrived assessing pt. Rapid team escorted pt via gurney for further observation."

Vasovagal reaction ashen color bradycardia for approx 1-2 minutes decreased B/P 90/60 with full recovery with ingestion of orange juice and recumbency

I had a rash that covered my neck, face and chest. A slight fever of 99.5 , soreness in the shoulder and joint area, mild headache the day I got the vaccine. Next day, rash still on face, joint pain and mild headache. Next day, joint pain. Today, a mild headache. Did a telephone call from Dr. and nurse from Health Dept. I was told to take Benadryl and go to ER if symptoms got worse. I took Benadryl one and one-half days.

She experienced nausea.

patient became dizzy, nauseated, received vaccine 10:00, at 10:09 patient became dizzy, lightheaded, nauseated, bp 125/85 p-85, sat 100%, 10:14 134/91 99% sat on room air, P- 98, 1020- BP 155/92, 1025 - 142/87, 1029- 98% on room air P-98, 1030- 129/91, 1047- sat 99% on room air, P- 89, 134/92, patient still feeling nauseated and dizzy transferred to Urgent Care

After receiving dose of COVID 19 vaccine patient reports the following: rash to both arms, right neck. Heart rate increased to 102. Reports slight shortness of breath. ER visit- administered Benadryl/Solumedrol IM

hot flushed, temporary weakness, temporary itching throat and back. lips tingling, lump in throat. 10 mins after injection symptoms started. all resolved except tingling in lips which persisted to the next day. area around mouth is itchy/burning but no other symptoms.

12/16/2020 WENT TO SLEEP AT 10PM 12/17/2020 - WOKE UP ABOUT 1:00 AM; 101 TEMP, SHAKING, CHILLS, BODY ACHES, RIGHT ARM VERY SORE, TRIED TO GO BACK TO SLEEP 12/18/2020 - FATIGUE, BODY ACHES, TEMP SUBSIDED; EVENING FELT SHAKY; 'CALLED OUT OF WORK' (NIGHTSHIFT NURSE)

12/19/2020 - ALL SYMPTOMS SUBSIDED 09/2020-10/2020 HAD FLU SHOT 'CANT REMEMBER EXACT DATE'

Patient pre-medicated with diphenhydramine due to infusion-type reactions in past. Patient with hoarse voice, itchiness to upper back, arms, and face, hives on bilateral arms. Per health system protocol (patient is health system employee) Patient administered diphenhydramine, famotidine, methylprednisolone succinate, epinephrine. All symptoms resolved by 1440.

18 minutes post vaccine dose 1, Pfizer COVID vaccine, development of globus sensation without airway compromise or stridor. Frequent throat clearing and swallowing. Followed by diaphoresis, loss of vision, extreme neuropathic tingling over entire head non painful. Bradycardic event to heart rate 35 recorded by Apple watch. Loss of consciousness with pupil dilation. Weak pulses but no loss of pulse. Heart rate recovered quickly. Blood pressure after initiation of iv fluids was normal in upright position once loss of consciousness subsided. Continued globus sensation. 30 minutes after initial event, again developed clammy hands, head tingling and worsening globus sensation but again no stridor or airway compromise. Given PO Benadryl 25 mg which did resolve globus sensation in next 30 minutes. Monitored for one hour post event with no subsequent symptoms other than fatigue.

"Tingling in right arm where vaccine was given. Hot at the site in her ""R"" hand. Still tingling 45 minutes after. Following up with Telemedicine."

Next day between 3 -6 AM - swelling of left eyelid followed by swelling and paresthesias of lips, followed by severe paresthesias of the left side of the face mostly lower half associated with a heavy sensation. Emergency treatment with 150 mg solumedrol and 50 mg benadryl. Symptoms persisted on and off for 3 days requiring benadryl 50 mg and claritin round the clock. On the second day post-vaccine headache, mouth blister (1), and diarrhea. Today (4 days post) very tired and fatigued.

Left arm erythema at injection site, lethargy, fever

Pt received Covid vaccine and afterward developed hives on chest and arms

Employee experienced headache and dry heaving

Patient complaint of itchiness, shortness of breath,tongue swelling, hyperventilating. Epipen was administered at 3:20pm

Body aches; cold symptoms; fatigue x 24 hours. ibuprofen

Widespread Pain; diarrhea; fever; vomiting; This is a spontaneous report from a non-contactable other healthcare professional. An 85-year-old female (non-pregnant) patient received first dose bnt162b2, intramuscularly on right arm on 14Dec2020 at 14:00 at single dose for immunization. Medical history included High cholesterol (no cholesterol lowering medication) edema, dementia, and no known allergies. Prior to vaccination, the patient was not diagnosed with COVID-19. Concomitant medication included influenza vaccine (INFLUENZA) on 30Nov2020 for immunization within 4 weeks prior to the COVID vaccine, other medications the patient received within 2 weeks of vaccination included daily

vitamin, diuretic, dementia medication, anti inflammatory. On 14Dec2020, the patient experienced widespread pain, diarrhea, fever, vomiting. The adverse event result in doctor or other healthcare professional office/clinic visit. No treatment was received for the events. Since the vaccination, the patient hadn't been tested for COVID-19. The outcome of the events was not resolved. No follow-up attempts are possible. Information about Lot/Batch could not be obtained. No further information is expected.

Headache, fever, chest congestion, cough, malaise, fatigue

Fast heart rate; Leg numbness; Hand numbness; This is a spontaneous report from a contactable consumer (patient). This 21-year-old male patient received the first dose of bnt162b2 (BNT162B2) (Lot # EH9899), via an unspecified route of administration at single dose in the left arm on 15Dec2020 12:00 PM at hospital for immunisation. The patient medical history and concomitant medications were not reported. On 16Dec2020 04:00 AM, the patient experienced fast heart rate, leg numbness, hand numbness. No treatment required. The outcome of the events was unknown. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient has not been tested for COVID-19.

Yesterday my head felt heavy. I took swab. Started coughing 2 days after vaccine. Second day experienced swelling in arm. Runny nose. Waiting on test results. Messaged PCP and they advised her to be tested. Coughing on and off.

Headache; muscle and joint aches; muscle and joint aches; This is a spontaneous report from a contactable physician reporting for herself. A 44-years-old female patient received the first dose of bnt162b2 (BNT162B2, Pfizer product), intramuscular in the right arm on 15Dec2020 12:45 at hospital at single dose for immunisation. Medical history included was none. Concomitant medication included bupropion (unknown manufacturer). The patient experienced headache, muscle and joint aches on 15Dec2020 with outcome of not recovered. No treatment was performed. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient has not been tested for COVID-19. Information on the lot/batch number has been requested.

Gradual onset of very mild rash and symptoms gradual improved with IM administration of diphenhydramine 50 mg and oral famotidine 20 mg. The physician was questioning if the mild rash was from where the patient was scratching secondary to anxiety vs allergic reaction. Patient was monitored for improvements.

She is feeling dizzy, a little wonky; Feeling bad like when she is about to get the flu; Her feet feeling like gelatin; Little nausea; Headaches; This is a spontaneous report from a contactable consumer (patient). This female patient of an unspecified age received BNT162B2 (Lot number EK5730) via an unspecified route of administration on 16Dec2020 at single dose for immunisation. Relevant medical history and concomitant medications were not reported. On 16Dec2020, the patient was feeling dizzy, a little wonky, feeling bad like when she was about to get the flu, with her feet feeling like gelatin, with a little nausea and headaches. The patient reported that when she got home after the administration, she reviewed the information provided after the vaccine and she found this information in the sheet,

realizing that she was feeling that way. At the time of the report, the outcome of the events was unknown.

Felt hot, chest felt different, BP elevated

Diarrhea; right arm pain; fatigue; This is a spontaneous report from a contactable nurse. A 27-year-old female patient received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine, lot number: EK5730), intramuscular at right arm on 16Dec2020 at 08:15 at single dose for immunization. The patient medical history was not reported. Concomitant medication included paracetamol (TYLENOL) for headache. On 16Dec2020 at 09:00, the patient experienced diarrhea, right arm pain and fatigue. The patient outcome of the events was recovering.

Starting 5 minutes from vaccination left sided arm numbness and tingling down the arm into the fingers. Felt the entire day. 12/21/20, symptoms improved but again returned today.

Headache; Dizzy; Front of her calves and into her feet felt a little like jello; Lightheadedness; Nausea; This is a spontaneous report from a contactable consumer reporting for herself. This 45-year-old female patient received on 16Dec2020 around 7:30am first dose of BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine, lot number: EK5730) intramuscular in the right arm for vaccination. Medical history was none. Concomitant medications were not provided. She sat there for the 15 minutes following administration of the vaccine.After that initial 15 minutes passed she had onset of side effects. On 16Dec2020, while walking to her car, she experienced what she described as dizzy, but it was more like feeling a little wonky like when you are coming down with the flu, where she did not feel right. She was ok to drive herself home, she took a shower. She worked the following night. She noted that mostly the front of her calves and into her feet felt a little like jello. She has brief moments of lightheadedness, a little bit of nausea and a tiny bit of headache starting. The room is not spinning, she is walking fine, bending over and does not seem to be struggling at all. Outcome she initially reported as having subsided, but then reported ongoing, further details unknown. Final outcome was unknown.

I had a fever and that's all

After sitting and waiting the 15 minutes, I left and as I was walking, I had the strongest taste of metal in my mouth. It lasted for about a minute, then slowly went away.; This is a spontaneous report from a contactable consumer. A 54-year-old female patient received first dose of bnt162b2 (BNT162B2; lot EK5730), via an unspecified route of administration on 16Dec2020, at 11:00 AM at single dose (right arm) for immunization. Medical history included asthma, hypertension (HTN), and allergies penicillin (PCN), medications, food or other products, many seasonal items, grass, trees, molds, dust mites, carrots, apples, celery, and walnuts. The patient did not received any other vaccines within four weeks prior to Covid vaccine. Concomitant medications were not reported. Patient reported that she had other medications received within 2 weeks of vaccination. On 16Dec2020, at 11:15 AM, after sitting and waiting the 15 minutes, the patient left and as she was walking, she had the strongest taste of metal in her mouth. It lasted for about a minute, then slowly went away. There was no treatment for the event. The patient did not have Covid prior the vaccination and was not Covid tested post vaccination. Outcome of event was recovered on 16Dec2020.

Anxious, tachycardiac and hypertensive.

felt very warm, overheated; clammy; started feeling slightly light headed; Thought I would pass out; This is a spontaneous report from a contactable consumer (patient). A 41-year-old female patient received the first dose of bnt162b2 (BNT162B2; lot:eh9899) via an unspecified route of administration in the left arm on 16Dec2020 10:00 at a single dose for immunization. Medical history was reported as none. Concomitant medication included paracetamol (TYLENOL) for an unspecified indication. On 16Dec2020 11:30, the patient started feeling slightly light headed and thought she was going to pass out. On 16Dec2020 11:50, she felt very warm, overheated and clammy. The patient sat down, attempted to eat her lunch and the events slowly subsided. The patient's blood pressure and pulse were checked on 16Dec2020 and they were relatively normal. The events were reported as non-serious and the patient did not receive treatment for the reported events. Outcome of the events was recovering.

Sore arm lasting about 24 hours post injection. Ibuprofen

received the vaccine on 12/18, 12/19 woke up with a headache and fatigue: lasted until the end of the day.

mild fever; chest pressure; dizziness; This is a spontaneous report from a contactable consumer. A 29-year-old female patient received dose number 1 of BNT162B2 (solution for injection, lot number Eh9899/expiration date unknown) via an unspecified route of administration on her right arm on 16Dec2020 at a single dose for immunisation. Medical history included penicillin allergy and allergies to gluten. Concomitant medications were not reported. The patient experienced chest pressure and dizziness that later turned into a mild fever on 16Dec2020; all of which prompted visit to the emergency room/department or urgent care. The patient received Tylenol for the events. The patient did not receive any other vaccines within 4 weeks prior to the COVID-19 vaccine. She was not diagnosed with COVID-19 prior vaccination and was not tested for COVID-19 since vaccination. The outcome of the event was recovering.

Circum-oral numbness; This is a spontaneous report from a contactable consumer reporting for himself (patient). This 59-year-old male patient received the first dose of BNT162B2 via an unspecified route of administration in the left arm on 15Dec2020 at 18:00 at single dose for immunisation. Relevant medical history included penicillin allergy. Concomitant medications were not reported. On 15Dec2020 at 18:30, the patient experienced circum-oral numbness. The patient did not receive corrective treatments for the reported event. The facility where the vaccine was administered was hospital. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination and since the vaccination he had not been tested for COVID-19. The outcome of the event was unknown. The information on the lot/batch number has been requested.

tachycardia, flushing

a fever of 99.5; body chills/chills; Not feeling well; Body itch; Pain; This is a spontaneous report from a Pfizer-sponsored program, received from a contactable healthcare professional (patient). A 36-year-old male patient received BNT162B2 (lot number: not provided) solution for injection, via an unspecified

route of administration on 15Dec2020 at a single dose for an unspecified indication. Patient has no medical history. There were no concomitant medications. The patient reported having a fever of 99.5 and body chills/chills after getting the Covid vaccine yesterday (15Dec2020). This was the first dose. The patient reported he was not feeling well, he had body itch, and pain on 15Dec2020. Patient stated he was just trying to think, he actually was feeling like drinking a lot of water and probably have some Tylenol. He asked if he should have the Tylenol or not really. The reason he was calling was because he was trying to figure out what was going on with his system before he do whole 8 to 10 minutes thing. He asked if this was required to find out if he could just drink some water and just take the Tylenol. He just wants the answer before he goes any further. Patient reported he was taking Tylenol for fever and chills. He reported he was in pain and he just needed to see if everything was alright. Outcome of the events was unknown. Information on the lot/batch number has been requested.

Patient states that after receiving the vaccine she felt lightheaded and dizzy. In the days following the vaccine she has experienced periods of vertigo and photosensitivity.

Site soreness - no treatment required.

swollen eyelids; cotton mouth; This is a spontaneous report from a contactable Nurse. A 43-year-old male patient received first dose of BNT162B2 (lot number EK5730), intramuscular on 16Dec2020 09:30 at a single dose in left arm for immunization. Medical history included smoker, overweight and known allergies with PCN. The patient's concomitant medications were not reported. The patient experienced swollen eyelids and cotton mouth on 16Dec2020 with outcome of recovered on an unknown date in Dec2020. The patient was given Benadryl and was under observation. The event was assessed as no-serious and did not caused hospitalization.

Mild sore arm at injection site; This is a spontaneous report from a contactable pharmacist. A 29-year-old male patient received bnt162b2 (BNT162B2), intramuscular (Arm Left) on 16Dec2020 11:00 at single for an unspecified indication. There were no relevant medical history and concomitant medications. The patient experienced Mild Sore arm at injection site on 16Dec2020 15:00. The outcome of the event was recovering. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

developed soreness at injection site 3-4 hours after the injection; This is a spontaneous report from a contactable consumer. A 50-year-old female patient received the 1st dose of bnt162b2 (BNT162B2) at single dose on 15Dec2020 for immunisation. The patient medical history and concomitant medications were not reported. The patient experienced soreness at injection site 3-4 hours after the injection on 15Dec2020. The outcome of the event was unknown. Information about Lot/Batch no has been requested.

The night after receiving the vaccine, I developed fever, severe muscle aches, nausea, headache, and a red area on my arm. These symptoms progressively got worse through the next day. Fever got up to 102. On 12/20/2020, I felt some better with temp 100.2 headache and body aches. Today is better with temp just 99.4. Still have minor headache and some chills. There is still a pinkish/red area about 2 inches

long and 1 inch wide on my arm where the vaccine was given. I did have a covid exposure at work last week and the employee health is going to test me before I go back to work.

Rash starting behind ears, moving to neck and trunk. Patient took a 2nd generation antihistamine (unsure which one) and this has helped with the itching. Rash is still present.

Moderate abdominal cramping; diarrhea; This is a spontaneous report from a non-contactable consumer (patient). A 37-years-old male patient receive the first dose of bnt162b2 (Pfizer-BioNTech COVID-19 mRNA vaccine batch/lot number: Eks730), via an unspecified route of administration on the arm left on 16Dec2020 16:15 at a single dose for immuninzation at the hospital. Medical history was reported as none. The patient had no allergies to medications, food, or other products. There were no concomitant medications. Prior to vaccination, the patient not diagnosed with COVID-19 and the patient has not been tested for COVID-19 since the vaccination. On 16Dec2020 17:30, the patient experienced moderate abdominal and diarrhea. The patient did not receive any treatments for the events. The patient was recovering from the events. No follow-up attempts are possible. No further information is expected.

my Doctor had a broken blood vessel that was like really bad, like a little hemorrhage; my Doctor had a broken blood vessel that was like really bad, like a little hemorrhage; This is a spontaneous report from a non-contactable consumer. A patient of unspecified age and gender receive dbnt162b2 (BNT162B2) at single dose on an unspecified date for immunization. The patient medical history and concomitant medications were not reported. The patient stated that the doctor had a broken blood vessel that was like really bad, like a little hemorrhage on an unspecified date. The outcome of events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

patient reports rapid heart rate 110-120

"burning in her throat; This is a spontaneous report from a contactable nurse. A 37-year-old female patient received bnt162b2, intramuscular from 16Dec2020 at 11:45 to at 0.3 mL, single for immunization ()COVID-19 vaccine). Medical history reported as ""none"". There were no concomitant medications. On 16Dec2020 11:48, three minutes after receiving the vaccine, the patient experienced burning in her throat . It was further described as it felt like constant reflux in the bottom of her throat. The patient was monitored for about an hour and forty five minutes. The burning was not more or not less. She was swallowing fine. She was breathing fine. Her vital signs and ""sats"" (saturation) were stable. Outcome of event was unknown."

"mild abdominal cramp; an episode of loose stools; profuse sweating; lightheadedness; headache; severe weakness; entire body felt cool and clammy; entire body felt cool and clammy; This is a spontaneous report from a contactable physician (patient himself). A 34-year-old male patient received the first dose of bnt162b2 (BNT162B2, Solution for injection; batch/lot number: ek5730), intramuscularly on the left arm on 15Dec2020 at 19:30 at a single dose for immunization at the hospital facility. Relevant medical history included childhood asthma and attention deficit hyperactivity disorder (ADD). Concomitant medication included lisdexamfetamine mesilate (VYVANSE) from an unspecified date in Dec2020. The patient had no allergies to medications, food, or other products. The patient did

not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. Roughly 13 hours after the vaccine administration, on 16Dec2020 at 08:00, the patient had mild abdominal cramp. He went to have a bowel movement and had an episode of loose stools. Within seconds after that, he started experiencing profuse sweating, lightheadedness, headache, severe weakness and his entire body felt cool and clammy. He managed to drink some water and laid down on the floor for the next few minutes. The episode lasted for a few minutes. All the events occurred on 16Dec2020 at 08:00 AM. The patient was not hospitalized for the events. Therapeutic measures were taken as a result of mild abdominal cramp, an episode of loose stools, profuse sweating, lightheadedness, headache, severe weakness, and entire body felt cool and clammy, which included acetaminophen (TYLENOL) 1000 mg. The patient recovered from the events ""mild abdominal cramp, an episode of loose stools, profuse sweating, lightheadedness, headache, severe weakness, and entire body felt cool and clammy on an unspecified date in Dec2020."

"Arm soreness at site of injection; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender received bnt162b2 (BNT162B2, also reported as ""COVID vaccine,"" Solution for injection; lot/batch number and expiration date were not provided), via an unspecified route of administration on an unspecified date at a single dose for immunization. The patient's medical history and concomitant medications were not reported. On an unspecified date after use of the product, the patient experienced arm soreness at site of injection. The outcome of the event was unknown. Information on the lot/batch number has been requested."

minor soreness; This is a spontaneous report from a non-contactable consumer. A male patient of an unspecified age received BNT162B2 (lot number was not reported) solution for injection, via an unspecified route of administration on an unspecified date at a single dose for an unspecified indication. The patient's medical history and concomitant medications were not reported. The patient experienced minor soreness after his injection on an unspecified date. Outcome of the event was unknown. No follow-up attempts are possible. Information about lot/batch number cannot be obtained. No further information is expected.

"hives on my neck and above my ear/few sparse hives; This is a spontaneous report from a contactable nurse (patient). A 49-year-old female patient received bnt162b2 (BNT162B2) lot number and expiration date were not reported, via an unspecified route of administration on 16Dec2020 at 07:15, 0.3 ml single dose for immunization. Medical history included seasonal allergy and seasonal asthma. The patient's concomitant medications were not reported. The patient stated that she received the product this morning (16Dec2020) at 0715. She mentioned that she took a shower this evening, 13 hours later, and observed hives on her neck and above her ear. She confirmed that she was not having an anaphylaxis and there are no other symptoms. She also denied any soreness at the injection site or pain. She stated that she has no other symptoms and no pain, no soreness. She added that she received vaccine on 16Dec2020 and wondered if there was a side effect of some hives, she meant that she was not having an allergic reaction and she got the vaccine at 7:15 this morning and she have been fine, but she just have like a few sparse hives at 20:30. When asked about causality, the nurse stated ""Yes I do. I have never had hives before."" She did not think that she needed treatment but she was wondering if it was

common or she wasnot having any anaphylactic reaction and they were sparse. She doesn't have it on her trunk, she just have some on her neck and there was like one above her ear. She put BENADRYL cream on them, they are fine, and they don't itch. She was just like preemptively treating them because of her high risk for work. Therapeutic measures were taken as a result of hives on my neck and above my ear (urticaria). The outcome of the event was unknown. Information on the lot/batch number has been requested."

Nausea 10 minutes after injection; This is a spontaneous report from a contactable consumer. A 25-year-old female patient received first dose of bnt162b2 (Pfizer-BioNTech COVID-19 mRNA vaccine), via an unspecified route of administration on 16Dec2020 18:15 at single dose (right arm) for immunization. Medical history included polycystic ovarian syndrome. The patient had no allergies to medications, food, or other products. Concomitant medication included ethinylestradiol, norethisterone (DASETTA 7/7/7) as Birth control. On 16Dec2020 18:15, the patient experienced nausea 10 minutes after injection. The Covid-19 vaccine was administered at the workplace clinic. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient did not received treatment for the event. The patient was not diagnosed with COVID-19 prior to vaccination and since the vaccination, the patient had not been tested for COVID-19. Outcome of event was recovered in Dec2020. Information on the lot/batch number has been requested.

muscle pain in thigh area; felt like muscle pain, cramp; This is a spontaneous report from a contactable consumer. A 52-year-old female patient received BNT162B2 (solution for injection, lot number EH9899/expiration date unknown), via an unspecified route of administration on 14Dec2020 at a single dose for vaccine. Medical history included blood pressure (abnormal). Concomitant medications included unspecified blood pressure pills. The patient experienced muscle pain in thigh area in Dec2020. She further reported that she was asleep and when she woke up somewhere around it went wave like 1-2 minute. It felt like muscle pain, cramp. The outcome of the event was unknown.

woke up today had a headache just on the right side of her head and injection site is sore and a little knot at the site; woke up today had a headache just on the right side of her head and injection site is sore and a little knot at the site; woke up today had a headache just on the right side of her head and injection site is sore and a little knot at the site; This is a spontaneous report from a contactable nurse. A 60-year-old female patient started to receive bnt162b2 (BNT162B2), via an unspecified route of administration on 16Dec2020 12:45 at SINGLE for immunization. The patient's medical history and concomitant medications were not reported. On 17Dec2020, it was reported that the patient woke had a headache just on the right side of her head and injection site is sore and a little knot at the site. Headache woke her up, no discoloration at injection site. The outcome of the events was unknown. Information about Lot/Batch has been requested.

"her arm is sore, to move or to lift; This is a spontaneous report from a contactable nurse via a Pfizer-sponsored program. A female patient of an unspecified age received bnt162b2 (BNT162B2), via an unspecified route of administration on 16Dec2020 at a single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. The nurse that received the COVID-19 vaccine on 161Dec2020 and described ""her arm is sore, to move or to lift"". She asked if Pfizer could tell her to

take Tylenol or Advil for her arm soreness. Clinical outcome of the event was unknown. Information on the lot/batch number has been requeste"

tingling; warmth and coolness in ears, head and face radiates to arms, legs and back; painful teeth; nausea; extremely flushed; goosebumps; This is a spontaneous report from a contactable consumer (patient) and healthcare professional. A 35-year-old female patient received the first dose of bnt162b2 (BNT162B2; lot number: EH9899), via an unspecified route of administration on the left arm on 16Dec2020 18:30 at single dose for immunization. Medical history included eczema. Concomitant medication included vitamin D3, zinc, ascorbic acid (VITAMIN C). The patient previously took trimethoprim / sulfamethoxazole (BACTRIM) and cefaclor (CELOR) and experienced allergies. The patient experienced tingling, warmth and coolness in ears, head and face radiates to arms, legs and back, painful teeth, nausea and extremely flushed with goosebumps on 16Dec2020 18:45. Outcome of the event was not recovered. It was reported that patient had no prior COVID vaccination and did not test positive for COVID. Reporter considered that events non-serious. It was unknown if treatment was received for the adverse events.

"both her hands were feeling pressure in her knuckles; redness in her hands; Itching; feeling headachy; feeling fluish; This is a spontaneous report from a contactable nurse. A 61-year-old female patient received the first dose of bnt162b2 (BNT162B2; lot number EK5730), intramuscularly in the right upper arm on 16Dec2020 at 15:40 at 61-years-old at a single dose for COVID-19 immunization. The vaccination facility was a hospital. There were no additional vaccines administered on the same date of the Pfizer suspect or prior vaccinations within 4 weeks. Medical history included ongoing asthma (asthma began sometime in her 50s and was ongoing) from an unspecified date. The patient had no other adverse events to any other vaccines in the past and there was no relevant family medical history. There were no concomitant medications. On 16Dec2020, the patient experienced: both her hands were feeling pressure in her knuckles, redness in her hands, itching. On an unspecified date in Dec2020, the patient experienced feeling headachy, feeling fluish. There was no visit to an emergency room or physician office. The clinical course was reported as follows: The patient was a nurse and she had a Pfizer lot number EK5730. The patient said she got the shot on 16Dec2020 at about 15:40 and when she got home both her hands were feeling pressure in her knuckles and they were red. Since then she had not stopped inching. The patient took cetirizine hydrochloride (ZYRTEC) and that made it stop enough; however, she could sleep but she still felt like she was itching all over. The patient clarified the pressure in her hands was primarily in her knuckles and then once that resolved she went to itching and feeling headachy. The patient clarified the redness was on her hands when she was having the pressure, her hands kind of got red. The patient reported the pressure in her knuckles had resolved completely and the redness in her hands and knuckles had resolved as well. The patient reported the itching began about an hour and a half after the injection and was ongoing, but it was not as bad since taking cetirizine hydrochloride twice. The patient reported the itching had improved. The patient did not have the NDC or expiration date. The patient did not know what dose was given. The card was all she had, and it just had the lot number and was to remind her to return for the next shot. The patient was calling Pfizer primarily about the itching and how she was feeling kind of ""fluish"", which she assumed was normal. The patient wanted to know, should she get the second shot, would she have a worse reaction to the second one.

