pain in the arm of injection site; numbness and pins and needle tingling in the lower arm and hand; numbness and pins and needle tingling in the lower arm and hand; loss of feeling in hand and loss of sensation and strength; difficulty holding onto objects; loss of feeling in hand and loss of sensation and strength; difficulty holding onto objects/weakness; loss of feeling in hand and loss of sensation and strength; difficulty holding onto objects; dizziness; severe joint pain; throbbing headache; This is a spontaneous report from a contactable other healthcare professional (patient). A 41-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EJ 1685, expiry date unknown) via unspecified route of administration at left arm on 19Dec2020 07:30 at single dose for COVID-19 immunization. The reporter informed that the covid-19 vaccine was administered in a hospital. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. Medical history included asthma, allergies to penicillin, allergies to milk, seasonal allergy, allergies to bees, allergies to latex. Concomitant medications included montelukast, fluticasone, budesonide, formoterol fumarate (SYMBICORT) and cetirizine; all from unspecified date for unspecified indication. The patient previously took Bactrim and experienced allergies. On 19Dec2020 15:00, the patient experienced pain in the arm of injection site including numbness and pins and needle tingling in the lower arm and hand, loss of feeling in hand and loss of sensation and strength; difficulty holding onto objects, dizziness and weakness, severe joint pain and throbbing headache. The patient underwent lab test and procedures post vaccination which included nasal swab/Covid-19 RNA rapid: negative on 22Dec2020. No treatment was

received due to the events. The outcome of the events pain in the arm of injection site, numbness and pins and needle tingling in the lower arm and hand, loss of feeling in hand and loss of sensation and strength; difficulty holding onto objects, dizziness, weakness, severe joint pain, throbbing headache was not recovered. The events were assessed as non-serious which did not results in death, not Life threatening, did not cause/prolong hospitalization, was not disabling/incapacitating, and not a congenital anomaly/birth defect.

Fever/ got up to 102 degrees Fahrenheit; Body aches; Sore throat; Feels like she has got just a regular cold; This is a spontaneous report from a contactable other hcp (patient). A 59-year-old female patient started to receive BNT162B2 (Solution for injection, lot number and expiry date unknown), intramuscular on 21Dec2020 19:00 to an unspecified date at single dose in the right arm for vaccination. Medical history included menopause from an unknown date. Concomitant medication included levothyroxine sodium (SYNTHROID), fenofibric acid, metformin, escitalopram and unspecified hormones for menopause. The nurse practitioner called to report on herself as the patient. She received her first dose of COVID-19 Vaccine on 21Dec2020 around 7:00pm. Starting about 10:00 am today, 22Dec2020, she had onset of fever, body aches and sore throat. She is hoping that this is all a normal part of the COVID-19 Vaccine; but she called to verify if that is all normal because she has to work tomorrow. Stated that her fever got up to 102 degrees Fahrenheit. She mentioned regarding seriousness criteria of all events that they are not serious, that she feels like she has just got a regular cold. She is scheduled to get the second dose of this vaccine 21 days after first dose. Causality of all events reported as yes, she really believes it is related to product. The outcome of the events was not recovered. The following information on the batch number has been requested.

Sore arm at injection site; This is a spontaneous report from a contactable healthcare professional reported for himself. A 41-year-old male patient started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EJ1685, expiry date: unknown), intramuscular on the left arm on 22Dec2020 01:30 at a single dose for COVID-19 immunization. There was no medical history. The patient's concomitant medications were not reported. The patient experienced sore arm at injection site on 22Dec2020 02:00. Outcome of the event was not recovered. No treatment was given. Patient had no COVID prior to vaccination and was not tested for COVID post vaccination. The event was considered non-serious.

back is achy; Injection site pain; Body achy; body feels like after you have a workout; Muscles are sore; My close coworker who works with me in the same company cubicle as me when we document, tested positive for COVID; This is a spontaneous report from a contactable other health professional (patient). A female patient (Age: 35; unit unknown) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899), via an unspecified route of administration on 21Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received COVID vaccine on 21Dec2020 and experienced side effect of the vaccine. Stated 'achy feeling. The patient's abdomen and trunk like after a workout.' She move suddenly her back was achy. She had injection site pain. Consumer stated, her close coworker who worked with her in the same company cubicle as she, tested positive for COVID and he had been having symptoms since Saturday. And she was body achy at the time of this report, like she kind of feel like, her body felt like after she

had a workout and her muscles are sore. So, she did not know what to do because she do not know if this body achiness is a symptom of COVID or a symptom of the vaccine. And if she went get tested, whether she will show like a positive because she had the vaccine. The outcome of events was unknown.

she was freezing one minute, and then she was hot the next minute; dizzy; soreness throughout body/achy; stated her eyes feel heavy; Chills; This is a spontaneous report from a contactable consumer (patient herself). A 50-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), lot number: EK5730, expiration date: Mar2021, intramuscular in left upper arm from 21Dec2020 10:00 to 21Dec2020 10:00 at 0.3 mL for Covid-19 immunization. Medical history included COVID-19 in Jul2020. She said she had a real bad case of COVID-19, and didn't get over it until Oct2020. The patient's concomitant medications were not reported. The patient stated she received the COVID-19 Vaccine yesterday at her employer, which is a hospital. She said she got the COVID-19 Vaccine at around 10:00AM on 21Dec2020. She said she had a few chills not too long after receiving the COVID-19 Vaccine. She said last night the chills got worse, saying she had chills all night. She said the chills are not as bad now. Reported she is sore and achy, clarifying she has more of a soreness throughout her body. She stated her eyes feel heavy too. Caller asked if what she was experiencing were side effects of the COVID-19 Vaccine and how long were the symptoms going to last. The reporter stated she is not a healthcare professional. She said she works in the surgery area at the hospital, and the hospital was offering the COVID-19 Vaccine yesterday, so she got the vaccine. Reported after receiving the COVID-19 Vaccine, she noticed she felt cool at work. She said last night she felt like she was freezing one minute, and then she was hot the next minute, and kept going back and forth between freezing and hot. She said she woke up at 1:00AM and felt really hot. She said she wished she had a thermometer at the time to check her temperature because she thought she had a fever. She said her husband told her what she was experiencing was part of having the chills. She said when she woke at 1:00AM, she got out of bed to go to the bathroom, and her eyes felt heavy, and she thought she may have been a little dizzy. She said now she doesn't think she was dizzy at the time, but maybe it was because she just woke up and got out of bed. She said she hasn't had any dizziness today. Treatment: Reported she took an Ibuprofen 200mg at 2:00AM and another Ibuprofen 200mg at 8:30AM. She clarified it was Equate Brand Ibuprofen 200mg. The event chills with outcome of recovering; the rest of the events was unknown. Therapeutic measure has been given as a result of the events. Information about the lot/batch number and expiration date has been requested.

Dry mouth; rapid heart rate; fuzzy feeling in middle of forehead; This is a spontaneous report from a non-contactable other healthcare professional (patient). A 23-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899, expiry date was not provided) solution for injection, intramuscular from 21Dec2020 11:15 at a single dose for Covid-19 immunisation. Medical history included PVC's (Premature ventricular contractions). Concomitant medication included ibuprofen. The patient received the dose number 1 of the vaccine at a hospital and experienced dry mouth, rapid heart rate, and fuzzy feeling in middle of forehead on 21Dec2020 11:15. No treatment was administered. The events were reported as non-serious. Patient was not pregnant. Patient was not

diagnosed with Covid-19 prior to vaccination and has not been tested. Outcome of the events was recovering. No follow-up activities are needed. No further information is expected.

4 days after first vaccine started to get left cheek and left arm numbness without weakness. Also had left vision spotting. Different pattern than pts usual migraine

Left arm pain on first 2 days; extreme fatigue; chills/ All night chills; flu like illness; This is a spontaneous report from a contactable Physician (patient himself). A 40-year-old male patient received his first dose of bnt162b2 (BNT162B2 also reported as COVID 19 vaccine brand Pfizer, lot/batch number and expiry date were not reported), via an unspecified route of administration in left arm on 18Dec2020 11:45 at single dose for Covid-19 immunisation in a hospital. Medical history included High cholesterol. Concomitant medication included influenza vaccine (FLU). Prior to vaccination the patient was not diagnosed with COVID-19 and had not been tested for COVID-19 post vaccination. The patient experienced left arm pain on first 2 days (21Dec2020) 12:00, had extreme fatigue, chills described as all night chills and flu like illness on 21Dec2020 12:00. The patient took Tylenol as treatment. The outcome of events was not recovered. Information on the Lot/batch number has been requested.

Nausea; injection site soreness; fatigue; chills; general feeling unwell; This is a spontaneous report from a non-contactable healthcare professional. A 33-year-old female patient received bnt162b2 (BNT162B2; reported as COVID-19 vaccine; solution for injection; unknown lot number and expiration date), intramuscular right arm on 21Dec2020 04:30 at single dose for COVID-19 immunization. The patient had no medical history and concomitant medications. The patient was not pregnant at the time of vaccination. The patient has no allergies to medications, food, or other products. On 21Dec2020 at 08:30 PM, the patient experienced nausea, injection site soreness, fatigue, chills and general feeling unwell. The patient did not treatment for the adverse event. The patient had her most recent COVID-19 vaccine was administered in a hospital. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient had no other medications the patient received within 2 weeks of vaccination. The patient was not diagnosed with COVID-19 prior to vaccination and has not been tested for COVID-19 since the vaccination. The outcome of the events was not recovered. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

Cold/Flu/COVID symptoms, skin rash around injection site and left side of back

Injection site pain; myalgia; abdominal pain; This is a spontaneous report from a contactable physician. A 40-year-old male patient (not pregnant) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot number: unknown), via an unspecified route of administration on 21Dec2020 (19:15 PM) at single dose for COVID-19 immunization. There was no medical history. Concomitant medications were not reported. The patient has not been diagnosed with Covid-19 prior to vaccination. No know allergies. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. There was no other vaccine in four weeks and other medications in two weeks. The patient experienced injection site pain, myalgia, and abdominal pain on 22Dec2020 (09:00 AM). There was no treatment received for the adverse event. The patient was not tested for Covid-19 post vaccination. The outcome of events was

recovering. This case is reported as non-serious. Information on the lot/batch number has been requested.