The patient needed to know because she was ""miserable itching so bad and she thought the second one could be worse than the first."" There was no relevant testing Therapeutic measures were taken as a result of both her hands were feeling pressure in her knuckles, redness in her hands, and itching The clinical outcome of the events: both her hands were feeling pressure in her knuckles, redness in her hands, was recovered on an unspecified date. The clinical outcome of the event, itching, was recovering. The clinical outcome of the event, feeling headachy and feeling fluish, was unknown."

Palpitations and lightheadedness after vaccination.

scratchy throat; fever of 100.0 [units unspecified]; Headache; Nausea; body aches; Diarrhea; This is a spontaneous report from a non-contactable consumer. A 35-year-old female patient started to receive bnt162b2 (BNT162B2; unknown lot number and expiration date), via an unspecified route of administration on 16Dec2020 to 16Dec2020 single dose for an unspecified indication. The patient medical history was not reported. The patient has no allergies to medications, food, or other products. Concomitant medication included levothyroxine. The patient reported that she had scratchy throat several minutes (reported as 02:30 AM) after receiving the vaccine (16Dec2020). It did subside but then 14 hours after receiving the vaccine, she had different symptoms, She had a fever of 100.0 [units unspecified], headache, nausea, body aches and diarrhea. The events did not cause hospitalization/ prolonged hospitalization. The patient has not received other vaccines in the last four weeks. The facility where the most recent COVID-19 vaccine was administered in a hospital. There was no treatment received for the adverse events. It was unknown if the patient was diagnosed with COVID-19 prior to vaccination and the patient has not been tested for COVID-19 since the vaccination. The outcome of the events was recovering. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

Headache about 3-4 hours post vaccine gone 45 minutes post acetaminophen; sore arm later that day. Acetaminophen.

Right hand felt cold at first but that sensation has subsided; Within less than 10 minutes I had a warm tingling feeling; heaviness in my legs which still continues over an hour later; Dry mouth; This is a spontaneous report from a contactable consumer reporting for herself. This 44-year-old female patient received on 17dec2020 10:00 first dose of BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine, lot EK5730) at single dose in the right arm for immunization. Medical history included reflux. No allergies to medications, food, or other products. Concomitant medications included omeprazole (PRILOSEC). On 17Dec2020, within less than 10 minutes, the patient had a warm tingling feeling, heaviness in her legs which still continued over an hour later. Right hand felt cold at first, but that sensation has subsided. Also had a dry mouth about 15-20 minutes after the vaccine. All symptoms subsided after 2 1/2 hours. Patient went to emergency room. Final outcome was recovered on 17Dec2020.

Employee calling to report a reaction after receiving a COVID-19 vaccine. Vaccine Name - Pfizer Vaccine Lot # - EK5730 Vaccine Date and time - ? 12/18/2020 @ 4:30pm Is this your first or second dose? First Date and time of symptom onset - ? 12/19/2020 @ 11am Symptoms - ? Fever of 104.6, headache, BLE pain Last day of work and shift - ?Friday 12/18/2020 @ work today 2:30pm-11pm Home remedies? -

Tylenol Any improvement? - Denies any headache and fever. Both leg pain are still present. Recommendation? Continue to monitor, take OTC Tylenol for pain and follow directions on the label and call PCP if concern arises. Employee voiced understanding Employee of information ? yes Employee voiced any concerns ? yes. She asked if it's a symptoms of covid-19. Mentioned that leg pain is not signs or symptoms of covid-19 Employee?s questions answered to employee?s satisfaction - yes

He woke up this morning and had a temperature of 100.8 degrees Fahrenheit; This is a spontaneous report from a contactable consumer reported for himself. A 27-year-old male patient received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine, lot EH9899) via unknow route at the right upper arm at single dose for COVID-19 Vaccination on 16Dec2020 11:45. The patient had no medical history. Concomitant medications included zinc and Vitamin D. On 17Dec2020 08:30 the patient woke up and had a temperature of 100.8 degrees Fahrenheit. He was supposed to get the second dose on 06Jan2021. He was planning on taking Tylenol for the fever if that was ok. The patient had no history of previous immunization with Pfizer vaccine and he did not receive other vaccine on the same date. The event did not require a visit to Physician the patient felt ok. The outcome of the event was unknown.

No chief complaint on file. Patient is a 25 y.o. female who had no chief complaint listed for this encounter. á á á History of Present Illness á Patient is at the Covid vaccination clinic Received her vaccination and approx 5 min following administration notified staff that she was feeling a little lightheaded Was also c/o feeling hot at time Patient admits that she did not have breakfast this AM and has not had anything to drink Denies throat discomfort or tingling No shortness of breath or headaches Patient brought to the bay for evaluation á á á History Review / Additional history á Review of Systems á Patient's medications, allergies, past medical, surgical, social and family histories were reviewed and updated as appropriate. Behavior: Behavior normal. á á á á Assessment / Plan á VSS on arrival to evaluation bay Following laying down for 10 min, drinking water, and eating a granola bar patient reports feeling much better. Sat at the bedside for an additional 5 min with no recurrence of symptoms. Repeat VSS Instructions given to go to the ED if worsening symptoms, lightheaded, throat swelling or shortness of breath. Encouraged to eat and drink prior to next immunization. á Per Attending APRN Electronic Signature 12/18/2020 10:10 AM á á

Injection site pain; This is a spontaneous report from a contactable consumer (the patient). A 27-year-old male patient received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine), via an unspecified route of administration on 16Dec2020 14:15 at single dose for immunisation. The patient medical history and patient's concomitant medications were not reported. The patient experienced injection site pain on 17Dec2020 07:00. The vaccine was administered at Hospital Facility. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. The patient had not been tested for COVID-19 since the vaccination. The event was non-serious with outcome of recovering. No follow-up attempts are possible; information about lot/batch number cannot be obtained. No further information is expected.

Immediately after receiving the dose of vaccine, rash, tickle in throat taken to ED treated with Benadryl on 12/20 developed swollen lips taken to ED treated with epinephrine, steroids, Pepcid discharged from ED 12/21/20 symptoms resolved

Complained of scratchy throat and feeling like throat was swelling.

painful chills; fever (101.7 f); body aches; headache; some tenderness at injection site; This is a spontaneous report from a non-contactable nurse. A 45-year-old female patient received BNT162B2 vaccine (Lot number EK5730) intramuscular in the left arm on 16Dec2020 at 18:30 at single dose for immunisation. Relevant medical history included high blood pressure and seasonal allergy. Concomitant medications included lisinopril and over the counter allergy pill. On 17Dec2020 at 10:00, the patient experienced painful chills, fever (101.7 F), body aches, headache and some tenderness at injection site. Corrective treatments taken as a result of the events included paracetamol (TYLENOL). The patient was not pregnant. Facility type vaccine: Hospital. The patient did not receive other vaccines in four weeks. The patient did not have COVID-19 prior to vaccination, and she was not tested post vaccination. At the time of the report, the patient had not recovered from the events.

15 minutes after vaccination start experiencing nausea and vomiting

Arrived to drive through as passenger in car. á He did let RN know before vaccine he has felt faint and has had syncopal episodes after injections or blood draws. Immediately after injection he had a loss of conciseness. Lasting approximately 1 min. Partner states this was a normal reaction. He then had a second episode lasting longer than first. Partner states this was not a normal reaction for him. He was not responding to voice or touch . After approx 1-2 mins he was alert and responsesive to person, place and situation. RN stayed with Patient as he remained in car. á á 911 called to evaluate RN gave report and hand of to EMS. EMS evaluated and found pt stable.

Significant arm soreness at injection site; body aches; chills; mild headache; restless night's sleep; This is a spontaneous report from a contactable nurse. A 46-year-old female patient received BNT162B2 vaccine (Lot number EH9899) intramuscular in the left arm on 16Dec2020 at 08:45 at single dose for immunisation. Relevant medical history included recent Urinary Tract Infection (UTI), treated and recovered. Concomitant medications included sulfamethoxazole/trimethoprim (BACTRIM), famotidine (PEPCID) and melatonin. Past drug reaction included allergy to doxycycline. On 16Dec2020 at 14:00, the patient experienced significant arm soreness at injection site, body aches, chills, mild headache and restless night's sleep. Corrective treatments taken as a result of the events included ibuprofen (ADVIL). The patient was not pregnant. Facility type vaccine: Hospital. The patient did not receive other vaccines in four weeks. The patient did not have COVID-19 prior to vaccination, and she was not tested after vaccination. At the time of the report, the patient was recovering from the events.

Patient got dizzy immediately and wanted to sit down, he also stated he was short of breath. His blood pressure was 160/111 and pulse 107. Rechecked shortly after that blood pressure check and it went to 176/115 and pulse 138. Patient stated he was feeling well and requested to go to ED, staff called 911.

he most painful vaccine he's ever gotten - arm hurts a lot; felt heavy; tired; This is a spontaneous report from a contactable consumer (patient's wife) A 64 year-old male patient received bnt162b2 (BNT162B2) , via an unspecified route of administration on 16Dec2020 at single dose for immunisation . The patient medical history and concomitant medications were not reported. The patient felt heavy on 16Dec2020 with outcome of unknown , tired on 16Dec2020 with outcome of unknown , arm hurts a lot on 17Dec2020 with outcome of unknown. The patient stated this was the most painful vaccine he has ever gotten. Information on the lot/batch number has been requested.

chills, body ache, sore throat, sever cough with chest pain

Approximately 10 minutes after receiving vaccine, patient experienced itching of lips, tongue and throat. Itching also on neck and left arm. Some erythema around neck and upper chest. Lips swelling. Symptoms resolved within about 30 minutes of administration of oral diphenhydramine 50 mg and famotidine 20 mg.

FATIGUE , HEADACHE, I WOKE UP WITH A MIGRAINE . Mild headache for two days

Repetitive intense sneezing night of vaccination which ended with overnight sleep. Arm pain the next day followed by swelling of lymph nodes with intense aching pain. Swelling lasted 24 hours, pain in lymph nodes has now lasted 36 hours.

Asymptomatic patient who had an immediate temperature of 100.8 degrees F, which they felt was too fast; This is a spontaneous report from a contactable physician. A male patient of an unspecified age started to receive bnt162b2 (BNT162B2) , via an unspecified route of administration on 17Dec2020 at single dose for immunisation . The patient medical history and concomitant medications were not reported. The patient experienced had an immediate temperature of 100.8 ¦F, which they felt was too fast . The patient resulted positive to Covid 19 virus immediately after receiving the vaccine when the temperatura was 100.8¦F. Five minutes later the body temperature was 99.8 ¦F, the patient returned negative the Covid 19. Information about lot/batch number has been requested.

At one and a half hours after receiving her vaccine, developed tongue and throat swelling, went immediately to the ER. She was treated in the ER and was discharged to home with EPI pen. She still has the following symptoms headache, dizziness, lightheaded, fever 99.2. Difficulty concentration and talking. She is following up with her primary care physician on 12/21/2020

approx. 5 minutes after injection, palms were itchy and lips felt tingly. After 30 min observation, pt returned home and noticed her lip felt tight. When she looked in the mirror, she saw one side was swollen.

This is a CCU nurse who received vaccine on 12/18/20 and later that day while at work developed nausea, vomited x1, became tachy and pale. Coworkers provided basic care. Patient went to ED at approx. 4p that day and was later discharged.

Severe fatigue; Myalgia; Head aches; Weakness; This is a spontaneous report from a contactable other hcp reporting for himself. This 33-year-old male patient received the first dose of bnt162b2 (BNT162B2),

intramuscular at single dose in the left arm on 16Dec2020 12:00 at hospital for immunisation. Medical history included atypical cluster headaches. Concomitant medication included docusate sodium (COLACE), verapamil and vitamin D3. On 16Dec2020 18:00, the patient experienced severe fatigue, myalgia, head aches, weakness. No treatment required. The outcome of the events was recovering. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient has not been tested for COVID-19. Information on the lot/batch number has been requested.

15 minutes after vaccination Employee began to experience light headiness, and rapid dehydration

approx. 10 min after injection felt light headed, flushed, and pre syncope. BP and HR were taken by staff and ER physician,, BP was hypertensive for me 145/90, 145/104, 137/89, 138/86, 132/91. I am normally 116/74. HR was 100. Oxygen was 100%, At 12;33 was given 50mg IM x 1 Benadryl. 12:40 felt loopy and shakey. 12:54 moved to room in PACU and monitored by nurse. BP remained in the 130-140's until appox 1430 BP returned to normal 118/80 and Benedryl had worn off. My co-worker took me home.

Left facial nerve tingling; discomfort especially around orbital area and cheek; discomfort especially around orbital area and cheek; Left posterior neck and head discomfort; Left posterior neck and head discomfort; This is a spontaneous report from a contactable Nurse reporting for herself. A 54-years-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730), intramuscular in left deltoid at hospital on 16Dec2020 08:45 at single dose for COVID-19 immunization. The patient was not pregnant at the time of vaccination. Medical history included colitis ulcerative as a child, colectomy total 27 years before. The patient previously experienced allergy to IV contrast as hives. Concomitant medication included loperamide hydrochloride (LOMOTIL) and bifidobacterium breve, bifidobacterium infantis, bifidobacterium longum, lactobacillus acidophilus, lactobacillus bulgaricus, lactobacillus paracasei, lactobacillus plantarum, streptococcus thermophilus (VSL#3). The patient experienced left facial nerve tingling, discomfort especially around orbital area and cheek; left posterior neck and head discomfort lasting 60-90 minutes on 16Dec2020 18:00 with outcome of recovered on 16Dec2020. The events resolved on own, no medications taken. Prior to vaccination the patient was not diagnosed with COVID-19 and has not been tested for COVID-19.

hives on hands that appeared next morning and still remain 3 days post vaccination

hives on hands that appeared next morning and still remain 3 days post vaccination

Sore arm; This is a spontaneous report from a contactable consumer reporting for herself. A 63-years-old female patient received the first dose on BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in the right arm on 15Dec2020 at 16:30 at single dose for COVID-19 immunization. Medical history included chronic angioedema and hops allergy. Concomitant medication included simvastatin (SIMVASTATIN), losartan (LOSARTAN). The patient experienced sore arm on an unspecified date with outcome of recovered. The patient was not treated for the event. Prior to vaccination the patient was not diagnosed with COVID-19. The patient underwent sars-cov-1 test (nasal swab) with unknown results on unspecified date and negative on 16Dec2020. Information on lot/batch number has been requested.

"stomach upset and then felt ""hot and cold"" and Temp was 99.3. Relieved with Tylenol and sleep. Next morning felt ""blah"" and slept and symptoms resolved"

Itching all over

Nurse reports that patient had no problems after receiving vaccination. Patient went home and EMS was called early the next morning and team administered vaccination was contacted physician that the associate works for stating the patient had a heart attack.

Nausea, lightheaded, some throat swelling, difficult to swallow. Transported to ED. No respiratory distress. Stable

Nausea; vomiting; diarrhea; This is a spontaneous report from a contactable consumer. A 42-year-old male patient received first dose of BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine, lot number: EH9899), via an unspecified route of administration at arm left on 16Dec2020 at 12:30 at single dose for immunization. Medical history included hyperlipidemia from an unknown date and unknown if ongoing. Concomitant medication included rosuvastatin calcium (CRESTOR) and finasteride. On 16Dec2020 at 22:30, the patient experienced nausea, vomiting and diarrhea. The patient outcome of the events was recovering. No follow-up attempts are possible. No further information is expected.

On 12/20/2020 I received the Pfizer covid vaccine at 3pm and 10 minutes after vaccine, felt tingling and a heavy sensation on my right eye. Was seen in ER at same facility. Per MD, no facial asymmetry noted and was sent home. On 12/21/2020, I woke up with mild right facial numbness and sensation of heaviness and very subtle right labial dropping. When closing my eyes tight felt the muscles of my right eye were mildly weaker but I was able to close my eye. I presented to the ER. Blood work normal and per MD, did not feel the need for steroids and told to monitor at home. Since then, the sensation on my right cheek is slightly better, my eye still bothering me slightly and the numbness still present but a bit less.

random metallic smell; This is a spontaneous report from a contactable physician (patient herself). A female patient of an unspecified age received bnt162b2 (lot number: EK5730; Expiration date: 31Mar2021), via an unspecified route of administration on 17Dec2020 at single dose for immunisation. The patient's medical history and concomitant medications were not reported. About a half hour later, the patient experienced random metallic smell on 17Dec2020. The outcome of event was unknown.

Body/joint pain Headache Joint Stiffness Injection site pain and soreness of the arm malaise Symptoms begin approx. seven hours after the injection and continues

Runny nose, sore throat

headache; dizziness; nausea; This is a spontaneous report from a contactable other health professional. A 56-year-old female patient received bnt162b2 (BNT162B2), via an unspecified route of administration on an unspecified date at single dose for immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient experienced headache, dizziness and nausea on an unspecified date with outcome of not recovered. The patient received the vaccine in

the emergency department. The reporter stated that the symptoms began immediately after getting the vaccine and are persisting. Information about batch/lot number has been requested.

Migraine (similar to the one I experienced when I had COVID in July/August) began a few minutes after the shot was adminstered. It started mild but continued to get worse. It started to get better the following night (12/16/2020) and was gone by the time I went to bed. The day after I got the shot I felt extremely nauseous when I woke up. It was bad enough that I missed two days of work. This lasted for several days and only just went away completely today (12/21/2020. I took ondansetron to treat the nausea. I felt lightheaded and fatigued around the same timeframe as the nausea, but did not use anything treat either. I am not a regular caffeine drinker but tried it every day to help combat the fatigue. It did nothing to help and made me anxious. I still do not feel great but I am well enough to work.

Fever (100 degrees Fahrenheit); Violent chills; she was shaking/Her hands shake terrible; she slept the entire night, which she never does; This is a spontaneous report from a contactable consumer reporting for herself. A 72-years-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular in the left deltoid on 16Dec2020 08:05 at single dose for COVID-19 immunization. Medical history was none. There were no concomitant medications. The patient experienced fever on 17Dec2020 with outcome of not recovered, violent chills on 16Dec2020 19:00 with outcome of recovering. The reporter described the events as pretty bad violent chills where she was shaking, and she could not get warm. Her hands shake terrible. She did not realize she had a fever until she slept the entire night through 16Dec2020-17Dec2020 which she never does. She took her temperature after she woke on 17Dec2020 09:50am and her temperature was 100 degrees Fahrenheit which is her ongoing temperature at time of the call. She asked if there are any recommendations regarding treatment or management of fever following administration of the vaccine; like if it is ok to take Tylenol or something. Information about lot/batch number has been requested.

Nausea, headache, epigastric pain, feeling flushed, metallic taste

5 days after vaccination on 12/20, patient developed a mild, erythematous rash on left hand (dorsal) and forearm. The character of symptoms is redness, no pain, no itching, and no swelling. Radiating symptom(s): spreading proximally. The degree of symptoms is minimal.

Initial arm pain, then nausea and dizziness while at work 2 hours after administration. Presented to the emergency department at the same facility where he works as instructed per occupational health. Symptoms were almost fully resolved 3 hours after receiving the vaccine, after a dose of ondansetron. Patient discharged and instructed to follow up with primary MD.

tiredness; This is a spontaneous report from contactable pharmacist via Pfizer sales representative. A 50-year-old patient of an unspecified gender received the first dose of bnt162b2 (BNT162B2; lot and expiry date was not reported) via an unspecified route of administration on an unspecified date at a single dose for immunization. Medical history was reported as none. The patient's concomitant medications were not reported. The patient experienced tiredness on an unspecified date following

administration of bnt162b2 vaccine. Outcome of the event recovered on an unspecified date No follow-up attempts are possible; information about lot/batch number cannot be obtained.

Felt like I had covid. Headache, nausea,light headed, hot and could not cool down. Overall tried. This was the next day after receiving vaccine.

Sore arm after injection; This is a spontaneous report from a non-contactable pharmacist received via a Pfizer sales representative. A 32-year-old female patient received BNT162B2 (solution for injection, lot number/expiration date unknown) via an unspecified route of administration on her arm in Dec2020 at a single dose for immunisation. Medical history and concomitant medications were not reported. The patient experienced sore arm after injection in Dec2020. The outcome of the event was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

10 minutes post-vaccine - tingling in both arms, all the way down arms. Right arm subsided after 20 minutes, but left arm continued to be warm and tingly. Left leg and foot tingly. 2 hours post-vaccine - Left side of face warm and tingly. Left back muscles heavy and fatigued, 24 hours later subsided. 12/21/20 - Left forearm to pinky tingling, palm numb. Left side of face pink and heavy.

Swollen, painful right armpit. It was present Sunday 12/20/2020 when I woke up. It has not reduced or improved over 24 hours.

Nausea was first noted followed by a sudden tachycardia with pulse in the upper 130's. With this my tongue and mouth began to tingle and it felt like I had something stuck in my throat. The facility gave me liquid benadryl immediately (50mg). Symptoms began to improve over the hour and a half that I was monitored and had fully resolved 3 hours post injection.

"feel lightheaded; I have a bright red, itchy, raised and warm welt at the injection site as well; Pain and itching at the injections site immediately; Pain and itching at the injections site immediately; Throat tightness across the front; Tongue began to tingle, felt a little ""fat"" and then went numb for approximately 3-5 minutes; Swallowing feels like a ""lump"" in my throat, but does feel obstructed; I have a bright red, itchy, raised and warm welt at the injection site as well; This is a spontaneous report from a contactable Nurse who reported for herself. A 51-years-old female patient received the first dose of bnt162b2 (BNT162B2, lot number EK5730), intramuscular in the left arm at hospital on 17Dec2020 09:45 at single dose for immunisation. The patient medical history and concomitant medications were not reported. The patient previously took bacitracin zinc, neomycin sulfate, polymyxin b sulfate (NEOSPORIN) and experienced rash. The patient experienced pain and itching at the injections site on 17Dec2020 at 09:45 (reported as immediately), lasted approximately 3 hours (as reported), the final outcome was recovering (as reported). Throat tightness across the front, but not ""inside."" Tongue began to tingle, felt a little ""fat"" and then went numb for approximately 3-5 minutes. Swallowing felt like a ""lump"" in her throat, but did feel obstructed. Ate lunch without difficulty. Drinking without difficulty. The front of her throat, distal from jawline, to top of breast-line felt like she had a very light weight resting on it, even 8 hours post injection. Approximately 30 minutes after injection, the patient began to feel lightheaded. Lightheadedness became more intermittent for the next 4 hours and resolved. She had a bright red, itchy, raised and warm welt at the injection site as well, 8 hours later, on

17Dec2020. The patient did not receive any treatment for the events. The outcome for the event lightheaded was recovered, for the other events was recovering. Prior to vaccination the patient was not diagnosed with COVID-19 and has not been tested for COVID-19.; Sender's Comments: The reported information is limited. Based on the close temporal relationship and the description of the events, there is a reasonable possibility that the events are related to BNT162 vaccine. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

Sudden consent of right sided facial numbness paralysis

About 4 hours after the vaccine during dinner felt tired. Around 11, midnight I felt achy, body hurts, I had chills, and developed cough and shortness of breath. By Thursday I felt horrible and now I can not even taste or smell anything. My body aches are gone I feel somewhat better. No shortness of breathe and no cough, still fatigued. Took Ibuprofen and Tylenol on Thursday Friday and Saturday. Was tested for COVID on 12/18 - tested positive.

Uncontrollable chills; Fever; Headache; Arm is sore a bit; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received BNT162B2 (Pfizer-BioNTech COVID-19 vaccine), via an unspecified route of administration at on an unspecified date at single dose for COVID-19 immunization. Medical history included Covid. The patient's concomitant medications were not reported. On 16Dec2020, Last night, about 12 o' clock, patient woke up with the same side effects that patient had Covid. Patient had uncontrollable chills and a fever. Those were better. Patient still had a headache. Of course, his/her arm was sore a bit, that was expected. Outcome of uncontrollable chills and fever were recovering, outcome of other events was unknown. Information on the lot/batch number has been requested.

Swelling and redness in my left eye. Severe pressure on the left side of head.

I am breastfeeding my 20 month old and she developed a rash on trunk. Maculopapular.

Right Ear red and purple and warm.

Migraine; Migraine; fatigue; nausea; diarrhea; This is a spontaneous report from a contactable consumer reported for herself. A 36-year-old female patient received the first dose of BNT162B2 (Pfizer product, lot number EH9899) , via an unspecified route of administration on 15Dec2020 13:30 at single dose on left arm for immunisation. Medical history included migraine. There were no concomitant medications. No allergies to medications, food, or other products. No other vaccines in four weeks and no other medications in two weeks. The patient experienced migraine, fatigue, nausea, diarrhea starting the following day around 10 am (16Dec2020 10:00). The patient was not pregnant. No Covid prior vaccination, and no Covid tested post vaccination. No treatment was received for the events. The outcome of the events was resolved on an unspecified date in Dec2020. The report was assessed as non-serious.