Soreness at the injection site, Joint pain, including hip, leg soreness with a change in mobility.

aches; chills/shivering; generally not feeling well.; don't fall asleep; I have been feeling tired and like funny like a you have a cold or something/fatigue; I have been feeling tired and like funny like a you have a cold or something/cold; The initial case was missing the following minimum criteria: Unspecified product. Upon receipt of follow-up information on 23Dec2020, this case now contains all required information to be considered valid. This is a spontaneous report from two contactable consumers (including the patient). A 70-year-old female patient received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine, Solution for injection; lot number and expiration date were not provided), via an unspecified route of administration on 20Dec2020 at single dose for immunization. Medical history included hot flashes. There were no concomitant medications. The patient stated that she just got the shot yesterday (20Dec2020) at the hospital she just went. Today (21Dec2020), she was feeling like a kind of funny and further described she had been feeling tired and like funny like she had a cold or something. She had a shot in the arm. It was further reported that she received the vaccine on Sunday (20Dec2020) at the hospital she works at; reported side effects of aches, chills, and generally not feeling well. She also stated tiredness and fatigue, she didn't fall asleep even if she did a night shift. For 2 days, she felt achy, chills were bad, she was cold, and was shivering, then they went away. The patient had hot flashes before, but it wasn't like that. She was having cold. Then it would go away, took a while. She had them (feeling tired, feeling cold, generally not feeling well, didn't fall asleep) since Monday (21Dec2020), then yesterday (22Dec2020), she felt the chills, aches and fatigue. The patient wanted to know how long to expect the side effects to last. The outcome of the events was not recovered. Information about lot/batch number has been requested.

shingles; This is a spontaneous report from a contactable Nurse. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), via an unspecified route of administration in Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient was vaccinated with the Pfizer-BioNTech COVID-19 Vaccine last week (in Dec2020). She claimed being diagnosed with shingles and has asked the nurse if it could be related to the vaccine. The outcome of the event was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained. No further information is expected.

left hip pain; This is a spontaneous report from a contactable physician. A 71-year-old male patient received bnt162b2 (BNT162B2), via an unspecified route of administration on 17Dec2020 at, SINGLE DOSE for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Caller stated that he got the coronavirus vaccine last Thursday and on midday Saturday that he got left hip pain. reported that he has sticky hips. Stated that he does not experience pain normally. Stated that the day before on Wednesday that he did yoga at home. Stated that he has done yoga for years. Stated that every time that he does it the he could strain something. Stated that the pain was bad enough that he took 3 doses of Advil over the next 24 hours and it went away. Stated that it did not

cause any major limping. Stated that he took 75 minutes walks on Saturday and Sunday and did yoga that evening. Stated that he is not sure that it is not related to the vaccine. Stated that this is his first dose of the vaccine. Stated that he is happy that he got the vaccine. Stated that he would get it again in a heartbeat. The outcome of the event was recovered. Information on Lot /Batch Number has been requested.

I am diabetic on a CGM and insulin pump. My blood sugar started to rise mid-afternoon and I couldn't get it below 200 despite giving myself increased amounts of insulin. It was up to 289 at bedtime. I count carbs and was very careful about what I ate yesterday. This morning I was back down to 169 when I got up, but I had increased my basal rates during the night. Second event that I'm not sure is related, but FYI, last evening I got some sharp pains in my left hip and continual aching in my left buttock while sitting watching TV. It continued until after I went to bed. It's back to normal this morning.

injection site pain-minor; tiredness-moderate/fatigue; headache-mild to moderate; muscle pain-minor/muscle aches; chills; fever-low grade; injection site redness light pink; nausea-comes and goes; feeling unwell-mild to moderate; muscle weakness; weak; This is a spontaneous report from a contactable consumer (patient). A 49-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), via an unspecified route of administration on 18Dec2020 12:15 on the right arm at a single dose for COVID-19 immunization. Medical history included allergies to anxiety medication. The patient's concomitant medications were not reported. On 18Dec2020 20:00, the patient experienced mild to moderate side effects: injection site pain (minor), tiredness (moderate), headache (mild to moderate), muscle pain (minor muscle aches), chills (sometimes), fever (low grade), injection site redness (light pink), nausea- (comes and goes), feeling unwell (mild to moderate), muscle weakness and feeling fatigue which were moderate Friday, Saturday, and Sunday and Monday. If patient was active, for example Christmas shopping for about an hour, she was very fatigue, weak and the nausea was strongly moderate and it would come and go. Outcome of the events was recovering. No treatment was received for the events. The events were considered non-serious. The patient was not diagnosed with COVID-19 prior to vaccination and had not been tested post vaccination.