"Date: 12/21/2020 á Subjective Patient is a 33 y.o. female who was seen at COVID Vaccine Clinic today for her first dose of the COVID 19 vaccination. á She denied any history of previous adverse reactions to vaccines. á She was given the Pfizer vaccination in the left deltoid muscle. á During her 15 minute waiting period after the injection, the patient began to experience feelings of hypoglycemia. She checked her blood glucose with her own monitor and had 77 at 1104. She chewed 1 glucose tab that she had in her purse. She noted some difficulty with swallowing it and notified clinic staff. Associated dizziness and was escorted by clinic staff to the emergency bay. á This provider was notified of patient reaction and she was then assessed in the emergency bay area. She denied difficulty breathing and chest pain, history of adverse reactions with prior vaccinations or allergies to medications with the exception of spironolactone. á Pateint had already been given a bottle of water by clinic staff and reported that the glucose tablet went down easier following the water. She took a second glucose tab sometime before 1113. She rechecked her sugar and had slight increase of 79. She did eat breakfast this morning about 0800 and had a protein bar right before her arrival today. á Monitored patient for severe reaction symptoms, including rapid progression of symptoms, respiratory distress with dyspnea and increased work of breathing, vomiting, abdominal pain, hypotension and chest pain. á Review of Systems HENT: Positive for trouble swallowing. Negative for facial swelling, hearing loss, rhinorrhea and voice change. Eyes: Negative for redness. Respiratory: Negative for cough, chest tightness and shortness of breath. Cardiovascular: Negative for chest pain. Skin: Negative for color change, pallor and rash. Neurological: Positive for dizziness. Negative for syncope and speech difficulty. Psychiatric/Behavioral: Negative for agitation and confusion. The patient is not nervous/anxious. á Objective Vitals There were no vitals filed for this visit. á á Physical Exam Constitutional: General: She is not in acute distress. HENT: Head: Normocephalic and atraumatic. Nose: No rhinorrhea. Cardiovascular: Rate and Rhythm: Normal rate and regular rhythm. Pulmonary: Effort: Pulmonary effort is normal. No respiratory distress. Skin: General: Skin is warm and dry. Coloration: Skin is not pale. Findings: No rash. Neurological: Motor: No weakness. Psychiatric: Mood and Affect: Mood normal. Behavior: Behavior normal. á á á Assessment/Plan Patient is a 33-year-old female who has a 15-year history of type 2 diabetes, and experienced a hypoglycemic event without complaint of chest pain or shortness of breath. á Vital signs obtained at 1105 with blood pressure within normal limits at 132/88, heart rate 83 and 98% O2 saturation on room air. Patient continued to compensate appropriately and reported feeling slightly better. Glucose checks repeated by patient at 1117 was 84, vital signs were blood pressure 116/80, heart rate 89, O2 saturation of 98% on room air. She continues to deny chest pain, shortness of breath or difficulty swallowing at this time. á At 1117 a 10 mg cetirizine was administered by mouth. Patient was able to swallow this with a small sip of water without any difficulty. á 1121, patient continues to deny chest pain or shortness of breath. She continues to be compensating appropriately and sitting at the edge of the bed. She states that she is feeling better. á Vital signs obtained at 1123 with blood glucose per the patient's own meter, continuing to elevate at 103, blood pressure within normal limits at 116/91, heart rate at 85 and 100% O2 saturation on room air. á At 1126, the patient continues to feel better. She is provided a granola bar to eat. She does note feeling sleepy though attributes this to this being the first day she has had off after working 4 days last week. She notes that she has been sleepy even prior to her arrival at the vaccine clinic today. She is able to eat the granola bar and continues conversing appropriately without difficulty. She continues taking small sips of water without issues. Continues to deny chest pain or shortness of breath. Blood sugar is rechecked at 1138 and continues to

elevate to 116. She reports that her meter says her sugar is ""stable."" á Final set of vital signs obtained at 1138 revealed blood glucose within normal limits at 116, blood pressure of 119/84, heart rate 83 and 100% O2 sats on room air. Patient denied complaints of chest pain, shortness of air, nausea, dizziness or blurred vision at this time. She felt much improved and we discussed her leaving the clinic and heading home to have lunch. She had no further complaints. She was able to rise to standing on her own without any further issues and ambulated out of the clinic without difficulty. á She was advised with strict return precautions should she develop chest pain or shortness of breath to present to the ED or call 911. She expressed understanding of this. á LPN, RN, PharmD present through this encounter and assisted as asked of the, by this provider. á Follow up response to treatment:excellent. á Patient discharge: Stable to go home and follow up with PCP. á Orders Placed This Encounter Procedures ? COVID-19 MRNA LNP-S PF á PA-C Electronically Signed 12/21/2020 11:17 AM á á"

Burning at injection site followed by tachycardia and lightheadedness within 2 minutes. Lasted over half an hour

sore arm; This is a spontaneous report from a contactable pharmacist (patient). A 35-year-old female patient (who happened to be a pharmacist) received BNT162B2 (Pfizer-BioNTech COVID-19 vaccine), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced a sore arm following administration of Covid 19 vaccine on an unspecified date with outcome of unknown. No follow-up attempts are needed. Information about lot/batch number cannot be obtained.

Patient has known anxiety and diabetes. Blood glucose 220 - patient admitted that they had not taken DM medications. Patient did not required any medication.

EE stated that she started feeling itchy within 30 minutes of receiving her vaccine but she didn?t tell anyone because it was not bad, the next day she noticed a rash on her chest (left side), it then spread down the left side of torso to the left leg, EE has a history of eczema and took her prescribed steroid, she also started using hydrocortisone cream on her rash, no reported fever, EE stated that she was fatigued with body aches and joint pain, EE does not have a history of Covid positive testing, she has not been around anyone with Covid, she has not traveled or live with anyone who has traveled, She stated that she went to see her PCP today, 12/21/2020 and was instructed to continue the hydrocortisone cream and do not get the 2nd dose of the Covid Vaccine.

36 hours after injection lymph node pain in back of neck, this flared my trigeminal neuralgia. Took 800 Ibuprofen 1 hour later that pain stopped and massive headache. Headache was followed by drunken type vertigo. I took 20mg steroid, Benadryl, Afrin, Albuterol. Two hours later better but still had vertigo. By 4am symptoms light enough to do light work out, legs felt fatigued. Today no symptoms.

Injection site pain; myalgia; arthralgia; congestion; neck pain; fatigue; This is a spontaneous report from a contactable consumer (patient). A 62-year-old male patient received first dose of bnt162b2 (lot number EK5730), via an unspecified route of administration in arm left on 16Dec2020 07:15 at single dose for immunization. Medical history included hypertension and CAD (coronary artery disease). Patient had no allergy history to medications, food, or other products. Concomitant medication included

ticagrelor (BRILINTA), lisinopril, acetylsalicylic acid (ASA), ergocalciferol (VIT D) and magnesium (MAGNESIUM). Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The patient experienced injection site pain, myalgia, arthralgia, congestion, neck pain, fatigue all on 16Dec2020 20:00. Treatment paracetamol (TYLENOL) were taken as a result of reported events. The outcome of the events was recovering.

Left arm feels swollen - resolved on own.

Developed numbness and tingling to face, forehead and lips about 45 minutes after administration. Everything but nose resolved in 5-10 minutes but nose remained feeling numb - had some sensation but not normal. 2 1/2 hrs later felt like it was continuing to improve, but not normal yet.

Patient developed hives 30 minutes after receiving injection. Received Benadryl and seen in ER for evaluation. No further issues reported.

About 5-7 minutes after the injection, I was sitting in the waiting area for my 15 minutes observation period. After about 5-7 minutes I noticed that it was hard for me to swallow and I became really flushed and hot and tachycardia. I was not anxious or upset about getting the shot. I am actually an ER physician and have had lots of shots in my life without any adverse reaction. The flushing and tachycardia resolved after about 20 minutes but the sensation of difficulty swallowing did not subside completely until I took dose of Benadryl 50mg orally. Symptoms resolved after about 1 hour post Benadryl. I also had a recurrence of symptoms the next day at around 24 hours where I felt again like I couldn't swallow, so I took Benadryl 50mg again, but this time I also had some numbness of the left side of my tongue and the left side of my face. The abnormal sensation in the left side of my face subsided over about an hour or so.

lots of pain on the site radiating from shoulder to hands; lots of pain on the site radiating from shoulder to hands; lots of pain on the site radiating from shoulder to hands; swelling; This is a spontaneous report from a contactable consumer. A male patient of an unspecified age received bnt162b2, via an unspecified route of administration on an unspecified date at single dose for immunisation. The patient's medical history and concomitant medications were not reported. The patient experienced lots of pain on the site radiating from shoulder to hands and swelling on an unspecified date. The outcome of event was unknown. Information on the Lot/Batch number has been requested.

headache; dizzy; ringing in her ears for hours -high pitched ring; sore arm where injection was administered; This is a spontaneous report from a contactable nurse (patient). A 28-year-old female patient (not pregnant) received first dose of bnt162b2 via intramuscular in arm right on 17Dec2020 11:30 at single dose for immunization. The patient medical history was not reported. The patient had no medications, food, or other products allergy history. The patient's concomitant medications were not reported. The patient reported 8 hours after administration of vaccine, on 17Dec2020 8:00 pm, the patient started to get a headache then dizzy then ringing in her ears for hours -high pitched ring, and sore arm where injection was administered. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. No treatment was

received in response for reported events. The outcome of the events was recovering. Information on the lot/Batch number has been requested.

"complained of ""chest tightness"" after receiving the vaccine; being nervous; This is a spontaneous report from contactable Pharmacist. A patient of unspecified age and gender received bnt162b2 (Pfizer-BioNTech COVID-19 Vaccine), via an unspecified route of administration in 2020 at single dose for immunization. The patient's medical history and concomitant medications were not reported. The patient (healthcare worker) received the Pfizer-BioNTech COVID-19 vaccine in 2020 and complained of chest tightness after receiving the vaccine. Chest tightness resolved quickly and the patient attributed it to being nervous. No medical interventions were received and the patient left the observation area without issue. The outcome of the events was resolved in 2020. Information about lot/batch number has been requested."

feeling tired; achy; This is a spontaneous report from a contactable consumer. This consumer reported similar events for two patients. This is 1st of two reports. A patient of unspecified age and gender received bnt162b2 (Covid-19 vaccine) , via an unspecified route of administration on 16Dec2020 at single dose for immunization. The patient's medical history and concomitant medications were not reported. The consumer had two friends who are health care professionals who received the Covid-19 vaccine on 16Dec2020. They just reported feeling tired and achy in Dec2020 to the consumer. The outcome of the events was unknown. Information on the Batch/Lot number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2020501305 same reporter/drug/event, different patient

feeling tired; achy; This is a spontaneous report from a contactable consumer. This consumer reported similar events for two patients. This is 2nd of two reports. A patient of unspecified age and gender received bnt162b2 (Covid-19 vaccine) , via an unspecified route of administration on 16Dec2020 at single dose for immunization. The patient's medical history and concomitant medications were not reported. The consumer had two friends who are health care professionals who received the Covid-19 vaccine on 16Dec2020. Left arm swelling; rash throughout body; left leg going numb; loss of balance; This is a spontaneous report from a contactable Other healthcare professional reported for herself. A 22-year-old non-pregnant female patient received first dose of bnt162b2 (pfizer-biontech covid 19 vaccine), intramuscularly on left arm on 17Dec2020 at 08:30 at single dose for immunization at workplace clinic. Medical history included known allergies to watermelon, cantaloupe, honey dew, kiwi. There were no concomitant medications in two weeks nor other vaccine in four weeks. There is no prior covid vaccination nor covid tested post vaccination. The patient experienced left arm swelling, rash throughout body, left leg going numb, loss of balance on 17Dec2020 at 09:15 with outcome of unknown. No treatment was received for the events. Information on the lot/batch number has been requested.

Physician receiving Pfizer BioNTech COViD 19 vaccine experienced sore arm; This is a spontaneous report from a contactable physician (patient) via Pfizer sales representative. A patient of unspecified age and gender received BNT162B2, via an unspecified route of administration in 2020 at single dose for immunization. The patient's medical history and concomitant medications were not reported. The physician receiving pfizer biontech covid 19 vaccine experienced sore arm within 24 hours of receiving vaccination dose in 2020 with outcome of unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

Pain in injection site; slight nasal congestion; This is a spontaneous report from contactable Nurse (patient) via Pfizer Sales Representative. A 27-year-old female patient received BNT162B2 (Pfizer-BioNTech COVID-19 vaccine), via an unspecified route of administration on an unspecified date at single dose for immunization. The patient's medical history and concomitant medications were not reported. The patient experienced pain in injection site, and slight nasal congestion on an unspecified date with outcome of unknown. Events took place after use of product. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

Has pain around injection site of COVID vaccine; This is a spontaneous report from a non-contactable Physician. A patient of unspecified age and gender received BNT162B2 (Pfizer-BioNTech COVID-19 vaccine), via an unspecified route of administration on an unspecified date at single dose for COVID vaccine. The patient's medical history and concomitant medications were not reported. The patient had pain around injection site of COVID vaccine on an unspecified date with outcome of unknown. No follow-up attempts are possible. Information about lot/batch number cannot be obtained.

sent to the emergency room for body rashes and hives.; sent to the emergency room for body rashes and hives.; This is a spontaneous report from a contactable pharmacist. This pharmacist reported similar events for 4 patients. This is a third of four reports. A patient of an unspecified age and gender received BNT162B2(Solution for injection) via an unspecified route of administration on an unspecified date at single dose for immunization. The medical history included allergies to bee stings. The patient's concomitant medications were not reported. The patient sent to the emergency room for body rashes and hives. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2020502532 same reporter, drug, event different patient

Mild throat swelling, not enough to obscure airway, went home and took Benadryl and went to sleep. Symptoms gone post nap (also had fatigue and mailase both gone after nap)

flushed face, shortness of breath, feeling like I was going to pass out, tightness in my throat but could still swallow, had heart palpitations and feeling like my heart was going to come out of my chest. Those symptoms lasted for about 5-10 minuets and slowly the flushed feeling went away and heart stopped racing after about 10 min. I was very shaky and still had a bit of tightness in my throat. I left the area out 40min but was still very jittery. Currently its 1510 and I still have some localized flush feeling in my cheeks and continued jitteriness but am breathing fine.

Fatigue Headache Pain at injection site

Approx 5 hours after receiving vaccine, developed an aching sharp pain between my shoulder blades worsening with inspiration, intermittent mild chills, and fatigue. Pain between my shoulder blades lasted 4 hours, until i took tylenol and went to bed.. i woke up 5 hours later and the pain was now a dull ache.

Fatigue: 18 hours after injection to current time. Dizziness: 24 hours to current time, Vertigo: 36 hours to current time, subsiding with use of Dramamine Nausea: coincides with the dizziness/vertigo Spoke with PCP office 3 times who referred me back to hospital, the provider of the vaccination. Hospital COVID-19 Incident Command pulled me from employment until I get a back to work note from my PCP. PCP states this is a Hospital issue, they pulled you, they need to reinstate you. Hospital Occupational Health agrees in principal and is working on an outcome.

Chest pain and diffuse, severe myalgias, as well as persistent tachycardia to 110's and hypertension resulting in ER evaluation. No abnormalities found on basic labs and studies. Symptoms started one hour after injection and worsened over the next 24 hours.

The evening of the shot, patient reported he had headache and nausea. Next day nausea and Headache continued and also included Body aches, chills, achy joints which lasted for 3 days.

Flushing Hives Nausea Heartburn Throat itching and swelling Hot flash Blood pressure and pulse spiked All of this happened within 5 minutes of administration. Patient was given benedryl and Pepcid and sent to the Emergency Room.

-Sore injection arm (left) starting at 4pm on day of injection (12/16/20) and resolved on 12/20/20. -Chills starting at 5pm on second day (12/17/20) and resolved on 12/18/20.

"PATIENT REPORTS RECEIVING VACCINATION AT APPROXIMATELY 830AM. SHE WAS BUSY THROUGHOUT THE DAY BUT ONCE SHE RETURNED TO HER OFFICE AROUND 120 PM, SHE STARTED TO NOTICE HER ARM IN WHICH SHE RECEIVED HER VACCINE WAS PAINFUL AND SHE WAS UNABLE TO ""LIFT IT UP"". SHE ALSO NOTICED HER TONGUE BEGAN TO FEEL ""WIERD AND TINGLY"". SHE THEN REALIZED HER TONGUE WAS PUSHED UP AGAINST HER TEETH AND COULD SEE A VISIBLE TOOTH MARK ON HER TONGUE. SHE ALSO REPORTS THAT HER BRAIN FELT ""FOGGY"" DURING THIS TIME"". ADDITIONALLY, SHE REPORTS THAT ONSENT OF ALL HER SYMPTOMS PRESENTED PROGRESSIVELY. SHE RECIEVED IM BENADRYL ONSITE PRIOR TO TRANSFER TO THE EMERGENCY ROOM FOR EVALUATION. AT THE EMERGENCY ROOM SHE WAS GIVEN THREE MEDICATIONS, SHE RECALLS ONE WAS A STERIOD AND BELIEVES ATLEAST ONE WAS AN ANTIHISTAMINE. HOWEVER, SHE IS NOT COMPELTELY CERTAIN WHAT THE OTHER MEDICATIONS WERE. SHE REPORTED IMPROVEMENT OF SYMPTOMS WITH MEDICATION. SHE WAS PRESCRIBED BENADRYL AND A MEDROL DOSE PAK AT TIME OF DISCHARGE. SHE WAS NOT ADMITTED TO THE HOSPITAL."

headache, dizziness, hypertension, subjective mild shortness of breath, BP 160/100 Taken to the ER for evaluation

"Received COVID-19 vaccine the afternoon on 12-18-2020 on 12-19-2020 developed chest pain and ""heart racing"" intermittently. Lasted approximately 1 hour . Patient did take Nitroglycerin 2 times ."

"Per documentation of other RNs invloved, at 1009, patient began reporting sensation of numbness in right arm and ""feeling funny"", she also presented with visible flushing and reported itching and feeling anxious. We monitored the patient's vital signs q5min and administered 25mg Benadryl IM. Over the course of aproximately 1.5 hours, the patient's flushing had visibly diminished, she reported significant improvement in her anxiety and stated that the itching was ""nearly resolved."" Her vital signs also improved and were WNL, including pulse, O2 saturation, temperature and blood pressure. The patient stated that she felt well enough to return to work and verbalized understanding that if any symptoms develped or worsened she was to report immediatley to the ED."

Injection site pain, malaise, fatigue decreased appetite, chills, joint pain

transient dizziness, history of dizziness with piercings and shots

Staff reported numbness, tingling and heat all the way down her left arm. She was sent to ER for further evaluation and monitoring.

Staff reported numbness, tingling and heat all the way down her left arm. She was sent to ER for further evaluation and monitoring.

Fever, headache, body aches, arm pain for two days at site of injection. Approaching 72 hours with fever.

"Patient woke up 3 am next morning and felt like she couldn't move limbs hardly at all and ""felt like a boulder sitting on my chest"". She also felt nauseous, dizzy and a headache. By 5 am the ""heaviness"" of her limbs and her chest and throat felt so heavy patient was scared and was transported to ED by her husband. ED physician didn't think it was an anaphylactic reaction, but just thought it was an extreme adverse reaction. EKG, labs including Cardiac enzymes, and chest xray were all normal. Given IV benadryl, IV zofran, Aspirin, tylenol and norflex. during ED visit. Discharged from ED 10:30 am. Took Benadryl and Solumedrol dose pack once home. by Saturday patient felt 95% better, but as of this report, still says arms still feel heavy and she is fatigued. Went back to work today."

Injection site pain

Vaccine on Wednesday. Sneezing (allergies) around the time of injection. Sore arm for a day. Felt fine on Thursday and Friday. A little off on Saturday. Myalgia, headache w temp of 99 on Sunday. Took Tylenol at 2000 and went to bed. Did not sleep well. Temp at 0400 was 100. Took additional Tylenol. Achfnese returned at 1100 on Monday. No fever. Shaking chills but no fever from 1400-1500. Resolved but temp of 101.2. This is where I am now.

12/18/20 @1400 - light headache 12/18/20 @2100 - extreme soreness at injection site (right arm). Difficulty sleeping on right arm during night. 12/19/20 @1030 - extreme fatigue. Took a 1.5 hour nap and awoke with chills. 12/19/20 @ 1230 - extreme fatigue and chills. Took a hot shower to help relieve chills. After about 15 minutes in shower, began to sweat profusely and my face was flush. *I did not take my temperature, therefore it is unknown whether or not I had fever, but I would assume so* Finished shower and slept until 1830, but only because my daughter awoke me. I was still tired when I awoke.

12/19/20 @ 2200 - Fell asleep and slept through the night. Awoke at 0930 the following morning and felt better, feeling almost normal by 1200.

Began to feel slight pain at injection site Friday, 12/18/2020, evening and was experiencing significant pain when trying to raise left arm above shoulder height. This sensation subsided by Sunday, 12/20/2020, morning Began to have a numbing sensation in both cheeks, nose, and throat on Saturday, 12/19/2020, early evening. The sensation was similar to that feeling of getting Novocaine at the dentist. There was no facial swelling, no difficulty breathing, no facial drooping, or slurred speech. Began to feel dizzy on Saturday, 12/19/2020, evening and this lasted until Sunday, 12/20/2020, morning. No sensation of nausea or vomiting. I contacted my Director and Occ Health dept as instructed. Occ Health felt that these symptoms may be an inflammatory response to the vaccine, I was advised to take Motrin to see if any relief could be obtained. Minimal numbness noted in mouth and nose on Monday, 12/21/2020.

Injection site pain. No redness or swelling. Fatigue, dizziness, lightheadedness, night sweats, body aches.

Shingles right arm 2 days after COVID 19 vaccination. Evaluated 12/21 and prescribed topical acyclovir and oral vatrex 1g TID x 7 days. Labs obtained and pending (CMP, CMP, ESR, CRP, Zoster IgG,M, viral swab)

Within two minutes of receiving the vaccine I experienced tachycardia and dizziness that were severe for approximately five minutes and improved over the subsequent ten minutes. Beginning approximately twenty minutes after receiving the vaccine I experienced another bout of dizziness accompanied by chest tightness. This resolved within approximately ten minutes.

I had nausea starting about 2 hours post vaccine and 7 hours later I was vomiting, I had Zophran I was taking and was still unable to keep anything down tuesday in the AM. I had a Teledoc appointment and was prescribed 2mg of sinofren, I was still vomiting with both meds until saturday morning and since then I've had nausuea that have been getting lighter everyday since. I am back to being able to eat solid food with light use of the Zophran

Patient is a 72 y.o. female who was seen at COVID Vaccine Clinic today for her first dose of the COVID 19 vaccination. á She denied any history of previous adverse reactions to vaccines. á She was given the Pfizer vaccination in the right deltoid muscle. á During her 15 minute waiting period after the injection, the patient began to experience lightheadedness and tingling to right upper and lower arm. Also c/o pain to mid forearm. She denied hives, difficulty breathing, difficulty swallowing, wheezing, throat tightness, itching and tongue swelling. When walking to the emergency bay reports some lightheadedness and generalized weakness Denies facial drooping or weakness. No loss of strength and normal ROM to hand and arms á This provider was notified of patient reaction and she was then assessed in the emergency bay area. á á Monitored patient for severe reaction symptoms, including: rapid progression of symptoms, respiratory distress with dyspnea and increased work of breathing, hypotension and chest pain á Review of Systems á á Objective á Vitals Vitals: á 12/18/20 1023 12/18/20 1025 BP: (!) 175/93 (!) 182/85 BP Location: Left arm Left arm Pulse: (!) 115 (!) 112 á á Physical Exam Constitutional: General: She is not in acute distress. Appearance: She is not ill-appearing. HENT: Head: Normocephalic. Mouth/Throat: Mouth: Mucous membranes are moist. Pharynx: Oropharynx is clear.

Cardiovascular: Rate and Rhythm: Normal rate. Pulses: Normal pulses. Pulmonary: Effort: Pulmonary effort is normal. Comments: Initially with slight shortness of breath After 3-4 min was able to return to normal rate of breathing SpO2 remained 99-100% for duration of observation Musculoskeletal: Right shoulder: She exhibits tenderness (where identified). She exhibits normal range of motion, no swelling, no effusion, no deformity and normal strength. Arms: Comments: C/o generalized tingling and mild weakness to right arm. Point tenderness where identified. Grip strength equal bilaterally Full ROM Injection site to right deltoid covered with bandaid Skin: General: Skin is warm. Capillary Refill: Capillary refill takes less than 2 seconds. Neurological: Mental Status: She is alert. á á Assessment/Plan á Treatment included antihistamines. Zyrtec given po at 1025 Follow up response to treatment:no change Patient discharge: Transported by ambulance á Report provided for Medical Record Patient reports some improvement in arm tingling, but pain to forearm and weakness remains á APRN Electronically Signed 12/18/2020 11:31 AM á á

Flu like systems, chills, headache , fatigue . Next morning I had a headache for the rest of the day .

Tingling in the back of throat with possible decreased ability to breathe and swallow. She was given oral Benadryl, 2 doses of IM Epi. Reaction improved. She was sent to the ER to be evaluated. Received IV Decadron. Clinically improved. Discharged home on Decadron, Zyrtec and Pepcid as well as an Epi pen. Discussed to follow up with primary care physician.

4 hours after injection, got right medial subconjunctival hemorrhage, 14 hours after injection, experienced chills, headaches x 2 days

On 12/19/20 Woke up at 4:30 , 3 hours after going to bed (9.5 hrs after receiving vaccination) with left arm throbbing. Was nauseated, whole body violently shaking, feverish (never took temperature). States he could not control shaking. Lasted about 30 minutes, could barely walk. Afterwards felt achy and very weak. Felt better on awakening, but whole body aching and weakness returned around 600PM and again at 1000PM. Took Tylenol/Ibuprofen for relief. On 12/20 at 600PM also experienced whole body aching and felt generally poorly. 12/21/2020 Doing well today.

She c/o of numbness and tingling on left side of entire body. 98.8, 92,142/84, o2 sat 99, rr 16. denied other compliant. emerenccy response team called. taken to ED

Minor pain and swelling at injection site, mild fever responsive to tylenol, fatigue. Fully recovered from all side effects at 48 hrs. Reporting only due to the fact that this is a new vaccine for tracking purposes.

Metallic taste in her mouth Itchiness to site, then progressed to whole body and back pain Arm pain

10 minutes after vaccine, leg itching, checked for redness. Between 2200-2330 swelling of tongue, and lips swelling, administered epipen and prednisone. No 911 or did not notify her PCP. Today she feels fine but still has fine pink rash over body.

Following vaccine, pt became nauseated and lightheaded. Offered water. Refused need to lie down

Patient reports redness and swelling around the injection site the size of an egg in terms of shape. She also reported red fingerlike projections that wrap partially around the arm. Offered patient acetaminophen and patient declined. She would prefer to ice injection site. She is to follow up with provider if issue persists or worsens

Right arm weakness; heavy chest. Given Orange juice due to low blood sugar, transported to ED.

Hives, rash, and tingling to lips 14 minutes post injection

Injection site / l arm soreness - 2-3days Headache - 2 days, treated with Tylenol

12/17/2020 deep sharp pain in my arm and not just at the injection site it was the entire upper arm where I couldn't pick up my daughter. I took tylenol 12/18/2020 and within an hour later I had no pain in my arm and I was fine

palpitations, shortness of breath, warmth in throat

Rash with itch to the extremities (upper and lower) as well as itch/ irritation to the vaccination site (right upper arm/ deltoid

45 minutes after receiving injection I got generalized large hives all over my body, my chest started to feel tight, and under my chin up to my bottom lip felt numb and tingly. Took 50mg Benadryl, Zyrtec, and Pepcid, symptoms subsided. Went to ER for follow up and they prescribed me 18 days of tapering prednisone and an epi pen, advised me to not get 2nd dose.

12/18/2020 ABOUT 5 MINUTES AFTER VACCINATION, STARTED TO FEEL DIZZINESS. 'IT WAS VERY WEIRD. LIKE I WAS MOVING. I MADE IT TO THE OTHER CHAIR'. I FELT MY LEGS GO NUMB, TINGLING IN ARMS AND LEGS. STAFF CALLED NURSE OVER. TOLD ME TO LIE DOWN ON THE FLOOR, STARTED TO CRY, 'DONT LIKE HOW MY FEET FEEL NUMB'. TOOK ME TO THE ER. TOLD MIGHT BE A 'NASAL VASOVAGAL REACTION'. DIDN'T LOSE CONSCIOUSNESS. BUT THE TINGLING IS STILL GOING ON .

Patient returned back to clinic after her observation time stating she had some heart palpitations and slight chest tightness. Declines medical attention at this time.

About 10 minutes after the injection I started feeling dizzy and hot. Then the headache started with pain moving up my head. Throat became dry. Started feeling nauseous. RN's started to check my vitals. Temperature was at 99.4. O2 was at 99%. Blood pressure was 135-92. Symptoms were not getting better and I started feeling worse. RN (House Supervisor) encouraged going to the ER. Was checked into ER where they gave me Benadryl, Tylenol, Zofran & steroids. Symptoms stayed about the same. Received second dose of Benadryl. Started to feel a little better about 30 minutes after. Spent about 3 hours total in ER. We home to sleep for about 7.5 hours. Woke up the next morning feeling very fatigued with a terrible headache. Continued to dose with Benadryl and Tylenol as needed.

All day Saturday the right side of my face felt tingly and when pressed hurt. Was able to smile, talk and move my face. Tongue tingled a little, and lips (right edge of mouth) off and on until it finally stopped

Sunday morning. Haven?t had any issues with it since then. Never had that happen before, so was a bit concerning.

Extreme dizziness

Paresthesia of part of tongue starting about 5 min. after injection; no swelling or airway problem. No other signs of allergic reaction. Observed x 30 min. w/o worsening. Given 25 mg diphenhydramine as precaution.

"Employee complained of metallic taste in mouth. Then complained of scratchy throat and a feeling of ""throat swollen on the inside"""

"Pt c/o diffuse itching ""all over"" approximately 2 hours after the vaccine was administered. no rash or other sx reported. treated with claritin, water. followed up at end of shift around 4:30 Pm and reports improvement, but still feeling ""itchy"". instructed to take PO benadryl once got home if didn't subside."

Hypersensitivity to touch all over body and joint pain, headache fatigue the day after vaccine administered. No medical intervention warranted

felt nausea, lightheaded and dizzy. developed itching and redness on chest. 25mg benedryl IM administered. Called emergency response. Patient taken to ED. Reports in ED not remembering the events.

Dizziness, Hot flash. Laid supine for 30 minutes, while repeatedly checking blood pressure.

Patient observed for over an hour due to symptom development including complaints of pressure in head, diaphoretic, swelling and increase muscle tone/rigidity in her left arm, tongue feeling thick. Brought to ED for care after an hour of observation. In the ED, left arm rigidity/spasm worsened. Here is the physician note: Patient's headache is improved. She has no neurological deficits or subjective complaints or objective exam consistent with a recurrent CVA. She has no evidence of significant anaphylaxis related to the immunization. May be a recurrence of her underlying medical problems that she has been seen by neurology for something similar. Possible unmasking of this is related to the Covid vaccine is difficult to determine. We will have her work individually with our pharmacy, infectious disease team to determine whether she is a candidate for a second vaccination. She would like to return home right now her CT labs are otherwise unremarkable I think this is reasonable. Return precautions for more significant etiologies were discussed at length. Received lorazepam 0.5 mg IV x1, diphenhydramine 25 mg IV x1, and methylprednisolone 60 mg IV x1.

approximately 30 minutes after the vaccine the patient began to experience itching and swelling of the throat and tongue.

Patient felt dizzy and tired after receiving the vaccine, additional monitoring, no further treatment.

I had diarrhea, aches, nasuea and fatigue

Patient was sitting in observation area after vaccine. Approximately 5 minutes (1050) after administration the patient reports feeling a 'head rush', like he was going to pass out, and nausea. Patient taken to exam room via W/C. Skin pale, cool, moist. BP taken with feet elevated. Denies SOB, itching. 1115 patient reports nausea has resolved. Denies dizzy, lightheaded, SOB, nausea, itching. Patient not as pale. Transitioned to sitting with feet down. 1125 patient denies dizzy, lightheaded, SOB, itching, nausea. Color natural. Blood pressure WDL. Patient standing and walking in exam room with no symptoms. Patient dismissed to home. 12/21/20 no symptoms reported.

Dizziness, Vertigo, Tachycardia, nausea, numbness and tingling of both arms

felt itchy on back, and then throat became scratchy.

Dizziness, chest tightness. Laid supine for 30 minutes while repeatedly check blood pressure.

Lacerations and blisters in mouth.

1645- Patient gave vague reports strange taste in her mouth and shortly after that began, strange sensation of tongue and heaviness in chest. VS 118/64, pulse74, SaO1 97, Resp 16. 1655- no change in symptoms. Ambulated around clinic with no change in symptoms. 1710- Patient reported some numbness and itching of her face and arms along with the heaviness in the chest. Denies lightheaded/dizzy. Benedryl given per allergic reaction protocol. 1730- patient report itching of face and arms continues. 1735- patient ambulating in clinic with steady gait. 1745- patient reports slight improvement of itching and chest heaviness resolved. Dismissed to home. 12/21/2020 Asymptomatic.

Dizzy first 20 minutes lasted all day. Very tired. 1:30 very tired. Went home slept the entire next day. Headache took motrin. Had palpitations on Sunday.

Left face/lips with decreased sensation. Intermittent left hand and foot tingling.

"Admin vx at 1530. Developed itching on lips at 1535. Pt reports this as a reaction to the surgical mask she was wearing. Exchanged surgical mask for cloth mask. 1555-Pt reports increased itching. BP 120/84, P 82, O2 96%. OHN offered Benadryl per S.O.; pt declined. 1600 BP 122/83. 1605-BP 133/84 P 84 O2-96%. Pt continues to report increased itching. Reports ""internal itching"" and itching of feet. No obvious rash visible. Offered Benadryl, pt declined. Offered to set up appt with Med Group to be seen now; patient declined. OHN again encouraged pt to f/u with OH doc. Pt seen in clinic at approx 1645. Dr. reports admin of depomedrol and phenergan."

"felt lightheaded, flushed about 10 minutes after vaccine administration while still within the observation period. The patient was laid on a gurney, given water to drink and vitals were taken. Patient was hypertensive, blood sugar was normal. She was examined by an emergency room MD in the vaccine room and it was determined unlikely to be an anaphylactic reaction. There was scattered blotchiness on the neck region, but no raised areas, swelling or other appearance on the face, trunk or at the site of the injection. The patient recovered well and was observed an additional 15 minutes. She did have a brief recurrence of the same symptoms approximately 10 minutes later but attributed it to a ""hot flash""."

"within 5-10 mins of receiving vaccine she started to feel light headed and jittery and ""floaty"" - she says she feels like, ""I am not here, right now"" - there are no hives - no swollen lips or tongue - pt denies SOB. pt was sent to ED at 8:18 AM for further evaluation. no significant findings and patient was discharged at 10:22 AM"

10 minutes after receiving the vaccine the patient began to vomit, stated her throat felt scratchy, face became flushed. patient taken to the ER

tingling in arm & chest directly after vaccine given. Tightness in throat and a little feeling of short of breath. Went to emergency dept and received bendaryl & solumedrol - symptoms resolved except arm tingling.

Pt arrived for her COVID vaccination. Dose received and during monitoring period she reported throat tightness and difficulty swallowing. VS WNL with BP 130/88, HR 90, O2 sats 98% on room air. Pt ambulatory and escorted by staff to ED for further monitoring.

Within 35-40 minutes after vaccination; lips became a little swollen and tingly. Benadryl taken within 10-15 min and s/s subsided.

Vaccine #1 12/19/2020. No immediate reaction. 12/20/2020 started to get burning around Left eye. 12/21/2020 started to get swelling and puffiness around both eyes, also started with cough and back pain. Feels like symptoms improving. Taking Benadryl.

One and a half hours after receiving injection redness, rash and itching to right arm from palm up to forearm. Given 25 mg PO Benadryl with resolution of symptoms in 30-45 minutes.

FEVER, FATIGUE, BODY ACHES, NAUSEA, HEADACHE

My arm was very swollen from the injection site to my fingers, pretty sore and I had a bit of a rash on my right arm. Nauseous, felt like I was going to pass out. Fatigued.

My lips and throat were swelling and I felt like my airway was being compromised. I was also experiencing neck pain and general malaise. I did not have a fever but have experienced adverse reactions in the past and knew that with the increased secretions and feeling like my throat was closing that I needed to administer my epinephrine pen injection. I administered my epinephrine pen at 11:18 am and within 1 minute my airway was clear and the secretions subsided. My upper lip/periorbital area are still somewhat numb and feel swollen but I no longer feel as if I cannot breathe.

Received the vaccine Wednesday evening, after work. Waited the recommended 15 minutes, then went home and went to bed. Woke up Thursday feeling fatigued and had injection site pain, no other side effects or fever. Thursday evening, I developed body aches and a low-grade fever. I took Tylenol and went to bed. Friday, when I woke up around 1pm, I noticed a small rash behind my left knee. I took Benadryl and ended up falling back asleep. When I woke up Friday evening, I had the rash, and hives, and red/white splotches all over my legs. I took Benadryl and consulted my doctor. The rash continued to spread to my arms, and stomach. The rash itched and burned. I went to the ER Friday night for it.

Before they gave me medication, I started coughing, couldn't breathe for a minute, and got lightheaded. They gave a steroid, Pepcid, Benadryl, and fluids. They observed me for several hours. I felt better then was discharged. They told to continue to take Benadryl or Zyrtec for a couple days. 5 days later, the rash/hives are still red, itchy and present, especially when Benadryl wears off.

9:00 pm. heart palpitations and pressure in midline. Heart felt like it was beating out of my chest. A little light headed. Took antacids. Lasted about 60 minutes. Woke up around midnight with a painful muscle cramp down back of left leg. lasted about 5 minutes. woke the next morning and have felt fine since.

Change in sense of taste; had a perpetual salty taste since the day after vaccination. Has lasted so far 5 days post-vaccination

Arm felt sore at the injection site (very sore) and it went away within a day. Mostly headache and fatigue, that was the worse of it. Almost like flu symptoms, but mild, like scratchy throat, a little bit of body aches, I noticed it at night, not so much during day time

Experienced a vasovagal response about 30 minutes after receiving the vaccine. I felt it coming on and knew I needed to elevate my legs above my heart but could not at the time, so I sat down and put my head down. I had intense cold sweats and loss of vision for about 2 minutes until my blood flow returned to my head. I was then able to get to a recliner to elevate my legs with assistance. The entire episode lasted approximately 30 minutes. I was able to stand and walk after this time without dizziness. I contacted my doctor today 12/21/20 and he advised I report this episode.

Fever 101.3F, fatigue, body aches 12/20 2245 Chills overnight & cough, fatigue remain 12/21(time of this report).

Itchy Throat 30 minutes after, throat swelling reported and hour later, SOB.

"PT WITH KNOWN H/O SEVERE ALLERGIC REACTION - APPROXIMATELY 15 MINUTES AFTER INJECTION, BEGAN TO COUGH AND EXPERIENCE ITCHY THROAT. SHE REPORTED THAT THIS IS WHAT HAS HAPPENED WITH OTHER ALLERGIC REACTIONS. SHE REQUESTED ORAL DIPHENHYDRAMINE HOWEVER SYMPTOMS WORSENED QUICKLY - DETERMINATION WAS MADE TO ADMINISTER EPINEPHRINE. SHE WAS GIVEN A DOSE OF 0.3 MG EPINEPHINE IM AT 1402. PT QUICKLY BEGAN TO FEEL BETTER. SHE WAS GIVEN ORAL BENADRYL 100 MG (PER HER REQUEST - SHE SAYS THIS IS HOW MUCH SHE TAKES EVERY TIME SHE HAS AN ALLERGIC REACTION). DOSE GIVEN AT 1410. SHE DID HAVE COMPLETE RESOLUTION OF HER SYMPTOMS. SHE WAS KEPT IN THE CLINIC FOR OBSERVATION. AT 1430, PT AGAIN BEGAN EXPERIENCING SYMPTOMS AGAIN, SHE WAS COUGHING AND HAD ITCHY THROAT. SHE WAS IMMEDIATELY TAKEN TO THE ED. SHE HAD COUGH, RUNNY NOSE, RASH ON FORARMS ONLY - NOT PRESENT ON CHEST OR BACK OR FACE. AN IV WAS PLACED BY ULTRASOUND IN HER LEFT AC. AT 1438, EPI 0.3 MG IM GIVEN 1440 - FAMOTIDINE 20 MG IV GIVEN 1441 - METHYLPREDNISOLONE 125 MG IV GIVEN 1442 - FAMOTIDINE 20 MG IV GIVEN 1443 - DIPHENHYDRAMINE 50 MG IV 1444 - VITALS - 136/94, HR - 92, OXYGEN SAT - 96% ON RA 1445 - PT C/O HEADACHE, STILL COUGHING, RASH PERSISTS 1450 - IPRATROPIUM / ALBUTEROL + RACEMIC EPI GIVEN 1453 - STILL CONTINUOUS DRY COUGH, RASH BETTER 1455 - BREATHING TREATMENT COMPLETE - COUGH MUCH BETTER 1457 - HEIGHT - 63""

None stated.

Treatment dugs:

12/17 6:30 pm- started to have general malaise to the point I couldn't cut carrots in the kitchen, then 645pm- 9pm general chills, sweating, muscle ache and pains, severe headache (unresponsive to ibuprofen 600 mg x1 and APAP 1 g x1), 10pm fever of 100.4 F, at 11 pm, symptoms started to decrease, by 12 pm 12/18, all symptoms suddenly stopped 12/19 woke up with sore throat, and overall consistent general malaise 12/20 sore throat continues, mild headaches 12/21 sore throat continues and muscle pain/chills returned note all other activities remained the same, and no new introduction of OTC/prescription medications, or change in daily activities

monitor vs 70 MIN, feels hot, NO HX OF PREVIOUS REACTIONS REPORTED, left at 1620

Approximately 30 minutes after vaccination developed intense pins and needles sensation to the left side of my face. I then developed a heavy, aching, tingling sensation to the left side of my face. I returned to the facility and was evaluated post vaccination. Symptoms persisted still 2 days later so I was evaluated by my PCP today and diagnosed with Bells Palsy. I was prescribed high dose steroids today.

8 minutes after injection I began to get dizzy. The nurse right away put ice packs on my neck. She checked my blood pressure and it had spiked. She had me drink a full bottle of cold water. She monitored me. Then after 25 minutes I was transported in a wheelchair to a observation area. About 1 hour later the dizziness went away. I also broke out in a rash on my neck for 3 days

12/16-headache/abdominal pain 12/16 3am nausea/headache/dizziness 12/17 headache/dizziness 12/18 dizzy/diaphoretic 12/19 headache/dizziness/night sweats 12/20 headache that worsened at night, dizziness, night sweats 12/21 headache/dizzy-went to doctor -pulse thready EKG was performed (normal). Dr felt I was dehydrated and suggested drinking plenty of water and following up with him.

Burning pain in site, starting to get numb down my arm, pain on side of breast going down to rib, chest pain in the middle ..

monitor for 45 min, vaccine at 1845, felt flush, NO HX OF PREVIOUS REACTIONS REPORTED, LEFT AT 1930

Within 3 minutes of receiving vaccine, had extreme nausea, dizziness, diaphoresis, and motion sickness. Had vomiting 30 minutes after vaccine. Within 3 hours injection site had swelling the size of a baseball with purple/blue discoloration and tenderness around the site.

Pt states that ~ 20 minutes after receiving the COVID-19 vaccine on her right deltoid, the R side of her face felt numbness and tingling on the R-side of her face. States her muscles felt weaker. Improved after waiting another 10-15 minutes. Advised to monitor and record her symptoms, speak with her doctor if necessary, and enroll in the V-safe reporting app.

After having the vaccine, felt out of breath, decided to take a shower, heart rate 155 bpm. Yesterday it was 133 bpm. Took it now it is 134 bpm. Feeling very anxious. Having some soreness in the arm.

About 20 minutes after vaccination patient vomited several times and experienced increased blood pressure and heart rate. Physician assistant consulted and recommended to continue to monitor for patient improvement. Patient blood pressure and heart rate began to decrease.

Received the vaccine approximately 1pm on Saturday 12/19/20 while working at the hospital. Slight pain at injections site but no other problems that day. Did not sleep well that night due to achy muscles especially in my neck. Next morning went to work and felt chills and I could not seem to warm myself up. Also felt very sore with all my muscles aching as though I has been exercising every muscle in my body. This continued during the day but was helped by Ibuprofen 800mg. Also very tired and exhausted during the work day. (10hrs) Went home and went to bed and slept well. Monday am I felt fine again.

Sustained HR 130's for 20 minutes, no chest pain, no SOB, taken to ED for evaluation.

stated she felt like she has cotton balls in her throat, and that was the same feeling she had when she had her allergic reaction to Gain detergent.

approximately 30 minutes after receiving the vaccine, patient reported development of symptoms including increased HR, chest tightness and mild shortness of breath. She presented to the ED and was evaluated. She was given diphenhydramine 25 mg IV x 1 1629, famotidine 40 mg iv x 1 @ 1630, methylprednisolone 125 mg iv x 1 at 1629. patient was observed for 90 minutes. She was without further symptoms, VSS and she was discharge to home in stable condition at 1800

After administration, employee stated feeling dizzy; place head btw knees; continued feeling dizzy; place employee lying on floor on side and attempted to give OJ - blood sugar 80; no LOC; called rapid response; vitals and EKG WNL; transported to ED via gurney; seen by ED MD; D/C home.

Patient received Pfizer COVID-19 vaccine on 12/21/20 at 15:24. Approximately 10-12 minutes later she reported having chest tightness, became pale, diaphoretic, short of breath, and looked unwell. She also had a feeling that the her throat was closing. She was given EpiPen 0.3 mg Inj. She had a reaction to Benadryl IV in the past, so we refrained from giving her an IM injection of benadryl. She did not feel like she could swallow so we did not give her benadryl. After Epipen Injection, she immediatley looked better and was taken to the ER for further workup and observation. Of note, she mentioned an

unspecified allergic reaction in the past. In the ED she was given pepcid IV,, solumedrol IV, and a bolus of saline.

Bilateral upper extremity myalagia. Headache. Fever to 100.5. Overall fatigue

COVID Vaccine administered 12/21/20 @ 15:16 and about 15 minutes later, pt reported feeling tachycardic. She felt short of breath and had a tingling sensation on her tongue. 25 mg of benadryl PO was given to her at 15:30. She continued to feel SOB and her voice sounded much more compromised so an additional 25 mg of benadryl PO was given and she was taken to the ED for observation. In the ed she was given prednisone and pepcid.

Shortly after receiving vaccine she began to have a scratchy throat with some mild increase work of breathing. No distress. Transported to ED for further evaluation and discharged to home approx. 2 hrs later.

Shoulder joint pain. Both sides but more on my right side. Had same pain sensation my back, right side. A few seconds. Right elbow pain sensation. Left calf pain sensation. few seconds. Wave of dizziness and feeling weakness. Experienced it 3x. Had a sensation of little itchiness similar to my radish allergic reaction. Drop and spike of blood pressure Some swelling of eyelids. Lasted for 30 min. Pain in between left knuckles Left shoulder back pain lasts few seconds Left upper shoulder warm sensation a 2-3 minutes, Consistent warm slight burning pulsing pain sensation Right forearm warm burning sensation no pain. Pain in right hip, lasted few seconds. Sudden fatigue feeling suddenly extremely drained

Left sided weakness of face, arm and left leg, onset 15 minutes after receiving vaccination Brought immediately to ED, subjective feeling of closing of throat. Given IM epinephrine 0.3mg x 1. Upon evaluation in the ED by tele-neurology consult, she received 88.5mg of alteplase on 12/20/20 at 1721 She was admitted to the Intensive Care Unit on 12/20/20 at 2208 Seen by neurology on 12/21/20 at 1227. Evaluation showed weakness on the left side but is noted that it could be effort-related. Neurologist noted that patient was treated with alteplase; CT angiogram showed no significant blockage or stenosis. Noted that this is could be related to a vasovagal effect, psychogenic or an acute ischemic stroke. As of 12/21/20 at 1615, attending provider noted left-sided paresthesia, left-sided tics and possible transient ischemic attack

About an hour after, I felt slightly lightheaded. About 4-6 hours after, I felt slightly achy, slight headache, slight nausea, and general mild unwellness. All symptoms were resolved by the following morning. I also had a very sore injection site the day of and day afterwards.

About 10 minutes after the injection, I experienced sudden onset of dizziness and shortness of breath, followed quickly by rapid heart rate. The shortness of breath and dizziness resolved in less than a minute. The rapid heart rate a few minutes later.

I?m having real bad muscle aches. I can barely walk and I?m in a lot of pain when I do walk.

Fast heart rate, palpitations, whole body flushed feeling

tiredness nausea- baking soda in water, with some relief last night. 30cc of mineral water today, with short term relief

Tingling and numbness in the face. Some itching

Reports dizziness, light headeded, heaviness on top of head 10 minutes after injection. No sob, chest discomfort, palpitation or weakness. AAOx3. VVS. States that she worked last night and did not eat breakfast yet, also ran two miles prior to getting vaccine.she was given fluids and was closely monitored. Symptoms mildly improved after about 30 Minutes but continues to keep the heaviness. States that she is likely very sleepy and tired. No acute distress. Instructed to contact clinic/ED/PCP if symptoms worsen or persist.

Injection site got swollen, big bump, red, hot to touch, painful to touch, headache, lower back pain, muscle aches, face warm to touch no fever at time temp 99 oral.

flushed face, facial swelling, lips and tongue swelling, elevated HR, elevated BP , light headedness, after vaccine I waited for 20 min with no symptoms, once I left the facility I immediately felt symptoms of face flushing and swelling and elevated heart rate . I immediately turned around and went to the ER,

headache, slight dizziness, injection site pain. symptoms started about 8 hours after vaccination.

Severe swelling, hard lump, hot to touch, severe itching

Pt. felt palpitations about 5 minutes after vaccination while seated. Pulse check revealed rapid regular rhythm at about 130 bpm

10 min post dose, I experienced a lump in my throat and tingling in my face as if I was about to break out in hives. I took an antihistamine (Zyrtec) when I got home about 20 min post dose.

Approximately 45 minutes after the injection, I felt a gradual tightening of my chest. I took about 6 puffs of my Albuterol inhaler over the next 45 minutes and still got no relief. The pharmacist took me back down to the clinic where I was told to then go to the ER. My blood pressure was 204/133 and my pulse was 136. The doctor determined that I was having a severe allergic reaction to the vaccine. I was given an epinephrine injection, 10mg of Decadron and 50mg of Benedryl. I was monitored for between 3 and 4 hours in the ER before I was discharged. The doctor told me that I should not receive the second dose of the vaccine.

severe pain at injection site radiating to elbow. Duration was 72 hours. Lightheadedness started 6 hours after injection and last 36 hours

Began with pinkish neck and chest approximately 15 minutes post vaccine administration. Within 10 minutes of further observation, more reddened splotches noted on chest, and c/o tightness in chest. Taken to ED via wheelchair immediately. Treated with Benadryl, solumedrol and famotidine. Pt discharged to home within 2 hours.

"The patient was in her normal state of good health prior to the vaccination. Almost immediately after receiving the vaccination, she began having a headache, then got an urticarial rash. She then felt a ""lump in [her] throat."" She was coughing uncontrollably. She was brought immediately to the Emergency Department where I assessed her with my resident. She had signs of a Type I Hypersensitivity Reaction including a hoarse voice, globus feeling and diffuse urticaria. She was treated at the vaccination site in the hospital with Benadryl 50 mg PO prior to ED evaluation and she self-administered Ibuprofen 400 mg. She did not have stridor or airway swelling. She was able to speak in full sentences. She was NOT treated with epinephrine, as she was in stable respiratory condition and improved with Benadryl (as previously administered at the vaccination clinic, Pepcid IV and Solumedrol IV. My concern over this reaction is that the patient has NO PRIOR HISTORY OF ANY ALLERGIES AT ALL. I have read and seen in the media reports of anaphylaxis with a history of allergies, however, this is the first case I have heard of regarding an anaphylactoid reaction in a patient with no prior history."

Generalized hives with onset not until the day after vaccination. Still an ongoing issue.

c/o lips numb. Observation 60 minutes after the reaction and gave OJ. Patient stated it was resolving and departed on her own.

~1 h 15 min after receiving experienced flushing, dizziness, near-fainting, arrhythmia, progressed rapidly to a rapid heart rate, elevated BP, hives, cool extremities, diaphoretic treatment: NS 1 liter, Benadryl 50 mg IV, Solumedrol 125 mg/ml discharged after 6 h with Rx for Epi Pen experienced dizziness/near-fainting episodes off/on for 3 days, slight headache, chest tightness, green/bloody nasal discharge for 2 days

Left armpit lymph nodes swollen and painful. Started as tender to touch on the morning of 12/20/20 and became increasing painful throughout the day and by end of day throbbing. On 12/21/20 throbbing has stopped but still painful to arm movement. Occassional tingling down the left arm.

Patient received dose #1 COVID-19 vaccine administration on 12/17/20. A day later on 12/18/20, patient experienced cold sweats, cough, body aches, fatigue, H/A, vomiting x2, chills, shaking, fatigue, and diarrhea.

Employed as a nurse at this hospital. Around 8 PM she received her COVID-19 vaccine. She waited the 15 minutes she was required to wait and then walked to her car. She reports that as she walked to her car she had a pain in her left shoulder which was short-lived but followed by numbness and tingling of her left arm and the left side of her face going up the back of her head. Symptoms started around 8:20pm. She reported back to the clinic to report the symptoms--she lives along and wanted to be assessed before going home. In the clinic, she was assessed by myself. Employee noted that she had not eaten. She ate in the clinic and had something to drink. While in the clinic over the next 10-15 minutes, she noted that she had some numbness and tingling in her feet and calves bilaterally. No leg pain or swelling. Around 9pm, the clinic was closing and she could no longer be monitored under observation. She opted to go to the ER for observation. Per ER note-- She denies any headache. She denies any left-sided weakness. Patient is right-handed. She also reports some mild chest heaviness that lasted for about 20 minutes and then resolved. No shortness of breath. No dizziness, syncope or presyncope. No

nausea or vomiting. No rash. No visual or speech changes. No ataxia. Patient continues to have the left-sided numbness and tingling but states that it is less intense than it was. She denies any other complaints. Follow up this AM-- Pt is only fatigued and has some muscle soreness where she had the vaccination. All of her symptoms have resolved and she is not having any further sxs of chest tightness or numbness

pt was given the vaccination for COVID on friday the 18th (2 days ago) had moderate aches and diarrhea yesterday and began to have rash on Saturday . Pt is a nurse where there has been a large number of children with gastroenteritis. Pt with h/o immune reaction (? Stills disease) where she breaks out in a urticarial rash ,previously only with illnesses in the past Now pt has a rash. However Pt states this rash feels different to her normal one and she has never had a reaction like this to vaccine befores. The rash began similarly to how it usually starts on upper ext and then spreads to trunk now she has swelling around eyes and rash is getting worse. benadryl ineffective pt also has swelling around her eyes and overall with irritation which she has not experienced before. pt was sent to the Emergency department for full evaluation concern for sjs type reaction with

Right after the injection I became acutely lightheaded. I tried to wait it out and it improved somewhat but not all the way. I then started to drive home after the 15 min. observation period. About 5 min into my drive home, I developed trouble swallowing/throat tighness and worsened lightheadedness. I called 911 who stayed on the phone with me as I drove back to the hospital. It started to imrpove rather soon and was resolved within 30 min later.

2 min post injection developed tingling around site, and then urticaria on left upper arm. Then diffuse flushing diffusely and headache. HR=130's, normal BP. Difficulty swallowing during EMS transport. Received EPI sc, Pepcid IV, and Benadryl 50mg IV PTA. HR+140 on arrival post Epi 6 hour obs. NS 1L D/c home with precautions, epilepsy pen rx, and allergist follow-up

Sore deltoid

Associate tested positive for COVID 12/21. Now reports symptoms of cough starting 12/18 not revealed at time of vaccine

Vaccine recipient became nauseas and light headed approximately 30 minutes after vaccine. Recipient also had started menses which was very heavy, also she said she saw the needle and she shouldn't have looked.