dry mouth; peculiar sensations running through extremities/trunk/abdomen (akin to IV contrast administration); elevated BP; tachycardia; lower abdominal cramping; This is a spontaneous report from a contactable physician (patient). A 46-year-old male patient received the first single dose of BNT162B2 (Lot number: EH9899, exp date not reported), intramuscular (vaccine location: left arm) on 21Dec2020 15:00 for Covid-19 immunisation. Medical history included hyperlipidaemia. The patient had no known allergies. Concomitant medication included atorvastatin (LIPITOR), and omeprazole (PRILOSEC). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The COVID-19 vaccine was administered at a Hospital. On 21Dec2020 at 3:00 pm (also reported as within minutes of receiving vaccine), the patient developed dry mouth, peculiar sensations running through extremities/trunk/abdomen (akin to IV contrast administration), elevated BP, tachycardia, and lower abdominal cramping. The patient considered the events as non-serious. AEs resulted in doctor or other healthcare professional office/clinic visit. No treatment was given for the events. The patient had no

prior COVID vaccination and did not undergo COVID testing post vaccination. The patient recovered from the events on an unspecified date Dec2020.

Patient with a nut allergy, tongue became tingly 20-30 minutes following vaccine. Patient was given 50 mg of diphenhydramine and was able to transport home with his wife.

is 'fibril' until today/ fever; This is a spontaneous report from a contactable pharmacist. A patient of unspecified age and gender received BNT162B2, via an unspecified route of administration on 18Dec2020 at single dose for COVID -19 immunization. The patient medical history and concomitant medications were not reported. The reporter asked to just call her back to give info Covid vaccine was administered to a physician last 18Dec2020 and was 'fibril' until today (pending clarification). Asking if there is info on the duration of the fever that occurs. The outcome of the event was not recovered. Information on the Batch/Lot number has been requested.

Sore throat, mild bronchial congestion, mild muscle aches, soreness in left arm; Sore throat, mild bronchial congestion, mild muscle aches, soreness in left arm; Sore throat, mild bronchial congestion, mild muscle aches, soreness in left arm; Sore throat, mild bronchial congestion, mild muscle aches, soreness in left arm; This is a spontaneous report from a contactable nurse (reported for herself). A 62-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), via an unspecified route of administration on left arm on 21Dec2020 08:45 at a single dose for immunization. Medical history included rosacea, primary hypertension, Hashimoto's Thyroiditis and penicillin allergy. The patient's concomitant medications were not reported. The patient experienced sore throat, mild bronchial congestion, mild muscle aches, and soreness in left arm; all on 22Dec2020 at 06:30. The patient did not receive treatment for the events. Outcome of the events was recovering.

patient called to report nausea, vomiting headache low grade fever abd pain

Extreme fatigue; nausea; lightheadedness; diarrhea; muscle ache; inability to sleep; sickness; This is a spontaneous report from a contactable physician (patient). A 41-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot number: unknown), intramuscular (left arm) on 21Dec2020 16:00 at single dose for COVID-19 immunization. The patient has no medical history. No known allergies. The patient has no allergies to medications, food, or other products. Concomitant medications were not reported. The patient has received other medications (unspecified) within 2 weeks of vaccination. The patient was not diagnosed with COVID-19 prior to vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 21Dec2020 (18:00), the patient experienced extreme fatigue, nausea, lightheadedness, diarrhea, muscle ache, inability to sleep, and worst sickness of entire life (as reported). The patient received over the counter medication as treatment for the adverse events. The patient has not been tested for COVID-19 since the vaccination. The outcome of events was not recovered. This case is non-serious (as reported). Information on the lot/batch number has been requested.

"arm stiff and sore two hours after getting vaccine/muscle is stiff in her right arm; arm stiff and sore two hours after getting vaccine, at right arm; she didn't get to sleep last night since it felt heavy and stiff with

discomfort; she didn't get to sleep last night since it felt heavy and stiff with discomfort; Couldn't raise her right arm/couldn't lift her right arm/ farthest she can lift her right arm from her side is 2 inches; she didn't have strength to open the bottle it was new and she cannot open it; This is a spontaneous report from a contactable consumer. A 69-year-old female patient started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 21Dec2020 15:00 at single dose, at right arm for COVID-19 immunization. Medical history included ongoing hypertension (controlled), ongoing prediabetes (controlled), blood thinner, stroke (it was a very mild trace of a very mild stroke) and MRI on 2015. Historical vaccine included flu vaccine on an unspecified date. Concomitant medication included clopidogrel bisulfate (PLAVIX) from 2015 as blood thinner. After the patient got the vaccine on 21Dec2020, she was instructed to sit for 15 minutes and was given flyers and the card that stated the next scheduled dose is on 11Jan2020. She mentioned that the card she was given is the COVID-19 appointment card with a return flyer attached regarding Pfizer vaccine recipients and care givers. She reported that all that she can see on there is that, there was no lot, batch or serial number, just the name of the vaccine. She stated that the vaccine was shipped in the morning and they started giving it around noon and she got hers at three o'clock in the afternoon. She stated this is their facility's second batch, and the first was consumed last week. She stated she made a mistake, and that she should have requested they inject her left arm because she is right handed. The patient reported that she experienced arm stiff and sore two hours after getting vaccine (17:00). It was tolerable at first, but when she got home, she couldn't raise her right arm. She thought it would just be like the Flu vaccine and tolerable but she couldn't lift her right arm. The farthest she can lift her right arm from her side is 2 inches. She tried putting a cold compress on it but it was not working. She doesn't know if she can take TYLENOL. She would like to know if she can take TYLENOL for the pain since it was the only medication she has. Her supervisor advised her to take Advil, but she only has TYLENOL. She says she does feel better and that she was fine, there was nothing else, just her arm is so sore. She has nothing negative, no other side effect, no redness, just her muscle is stiff in her right arm and it feels sore. She stated maybe if she had taken TYLENOL the night before, but last night or today she didn't have strength to open the bottle it was new and she cannot open it. She stated at least the pain is lesser than last night, she didn't get to sleep last night since it felt heavy and stiff with discomfort. She was supposed to get a mammogram on reporting time, but since she couldn't raise her arm she was trying to reschedule. She is supposed to have a blood test the following day. Therapeutic measures were taken which includes cold compress. Outcome of the event ""arm stiff and sore two hours after getting vaccine, at right arm"" was recovering while outcome of all other events was unknown. Information on the lot/batch number has been requested."

Subject received vaccination Wednesday Dec 16th in the afternoon. He became symptomatic (shortness of breath, low grade fever) the next day. Went to the Emergency room on Saturday Dec. 26th, 2020 due to shortness of breath, had an 02 Sat of 60%, and was hospitalized in the ICU at another hospital (due to bed unavailability).

Brown spots in the shape of a circle at different locations in the body all appearing within a few hours; This is a spontaneous report from a contactable nurse (patient). A 29-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE lot/batch number: EH9899), via an

unspecified route of administration on the right arm on 22Dec2020 07:45 at SINGLE DOSE for COVID-19 immunization at the hospital. The patient had allergies with detergent and soap products. Concomitant medications included fenofibrate (FENOFIBRATE) and vitamin D from unknown dates and indications. Prior to vaccination, the patient was not diagnosed with COVID-19 and has not been tested for COVID-19 since vaccination. On 22Dec2020, the patient experienced brown spots in the shape of a circle at different locations in the body all appearing within a few hours. No treatment was received for the event. Outcome of the event was not recovered. No follow-up attempts are possible. No further information is expected.

Fever; Chills/rigors; Nausea; Vomiting (one episode); Headache; Myalgia; Change in taste; Generalized weakness; This is a spontaneous report from a non-contactable physician (patient). A 44-year-old male patient received one dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: 1647, expiration date not reported), via an unspecified route of administration (left arm), on 21Dec2020 at 12:30 at a single dose, for COVID-19 immunization. Medical history included hypertension and COVID-19 from an unknown date. Concomitant medication included lisinopril and amlodipine. On 22Dec2020 at 04:30, the patient experienced 8 hours of severe symptoms: fever, chills/rigors, nausea/vomiting (one episode), headache, myalgia, change in taste, generalized weakness. The patient took Tylenol and naproxen as treatment. The patient was recovering from the events. No follow-up attempts are possible. No further information is expected.

"Patient became visibly flushed within five minutes after inoculation, and she reported having ""waves of nausea."" A cool compress was applied to her neck. While she was closely being monitored, she admitted feeling ""dizzy right after the shot bit didn't want to tell anyone because she [ic] was embarrased."" At 1532, patient denied that she was allergic to Benadryl, so Benadryl 50 mg/mL IM was injected into her right deltoid. At 1545, patient reported an alleviation of symptoms. She was advised to go home to rest, but to immediately contact 911 or go to the ER if symptoms worsened. Patient voiced understanding and left the facility with coordinated ambulation and in stable condition. RN 12/29/2020 @ 1318"

"tingling in injection arm, left arm, left neck, around the lips/tingling through arms, hands, fingers, and legs/worsened by sitting on legs/dense tingling in anterior shins upon standing; tingling in injection arm, left arm, left neck, around the lips/tingling through arms, hands, fingers, and legs/worsened by sitting on legs/dense tingling in anterior shins upon standing; tingling in injection arm, left arm, left neck, around the lips/tingling through arms, hands, fingers, and legs/worsened by sitting on legs/dense tingling in anterior shins upon standing; This is a spontaneous report from a contactable physician (who is also the patient). A 37-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730, expiry date not reported), via an unspecified route of administration in left arm, on 19Dec2020 09:30, at single dose, for COVID-19 immunization. There were no medical history and no known allergies. The patient's concomitant medications were not reported. The patient reported that about 30 minutes after vaccination on 19Dec2020 at 10:00, while driving home, tingling was noted in injection arm, traveling up the left arm into the left neck and around the lips. Tingling resolved but the next day, tingling was noted to be diffuse, light and scattered through arms, hands, fingers, and legs equally and bilaterally. No dermatomal or distinct nerve distribution. Tingling worsened by sitting on