Within 3 minutes of receiving the vaccine, I felt a fluid like sensation trickle down my right bicep. I think proceeded to feel tachycardia, dizziness, lightheaded, and was hypertensive. My chest appearance was red and blotchy as well as my face. I was monitored in the ED for 2 hours. My vitals stabilized and the redness dissipated. I continued to feel a bit anxious and a headache. I was told to go home, take Benadryl as needed, and to follow up with an allergist.

About 10 minutes after the injection I felt something in my throat like when I have a sore throat. I was checked by the nurse and she said my pulse is beating a little faster. My breathing was fine. I was

brought to Er and my blood pressure was elevated than usual. About almost an hour after the vaccine my forehead started itching and but I was given benandryl so my hives didn?t continue to develop..

While sitting in chair in observation area after vaccine was talking on phone to friends and suddenly felt very weak with tachycardia to the 120s, SOB, pre-syncopal, very lightheaded. Weakness. No chest pain or tightness. Waved to the staff,. wanted to lay flat. They raised my legs and as there was no stretcher available. Felt heart racing and a sense of doom. HR settled down after about 3-5 mins. Tried to stand so staff could get orthostatic BP but could not support my weight. Remained under observation by the staff for about 45 min. symptoms improved. Was directed to go to ED for evaluation. My husband picked me up.

Full vial of 0.3ml concentrated vaccine administered undiluted with normal saline.

Very soon after receiving vaccine experienced some tingling in the left arm, left leg, left side of face - especially left arm in approximately C8 distribution - down into ring and pinky fingers. Left arm tingling has been intermittent since then. Today noticed a rash in both arms, but worse on the left side in the same distribution. There is numbness, tingling, slight burning along with the rash in that area.

Developed headache, chills, body aches and sore left arm

Jittery and involuntary muscle movements. Chills. Dizziness when I would try to lay down. Nausea followed by abdominal pain. Dry heaving. Later in the day I developed a headache. Resolved at 11pm that night.

around 1730 Patient was given vaccine and d/t allergy history was brought in the 15 minute observation. Patient stated that she was feeling dizzy and throat feeling funny also the same way when gets the flu shot. Patient was kept in observation while being monitored and Code Blue Team arrived d/t the possibility of an anaphylactic reaction.

Around 0800 the patient got her vaccination. During the registration process, she was seen by An Employee (Pharmacy) and associate stated that she never had any allergic reactions in the past and filled in both forms that she does not have any allergic reactions to either the vaccine components, food, and medication. She was then escorted to the Observation room for 15 minutes where she felt dizzy at first. The observation nurse and pharmacy was also present at site. After a few minutes, associate complained of more dizziness, some tightening of the jaw but was still able to speak and swallow. Associate was then given Benadryl around 0804 and connected to the vitals machine for continuous monitoring. Around 0806 patient was feeling worst and Observation RN took her vitals and her HR went down to the 30?s associate was given epinephrine and hence the CODE BLUE was called on 0807. During the CODE BLUE, ED was notified, and a gurney was sent to the Observation Room. Patient was then transported to ED for further evaluation and observation.

35yo female urgent care physician in normal State of Heath when while seeing patients I got lightheaded. Sat down, drank water, ate sugar cookie for about 10/15 minutes but symptoms persisted.

Tried to keep working, but found myself just thinking about how I am going to pass out. No LOC. Evaluates by colleague. Received 2L of IVs (Cr wnl) with transient improvement in symptoms.

Rapid heart rate of 203 bpm

Around 0320 on 12/20/20, approximately 12 hours after my vaccination, I experienced uncontrollable chills for an hour and had an onset of a headache, nausea and weakness that lasted until about 1500 on 12/20/20. Side effects have since resolved.

Woke up 2 days later with pain and swelling under my eyes and in my chin. These are places that I have had dermal filler. I started steroids immediately, swelling went down after 2 days.

Pt noted tightness/swelling around eyes along with itching/burning sensation at same. Then developed itchy erythematous rash starting right shoulder (near where injection was done) and spreading to back. Benadryl 50mg IM given. Was sent to ER for continued monitoring; she did well without further treatment (other than 500mL of saline IV) and was released in good condition. She did not have lightheadedness, lip/tongue/throat swelling, SOB, GI symptoms, or hypotension.

Numbness and tingiling on fingers (both hands and feet). Unable to extend without feeling severe pain on ring and pinky fingers on right hand.

Employee, 1st Pfizer COVID19 vaccine today. ~6min s/p shot, he felt a little itchy just @injection site, then got anxious & felt woozy, sweaty. Wearing big mask and a face shield, seemed anxious. Walked independently to go lay down. No syncope. BP up to 140/90, HR 90, RR 20, breathing fine, no itchy throat/swelling/hives. Improved w laying down. To ER out of an abundance of caution-- vitals nL, nL exam, still itchy at shot site. Got 1L NS IV, 25mg PO Benadryl for itchiness- likely anxiety > severe allergy

Migraine greater than 24 hours, included headache, photosensitivity, noise sensitivity and nausea/vomiting.

Day 2 December 20 woke up with dizziness and nausea, and soreness to left arm Day 3 December 21 having continued constant dizziness and waves of nausea thus far Spoke with Dr per phone she suggested to take Dramamine, which eased dizziness but feeling odd. Unable to register for v-safe not going thru from your end?

30 minutes after receiving the vaccine, I (the patient) felt tingling in my lips, nose, and feet. I then developed a non-itchy, macular rash on my chest and back, associated with flushing. No fevers, chest pain, shortness of breath, nausea, vomiting, or diarrhea, I was taken to the emergency department, where I had normal vital signs. I was given Benadryl 25 mg PO with complete resolution of rash and tingling sensation within one hour.

Urticaria to arms started on the eve of December 20, 2020, took benadryl and applied triamcinolone ointment to rash, woke up and found more rash all over the body took benadryl again, after an hour of taking the benadryl, my face started to itch, that;s when I went to the ED where they gave me, a steroid IV , Benadryl IV and Pepcid IV.

Numbness and tingling in face from ear to ear and forehead to jawline, especially lips

Pfizer-BioNTech COVID-19 Vaccine EUA Currently having fever up to 101.8¦F, malaise, headache, and fatigue.

L ring and pinky finger tingling/numbness

Pfizer-BioNTech COVID-19 Vaccine EUA Erythema and pain noticed at injection site at 22:00 Pain worsened over night The next morning around 0700, noticed worsening Erythema, inflammation, tenderness, warmth No fever 12/21 borders of Erythema have expanded

"Patient notes that she received the COVID vaccine around 1800 today. After receiving the vaccine she notes she had developed a headache. She was otherwise doing fine until around 2000-2100 when she noticed her left arm become numb with paresthesias from her left bicep to her hand with whole arm localization. She felt her hands and wrists were puffy at this time and somewhat swollen. She reports feeling ""floaty""/Dizzy at this time, and at least once had to sit down due to this. She started feeling her heart race and some associated SOB, this has since resolved. She notes that she had two loose stools around this time as well. This progressed to develop into right numbness/paresthesias from her mid right forearm down to her hands. As the evening progressed she developed itchiness of her bilateral arms and torso. She notes that she has had a waxing/waning reddish rash on her arms that has been pruritic. She has since developed intermittent nausea, and still endorses feeling some ""skipped beats."" While in the ED from Triage to repeat evaluations her lips began having progressive swelling. She had been given Benadryl 50mg, Zofran 4mg, 1L IVF. Given ongoing tachycardia and lip swelling she was given Prednisone 40mg and Epinephrine for allergic reaction and concern for anaphylaxis."

Fever, Nausea, Vomiting, body aches, Diarhea taking po fluids trying to stay hydrated with po fluids. rest

7 hours post vaccine, I had very runny nose, thick clear mucus kept coming out of my nose. I felt feverish although my temperature is within normal limits. I had a mild headache and very sore arm on the vaccine site, body aches and malaise which I know are part of the list of side effects I would experience post vaccine, but then about midnight, I developed a huge rash or hive near my left armpit. Then, on Sunday, 12/20/2020, more big hives appeared on my body and my left hand is very itchy and the palm looked red and more swollen than my right hand. I took some antihistamine and notified my doctor via an e-mail. He told me to take diphenhydramine 50 mg every 6 hours. The hives are still present and much bigger and appear in more areas of my body.

Around 1230pm I started to itch, then got nausea, then felt palpitations, checked my own heart rate using and I watch and heart rate was on svt with a rate of 160. I held my breath and heart rate came down after 5 min to a rate of 80 Sinus rhythm.

Rapid heart beat, difficulty breathing, itching, rash, clamminess, cold sweats, nausea

About 1 1/2 hour after injection, one hive appeared on face. Face and arm, head itchy. No rash.

Fever of 101.2F. Cold chills. sweats. Muscle aches. Headache. Lasted for 14 hours and treated with OTC tylenol and advil.

Patient reported felling light headed and dizzy after vaccination. Immunizer questioned patient as to last known meal. Patient had not eaten breakfast. Given orange juice and a light snack. Side effects subsided within 20 minutes and patient was able to return to work. Immunization given under emergency protocol. Patient is a healthcare worker in a long term care facility. Was able to resume normal duties after being monitored by immunizing staff.

redness, swelling and pain at injection site

Fever 102' Chills Body Aches Fatigue

redness, swelling and itching at injection site

"Pfizer-BioNTech COVID-19 Vaccine EUA: Shortly after receiving Pfizer-BioNTech COVID-19 vaccine patient experienced dizziness and ""shakiness"" in extremities. No hives, no swelling, no shortness of breath, no chest pain, no loss of consciousness, no numbness, and no tingling noted at any time. Initial vital signs: blood pressure 140/78 mmHg, temperature 98.7 degrees Fahrenheit, pulse 106 beats per minute, respiratory rate 20 breaths per minute, oxygen saturation 98% on room air. Repeat vitals 14 minutes later: blood pressure 125/88 mmHg, temperature 98.6 degrees Fahrenheit, pulse 110 beats per minute, repiratory rate 18 breaths per minute, oxygen saturation 98% on room air. Thirty minutes after repeat vitals assessed patient stated they felt much better and able to leave clinic ambulatory with a steady gait. Patient was awake alert and oriented the entire time."

Woke up this morning around 5:30 with chills, could not get warm, took temperature around 6:30- 100.4, right side of the throat is slightly scratchy, took temperature again at 7:15am- 99.7, feel very flushed and warm, starting drinking water and took Tylenol

About 1-2 hours after receiving the vaccine, I began to have tongue Hb and throat swelling?mild to moderate. About 3-4 hours later, I had one episode of diarrhea, followed by chills and palpitations. I took Benadryl and Zantac around 8P. When I woke up in the morning, I still had tongue and throat swelling (no trouble breathing), so went to the ER and was treated for an allergic reaction with IV Benadryl, Solumedrol, and Pepcid.

Employee had tingling and numbness in arm a few minutes after injection. This improved within 30 she left the clinic at 40 minutes post vaccine injection. While driving home employee reports having a sudden onset of headache, palpitations and thick speech. Her sister with whom she was taking on the phones told her that her speech sounded strange. Employee had pulled over and called 911. EMS spent time with her and her symptoms subsided so they released her to her own care. She went home and noted nausea, chills then had the onset of a migraine. She took po Benadryl thinking this would help if she was having an allergic reaction. Employee reports feeling achy and chilled so missed work on Saturday. Sunday she was well enough to report to work. Monday upon checking in with this employee she reports mild soreness at injection site, otherwise no residual symptoms

"Patient developed sudden onset of headache with hypertension (BP 205/112), tachycardia (HR 137), redness and hives around 10 minutes after receiving the Pfizer covid vaccine (time 1600). She described ""feeling a wave of heat climbing from her feet up to her face"". 911 called and patient was transported to ER at around 1630. Upon arrival her BP trended down to 129/89 with HR of 78. She did not report difficulty breathing, and she did not receive additional medications while in ER. She was monitored for around 2 hours and discharged at 1847."

Pfizer-BioNTech COVID-19 Vaccine EUA Woke up 12/21 feeling feverish, fatigued, and myalgia, as well as injection site soreness, got worse in the afternoon, peaked around 6pm but started to improve in the evening. Completely gone the following morning 12/22. No treatment taken

Within 1-2 minutes of vaccination, pt felt flushing. He sat down in waiting room. He started to sweat and felt dizzy. Pt requested help. He was brought back to medical room. Pt laid down for 5 minutes and felt better. He ate a snack and drank some water. BP was 162/102 initially. BP was 144/96 after 13 minutes. Pt states he has had similar reactions after giving blood.

Started to have more and more soreness at injection site after administration. Then soreness turned into muscle and joint pain. After about 6-7 hrs from injection time started to feel really bad. I took an Advil before trying to lay down. Was unable to sleep, started getting chills and headache. I took my temperature and it was 102.4. I then took some Tylenol and put some wet clothes on. Temp stayed at 102.4 for a few hours and then finally broke. My temperature went down to 101.4 and stayed there for awhile and now is 99.2. Feeling better than I was, still have severe headache and soreness in body.

Woke up with fever, chills, muscle aches, joint pain, headache, fatigue. Nausea, loss of appetite. treated with Tylenol which controlled fever. Slept a lot.

light headedness; shortness of breath; headache; some nausea; get some redness to her neck and upper chest; Had elevated BPs; This is a spontaneous report from a contactable pharmacist. A 41-year-old female patient (non-pregnant) received first dose of bnt162b2 (Pfizer-BioNTech COVID-19 Vaccine, Batch/lot number: EH9899), intramuscularly on right arm on 15Dec2020 at 13:30 at single dose for immunization. The COVID-19 vaccine was administered in hospital. Medical history included arrhythmia - right bundle branch block, GERD (Gastrooesophageal reflux disease), spinal headache, allergy to gabapentin, adhesive, duloxetine hydrochloride (CYMBALTA). The patient wears contact lenses. Prior to vaccination, the patient was not diagnosed with COVID-19. Concomitant medication within 2 weeks of vaccination included hydrocodone bitartrate, paracetamol (HYDROCODONE/ACETAMINOPHEN, 5-325 mg), omeprazole, meloxicam, docusate sodium, sennoside a+b (SENNA AND DOCUSATE SODIUM). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Within a few minutes of receiving the shot on 15Dec2020, the patient developed lightheadedness, shortness of breath, headache, and some nausea and was taken to the ED (emergency department). She did get some redness to her neck and upper chest, had elevated blood pressure. O2 saturation was fine. The patient received treatment for the events which included acetaminophen (TYLENOL), dexamethasone, diphenhydramine, famotidine, ketorolac, ondansetron, and 1 L normal saline in ED. The patient was prescribed adrenalin autoinjector (EPIPEN) and prednisone and discharged home. Since the vaccination,

the patient hadn't been tested for COVID-19. Outcome of reactions was resolved in Dec2020.; Sender's Comments: Based on the close temporal relationship and the description of the events lightheadedness, shortness of breath, headache, nausea, erythema and high blood pressure, there is a reasonable possibility that the events are related to BNT162b2 vaccine. The case will be reassessed upon receipt of follow up information.

the patient received five times the recommended dosage; the patient received the unreconstituted dosage; body aches; headaches; This is a spontaneous report from a contactable Other Health Professional (pharmacy student) reported on behalf of a pharmacist. A 37-year-old female patient received first dose of BNT162B2 (Pfizer product, batch/lot #: EH9899, NDC number: 59267100001, Expiry Date: 31Mar2021), intramuscularly on 15Dec2020 at single dose (five times the recommended dosage) to prevent the development of COVID 19. There were no medical history and no concomitant medications and no investigation assessment. They did not reconstitute the vial. The patient received five times the recommended dosage and the dosage was unreconstituted on 15Dec2020. The patient experienced body aches and headaches on 15Dec2020 with outcome of not recovered. Reporter seriousness for the patient received five times the recommended dosage was: Medically significant. Seriousness of body aches and headaches was: Too soon to tell. The seriousness of receiving it unreconstituted was: unknown.; Sender's Comments: The reported information is limited. Based on the close temporal relationship and the description of the events body aches and headaches , there is a reasonable possibility that the events are related to BNT162 vaccine received unreconstituted and five times the recommended dosage. The case will be reassessed upon receipt of follow up information.

patient started feeling weak, dizzy and even blacked out a couple times; patient started feeling weak, dizzy and even blacked out a couple times; patient started feeling weak, dizzy and even blacked out a couple times; This is a spontaneous report from a contactable consumer. A female patient of an unspecified age received BNT162B2, via an unspecified route of administration, on 16Dec2020 at 12:00 PM at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. On 17Dec2020, at around 1:00 in the morning, the patient started feeling weak, dizzy and even blacked out a couple times. The outcome of the events was unknown. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.; Sender's Comments: The reported information is limited. Based on the close temporal relationship and the description of the events feeling weak, dizzy and blacked out, there is a reasonable possibility that the events are related to BNT162 vaccine. The case will be reassessed upon receipt of follow up information.

Severe fatigue until 48 hours; severe headache still present; fever; chills; nausea; This is a spontaneous report from a contactable physician. A 30-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), intramuscularly in the left arm, on 15Dec2020 at 15:15 (at the age of 30-years-old) at a single dose for COVID-19 immunization. The patient had no medical history or concomitant medications; there were no other medications the patient received within 2 weeks of the vaccination. The patient was not pregnant at the time of vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient had no known allergies to medications, food, or other products. The patient did not receive any other vaccines within four weeks

prior to the vaccination. The patient experienced severe fatigue until 48 hours, severe headache still present, fever, chills, and nausea on 16Dec2020 at 03:00. The events were reported as non-serious. No therapeutic measures were taken as a result of the events. The clinical outcome of severe fatigue until 48 hours, severe headache still present, fever, chills, and nausea was not recovered. It was also reported that since the vaccination, the patient had not been tested for COVID-19. The batch/lot number for the vaccine, BNT162B2, was not provided and was requested during follow up.

Hives; This is a spontaneous report from a contactable consumer. A 43-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot number: GH9899), via an unspecified route of administration in the left arm, on 17Dec2020 at 09:00 (at the age of 43-years-old) at a single dose for COVID-19 immunization. Medical history included allergic to unknown food. The patient's concomitant medications were not reported. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient experienced hives on 17Dec2020 at 16:00. The event was reported as non-serious and did not cause/prolong hospitalization. Therapeutic measures were taken as a result of the event, which included treatment with diphenhydramine hydrochloride (BENADRYL). The clinical outcome of hives was recovering. It was also reported that since the vaccination, the patient had not been tested for COVID-19. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.

waves of flushing through out her body; severe dry mouth; nausea; elevated heart rate into 120s; panic attack; This is a spontaneous report from a contactable consumer. A female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in 2020 (at 0810 her time) at single dose for immunization. The patient's medical history and concomitant medications were not reported. The reporter is a Certified Nursing Assistant (CNA) who received the Covid 19 vaccine at 0810 her time. Five minutes after receiving the vaccine (2020) she reported having three episodes of the following symptoms: waves of flushing through out her body, severe dry mouth, nausea and elevated heart rate into 120s. She denied any shortness of breath, swelling or anaphylaxis. She was treated in the Emergency Room (ER) with fluids and lorazepam (ATIVAN) and sent home. She contacted her doctor who advised she was probably having a panic attack and was told her to take lorazepam. She reported sleeping when she got home but experienced the elevated heart rate and flushing again after waking. She spoke to her doctor a second time and was told to return to the ER to be treated for the elevated heart rate. She did not go to the ER because she took more lorazepam and the HR declined into the 90's. She stated her doctor was prescribing a beta blocker for her but advised to go to the ER if her heart rate goes over 100 again. She would like to report and Adverse Event. The outcome of the events was unknown. Information regarding lot/batch has been requested.; Sender's Comments: Based on the information available as reported at this point, a possible contributory role of the suspect products cannot be excluded for the reported event flushing, dry mouth, heart rate increased, nausea and panic attack due to temporal association.

Hearing loss; Severe tinnitus; This is a spontaneous report from a contactable pharmacist. A male patient of an unspecified age received first dose of BNT162B2 (solution for injection, lot number: EK5730, Expiry Date: 31Mar2021, NDC number: 59267-1000-01), intramuscularly on 16Dec2020 at 0.3

mg, single in deltoid for prevention of COVID viral infection. The patient's medical history and concomitant medications were not reported. The patient's wife is COVID positive, but he has not been tested and has no other symptoms. On 17Dec2020, the patient experienced hearing loss, and severe tinnitus. There is no additional vaccines administered on same date of the Pfizer suspect. The outcome of both events was not resolved.; Sender's Comments: The reported information is limited. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Feeling of going to pass out; PVC's; PVC's; Shaking feeling internally from neck down to ankles; Sweating; palpitations; This is a spontaneous report from a contactable consumer (patient herself). A 60-year-old female patient received bnt162b2 (lot number: FK5730), via an unspecified route of administration at site of right arm at 10:15 on 17Dec2020 at single dose for immunisation. Medical history included Chronic migraine. Occasional PAC/PVC's. Concomitant medication included clonidine (strength: 0.02 mg). Within about 5 minutes of receiving the vaccine, the patient experienced shaking feeling internally from neck down to ankles, sweating, feeling of going to pass out. Some palpitations and PVC's. Shaking Symptoms lasted approx 4 hours. The patient visited emergency due to events. No treatment received for events. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The outcome of events was recovered on 17Dec2020.

severe hypersensitivity; swelling of tongue; dyspnea; skin rash; This is a spontaneous report from a non-contactable consumer. A 35-year-old male patient received BNT162B2 (Pfizer-BioNTech COVID-19 vaccine), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient administered vaccine and developed swelling of tongue, dyspnea, skin rash on an unspecified date. There is a report of severe hypersensitivity for his awareness. The patient was treated with dexamethasone, Benadryl, IM epinephrine in ER. Outcome of events were unknown. No follow-up attempts are possible; information about batch/lot number cannot be obtained.

Bilateral itchy rash, mostly with small areas of erythema especially around arm pits, but also on abdomen, back, neck, arms, forearms, thighs, legs; Bilateral itchy rash, mostly with small areas of erythema especially around arm pits, but also on abdomen, back, neck, arms, forearms, thighs, legs; some less erythematous areas of swelling with well-marked borders at most 1cm in diameter; This is a spontaneous report from a contactable physician. A 28-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), intramuscularly, on 15Dec2020 at 02:45 (at the age of 28-years-old) at a single dose for COVID-19 immunization. Medical history included hypertension (HTN). Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications, taken within two weeks of vaccination, included lisinopril (MANUFACTURER UNKNOWN), melatonin (MANUFACTURER UNKNOWN), and vitamin D (MANUFACTURER UNKNOWN) taken for supplement. The patient had no known allergies to medications, food, or other products. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient experienced bilateral itchy rash, mostly with small areas of erythema especially around arm pits, but

also on abdomen, back, neck, arms, forearms, thighs, legs and some less erythematous areas of swelling with well-marked borders at most 1cm in diameter on 16Dec2020 at 08:00. The events did not cause or prolong hospitalization. Therapeutic measures were taken as a result of the events, which included treatment with diphenhydramine hydrochloride (BENADRYL) and loratadine (CLARITIN). The events improved with loratadine but started to reoccur 18 hours after loratadine use. The clinical outcome of bilateral itchy rash, mostly with small areas of erythema especially around arm pits, but also on abdomen, back, neck, arms, forearms, thighs, legs and some less erythematous areas of swelling with well-marked borders at most 1cm in diameter was not recovered. It was also reported that since the vaccination, the patient had not been tested for COVID-19. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.

extreme pain in her arms feeling like they are dead and heavy; extreme pain in her arms feeling like they are dead and heavy; She was unable to continue working; This is a spontaneous report from a non-contactable other health professional via Pfizer Sales Representative. This other health professional reported for a 50-year-old female patient (nurse) received BNT162B2 (Pfizer-BioNTech COVID-19 vaccine), via an unspecified route of administration at on 15Dec2020 at single dose for COVID Vaccine. The patient's medical history and concomitant medications were not reported. Nurse was administered the Pfizer COVID Vaccine on 15Dec2020. On 17Dec2020, at work she complained about extreme pain in her arms feeling like they are dead and heavy. She was unable to continue working and went home. Event took place after use of product. Outcome of events were unknown. No follow-up attempts are possible; Information about batch/lot number cannot be obtained. No further information is expected.; Sender's Comments: The reported information is limited. Based on the close temporal relationship and the description of the events, extreme pain in her arms, feeling like they are dead and heavy and unable to continue working, there is a reasonable possibility that the events are related to BNT162 vaccine. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Headache; Dizziness; Nausea; This is a spontaneous report from a contactable other health professional. A 56-year-old female patient received bnt162b2 (BNT162B2) via intramuscular in right arm on 17Dec2020 at single dose for vaccination. There were no medical history or concomitant medications. The patient experienced headache, dizziness, nausea all on 17Dec2020. The reporter described that immediately after patient was administered the COVID-19 vaccine injection she was handed the paperwork, stood up and had sudden onset headache, dizziness and nausea. As of time of the report the headache had subsided slightly but came and went in waves. The dizziness and nausea remain persistent. She reported the seriousness criteria as probably medically significant or somewhere between not serious and medically significant. Patient was currently under observation in the ED (emergency department), but had not been admitted to the hospital. The patient had been in the ED for over 30 minutes at time of report, so patient did not believe that these events are vagal. The reporter called to report these events and to ask for recommendations on how to respond to these events relative to this product. The reporter verified that there had been no relevant testing, imaging, lab work

or investigations done at this time. The outcome of the event headache was recovering while for all other events was not recovered. Information on the Lot/Batch Number has been requested.; Sender's Comments: The reported information is limited. Based on the close temporal relationship and the description of the events, headache, dizziness and nausea, there is a reasonable possibility that the events are related to BNT162 vaccine. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

waves of heat feeling; tachycardia; chest tightness; This is a spontaneous report from contactable physician via Pfizer Sales Representative. A 50-year-old female patient received bnt162b2, via an unspecified route of administration in 2020 at single dose for immunization. The patient's medical history and concomitant medications were not reported. The patient experienced waves of heat feeling, tachycardia, chest tightness 15 min after receiving the vaccine in 2020. Patient received several doses of steroid and was kept overnight in hospital and recovered. The outcome of events was recovered in 2020. Information on the Lot/Batch number has been requested.; Sender's Comments: The reported information is limited. Based on the close temporal relationship and the description of the events, waves of heat feeling, tachycardia, chest tightness, there is a reasonable possibility that the events are related to BNT162 vaccine.The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this reviewas well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Some mild nausea; This is a spontaneous report from a contactable consumer. A male patient of an unspecified age received BNT162B2, via an unspecified route of administration on 16Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced some mild nausea on 16Dec2020. The reporter indicated that the patient had some mild nausea that lasted for an hour or two but that it had completely passed. The outcome of some mild nausea was recovered in Dec2020. No follow-up attempts are possible; information about batch/lot number cannot be obtained.