legs, became dense tingling in the anterior shins upon standing, but then resolved a few minutes later to the more diffuse light tingling. No notable difference in strength (able to hike and cook) and no notable numbness. No rashes, no shortness of breath, no changes in heart rate. The events resulted in ""doctor or other healthcare professional office/clinic visit"". No treatment was received for the events. The patient was not diagnosed with COVID-19 prior to vaccination. The patient has not been tested for COVID-19 since vaccination. The patient did not receive any other vaccines within 4 weeks prior to BNT162B2. The reporter assessed the case as non-serious. The outcome of the events was recovered (as reported)."

"light headache; Low grade fever; Muscle ache; Pain; This is a spontaneous report from a contactable consumer (parent) reported that a 49-year-old female patient received single dose of (BNT162B2, Solution for injection, lot number was not provided), via an unspecified route of administration on the left arm on 18Dec2020 for covid-19 immunization. Medical history included ongoing hypertension that was diagnosed when she was 32-years-old, after she gave birth to her second child; she was diagnosed with COVID-19 on 25Aug2020, and now was 4 months out from having COVID-19; reportedly she was tired and had a lot of ""nervously"" feeling, like heart palpitations before she took the COVID-19 vaccine. There were no concomitant medications. On 19Dec2020, the patient experienced light headache, low grade fever, muscle ache and pain. The patient underwent lab tests and procedures which included weight: 212-213 lbs on an unspecified date. The outcome of the events was recovered on 19Dec2020. Information about lot/batch number has been requested."

Raspy voice, body and joint pain, pain at injection site, fatigue, headache

myalgia; chills; headache; fatigue; Loss of appetite; This is a spontaneous report from a non-contactable physician. A 44-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), via an unspecified route of administration on 21Dec2020 14:30 in left arm at single dose for COVID-19 immunization. Medical history included COVID-19 from an unknown date and unknown if ongoing. Concomitant medication included omeprazole. After vaccination, 12-15 hours later, the patient pronounced myalgia joined 18 hours later with chills, headache, fatigue and loss of appetite. The patient experienced myalgia on 22Dec2020 05:00; chills, headache, loss of appetite and fatigue on 22Dec2020. Treatment such as acetaminophen and rest was given to patient for the events. The facility where the most recent COVID-19 vaccine was administered was in the hospital. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. The patient had no allergies to medications, food, or other products. The events were considered non serious as it did not results in death, was not life threatening, did not cause/prolonged hospitalization, was not disabling/Incapacitating and had no congenital anomaly/birth defect. The outcome of the events was not recovered. No follow up attempts are possible. No further information is expected.

Metallic taste in mouth.

Headache; nausea; mild body aches; hot flashes; This is a spontaneous report from a contactable nurse (patient). A 39-year-old female patient (not pregnant) received the first dose of BNT162B2 (PFIZER-

BIONTECH COVID-19 VACCINE, lot number EJ1685), intramuscular at right arm on 21Dec2020 17:45 at single dose for COVID-19 immunization at a hospital. The patient's medical history included migraines, bipolar II, anxiety, attention deficit hyperactivity disorder (ADHD) and insomnia. No allergies to medications, food, or other products. No other vaccines within 4 weeks prior to the COVID vaccine. Concomitant medication received within 2 weeks of vaccination included amfetamine aspartate, amfetamine sulfate, dexamfetamine saccharate, dexamfetamine sulfate (ADDERALL), diphenhydramine hydrochloride (BENADRYL), lamotrigine (LAMICTAL), nortriptyline, alprazolam (XANAX) and multivitamin. The patient was not diagnosed with COVID-19 prior to vaccination, and since the vaccination, the patient been had not tested for COVID-19. It was reported that on 22Dec2020 17:45, the patient experienced headache, nausea, mild body aches, and hot flashes. Treatment for the reported events included that the patient took ondansetron (ZOFRAN) and acetaminophen (Tylenol) that she had at home. She took them on her own. No doctor needed. The outcome of the events was recovered in Dec2020.

Arm pain/Pain in arm was so severe; Pain in arm was so severe I could not sleep; Extreme body aches the aches intensified throughout the day; Headaches; sore throat; head and chest congestion; head and chest congestion; This is a spontaneous report from a contactable other hcp (patient). A 49-year-old female patient received bnt162b2 via an unspecified route of administration on arm left, first dose on 16Dec2020 12:45 at single dose for COVID-19 immunization. Other vaccine same date product included Pfizer-Biontech first dose on 16Dec2020 on left arm (pending clarification). Medical history included COVID-19 prior vaccination from an unknown date. Not pregnant at the time of vaccination. No known allergies. No other medical history. Concomitant medication included bupropion from 2020. No other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced arm pain. Pain in arm was so severe she could not sleep. Applied an ice pack throughout the night. Extreme body aches the aches intensified throughout the day. Headaches, sore throat, head and chest congestion. Adverse event start date was on 16Dec2020. The event was reported as non-serious. Therapeutic measures were taken as a result of arm pain/pain in arm was so severe, treatment included ice pack. No treatment was received for other events. The outcome of the events was recovering. Information about Lot/batch no has been requested.