At 18:45 patient reported development of numbness in back of throat. Pt. reported no difficulty swallowing. Patient ate her evening meal without difficulty and symptoms begin to resolve. Patient took 25 mg of diphenhydramine PO before going to bed. Patient reported no symptoms the next morning.

Patient was nauseas but did not vomit. Had the patient lay down and took the patients blood pressure first reading was BP 98/65, second reading was 94/62 with pulse rates of 80 and 67 respectively. Patient started to feel better after 30 minutes

Patient began having tingling around her mouth on 12/20/20, stated that cold sore has gotten larger and is worse than previous sores. Patient is cautious to not spread fluid from sores but they are spreading. Patient was advised to contact PCP.

Headache, nausea, subjective fever and injection site arm pain.

Patient was nauseas and lightheaded. She was instructed to lay down in which she felt better.

Shortly after receiving injection, I began feeling some lightheadedness.

Itchiness and rash on skin.

"Employee reported ""tongue thickness"" and dry mouth. Employee was taken to ED for evaluation and treatment."

generalized hives

Nausea and Vomiting

Fever, chills, body pain

fever of 101, fatigue, lethargy

Body aches, chills, dry cough

Nausea and vomiting, dry cough, sore throat

Headache, Tiredness, arm soreness

Patient became slightly tachycardic (HR 145, BP 140/75) and light-headed. Described as anxiety attack. Patient laid down and feet were elevated and heart rate and blood pressure returned to normal. Patient was observed for another 30 minutes and released

Caller stated on 12/18/20 and on 12/19/20 she had some arm pain and nasal drainage. Caller stated that she went to doctor on 12/21/20 and was diagnosis with Cellulitis and was prescribed steroids and cefalexin for 7days x three times daily. Caller stated that physician does not recommend second injection. Vaers report completed over the phone.

Headache, injection site soreness

Headache, injection site soreness

Stomach pain, nausea, vomiting, diarrhea

Nausea

Employee reported headache, flushing, and a sweaty feeling. He was taken to ED for evaluation and treatment.

12/21/2020 3:00PM Abdominal l quad pain, nausea sore arm, headache, fever 101.9 with chills -- tylenol, ibuprofen some relief. 12/22/20 tylenol in AM-- low grade fever persists with headache, some nausea.

Histamine reaction 2 hours after injection and still present at 15 hours from injection: itchy runny nose, post-nasal drip, mild itchiness around body (torso, arms, ears, head), Left ear pain on side of injection . Took 50mg benadryl at bedtime and this morning took 10mg claritin and 10mg syngulair.

Evening following receiving vaccine: Severe Dizziness, Chills, Body Ache, Increased Heart Rate (racing sensation). Following day: Minor/Noticeable Joint Pain throughout body (knees, shoulders, spine). Continuing symptoms: Minor Redness/Itchiness around injection site.

Na

Palpitations, BP 113/78, HR 115 - treated with prone position, resolved at BP 122/91, HR 111

worsening peripheral neuropathy feet/legs/hands/arms

Employee stated after 15 mins observation, that he experienced heart palpations for 2mins. This nurse then obtained employees vitals. BP - 126/80, P-80, O2-97. Employee was then observed by this nurse for 40 more mins. Employee stated @ 0902 he felt fine. Denies any prior anxiety/cardiac issuses when asked. Employee left observation @ 0905.

10 minutes after initial vaccine was given patient experienced numbness and tingling to tongue, lips, and fingers. No shortness of breath or respiratory distress noted

Immediately after vaccination developed tingling in soft palate. Pale. sat for 15 minutes and symptoms remained and was given 25mg benedryl.

2hrs after vaccination, begun feeling right arm pain (on vaccine site), headache mild but continued until 4 pm same day, dizziness, felt cold though heavily dressed, right cheek tingling. Visited ED was evaluated however found to be hypertensive 170/95 (no prior history) later improved some mild headache, pain right arm improved e discharged when pain became g pain and dizziness mild , no more sensation of being cold, and assured by ED doc symptoms will improve x24 hrs. If worsen contact primary care physician

Immediately after receiving the vaccine, I felt tingling sensation in my extremities. I felt flushed, my chest became red, and I felt like my heart was racing. It generally lasted about a minute. Now, two hours later i am still feeling some tingling in my left arm.

Fast Heart Rate and light headed 10 minutes after receiving the injection and lasted around 5 minutes.

12/19/2020 Received vaccine 12/20/2020 around 2am woke up with strong body aches, pain at injection site, chills, and fever 100.9. Continued with extreme fatigue, headache, body aches and high fever through out the day. 12/21/2020 fever gone,arm still sore and headache returned mid day.

Left arm numbness/heaviness 15 minutes post injection, mostly resolved with minimal parasthesia at departure. Patient advised to go to ED for any additional symptoms.

pain at injection site, fatigue, headache, malaise, body aches, irritability

On 12/18/2020 when I woke up at 10am. The site area of the vaccine was sore, then my neck started hurting. When I went to the bathroom to view it, my right lymph node is swollen, and sore to touch. My lymph node is swollen on the same side I received the vaccine. It's still swollen today 12/22/20 and still sore to the touch. It was stated that reactions were to last 24-48hours, but this has lasted past then. No fever, no dizziness, and no nausea, just swelling in my neck.

phone call

Muscle and joint pain started 12/19/2020 and ongoing

PVCs developed about 20 minutes after administration of vaccine. Placed on Zoll cardiac monitor. Vitals to include BP, heart rate, respiratory, pulse ox several times during additional monitoring period. No respiratory distress or other issues during this monitoring period. Monitored until 1510, patient contacted primary care provider via patient portal.

12/17/20 10-mintues post injection headache, l numbness in face (15 mins, then resolved), injection site l arm and pain in r upper arm (has not resolved), nausea, loose bowel movements. 12/18/20 severe

body muscle pain has not resolved not as severe today 12/22/20, 12/19/20 joint pain in fingers more severe to l hand than the r hand, unable bend from pain today 12/22/20

Hour after vaccination: muscle and joint pain bilateral arms (still ongoing next morning but feels better after ibuprofen), right side face felt weird (numb/weakness) spouse said it looked a little swollen (face felt better next morning after benadryl)

Approximately one hour after receiving the vaccine her arm was very sore by 8pm, 12 hours later, she was very fatigued and had an upset stomach. She slept from 8pm to 5am with a very sore arm, upset stomach, pounding headache and bad body aches. She continued to sleep the remainder of the day after the vaccine.

"Employee reports onset of slight headache after vaccination on 12/17. It was relieved by motrin. On 12/18 she had ""a little dizziness"" with shifting positions. She hasn't taken any medication. The symptom has become much better. She also had mild nausea which has improved. She feels like she is not well enough to be at work today. She is going home."

Fatigue and redness around injection site about 5 hours post vaccination. Symptoms resolved by next morning.

Pt reported mild tachycardia within 15 minutes of receiving the injection with tingling in her legs. She returned to work and did not note the tingling again until the next evening. At that time, she noted tingling and a sense of weakness in her legs, though no manifestation of weakness (i.e. no falling down or legs giving out). Symptoms persisted through the 18th and 19th but were noted to resolve on the 19th.

Arm pain, shoulder pain, neck pain, back pain, fatigue, headache, chills, body ache, slight dizziness. Tylenol and Motrin taken, ice pack applied to arm

redness, hot and slight swelling in left arm and itchy all over

gout attack

TIGHTENING OF THROAT, VERTIGO - 50MG IV BENADRYL

"Initially she felt flushed and ""foggy-headed"". Then developed a metallic taste in mouth and elevated blood pressure, required extended monitoring period with continued elevation in blood pressure. Heart rate and respiratory rate stable, no respiratory distress noted. Highest BP 195/93 ranging 180s/90s, however denied need to be seen in emergency department. Final BP 155/93, less foggy, no dizziness or lightheadedness; feeling flushed remains however, declines emergency treatment. Total monitoring time: 83 minutes, without significant distress."

Fever, chills, rashes, CP, fatigue, diarrhea, congestion, pain at injection site and numbness to left arm

Head ache- started around 1pm on 12/18/20. Small joint pain started around 7pm on 12/18/20 and continues to present

About 10 hours after receiving the vaccination I became acutely lightheaded and dizzy. I walked to my bed and laid down. After 4 hours I was no longer dizzy.

Moderate soreness to injection site, mild fever, chills, body ache and head ache all started the day after the vaccine, and lasted for 2 days.

Pfizer-BioNTech COVID-19 Vaccine EAU I started with bilateral leg aches about 6-7 hours after receiving my COVID-19 vaccine. It slowly progressed through the evening. Upon awakening this morning at 4:45 am, I feel like every muscle and joint in my body is aching and hurting so bad! I am nauseated, have chills, sore throat, and fatigue.

12/21/20 fever 101.9, body aches, lower back pain, congestion and cough -- tylenol . 12/22/2020 mortin for fever AM 101.9 some relief, symptoms less today.

Headache, Angina & sore throat ALTEPLASE 2 MG ONCE left upper arm@ 12/17/20@1522

Body chills then a fever Body aches Diarrhea Headache Feeling very unwell

patient has a history of minor allergic reactions. She developed some difficulty swallowing and tightness in throat. She was not in distress and requested oral benadryl as this has worked for her in the past. Vitals monitored, benadry given 50MG PO. Patient improved over 45 minutes. Returned to work with instructions to report to ER if symptoms return.

Headache

19 y/o fully immunized female with history of anxiety presents for dizziness and nausea x 2 hours. Received COVID vaccine at 14:30. At 16:30 went from sitting to standing, felt dizzy and nauseous. No syncope. No palpitations. Similar reaction to influenza vaccine. No intervention required to previous vaccination. No history of anaphylaxis. BP 125/88, pulse 88, RR 18, 02 95%, temp 37.3.

After about 10 min, she noted numbness and tingling in the 4th and 5th digits of the hand on the side where the injection was given. She felt SOB and like she might pass out though admits this may be from anxiety. She remained in the vaccine waiting area for 45 minutes, she notified staff and was provided something to drink. She was eventually dismissed and returned to work where she completed her scheduled shift on Med Surg. On Friday, she felt numbness and tingling in both hands, both feet, and her face intermittently that persisted into Saturday. On Sunday she noted swelling in both hands to the point that she could not put her rings on. The numbness and tingling was improved in hands and face but persisted in her feet. Monday she reported that swelling is improved but still present, and there is still slight tingling in her hands. She also notes that she has been fatigued since receiving the vaccine. She had injection site pain and some generalized muscle achiness for about 36 hours after receiving the vaccine, but that has resolved. Today (Tuesday) she reports continued sensation of mild swelling in hands, reporting that they feel tight. Otherwise symptoms appear to be resolving.

A little bit of arm and neck pain still. Today I am feeling great.

Pt. received part one covid vaccine on 12/15 at 4:30 pm. The next morning at 10:30 when she woke up, she had moderate facial swelling and redness. (No rash, no GI discomfort, no difficulty breathing) Pt. took Benadryl, Zyrtec, and iced face. The following day it resolved after another dose of Benadryl.

Seen in ED - mild symptoms of feeling like his throat is swelling and he has shortness of breath. Physical exam was normal. Vital signs normal. EKG with sinus tachycardia at 106. Given PO benadryl and prednisone. Observed in the ED for a couple hours without further worsening of his symptoms. Impression/plan: possible reaction to Covid vaccination. Improved. D/C home

Vaccine was given in the ED because the employee had a history of allergic reaction to shellfish. She reported feeling like her throat was closing up and she was having shortness of breath soon after receiving the Covid vaccination. By the time the physician evaluated her she reported her symptoms had resolved. She was observed in the ED for an hour with no return of any symptoms. No medication or other treatment was required.

12/19 - onset of abdominal pain which is like her usual chronic necrotizing pancreatitis which she has had off and on for 10 years. This was accompanied by nausea. The pain & nausea last for about 3 hours. 12/20 - nausea and diarrhea. Today 12/21 she reports that she has recurrence of the abdominal pain, nausea, and feels hot. She is at work today. Advised to contact her physician for assessment and treatment as needed. Will follow-up with her

"Chills, body ache, fatigue 100.9 fever-lasted 24 hrs Injection site very sore + approximately 48hrs after injection soreness mored toward armpit. Arm is warm, red, itches slightly almost entire upper arm (5"" long x 2"" wide) + still tender to touch on 12-21-20"

Had vaccine shot on Saturday 12/19/20. Slight tingling/numbness in cheek and upper jaw for 45 minutes on Sunday 12/20/20.

Given the vaccine at 712 pm on 12/20/20. At approximately 715 pm, she began to clear her throat and then became unable to speak, followed by audible wheezes and short, shallow breaths. At 1923, Epinephrine was administered. At 1928, she was able to speak again and was transported to the ED. The patient reports after arrival to the ER, the symptoms returned. She was given PO Benadryl, followed by IV Benadryl, and then a 2nd dose of Epinephrine. She was admitted to the ICU for observation.

DEVELOPED LEFT LOWER EXTREMITY WEAKENSS for 72 hours post vaccination. Loss of sensation in left foot continues.

12/16 vaccine date 12/16 - fatigue, H/A, low grade fever 12/17 - fatigue, body aches, moderate headache 12/18 - resolution of all symptoms

At work patient had ALOC x10 minutes. Rapid response called. Transf to Hospital (12/18-12/20). D/C Dx ACUTE CORONARY SYNDROME (NON-STEMI)

"12/18 - developed headache and nausea. 12/19 - developed fever and fatigue and cough. 12/20 - temp to 100.7 with cough and some body aches. 12/21 - feels the same as 12/21 but with bad headache and

fatigue. She is taking TYLENOL and ibuprofen for the symptoms. She feels she's the same today as she was yesterday. She stayed home from work 12/21. Because of her prolonged symptoms and fever with cough - a COVID-19 PCR nasopharyngeal swab test was performed. This case back as ""DETECTED"" on 12/21."

Feels unwell. Temperature is at 100.3F.

None stated.

fever, body aches, light headness/dizzy, vomiting

chills, fever 102, fatigue, headache, sore throat, cough, SOB with exertion

Mild rash to neck and upper back- not itchy, just red starting at 9:30 pm on the night of the injection. The following morning- Body aches, headache, sore throat- moderate in severity.

Within the first 15 mins I felt flushed , the left side of face hot and red , headache , ears started to ring, hour later I felt nauseated, light headed .Left side of face felt numb , really tired . The next morning I was fine , left arm was sore couldn't lift my arm . Since the Vaccine I've been having headaches daily

Within 20 minutes of receiving the vaccine, experienced tingling on both sides of mouth and sensation of numbness in lower lip. Symptoms lasted for 15 minutes or so and resolved. No other symptoms noted.

Fatigue. Joint pains. Muscle pains. Numbness and tingling of hand/feet. Fever 101.2 . Headache

Fever, chills, sweats and a few hours later headache and myalgias

I woke up the next morning with a little puffiness in my face, my eyes and my cheeks

Very bad HA, almost migraine, 21 hrs post injection. Then added nausea. Some neck soreness. Slept/rested for 8 hours. Took excedrine and advil intermittently.

Ten minutes after received the vaccine, patient felt lightheaded, weak, diaphoretic, dizzy, nauseous, and experiencing palpitations. At that time BP 112/78 mmHg, pulse Ox 99%, HR 102. Patient was transferred to the Emergency Department for monitoring. Patient was discharged without any further sequalae.

First night local pain (1/10) only. At 45 hours post vaccine, few palpitations. At 49 hours, a few more. At 53 hours, multiple continuing palpitations without letup so went to ER Friday night 12/18. Many PVCs, some bigemminy. This is also now only 5 hours after my BID dosing of carvedilol 25mg. Cardiac and metabolic workup negative -- all normal. Went home after 4 hours. Mild chills at times but never fever. Amount of ectopy and annoying symptoms declined during following day. My internist placed me on additional propanolol beta-blockade to add to carvedilol. Still required some extra propanolol day 5 post-vaccine but otherwise felt basically normal.

hives on neck and chest 20mins after the injection. The hives burned no itching

Felt fine after vaccine. Approximately 9 pm, I went to bed and began experiencing paresthesia in right arm, then noticed the paresthesia in both hands, both feed and also in right leg. The following morning, was primarily in my hands. I went to work, and as the day progressed, noticed in my feet, and right leg again, but hands not right arm. On Sunday & Monday, the paresthesia was more intermittent with timing lengthening between bouts. Monday, I went out in my car, and noticed that the paresthesia was worse in my right foot, Mid plantar to toes, Couldn't feel the gas pedal with right right foot. No paresthesia in left foot, left hand. Also noticed besides not feeling well, that I felt like was in mental fog, unable to articulate some things. That was intermittent, also (have had poor appetite for @ least a week prior to vaccine). This morning (Tuesday) I have paresthesia from my right shoulder down to fingers, and continue with right foot from mid plantar to toes. Mentally feel a little bit better, not as foggy.

Fever, chills, body aches muscle and joints, headache, ringing ears, eye pain

Patient stated burning sensation upon administration of Pfizer-BioNTech COVID-19 Vaccine.

Hives at day 2 treated with OTC medication like benadry. Day 4 reported shortness of breath and patient being seen in the ED.

Felt pain after vaccine. I had some diarrhea. Then this morning, I had more diarrhea with my throat soreness, and congestion, and still diarrhea.

dizziness, light headedness, severe nausea, rash/hives over chest and back and forearms, severe chills/shivering

Right jaw numbness, resolved with 1 hour, did not seek medical attention.

20 minutes after receiving the vaccine this employee experienced nausea

At 35min post vaccine patient noted with redness to the chest, neck and going up to face and bilateral ears. Ears were swollen. Patient transferred to the Emergency Department where she was noticed to have swollen lips

Bodyaches, headache and chills that started the next morning after the vaccine.

nausea that night, Vomited that night and the next morning , Fatigue, headache

57-year-old female history of hypertension, hyperlipidemia, type 2 diabetes, COPD, subsegmental PE is not on anticoagulation, multiple cardiac stents presenting with greater than 12 hrs of worsening left-sided chest pressure, headache and shortness of breath. Patient takes a daily aspirin and had no improvement of symptoms with her at-home nitroglycerin. Here afebrile, HTN, remaining vitals wnl. Non-toxic, in moderate distress 2/2 to pain. EKG with minimal ST depressions in leads II and III. Will plan for CXR and labs. Pt given zofran and morphine for pain control. Will give additional aspirin for total 324 mg in last 24 hrs. On re-evaluation, pt with mild improvement in pain. Troponin elevated at 0.18, remaining labs wnl. At this time concerned for NSTEMI, pt treated with 1 mg/kg of lovenox and MOD consulted for admission. MOD evaluated pt and cardiology was consulted. Given concerning PMHx and

current hx of chest pain with findings consistent with NSTEMI, cardiology at recommended likely transfer for cardiac cath. Will pend repeat troponin and EKG for dispo decision.

Employee described being fatigued, dehydrated, and low grade fever

Woke up in the middle of the night on 12/20 and noticed that the left side of tongue felt like he had bit it. He woke up again on 12/21 at 1:10 AM with a swollen tongue. He also had left sided unilateral edema. NKDA or significant past medical history. No past allergic reactions. Went to the ED and was treated with benadryl and a methylprednisone. Sent home with additional medications in case condition worsened again.

Employee reports itching and tingling to right arm that traveled to elbow, employee reported sensation was 'easing up' 5 minutes after it started. She also reported itching to flank area, no rash was noted. Employee was taken to ED for evaluation and treatment.

Increased heart rate, increased blood pressure, cold/clammy feeling, urticaria (neck), swelling in neck and chest. At vaccine clinic area, Benadryl 50mg IM given. Rapid response called via overhead page. Patient taken to ER from vaccine clinic. In ED, given famotidine 20mg IV, methylprednisolone 125mg IV.

Tongue tingling, throat tightness @0520 Chest heaviness, lips numb @0525 Voice hoarseness @ 0530 IV Benadryl given approx 0550 PO prednisone given approx 1000 Left side of face still numb after 24 hours

Employee experienced nausea and headache

ain at injection site 8 hrs after injection, fever, chills, joint and muscle pain, tiredness 16 hrs after infection. temp reached 101.0.about 20 hrs after injection. temp down to 99.6 after 36 hrs, just still running some low grade temp. soreness, joint pain better.

12/17/2020 INJECTION. 12 HOURS LATER, NAUSEA W/ TACCYCARDIA, PROXIMAL. HEARTRATE 150. WENT TO ER. HAD TESTS DONE. NO HISTORY OF ANXIETY; HAD PRETTY ANXIETY. LASTED ABOUT 45 MINUTES. ATIVAN PRESCRIBED BY ER DOCTOR. DIAPHORETIC. I AM WORKING BUT STILL DIAPHORETIC AND STILL FEEL A LITTLE FATIGUED. DON'T KNOW IF RELATED TO VACCINE.

Exhausted, dizzy, nauseated, rapid heartbeat, pain in joints all over body, fatigue

1 episode of vomiting and diarrhea 12 hours after administration. Afebrile. No other events of nausea/vomiting yet during pregnancy. 4 weeks, 4 days pregnant. EDD 8/27/21.

Began developing tightness/soreness in his throat, some DOB, and increased blood glucose. NKDA or history of adverse reaction to vaccines. Benadryl 50 mg given IM at clinic site. Noted to improve after 15 minutes. Was sent home with instructions to return to the ED with worsening of symptoms.

Approximately 65 hours post-vaccination patient felt profound fatigue, no appetite, and had increase in baseline chronic cough, and anosmia. Patient was admitted to the hospital on 12/21 due to worsening respiratory symptoms that required supplemental oxygen-initially 2L via nasal cannula. Patient was

upgraded to ICU-level of care at 6:30PM 12/21 to receive high-flow nasal cannula, and has had one episode of fever (100.6) 12/22 at 7:00 AM.

Post-dose 1 of COVID-19 Pfizer vaccine, pt started feeling lethargic and lightheaded. Lightheadedness start 12/18(post-dose Day1) and it became more significant 12/19-12/20.

fever, chills, headache, dizziness, lightheadedness, body aches

I have a sore throat, runny nose. Also, I am having chest discomfort as my chest feels heavy, the mask did not effect my breathing, but now since I received the shot it is hard for me to breath while wearing a face mask. I am taking deep breaths to try and catch my breath. My hands are swelling with fluid and going numb. I feel warm/hot but no temperature

12/18/20 approximately 10:00am 1st COVID injection administered. within 30 minutes I had a mild headache (was not throbbing but nerve shooting in nature). later that evening i noticed heart palpitations and rapid heart rate max 130 reps. the heart rate quickly normalized but heart palpitations remained intermittently that night. Saturday morning I woke with stuffy sinuses, chest little tight but chest tightness clear with coffee intake. sinus remained irritated and then as day progressed i began feeling aches/fatigued/temp 99.0F/mild headache with shoots ear pain bilateral/mild chills/loss of appetite. woke Sunday feeling fine with the exception of loss of appetite. As Sunday progressed i attempted to eat lunch approximately 2:00pm (first meal of day). could not eat much, felt heavy on stomach, began to feel aches/chills/no Temp/loss of appetite with stomach pain and nausea after eating solid food/fatigued again. since then these symptoms have remained. reported to necessary provider and Employee Health.

swelling to uvula seen in Emergency department observed for 4 hours in Tele unit sent home on 12/21/2020

Slight tingling in injection arm

None stated.

employee self-administered epipen prior to going to ED (community)

Employee received vaccine in hospital. Waited through 15 minutes observation period and went back to his shift. There he felt some throat irritation and lip tingling. Manager took him to the ER where they evaluated him - vital signs stable, no shortness of breath, no rash - and gave him benadryl and prednisone and he was able to return to his shift and complete his entire shift.

None stated.

None stated.

Was taken to Emergency Department within the same hospital facility where vaccine was administered. No other side effects other than those mentioned above: scalp itchiness and erythema to right knuckle.

Immunized at 9:15 AM- no symptoms, 2-3 episodes of palpitations throughout the day, resolved spontaneously; 9:00 PM chills and palpitations lasting approximately 1 hour- resolved spontaneously with no further symptoms outside of a sore (expected) injection site.

Left arm pain radiating down extremity, mostly resolved immediately

About 4-6 hours after I had the vaccine, I experienced severe tenderness at the injection site. I had a low grade fever of 99.6 for a short period of time. Dizziness, headache, and body aches have continued over the past 9 hours (~2AM - 11:30AM).

All started 2 days after injection Severe Headache, Diarrhea , Chills, congestion nose

Patient provided immunizations, after injection and retraction of needle, member has some fluid seepage from injection site. Concern not entire 0.3ml were absorbed. No pain or redness at site. Member scheduled for follow up 2nd dose in 21 days.

States she had headaches lasting several days, back and hip pain, shoulder and upper back soreness, chills. Took Ibuprofen, did not alleviate symptoms. Slept and rested until symptoms subsided. Symptoms lasted for about 3-4 days.

Pfizer-BioNTech COVID-19 Vaccine EUA On 12/21/2020 13:17 the patient received the first dose of COVID-19 vaccine. During monitoring, the patient experience itching skin. Hives and welts were not located. The injection site was read and hot. No wheezing occurred, no tachycardia observed. The patient report a history of anaphylactic reactions to food (Sesame), but has never had an anaphylactic reaction to vaccines in the past. Patient also reports anaphylaxis to lidocaine. The patient was treated with ice pack on injection site, 50 mg diphenhydramine, 10 mg cetirizine, and 20 mg famotidine. Patient was observed for a full hour. Advised to pre-medicate at 2nd dose and to alert vaccinator of this reaction.

My arm was not that sore or anything but Friday morning when I woke up my throat was really really sore and I felt congested. My nasal mucus was green and I was also coughing up some green phlegm. I went to the walk in clinic because I had to go to work and wanted to make sure I was well enough.

12/19/20 AM tender arm-- PM arm/ hand tingling numb, itching hands and lips. 12/20/20 Nurse triage line advise to take medication for Loratadine 10mg, Symptoms have not resolved; not as intense today 12/22/2020.

headache and extreme pain in left arm

Dizziness, muscle aches, sore throat

Itching at medial surface of left upper arm (injection site on lateral L UE). Also reported numbness down ventral surface of L forearm into hand. No weakness. She received Benadryl 50mg po at 10:00am. Itching began to improve during this documentation. No airway compromise. Clear mental status. She is recovering from the itching, but the numbness in the hand is still present.

12/16/2020 around 2300 body aches, followed by chills progressed to rigors, developed a migraine 6 to 8 hours after fatigue, insomnia, temp was 100.4. Those symptoms progressed and stayed stable for 24 hours until the next night and didn't resolve until the 18th and late that night I developed lymphadenopathy in left axilla, al nodes very swollen and large. That subsided since then. I took Tylenol and 10mg Rizatriptan for migraines and that resolved. **I was in a double blinded study for the AstraZeneca trial and am still unsure whether or not I received the placebo or the actual shot. Nov 30th

within 10 mins of receiving the vaccine I had a burning sensation across my chest, arms and face, developed hypertension, tachycardia and had perfuse sweating. Blotchiness was noted on my face. I felt like the inside of my body was on fire, only in my torso area. I was given an ice pack, vitals were monitored and the symptoms resolved after 10 mins. Then within 5 mins, the symptoms returned. They again last for about 10 mins and resolved enough for me to leave the vaccination observation area. I was monitored closely for over an 1hr post injection. I did have itchiness in the roof of my mouth, so I took Benadryl 50 mg when I got home and the next morning had major fatigue and mild soreness in the injection site.

I would just say not sure if it's from vaccine exp severe headache 12-18 hrs after vaccination. No other symptoms was unable to return to work.

Headache, Chills, sore throat, muscle weakness, fatigue

Symptoms occurred approximately 30 minutes after vaccine administration

Chest tightness and shortness of breath since 12/19/20

"Patient noted that approximately 18 hours post vaccination, began to experience ""COVID"" symptoms, including aches, chills, dizziness, shortness of breath, fatigue, difficulty focusing, some lower limb weakness. Patient did conform past COVID infection and symptoms are consistent, yet milder than when actively infected."

Had chills at 3 am, took Tylenol 750 mg PO. Skipped work that day due to unexpected chills. Had a fever of 100.3 F, neck pain, headache and muscle aches around noon the same day. Took another Tylenol 750 mg. At 9:00 PM and next morning at 6:00 AM took Tylenol 750 PO. No more symptoms observed.

Itchiness in throat and edema at the mouth.

Sore arm, chills but no fever, body malaise

Pfizer-BioNTech COVID-19 Vaccine EAU

12/18/2020: Pain/heat at injection site, dizziness, muscle aches, nausea, increased mucus production, fever, chills. 12/19/2020: Fatigue, tiredness, headache, nose congestion, muscle aches, injection site was very painful/muscle stiffness left deltoid/applied heat didn't even help, left arm wasn't red, swollen, or hot to the touch. 12/20/2020: Fatigue, tiredness, increased mucus production, cough,. ADHD medication was not taken this day to specifically rest the majority of the day because I thought that would help

alleviate the symptoms. 12/21/2020: Cough, headache, nasal congestion and drainage. I did take a short jog (2mile) this day because I was felling overall better. 12/22/2020: Cough (no chest congestion), increased mucus production, headache (sinus), tiredness, slight confusion/unable to focus well, nausea, diarrhea.

Pt noticed discoloration/mottled appearance of skin near joints on lower extremities. Adverse event lasted less than 36 hours and resolved without treatment.

1st day- started to have left arm pain, sore, heavy at around 6PM 2nd day - started at 5 am noted my left arm was swollen, still sore & painful, having chills, headache muscle aches and later on having fever 99.8F-100.2F. Took Tylenol x 3. 3rd day - still having muscle aches and left arm pain & soreness. 4th day - still having mild left arm pain.

Left UE injection site soreness 4 hours post. Severe vertigo approximately 10 hours after, lasting about 4 hours.

Dry mouth and dry throat. Symptom began 15 minutes after injection and lasted about 3 hours.

Employee calling to report a reaction after receiving a COVID-19 vaccine. Vaccine Name - Pfizer Vaccine Lot # - EK5730 Vaccine Date and time - ?12/18/2020 @ 5:30pm Is this your first or second dose? First Date and time of symptom onset - ?12/22/2020 @ 9:00am Symptoms - ? mild dizziness, feeling hot but no fever, very mild sore throat, intermittent cough, fatigue Last day of work and shift - ? 12/22/2020 7a-3p Home remedies? none Any improvement? - n/a Recommendation? Employee asked her manager to go home early because of her symptoms. She wanted to be tested cause her family from out of states are coming over for the holiday. Advised to continue monitoring at home & call us back if symptoms worsen. Employee voiced understanding Employee of information ? yes Employee voiced any concerns ? no Employee?s questions answered to employee?s satisfaction - yes

Shortness of breath, chest tightness. Treated with epipen, benadryl, pepcid, solumedrol in ED. Symptoms resolved.

Hives

Employee reported diminished sense of smell and taste and 12/18 the day following vaccine. A nasopharyngeal swab was performed for PCR testing for COVID-19 on the day (12/18) and was negative for COVID-19 (Not Detected).

Notes APRN (Nurse Practitioner) ? ? None stated.

chest pain, across bottom of rib cage, pain with deep breathing, Motrin did not help

Sore arm, shortness of breath, swollen lymph nodes, anxiousness, and tiredness.

First 10 minutes felt cold, headache and numbness in both legs. Tingling in legs and headache remained for 30 minutes. But then indicated felt much better after 30 minutes. Patient also stated that he felt he needed to urinate right away. Patient stated he is blood pressure medications and did not take his medications the morning of the vaccine administration. Pre administration BP 143/76 and Pulse 92 Post administration BP 235/135

Employee experiences nausea and injection site pain

Hives on left leg above the knee (ventrolateral surface)

Self-limiting Pain at injection site (lasted 3 days) Self limiting Tingling in left arm (pins and needles feeling) starting morning after the vaccine and lasting for 3 days and mild hand tingling (lasting 4 days).

immediately after the injection was administered, pt experienced a vagal response; experienced instant lightheadedness, dizziness, and diaphoresis. after elevating feet and sipping cool water, all symptoms resolved after about 15 minutes and pt was able to leave the clinic on her own. pt also reported high level of anxiety prior to receiving injection.

Pt called to report rash on arms and legs on day 3 after receiving the vaccine.

Entire left arm pain that radiated up left side of neck, fever, chills, body aches, joint/muscle pain, teeth hurt, hair hurt, sweats, nausea

Developed body aches and fatigue the day of the vaccine. Developed fever of 100 and high bp and p 12/22 (day after vaccine). BP 151/108, p 116. Referred to clinic for f/u.

Developed body aches and fatigue the day of the vaccine. Developed fever of 100 and high bp and p 12/22 (day after vaccine). BP 151/108, p 116. Referred to clinic for f/u.

PT states he began feeling tired the afternoon of the vaccination, approx 1500. He rested and woke during the night at 2am with temp of 103.0 and headache, muscle aches. Temp at 3 am was 100.7 and headache/muscle aches. Temp 0900 was 100.0 with headache/muscle aches. Pt denies nausea, vomiting, sore throat. will continue to monitor

"12/21/2020 4:30PM itching throat, clearing of throat, lump in throat, coughing, very dry throat, coughing sensation to remove ""something"" in throat, fat tongue/throat feeling, throat feeling as if closing, coughing fit --- pt transferred to ER. Panic attack, unable to breath feeling --medications via IV -- Benadryl (flushed), Pepcid and steroid for inflammation) administered. Heart monitored while receiving treatment. Discharged at 08:00 PM with prescription for Benadryl and steroid Prednisone."

Headache Fever- temp as high as 102.7

Patient self reported day after vaccine having an adverse reaction and taking benadryl. He reported to work today.

Developed numbness in legs and back of neck. Swelling on left side of face. Given Benadryl 50 mg PO and sent to emergency room.

Employee began to experience light headiness right after receiving the vaccine

Headache ,whole body ache , back pain ,low grade temperature 99.2 since yesterday

Dizziness, headache, body aches. Temp 99.4-99.6. Supportive measures.

Itchy rash on face and neck, slight body aches, fatigue

Shortly after receiving the vaccine I developed a headache followed by muscle aches, fever, chills, nausea, joint pain, brain fog, fatigue, dry cough.

20 mins after receiving vaccination experienced lightheadedness, palpitations, and faintness; was assessed (BP, HR, RR) which were elevated; rested, water, and started to feel better; 20 mins later had another wave of lightheadedness and my vitals increase again which was more intense then the first time; put me on O2 and sent me down to the ER where they monitored me on telemetry, general blood work, EKG, and assess me for swelling, rash and further reaction; BP got to 134/100 but other then that no outstanding numbers; 15 mins after arriving at ER they gave me benedryl and a steriod per IV and IV fluids; right after they gave me that had another wave of lightheadedness which didn't last a long as the

others; symptoms seem to subside and then the let me go home; had no further issues that night other then insomnia; Next day had shortness of breath on exertion but was able to go about my day and just ease up is I was tired; at 6pm that night I started having redness, hottness from the injection sight and the redness (like flushing, not rash) spread from my left arm across my chest to my right arm, and up to my face; felt over heated like I was having a hot flash and my left ear (side I received the vaccine) start to ring; took a dose of benedryl per the bottle instructions and it seemed to calm down; today (day 2) I woke up feeling somewhat ok but as the day is progressing my head feels floating and having trouble concentrating, my upper body from my chest up feels tingly, heavy and weak like I just worked out my muscles and my had are really cold esp on my right hand; my vaccine site is still very warm;

"Patient states that she received the vaccination at 10:24 AM. Patient states approximately 2 minutes after that she felt pain and swelling and erythema in her left arm at the injection site. Patient states she felt like she had a somewhat of a ""apple in her throat"". Patient states that her left arm was tingly. Patient states that she has a headache in the bitemporal area. She states that she has a history of headaches. Patient states that she has no visual changes. Patient states that it started after the immunization. Patient states 5 minutes before I came into the room she vomited and now feels tremendously better. She is talking in a complete sentences. Patient is somewhat tachycardic on initial Patient states that she received the vaccination at 10:24 AM. Patient states approximately 2 minutes after that she felt pain and swelling and erythema in her left arm at the injection site. Patient states she felt like she had a somewhat of a ""apple in her throat"". Patient states that her left arm was tingly. Patient states that she has a headache in the bitemporal area. She states that she has a history of headaches. Patient states that she has no visual changes. Patient states that it started after the immunization. Patient states 5 minutes before I came into the room she vomited and now feels tremendously better. She is talking in a complete sentences. Patient is somewhat tachycardic on initial presentation. Patient presents via BR RT for evaluation. Patient has a host of allergies.Patient is anxious upon presentation. Patient does have a history of anxiety. No other travel or trauma. Patient states that her pain is severe. States that she has some pressure in the bitemporal portion of her head and her left arm injection site. Otherwise nonradiating. No other known aggravating, triggering or alleviating factors. Patient dates its concurrent with the injection time. Otherwise nonradiating. BP 180/100 at 1045, O2 sat 98%, ECG sinus tachycardia Repeat Vital Signs BP 133/82 | Pulse 82 | Temp 36.9 ¦C (98.4 ¦F) (Oral) | Resp 16 | Ht 1.702 m (5' 7"") | Wt 197 lb 1.5 oz (89.4 kg) | SpO2 98% | BMI 30.87 kg/m¦ Constitutional: Well developed; well nourished; in no apparent distress; non-toxic appearance HEAD: Atraumatic. Normocephalic. Eyes: PERRL; EOM intact; conjunctiva and sclera normal to inspection. HENT: TM's normal; no rhinorrhea; normal pharynx with no erythema or exudates. Mucous membranes are moist. Uvula is midline. No hemotympanum or foreign body. NECK: Supple; non-tender; no cervical lymphadenopathy. Respiratory: No respiratory distress; normal breath sounds; breathing non-labored Cardiovascular: Normal rate; good peripheral perfusion. No murmurs or rubs CHEST: Nontender. There are no retractions. GI: Normal bowel sounds; non-distended; non-tender to palpation; no palpable organomegaly GU: Musculoskeletal: Extremities non-tender; normal range of motion; no edema; Normal distal pulses Back -Normal tone; no tenderness Integument: Well hydrated; no lesions; no significant rash or palpable nodes. Neurologic: Alert, appropriate; oriented to person; place and time. No focal deficits. Motor 5/5. Sensation intact in all 4 extremities. Psych: Mood and affect are anxious.

Mental status appears normal at time of exam. Patient upon presentation is anxious. Patient did vomit x1. Patient was talking in complete sentences upon my evaluation. Patient feels that she has some discomfort to her injection site with a headache. They feel no warmth or erythema. Patient was given Tylenol for the headache which did improve. Also received ondansetron, diphenhydramine, famotidine, methylprednisolone, NS 1000mL. Patient was monitored for an extended period of time and has had no return of symptoms. I am uncertain whether this is a true allergic reaction since the symptoms started approximately 2 minutes from the time of the injection. Patient does have a history of anxiety and this may have played a role within the symptomatology. At this time patient feels much better. Patient be dismissed we will send the patient home with a prednisone taper. She can take oral Benadryl and Pepcid. Follow-up with her family doctor next couple days not feeling better. Patient is dismissed. Patient returned to ED on 10/22/20 0100. Presents to ED complaining of numbness and tingling all the way from her head to her left toe on the left side. Has taken Benadryl 3 times today. She states that she woke up this evening with her heart racing. She still has a little bit of a headache. No fevers. He was nauseous. Again she says the whole left side of her body is tingling. All other systems negative/without deficit. HR 124, BP 168/107. Repeat Vital Signs: BP 129/77 | Pulse 99 | Temp 37.2 ¦C (98.9 ¦F) (Temporal) | Resp 20 | Wt 206 lb 2.1 oz (93.5 kg) | SpO2 100% | BMI 32.28 kg/m¦ EKG showed a sinus rhythm without acute ST changes. She is anemic but she has a history of that and her hemoglobin is not significantly lower than usual. Sed rate is little bit elevated but her C-reactive protein is normal. Her glucose slightly elevated at 173 but the rest of her labs are normal. CT and CTA of her head and neck were normal. I do not know at this time if this is a reaction we will have her continue the prednisone taper she was started on earlier as well as Benadryl and have her follow-up with her primary care physician."

Left arm soreness and pain. Began overnight. No skin changes. Painful to touch. Painful with abduction and lifting. Empty Can Test positive.

Around 1-2am I developed a fever and chills associated with moderate diffuse myalgia, arthralgia in my left elbow strangely enough (injection was in right deltoid), and fatigue. My symptoms were constant until around 1pm when I took 500mg Tylenol. Of note, I had COVID in March 2020.

Lightheaded, dizzy, nauseous, and heart palpitations about 5 minutes after getting vaccine. Laid supine for 30 minutes with blood pressure continuously taken. BP 188/93

Developed numbness and burning to left arm. Had tingling on left side of face. Given Benadryl 25 mg PO and sent to emergency room.

30 minutes post vaccination, pt started feeling flushed and itchy (mostly in the anterior neck, Rside of face and R ear). Positive pruitis and flushing, vital signs taken, within normal limits for pt

Employee Experienced hotflashes

Weakness, low fever, chills, sensitivity to touch/light/sound, headaches, muscle aches, shakey

Contracted associate received vaccine on 12/18/2020 at 1000. Within 1/2 hour began to feel very hot and extremely tired. She left and had to rest in the lobby before she could drive home. She finally drove home and all weekend was short of breath, hot (not sure if she had a fever), fatigued. She went to the ED this morning (12/21/20) had a Rapid COVID test that was neg and is now waiting for PCR test results. She has been instructed to quarantine for 20 days. She has lupus and a history of kidney transplant in 2004.

Shoulder pain, arm pit pain, deep scapula pain with inability to move arm without significant pain starting on 12/20.

Felt dizzy with blurred vision for a few seconds. Began to have chills for a few minutes, with concurrent shaking.

Temperature of 99.6 and fatigue

Numbness to left arm with shoulder blade pain and neck pain. Resolved on own.

Severe fatigue, Brain fog

Employee Experienced high blood pressure, headache, and light headiness

7 hours after vaccination onset of fever, lethargy, headache, dizziness. 1 Liter Normal Saline

"Patient reports headache 7/10 not relieved by motrin. Onset of the headache was upon awakening at 0500 on 12/17. She denies visual changes, nausea, and vomiting. She also reports that her back is sore. She has a history of migraine headaches and has not taken her migraine medication for this headache. She says she gets headaches ""all the time"" and this headache is different for her in that she didn't experience the visual aura she usually gets with her migraines."

following vaccine administration, patient verbalized dizziness and became pallor. rapid response team notified for further disposition. patient denies chest pain, SOB, N/V. patient remain AAOX3 with no LOC. treatment resolved with no ED escalation. Patient exited vaccination area ambulatory with no concerns.

Patient started new blood pressure medication this morning. Vitals at beginning of ADR: BP 91/56, HR 66 therefore, rapid response called, vitals were BP 105/67, HR 73.

phone call visit

phone visit

Arm soreness, swelling achy, cold, headache

Pfizer-BioNTech COVID-19 Vaccine EUA given to RD on 12/16 @ 12pm. Loss of feeling in right arm started @ 4pm & lasted until end of day on 12/17, along with muscle weakness & migraine. All symptoms resolved by 12/20 & she felt great.

Ee stated she started to feel dizzy. V/S as followed B/P: 96/60 P: 63 O2: 99. Ee stated she was feeling clammy and she usually gets this way when given vaccines. Adverse reaction started appro 7:38 pm. Ee felt better approx. 7:46.

phone call

Right after given the covid vaccine. When I stood up to go to another desk, I sat down and my throat started to feel funny, and my tougue started to swell and I had a hard time swallowing. I informed the nurses that I have a problem. I was taken to the emergency room right away. I was treated with an epi injection and it did not relieve my reaction. They then gave me another injection, then later my throat started to swell again, and I was given another dose of an epi injection. I was release at 7pm after observation. Last night, I had another delayed reaction, I took a benadryl, and a zertec, and prednisone and the symptoms went away. This morning, I am fine. Today, it feels a little tight, but it's not bad.

"PATIENT STATES ""I FEEL LIKE MY HEART IS RUNNING"" HEART TAKEN AT 9:30- 90 IRREGULAR TAKEN AGAIN AT 9:49- 72 IRREGULAR PATIENT STATES THAT SHE IS FEELING BETTER PATIENT OBSERVED ADDITIONAL 15 MINUTES AND RELEASED"

Tingling all over the body, nausea, pale-looking, hot/cold, clammy, duration approx. 2 hours but not as severe.

had fever, chills, body aches?..a rough night. Still have body aches beyond just the arm

Headache, myalgias, fever, chills for 24 hours, starting 18 hours after vaccination

Severe headache for four days after vaccine, trouble keeping temperature below 100, extreme fatigue, shortness of breath, chills, nausea, loss of appetite, body aches, chest pain.

About 10 hours after I received the vaccine I developed chills and a slight fever (99.4). About 18 hours after I received it I developed shaking chills, fever of 100.6, and severe body aches. The fever responded to ibuprofen. It is now approx 28 hours after I was vaccinated and my fever and chills have returned along with the body aches. It is hard to tell if this is from the vaccine or if it from an unresolved pneumonia, as these are symptoms I had with the pneumonia and strep infection.

After I got home from work, around 7 pm I started to feel side effects such as the following: fatigue, muscle aches, feverish, malaise, injection site soreness/pain. This lasted for about 48 hours.

Temp spike at approximately 32 hours post vaccination. Mild flu-like symptoms that resolved 72-80 hours post vaccination

Racing & pounding heart, dizziness, tingling feeling prior to dizziness, then shaking hands. After shaking, heart rate returned to normal. No blood pressure change was noted. Whole event lasted no more than 5-10 minutes.

Arm/injection site pain within first 12 hours, then chills, followed by fever and severe headache, muscle aches and fatigue. Symptoms continued into 48hrs post injection.

I was awoken around 1 in the morning to severe calf muscle cramps - right and left leg, fever, body aches all over for about 15 hours. Tylenol, rest and water.

Mild soreness to upper left arm which was still present the following morning.

Pfizer-BioNTech COVID-19 Vaccine EUA Injection site pain that started 7 hours after injection and has continued to now. Pain is lessening as time goes on. Tylenol has helped. Headache, Nausea and ear ache all started this morning (7am). Headache is continuous; nausea and ear ache are intermittent

20 hours after vaccine, I had uncontrollable shaking, fever 99-101, headache, and I am still experiencing on the left side of my neck - clavicle, and in my axilla under my arm, clusters of lymph nodes that wont go away. Fever, chills, head ache and body ache all went away and lasted only for 2 days. The lymph nodes are still pretty big and are still here .

0843 vaccine administered. 0855 patient reported a rapid heart rate (112 beats per minute) and tremors. No airway complications.

High fever, upto 101.5, severe myalagias, nausea, similar intensity as of my actual infection. Took Acetaminophen with no effect. Responded to Ibuprofen. Better on day 3 12/22/20

Approximately 10 minutes after vaccination c/o feeling shaky, she then stated her neck itched and she exhibited generalized urticaria. Was given .5ml Epinephrine IM at 1000. Stated she was having thickened feeling in her throat, had high blood pressure on 191/126 and was nauseated. Was given 1ml of Benadryl IM. Ambulance called at 0958 and transported to hospital at 1008.

Flushing Sweats Chills Heart rate was ranging between 45-190 according to watch Nausea Vomiting

Next day developed approx. 2.5 x2.5 inch, round, reddened area around vaccine site, told to ice site & contact if any worse. 12/22/2020 improved site reaction

Yesterday had no energy, real tired, heart beat rapid. Not normal for him. Slept yesterday a few hours. and then again at night. Called facility and they stated that he should go to ER if needed and to call VAERS to report AE. Patient is a DOD Firefighter.

Petechiae developed on 12/19 on legs and torso and back Took Benadryl although not pruritic.

ITCHY, HARD TO BREATH,HEADACH I WAS GIVEN EPIPEN RUCHED TO ED FOR FUTHER TREATMENT

Received vaccine Saturday 12/19/20 around 0700AM. ON 12/21/20 patient began developing rash and redness around injection site. Took diphenydramine and recovered.

Nausea, headache

11 minutes into the vaccination, patient noted to have tongue and mouth tingling and heart racing. No noted tongue/lip/throat swelling, dyspnea, n/v, abdominal pain, rash, near-syncope. Started to improve after 30 seconds.. H/o tachycardia secondary to salmon, no prior anaphylaxis or use of epinephrine in the past. Sent to ED for evaulation

Developed tachycardia, tremors, hypertension, rash. Given diphenhydramine and fluid bolus in ED and discharged home.

within one hour facial prickling sensation and mild dizziness -- by 6pm same day, moderate aching all over and moderate headache also. Next day continued symptoms but milder and intermittent facial prickling

Fatigue, headache, body aches, chills, nausea, diarrhea, fever, joint pain, cough, sore throat, nasal drainage. All started 2 hours after vaccine, although she states she had a headache at time of vaccine, but stated this is not abnormal for her. She also reports that she had an exposure at lunch to co worker on the 10th, that then became symptomatic on the 15th and tested positive. Also states she had sore arm at injection site for 4 days.

5-10 minutes after the vaccination, I experienced tingling and numbness in my tongue. Very similar to the feeling when you go to the dentist and he uses the numbing agent before procedures. Comparing to the dentist, my adverse reaction is not as severe, 10 being a whole injection of numbing agent to prevent sensation in the mouth, this is likely a 4/10 tingling/numbness feeling. It has persisted for 3 hours now, the intensity of the feeling has slowly decreased overtime, but I still notice it after 3 hrs. My right arm where I get the injection is also a little sore, but that is expected and very similar to all the other vaccines I get.

Left side vaccine administration, site reaction, slightly reddened. Iced

Patient woken by sore arm in the middle of the night following vaccine. Over the next 3 days had intermittent headaches, some nausea, and fatigue.

Patient experienced tingling on lips and back of the tongue as well as coughing. Then benadryl was administered which led to resolution.

Saturday 12/19 early am, sore shoulder when rolled onto in sleep. HA through out day Sunday 12/20 quarter size red area surrounding shot Monday 12/21 knot at site of injection that others could feel through my shirt-painful. Swollen left arm pit but no distinct lymph nodes felt. Arm pit tender when palpated. Tuesday 12/22 arm pit swelling remains as well as knot at site and pain when either or both palpated.

Vaccinated at 9:00am through employee health. Within 5 minutes of vaccine administration, developed palpitations and flushing. These persisted and worsened and I was transported to the ED. During transport I developed chest tightness and throat tightness. On arrival to ED, HR 125, BP 150/97. Observed for 2 hours, given normal saline but no medications. Over time, palpitations and flushing subsided first. Then chest tightness persisted for about 2 hours. Was discharged from ED within 2 hours. Throat tightness persisted for approximately 8 hours total and gradually resolved.

PATIENT IS EXPERIENCING ELEVATED BLOOD PRESSURE OF 170/101

Burning in throat, flushed face and neck. Developed stridor. Benadryl 25 mg PO given, Epinephrine 0.5mg given IM, albuterol inhaler 4 puffs. Transferred to the Emergency department and admitted to the hospital.

"Nurse who had worked the shift and had drank an "" energy drink"" prior to vaccine. she felt palpitations and and elevation of blood pressure. No itching hives or angioedema. No dyspnea. Pt observed and discharged home without any therapy"

fever of 101.4 reduced with Tylenol administration

Next morning, patient had a rash and swelling on forehead and back of hands. She took a benadryl and went to the emergency room.

0755 Pt notified other Nurse that he is feeling nausea; slight dizziness. He reported to Nurse that he did eat light breakfast this AM prior to COVID #1 Injection. Pt resting with eyes closed. Nurse spoke with pt, DOB, pt works in, Nurse offered pt Water, Crackers, snack. Pt offered to be taken to ER or to call Rapid Response so vitals can be taken and closer monitored. Pt refused ED and Rapid Response. Pt stated he will just sit longer and complete his Observation time. Nurse provided Continuous Monitoring; checked on Pt symptoms every 5-8 minutes. Pt stated he is fine and symptoms are subsiding. After 15-20 minutes of Observation; Pt was ready to leave. Pt stated he is well, symptoms have resolved, he is fine; per pt. Pt left Observation at 0808; steady gait, denies chest pain, SOB, any further Dizziness, or any further Nausea.

Patient became Lightheaded, dizzy @ 11:24 am BP 155/92, Sat 100% on room air, P-100, repeat BP 11:25 141/94 Sat 99% P-98, 11:28 154/91 sat 100%, P-99, patient described having palpitations, transferred to ER via gurney for increased BP, light headed, dizzy palpitations

Patient received the first dose of the Pfizer covid vaccine on 12/16 and on 12/17 in the afternoon she developed a rash on her chest. She reports the rash was little raised bumps and was itchy and red. The rash extended to her abdomen, back, neck, arms and legs on 12/18-12/19. The rash began to fade on 12/20 and is almost completely gone now 12/22. Patient not treat with rash with any topicals or oral medications.

Fatigue- On going body aches Muscle pain-Torso Headache- On going - Head aches when moving around chills- 3 hours

Patient was administered the Covid19 vaccine. She was advised to wait 30 minutes post vaccination. While the patient was waiting, she reported having an itchy throat, throat tightness, then a hoarse voice and a cough developed. This happened at about 20 minutes after she received the vaccine. The patient was assessed by the nursing and provider staff. She received an adult epi pen injection and EMS was called. Patient was taken to the ER by EMS. She reports she received two more epi injections, benadryl, and Solu Medrol. She was stabilized. Patient was discharged from the ED after several hours. She then reports a second episode of throat tightening and worsening cough at 12:30 am and was taken by ambulance to the ICU and admitted. She is still in the hospital at this time 12/22/2020.

17 minutes after vaccination, had itching all over body, inside mouth; noted itching palate and tongue, hot flashes and given famotidine and diphenhydramine and sent to ED for evaluation. in ED: given diphenhydramine 25mg PO one time felt abdominal discomfort and radiating up to the chest and given GI cocktail with temporary improvement. also mild nausea given ondansetron x2; also NS IVF given for 2L Discharged with ondansetron and prednisone 40mg PO daily for 5 days.