Significant arm soreness, headache.

"muscle soreness; This is a spontaneous report from a contactable physician (patient). A patient of an unspecified age (reported as 35, unit unknown) and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration from 15Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient reported that after he got the shot (Dec2020), he had experienced ""just a little muscle soreness"". The outcome of event was unknown. Follow-up attempts are completed. The following information on the batch number has been requested."

muscle soreness; This is a spontaneous report from a contactable physician (patient). An adult patient (Age: 44; Unit: Unknown) of an unspecified gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE lot/batch number: not provided), via an unspecified route of administration on 14Dec2020 at

SINGLE DOSE for COVID-19 immunization. Medical history and concomitant medications were not reported. It was reported that the patient had side effects that were minimal - muscle soreness in Dec2020 for 24 hours, that's about it. The patient recovered from the event in Dec2020. No follow-up attempts are possible, information about batch number cannot be obtained.

I started getting profused rhinitis; I am got a little hoarse and it lasted all night long; I started getting profused rhinitis; I am got a little hoarse and it lasted all night long; I had enough Postnasal drip that I got a little bit of cough and no fever and didn't know if this was related to the vaccine; I had enough Postnasal drip that I got a little bit of cough and no fever and didn't know if this was related to the vaccine; This is a spontaneous report from a contactable physician who was also the patient. A 71-year-old male patient received bnt162b2 (BNT162B2 lot: EK5730, expiry: Mar2021), intramuscular in left arm on 17Dec2020 at a singe dose for covid-19 immunisation. The patient's medical history included hypertension from an unknown date and unknown if ongoing. Concomitant medications included olmesartan medoxomil (BENICAR) for hypertension and unspecified vitamins. On a unspecified date, the patient started getting profused rhinitis, he got a little hoarse and it lasted all night long. Patient actually had enough Postnasal drip (Captured as suspect conservatively) that got a little bit of cough and no fever and didn't know if this was related to the vaccine or not and needed to find out if that's the case. It was also reported that the patient took a rapid Covid test in the morning and whould like to know if that would to be 'false' positive because of taking the virus shot or Covid shot. It was reported that an RN administered the vaccine. The outcome of the events was unknown.

"Pain in arm; Kind of allergy you know like sneezing a lot, the whole day I have been sneezing; Kind of allergy you know like sneezing a lot, the whole day I have been sneezing; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender received bnt162b2 (BNT162B2), via an unspecified route of administration on 18Dec2020 at SINGLE DOSE for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Consumer stated, ""I have a question about, I just had Pfizer on last Friday so I didn't have any symptom anything, the next day on 19Dec2020 I have like my arm pain, not swollen just pain and then I have kind of allergy you know like sneezing a lot, it is the whole day I have been sneezing and just like the whole day. Is it allergy to the Pfizer or should I just have another like second shot should I have it or is it the allergic reaction or what is that? It is the COVID the one COVID I had from Pfizer (COVID Vaccine). Because of I am afraid to have second shot if I have like more allergy or."" The outcome of the events unknown. Information on the Batch/Lot number has been requested."

Spiked the temperature during the night; Body ache; Fatigue; This is a spontaneous report from a contactable nurse (patient). A 58-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EH9899), via an unspecified route of administration on 21Dec2020 at a single dose for COVID-19 immunization. There were no medical history and no concomitant medications. The patient was not having any serious side effects but she was having like probably spiked temperature during the night, body ache, and fatigue on 22Dec2020. The patient want to make sure if it is okay to take paracetamol (TYLENOL) or ibuprofen (MOTRIN) generally. Outcome of the events was unknown. The reporter assessed that the events were related to the suspect drug.

bad headache; This is a spontaneous report from a contactable consumer. A male patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration on 22Dec2020 as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. On 22Dec2020, the patient experienced bad headache. The clinical outcome of the bad headache was unknown. No follow-up attempts are possible; information about lot number cannot be obtained.

I have COVID after getting the vaccine. Fever, chills, and I feel very bad.