After receiving the shot and getting up to walk across the room to sit down for the waiting period, I started to experience extreme dizziness and weakness. My heart rate jumped and I felt extremely hot. I thought I was going to faint. Within about 10 minutes I got an extreme headache that felt like someone was squeezing my head. I was given a heavy dose of benadryl as I was not experiencing difficulty breathing and we did not feel like I needed an epipen. After the benadryl kicked in my symptoms became less intense and I just had periodic bouts of sweating and chills. I am now on my third round of benadryl but have been able to lessen the dose, I do not anticipate having to take a fourth dose.

Explosive diarrhea that started nearly 24 hours after vaccination

When I got the vaccination I was 32weeks pregnant and on Saturday I had spontaeous rupture of the amnotic fluids and went immediately to the hospital and was immediately given steroid, magnesium for the baby. And on Sunday around 3:45PM I got a second round of the steroids and was transferred for observation. On Monday, at 8:06am I went into early labor I delivered my baby at 33weeks gestation and she weighed 3lb 11oz. Expected Date of Delivery-2/8/2021. I was a high risk patient d/t Fibroids but have experienced no issues the entire pregnancy and my last ultrasound was 12/17 and baby was healthy with no complications at that time.

Initially employee experienced flushing, palpatations, nausea. ER- developed hives on arms TX:Prednison 60mg po given at 11:53am Benadryl 50mg po given at 11:52am Observed for 2 hours with symptom resolution. Discharged with oral steroids.

seizure, resident sent to er and in CCU

Chills, fever over 100, body aches, tiredness, fatigue, injection site pain, feeling unwell, nausea

Received COVID19 vaccine at 730am, developed erythematous patchy rash on anterior neck and chest around 1130am. Initially began on neck, spread, then resolved over about 1 hour. No itchiness, no irritation, no fever, asymptomatic. No PMH, allergies, medications.

She went to the Emergency department 12/20 and received a high dose of Benadryl. She reported tachycardia all day yesterday in the 130?s and was itchy all over. Subsequently she developed a rash.

Pain in the site of injection

5 minutes post vaccine, while sitting in the socially distanced observation area the patient felt dizzy. While getting a gurney to the area, she had a syncopal episode. We moved her to the gurney and elevated her legs. She regained consciousness promptly. She told us she was diabetic and her glucose was 101 that morning. We gave her juice and observed her for 30 minutes more. She had no focal symptoms and felt well at discharge. No previous history of vagal episodes, hadn't eaten before the vaccine. The patient is an RN.

From patient interview: The patient stated feeling dizzy with lightheadedness and seeing spots. She felt like she was going to pass out. She was transported to our emergency department for examination. When I spoke with her she was resting and felt she had returned to baseline. From medical record:Patient Stated Complaint SYNCOPE, Narrative of Presenting Problem Patient is a 35-year-old female with history of vasovagal episodes during her prior pregnancy was in the hospital getting a Covid vaccination and became weak dizzy and sweaty and had a syncopal episode while in a chair. Patient did not hit her head. Upon evaluation patient is awake alert lying supine with no complaints. Patient states she has been suffering with Covid related anxiety and depression.

Conjunctivitis in both eyes. Uveitis in the right eye.

pain in right shoulder immediately after injection. then shortly after felt nausea and thinking I might puke. did not feel like myself. this lasted about 2 hours. (8am-11am) I also felt muscle pain, laterally in my neck on both sides.12:00pm I did not feel nauseated or neck pain anymore but felt general malaise still. and this came and went all day. today, the following day I have no symptoms.

Hypertensive to 190/80; shaking; chills; after 30 minutes, BP reduced 159/80; sent to ER; monitored; sent home; resolved, per follow-up call following day.

Patient started to experience some periorbital edema. No respiratory distress

Fever Headache Left arm discomfort Malaise; Fever Headache Left arm discomfort Malaise; Fever Headache Left arm discomfort Malaise; Fever Headache Left arm discomfort Malaise; This is a spontaneous report from a contactable physician. A 33-year-old non-pregnant female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), intramuscular in the left arm on 16Dec2020 at 10:45 (at the age of 33-years-old) as a single dose for COVID-19 immunization. Medical history included generalized anxiety disorder, gastrooesophageal reflux disease, vague gallbladder, and lactose allergy. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included escitalopram oxalate (LEXAPRO) for an unknown indication from an unknown date and unknown if ongoing. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 16Dec2020 at 21:00, the patient experienced fever, headache, left arm discomfort, and malaise. Therapeutic measures were taken as a result of fever, headache, left arm discomfort, and

malaise and included treatment with paracetamol (ACETAMINOPHEN). The clinical outcomes of the fever, headache, left arm discomfort, and malaise were recovered on an unknown date in Dec2020. It was also reported that since the vaccination, the patient had not been tested for COVID-19. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.

patient received vaccine at 10:31, at 10:43 am reported left arm tingling, BP unable to read, sat 98% on room air, switched vital macine, 10:46 am sitting BP 188/102 sat 100%, P-71, 10:58 repeat 179/106 sat 100% P-69, tingling remains, no shortness of breath, took patient to Urgent Care for evaluation

Upon initial injection (0940)pt reported some lightheadedness, pt sat for aprox 20 min and then stated feeling better. She returned to her clinic to work and at 1030, reported return of s/s with increased severity. She was brought back to vaccination area an evaluated by MD, given 50mg of po liquid Benadryl and then taken to ED via WC. VS: 155/77, 105, 18, 96% on room air.

headache; Body aches; induration at the vaccine area; This is a spontaneous report from a non-contactable consumer (patient). A 34-year-old female patient received bnt162b2 (BNT162B2), via an unspecified route of administration on the left arm on 16Dec2020 11:00 at a single dose for immunisation. Medical history included sever dermatitis. The patient's concomitant medications were not reported. The patient previously took influenza vaccine and experienced drug hypersensitivity. The patient experienced body aches, headache, induration at the vaccine area on 16Dec2020 11:00. Ibuprofen was given as treatment for the adverse event. Outcome of the events was recovering. The events were considered non-serious. The patient was not diagnosed with COVID-19 prior to vaccination and has not been tested since the vaccination. No follow-up attempts are possible. Information about Lot/Batch could not be obtained. No further information is expected.

12/16/2020 2:30 AFTER VACCINATION, STARTED TO FEEL INCREASE HR. STARTED TO FEEL WOOZY, UNABLE TO FOCUS. CHECKED VITALS IN ICU; HR 116. WENT TO ER, TRIAGE BP WAS 163/101; HR 115. GIVEN LITER SALINE, DREW LABS. BP AND HR CAME DOWN. TOLD TO REST COUPLE DAYS. WAS CONCERNED AS HX OF STROKE. F/UP WITH CARDIOLOGIST 'DOESN'T THINK THE SECOND VACCINE WOULD BE HARMFUL' BUT 'I JUST DON'T KNOW'. FAMILY HAS HX OF HEART DISEASE. I KNOW ANXIETY BUT NEVER HAD HR DO 'WHAT IT DID'. DON'T FEEL LIKE IT WAS ANXIETY. I KNOW MY BODY. I HAD TAKEN CARE OF COVID PATIENTS THE WEEK BEFORE. I DON'T KNOW WHAT TO THINK. TRYING TO LOOK AT ALL FACTORS. 12/17/2020 HEADACHE; FOLLOWING DAY I WAS FINE

Have nausea, malaise, headache, chills.

The vaccine recipient received the vaccine on 12/16/2020. On 12/17 they reported pain at the injection site. On 12/18 and 12/19 they reported that they became with the following symptoms: swollen glands, body aches, fatigue, and sore throat. During a follow-up phone call they reported that the symptoms have resolved 12/20.

After receiving the vaccine earlier, patient had difficulty swallowing for 3 minutes and also dizziness-- > went to ED for evaluation. Symptoms resolved after rooming in ED. ED physician DX with possible

allergic reaction and he was given diphenhydramine 50mg PO x1 and prednisone 40mg PO x1 in ED-- > discharged home with PRN diphenhydramine, cetirizine 10mg daily and epi pen PRN.

Developed headache, tachycardia and urticaria 12 minutes post immunization. Transfer to ER for care. Had NS 100 ml. bolus, Benadryl 25 mg IV, Solumedrol 125 mg IV, Pepcid 20 mg IV, Tylenol 1 Gm PO. Symptoms resolved. Discharged home from ER same day with Rx for Benadryl and Pepcid.

Headache ,muscle pain , join pain , chills , runny nose.

itchy, dizzy right after injection

Rash on arms

Palpitations and elevated heart rate from Friday 0600 until wake up on Sunday. Felt tired and aching on Thursday night however, no fever

Within 30 minutes I began to feel somewhat jittery and felt very hot . Then I began sweating profusely. I was not tachycardic but my pulse felt very strong. The sweating lasted about 20 minutes. The jittery nervous feeling about two hours.

Dizziness, headache, abdominal pain. Supportive measures.

Headache Low grade fever 99.7 Back ache Body ache Chills Cold hands Nausea These started Dec 20, the night of my vaccination. My symptoms continued on Monday the 21. On Tuesday Dec 22 I still have a slight headache and body aches. I just feel run down. I took regular strength Tylenol I-II PRN

Diaphoretic and tachycardic within 5 minutes of receiving vaccine. Rate up to 151 with BP 146/82. Rate would go down after 5 minutes sitting quietly and then return to 150. Back down and then 15 min later, up. gave 25 mg of po benadryl at 11:30 am. This continued and 911 called. Paramedics assessed. Patient brought to ed for additional monitoring and assessment in private car. D/C'd at 2:30pm with no other interventions.

Severe headache and limb numbness ~ 30 minutes after vaccination Sent to emergency department - no treatment needed

headache - pt reports she will take Tylenol , reports head is ongoing tingling between shoulders - resolved

After I ate lunch I had watery stool, Next day I had hot flashes , body aches, eyes watering, chills,

Redness and ache at injection site since noted 12/21/2020, left arm itchy since 12/20/20

"Reported ""Heart going fast, it might be anxiety"". 1400: O2 Sat 99% 65HR 12RR 154/101 1405: 02 99% 68HR 12RR 139/95 1417: O2 99% 66HR 1430: O2 100% 69HR 12RR 129/89 Symptoms began resolving between 1405 and 1430. Afterwards was escorted to work station."

Employee was being monitored post Covid19 vaccine, approximaetely 10 minutes after recieving vaccine she complained of feeling dizzy and light headed and then became unresponsive. 911 was called and employee was taken to ER

Subconjunctival hemorrhage (R eye)

Pt received vaccine around 1302. Pt experienced some minimal injection site bleeding, which was stopped gauze and a non-latex bandage was placed. While patient was at the vaccine table she reported itching around the injection site. Bandage was removed and patient was monitored further. Patient then reported that itching was worse at 1320, spreading to her thigh, head and back. 25mg PO diphenhydramine was administered and the patient was monitored for worsening symptoms. No further symptoms were reported and itching relieved by PO benadryl.

Patient developed tingling in back of throat and back of tongue. No swelling, vomiting, trouble breathing, hives. Symptoms lasted about 1 hour, did not get progressively worse and seemed to resolve within 1-2 hours. No medication, treatment or intervention was needed.

Reported received the vaccination at approx. 10am on 12/18. Developed headache during her 12 hour shift at the hospital. At 830pm after getting home from work, she developed elevated heart rate 130s, heart palpitations, body aches, severe nausea, muscle pain, and fatigue.

Abdominal pain, upset stomach, and nausea

After receiving the vaccine, within 10 min I developed a headache that lasted no more than 20 min. The day after, I developed a sore throat (don't think it's related to vaccine) in the morning and gradually got worse in the day.

12/18, 0905: metallic taste in mouth lasting all day 12/19: fatigue all day, 2200-nausea and low grade fever 12/20: fatigue lasting all day 12/21: woke up at 0400 with congestion and sore throat. Swollen lymph nodes and swollen glands over right clavicle. 12/22: congestion, drainage, sore throat, swollen glands/lymph nodes as described yesterday and fatigue

Day after vaccine patient started feeling fatigue, body aches, headache. By 1700 that evening she was running a 102 fever and her back was hurting. She took Famotidine and Benadryl and Tylenol and Ibuprofen. She went home and rested, pushed fluids. Felt completely better by the afternoon on 12/19/20

Patient's wide noticed a hive on upper chest below clavicle on L side. No resp. distress. 1435: VS: 126/80, 75 HR, 16RR, 97% O2 Sat Patient reported skin on neck blotchy. Benadryl 25mg 1448. 1453: 151/88, 97%, 76 HR, 16RR, 1512: 120/82, 97%, 75 HR, 16RR, Seen by RN Supervisor. Hive diminishing at 1528. 129/84, 97%, 75HR, Discharged w/wie at 1545.

Upper left arm/shoulder pain. Also reported 36 hours of low grade fever and body aches after injection Left arm at deltoid felt somewhat warm to touch, very mild erythema, tender to palpation. Pt sent to Urgent care for evaluation

Chest tightness; Tiredness; Headaches; Joint pain; Low grade fever; Nausea; Swollen lymph nodes in neck; Chills; Muscle pain; This is a spontaneous report from a contactable healthcare professional (patient). A 33-year-old female patient received the first dose of BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine; Lot Number: EH9899), intramuscular in right arm on 15Dec2020 07:45 at a single dose for an COVID-19 immunization. The vaccine was administered in a hospital. Medical history included celiac disease, allergy, and diagnosed with COVID-19 prior to vaccination. Concomitant medication included fexofenadine hydrochloride for allergy. The patient experienced tiredness, headaches, muscle pain, joint pain, chills, low grade fever, nausea, swollen lymph nodes in neck, and chest tightness on 15Dec2020, 03:00 PM. No treatment was received for the events. The outcome of the events was not recovered. The events were reported as non-serious.

"15 minutes after vaccination, started to have SOB, numbness on legs and extremities-- > sent to ED for evaluation. She c/o funny feeling in her mouth and tingling in her arms and legs after vaccination. She felt short of breath initially, but not at ED. No rash. No swelling that she is aware of. She just doesn't feel right. States she feels ""jittery"" and shaky. Received 2 L NS and epi 0.3mg IM x1 and diphenhydramine 25mg IV x-- > symptoms improved. Observed for 4 more hrs in ED. Discharged home on Epi pen."

Dizziness; hypertensive to 109/80; nauea, sweating, sent to ED for monitoring; follow up call next day: symptoms resolved.

Employee was being monitored post Covid19 vaccination. Approximately 10 minutes after vaccination employee had an allergic reaction and developed Hives all over her body and became itchy with hot flashes. Employee was given 50MG of Benadryl which was effective.

Pain at injection site; This is a spontaneous report from a contactable other healthcare professional (patient). A 54-year-old male patient received the first dose of bnt162b2 (lot number: EH9899), intramuscular on the left arm on 15Dec2020 09:00 at a single dose for immunization. There were no medical history and concomitant medications. The patient have no known allergies. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 and had not been tested for COVID-19 since the vaccination. On 15Dec2020 18:00, the patient experienced pain at injection site. No treatment was received for the adverse event. Outcome of the event was recovering.

Headache, tachycardia, body aches, malaise, lethargy,

Injection site tenderness for 48 hours Myalgias for 72 hours Morning nausea for 4 days post-injection Chills for 48 hours Headache for 72 hours

Arm pain at site; This is a spontaneous report from a contactable nurse. A 59-year-old female patient received bnt162b2 (lot number: EH9899), intramuscular on right arm from 16Dec2020 15:45, at an unspecified dose, single, for immunization. Medical history included hypertension. The patient's concomitant medications were not reported. Patient had other medications the patient received within 2 weeks of vaccination. On 16Dec2020 at 19:45, the patient experienced arm pain at site. Outcome of

event was unknown. Event occurred in a country different from that of the reporter. This may be a duplicate if the reporter also submitted directly to his/her local agency.

Patient states 20 minutes after receiving the injection she began having a scratchy throat and began having shortness of breath. She also developed some itching to the site. She presented to the Emergency Department and noted to have hoarseness but no severe dyspnea. Patient was given steroids and Benadryl. Her symptoms did not worsen and she was discharged home.

Patient waited her 15 minute time of observation. She said she felt her throat closing . Moved her into the observation area. Dr. was present and ordered for 25mg of Benadryl to be administered po. This was given at 16:00. Dr. observed patient for approximately 45 minutes until all symptoms resolved. Patient was allowed to leave at 16:45. Patient was provided with the instructions to please go to the ED if she should have any new symptoms tonight.

Body aches, joint pain, chills, headache, injection site pain; Body aches, joint pain, chills, headache, injection site pain; Body aches, joint pain, chills, headache, injection site pain; Body aches, joint pain, chills, headache, injection site pain; Body aches, joint pain, chills, headache, injection site pain; This is a spontaneous report from a contactable nurse (patient). A 29-year-old female patient received bnt162b2 (BNT162B2) lot number and expiration date were not reported, intramuscular (arm right) first dose on 16Dec2020 13:45 at a single dose for immunization. Medical history included migraine with aura, ovarian cyst and paragard IUD. Concomitant medication included fluconazole (DIFLUCAN), probiotics and famotidine. The patient previously took codeine and experienced drug hypersensitivity. The patient reported adverse events of body aches, joint pain, chills, headache, and injection site pain on 09Dec2020 at 03:45 PM (pending clarification). The patient had not taken any other vaccine in 4 weeks. The events were considered non-serious. The patient recovered from the events body aches, joint pain, chills, headache, and injection site pain on an unspecified date. There was no treatment given due to the events. The patient was not diagnosed with COVID-19 prior to vaccine nor was she tested positive for COVID-19 since vaccination. No follow-up attempts are possible; Information about batch/lot number cannot be obtained. No further information is expected.

"Severe Headache (""Felt like someone hit me with a bat in the head""; water/tylenol given; sent to ED - given Toradol; later: chills; resolved per follow-up call prior day."

Pfizer-BioNTech COVID-19 Vaccine EUA Headache, body aches and extreme fatigue started on 12/20/2020. I had a doctor appointment on 12/22/20 for a routine visit and I told my doctor about these symptoms that had occurred and he stated that I needed to be tested for COVID since these were symptoms. He also ordered blood work and I had blood drawn. I had informed him at the beginning of the visit of my recent COVID vaccine last week.

Phizer-BioNtech COVID-19 Vaccine EUA pain at site of infection. Fatigue, maliaise, dizziness, nausea, low grade fevers

Pt reports joint pain, nausea, headache, fatigued.

"25 mins after the vaccination his right arm became tingly ranging from the lower part of the arm to his pinky. fell asleep. He was touching it and could not feel it, like it was ""asleep"" . Felt himself get hotter and sweaty. Patient was advised to go to the ER, but refused. Called patient one hour after the event, and they reported that arm started to feel less tingly."

pain at the injection site; felt some numbness; slight headache; This is a spontaneous report from a contactable consumer. A 49-year-old female patient (not pregnant) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot number: unknown), intramuscular on arm left on 16Dec2020 (10:00 AM) at single dose for COVID-19 immunization. The patient's medical history included rheumatoid arthritis and COVID-19. Concomitant medication included secukinumab (COSENTYX) (received within 2 weeks of vaccination). It was reported that prior vaccination, patient diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. No known allergies. The patient reported that after a few hours of initial injection she felt pain at the injection site. In addition, she mentioned that she also felt some numbness and had a slight headache on 16Dec2020 (08:00 PM). There was no treatment received for the reported adverse events. The outcome of event was recovered on an unspecified date. Information about lot/batch number cannot be obtained.

dizzy; funny feeling on the throat; vasovagal reaction; This is a spontaneous report from a contactable physician. This physician reported similar events for two patients. This is the second of two reports. Only the first case is serious. This case is non-serious. A female patient of an unspecified age (reported as 59, unit unknown) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 17Dec2020 22:00 at a single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient stated that she felt dizzy, funny feeling on the throat and ED (emergency department) assessed vasovagal reaction as normal; no rash or major allergic reaction was noted. Outcome of the events was unknown. Follow-up attempts are completed. The following information on the batch number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2020500236 Same reporter, product, and event, different patient

tingling sensation around the mouth; tingling sensation around the mouth and in her arm; This is a spontaneous report from a contactable physician. A 59-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE lot/batch # not provided), via an unspecified route of administration on 17Dec2020 22:00 at SINGLE DOSE as COVID-19 immunization. The patient's medical history and concomitant medications were not reported. In Dec2020, the patient felt tingling sensation around the mouth and in her arm. Outcome of the events was unknown. Information regarding batch number has been requested.

Intermittent tachycardia; headache; left shoulder pain, increases when lifting elbow above pectoral; This is a spontaneous report from a contactable nurse, the patient. A 30-year-old non-pregnant female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EK5730), intramuscular in the left arm on 16Dec2020 at 16:45 (at the age of 30-years-old) as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient previously took

amoxicillin (MANUFACTURER UNKNOWN) from an unknown date to an unknown date for an unknown indication and experienced drug allergy. On 16Dec2020 at 21:45, the patient experienced intermittent tachycardia, headache, and left shoulder pain (which increased when lifting elbow above pectoral). Therapeutic measures were taken as a result of the intermittent tachycardia, headache, and left shoulder pain and included treatment (self-medicated) with acetaminophen (TYLENOL) and diphenhydramine hydrochloride (BENADRYL). The clinical outcomes of intermittent tachycardia, headache, and left shoulder pain were unknown. It was also reported that since the vaccination, the patient had not been tested for COVID-19.

Patient felt lightheaded & dizzy 10 minutes after receiving vaccine. Layed down flat with feet elevated for 10-15 minutes.

tingling to the tip of the tongue and further back to the middle of tongue, oral tingling (upper lip and then into the lower lip); mild swelling to the tip of the tongue; This is a spontaneous report from a contactable nurse. A 51-year-old non-pregnant female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot number: EH9899), intramuscularly in the left deltoid on 17Dec2020 11:15 at a single dose for COVID-19 immunization. Medical history included palpitations multiple premature ventricular contractions (PVC)s from 11Jan2020 to an unknown date. The patient's concomitant medications were not reported. Patient denied any history of previous adverse reactions to vaccines. The patient previously took dexamethasone (DECADRON) and experienced tingling of lips and tongue and sulfamethoxazole trimethoprim (BACTRIM) and experienced allergies and acute kidney injury. The patient experienced tingling to the tip of the tongue and further back to the middle of tongue, oral tingling (upper lip and then into the lower lip) and mild swelling to the tip of the tongue on 17Dec2020 11:15. During the 15-minute waiting period after the injection, the patient began to experience oral tingling (upper lip and then into the lower lib). It then progressed to the tongue and she reported tingling to the tip of the tongue and further back to the middle of tongue. She thought there might be some mild swelling to the tip of the tongue. She denied rash, hives, welts, difficulty breathing, difficulty swallowing, wheezing, throat tightness, hoarseness, stridor, itching, lightheadedness, dizziness, facial swelling and lip swelling. The patient went to the emergency room/department or urgent care. The patient received diphenhydramine hydrochloride (BENADRYL) as treatment for the events. The outcome of the events was recovered in Dec2020.

"feeling ""Sort of dizzy""; arm is sore; just doesn't feel well; This is a spontaneous report from a contactable consumer (patient). A 61-year-old female patient started to receive bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730), via an unspecified route of administration on her left upper arm on 17Dec2020 13:25 at a single dose for covid-19 prevention. The patient's medical history included blood pressure abnormal. Concomitant medications included blood pressure medicine at night. The patient went to the hospital today where she works, to have a vaccine for COVID, and then she drove herself home. After she got home, she decided to rest a bit before her shift at work tonight, she laid down for a little while, and she started feeling sort of dizzy and her arm was sore. She just doesn't feel well. She does not feel like she needs to go to the hospital or anything, but she may need rest. Patient was wondering if these are known side effects of the product. She started feeling the side effects maybe 20 or 25 minutes after getting the vaccine and after she had left the hospital. She was just

thinking at the time that it was okay and maybe she just needed rest. She takes blood pressure medicine at night, but she does not think that has anything to do with how she is feeling. Outcome of the events was unknown."

Within just over half an hour of receiving it my lungs and throat started burning. Shortly after that my upper lip started to swell. Over night my lip swelled more and my face became itchy.

She noticed that she got breakthrough bleeding, when she just got her menstruation last week; This is a spontaneous report from a contactable healthcare professional, the patient. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration on 16Dec2020 at 17:00 as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. On an unknown date in Dec2020, the patient noticed that she had breakthrough bleeding and she just had her period last week. The stated that she was very regular when it came to her period. The clinical outcome of the breakthrough bleeding was unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.

developing a cold sore (herpes simplex type 1) the following morning/She usually develop a cold sore with an illness; developing a cold sore (herpes simplex type 1) the following morning/She usually develop a cold sore with an illness; This is a spontaneous report from a contactable consumer (patient). A 52-year-old female patient received the first dose of bnt162b2 (lot number and expiration date were not reported), via an unspecified route of administration on the right arm on 16Dec2020 16:15 at a single dose for immunization. The patient's medical history included cold sore and celiac disease. The patient was not pregnant. Concomitant medication included cetirizine hydrochloride (ZYRTEC). The patient reported that it was not necessarily an adverse event but she noticed that she was developing a cold sore (herpes simplex type 1) the following morning on 17Dec2020 10:00. She usually develop a cold sore with an illness. She also typically take valacyclovir to treat but opted not to take it (did not want to interfere with the vaccine and body developing antibodies). No treatment was received for the events. The patient was not diagnosed with COVID-19 prior to vaccination neither had been tested for COVID-19 post vaccination. Outcome of the events was recovering. The events was considered non-serious. Information on lot/batch number has been requested.; Sender's Comments: Based on the information currently provided, cold sore (herpes simplex type 1) onset more likely represents the recurrence of the underlying herpes viral infection. Currently no biological plausibility indicated the event is attributed to the vaccine use.

Red raised rash 48 hours after Extreme nausea and dizziness; Red raised rash 48 hours after Extreme nausea and dizziness; Red raised rash 48 hours after Extreme nausea and dizziness; This is a spontaneous report from a contactable healthcare professional. A non-pregnant 45-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), intramuscularly on 15Dec2020 15:45 at a single dose for COVID-19 immunization. Medical history included ulcerative colitis, hypothyroidism, allergies: sulfites. sulfa. Concomitant medication included amfetamine aspartate, amfetamine sulfate, dexamfetamine saccharate, dexamfetamine sulfate (ADDERALL), dhea (MANUFACTURER UNKNOWN), levothyroxine, liothyronine (NP THYROID),

progesterone (MANUFACTURER UNKNOWN), fluoxetine hydrochloride (PROZAC), levothyroxine sodium (SYNTHROID), bupropion hydrochloride (WELLBUTRIN). On 15Dec2020, the patient experienced red raised rash 48 hours after extreme nausea and dizziness. No treatment was received from the events. The outcome of the events was not recovered. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.

Client started to feel faint about 10 minutes after she had the vaccine administered. She informed the nurse. Her blood pressure was 100/62 hr 58. She sat for a few minutes and then vomited. She had bcome very diaphoretic. Her bp was 146/100 and hr was 96. She was responsive and she refused a shot of Benadryl. We called for an ambulance. We continued to monitor her bp and hr. Her husband arrived. She left with her husband. Her last bp was 136/100 hr was 70 ab she was not longer diapheretic. He husband took her to the ER. I spoke to patient today at (9:10 am. The ER doctor told her she had a vasovagal incident. He told her she can get the second dose if she is in a supine position with monitoring.