Respiratory: Laryngeal stridor going into the trachea and the central bronchial tubes. No wheeze out on the periphery. , Respirations: Tachypneic, Breath sounds: Stridor.

lightheaded/dizzy; This is a spontaneous report from a contactable consumer. A 35-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730), first dose via an unspecified route of administration on 21Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient was vaccinated yesterday with the Pfizer COVID-19. The patient felt lightheaded/dizzy after the injection and for many hours after in Dec2020. The patient felt these events before with other vaccines. The outcome of the event was unknown.

chills; malaise; raynauds in left fingers cold,blue; tingling; This is a spontaneous report from a contactable physician (patient). A 42-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899), via an unspecified route of administration on 21Dec2020 06:15PM, at right arm, at single dose for covid-19 immunization. Medical history included Guillain barre after flu vaccine in 2010, covid-19 prior vaccination. The patient's concomitant medications were not reported. The patient previously received flu vaccine in 2010. The patient experienced chills, malaise, raynauds in left fingers cold, blue, tingling on 22Dec2020 08:00 AM. No treatment received for all events. The outcome of events was recovering. Patient had not tested for COVID-19 post vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No seriousness criteria: no Results in death, no Life threatening, no Caused/prolonged hospitalization, no Disabling/Incapacitating, no Congenital anomaly/birth defect.

Headache Fever (101.3) with chills body aches/malaise nausea/decreased appetite site injection-arm pain

headache; Tachycardia; chills; body aches; This is a spontaneous report from a contactable nurse (patient). A 25-year-old female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number: EH9899), intramuscularly on right arm at 07:30 AM on 18Dec2020 at single dose for COVID-19 immunization. The patient medical history was not reported. Concomitant medication included ethinylestradiol, ferrous fumarate, norethisterone acetate (LO LOESTRIN FE). The patient experienced tachycardia, chills, body aches, headache at 12:00 AM on 19Dec2020, events resulted in: Emergency room/department or urgent care], events were reported as non-serious. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient was tested COVID post vaccination on

19Dec2020; COVID test type: Nasal Swab, COVID test name : Covid PCR, Covid test result: Negative. The patient did not receive any treatment for events. The outcome of events was recovered in Dec2020.

Episode of nausea; Right-sided preauricular and superficial cervical lymphadenopathy; This is a spontaneous report from a contactable physician (patient herself). This 36-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EJ1685), via an unspecified route of administration, at single dose on 19Dec2020 at 08:45 AM for COVID-19 immunisation. Vaccine location was left arm. The patient was vaccinated at hospital, age at vaccination was 36-year-old. No other vaccine was received in four weeks. The patient was not pregnant. The patient did not have a relevant medical history. Relevant concomitant medications included ibuprofen and 20 Ethinyl Estradiol-3 Drospirenone. On 21Dec2020, the patient developed right-sided preauricular and superficial cervical lymphadenopathy. On 22Dec2020, the patient had an episode of nausea. The patient did not perform COVID test before and after vaccination. No therapeutic measures were taken as result of the events. The outcome of the events was unknown.

On day to the left arm had some redness at the injection site and was sore. This was listed as unknown possible side effect. On the days following a became increasingly red and itchy. I took Benadryl to help resolve the itching. Redness and itching continued and then on Sunday 12/27/20 The site became increasingly read painful to touch and warm to touch. On Monday morning I contacted my immediate supervisor advised her that I was having something outside of what I believed to be a ?normal? reaction or side effect. I went to urgent care to see occupational health. I was given prescriptions for keflex and naproxen for cellulitis. My arm is extremely painful to touch. I was advised if the area worsens or spreads to see the ER because I may need IV antibiotics.

Sore arm; This is a spontaneous report from a contactable nurse (patient). A 24-year-old female patient (no pregnant at the time of vaccination) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899) via intramuscularly on 22Dec2020 06:15 AM on left arm at single dose for COVID-19 immunization. The patient's medical history included hyperthyroidism/goiter and not allergy to medications, food, or other products. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine and did not receive any other medications within 2 weeks of vaccination. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient has not been tested for COVID-19. The concomitant drug included vitamins within 2 weeks of vaccination. The patient experienced sore arm on 22Dec2020 06:15 AM. No treatment for sore arm. The outcome of the events was recovering.

"In Clinic: Pt received Moderna vaccine on right arm. She immediately felt numbness and tingling sensation on both shoulders and right neck. Neck felt tight, pain and + weakness on left wrist and 4th / 5th digit. BP was 149/ 78, O2 sat 99%, pulse 82. Pt then felt nausea, dizziness, burning sensation of left thigh, ""not feeling well"". Pt abvle to move all extremities, denies SOB. Hx of allergic reaction to Reglan and compazine. Repeat Vitals: 160/74, pulse,83,O2sat 100%, 2 pm: 135/85, pulse 75, O2 sat 99% Paramedics was called and arrived at 2:11 pm. Pt to be further evaluated in ER. In ED: Gen: Patient is in NAD, non-toxic appearing, cooperative HEENT: NC/AT, MMM, no conjunctival injection, b/l sclera anicteric. Mallampati 1 oropharynx clear, no exudates, tonsils within normal limits. No edema or

erythema. Neck: Supple. Cardiovascular: RRR Pulmonary/Chest: CTAB, no increased WOB, no respiratory distress, no wheezes/rhonchi/rales, chest wall tenderness. Abdominal: Soft. NT/ND, no r/g, no masses Extr/MSK: Well perfused, distal pulses intact. No tenderness. No LE edema. Back: No CVAT Neuro: No evidence of facial droop, normal speech, mentation appropriate, steady gait. Sensation intact to light touch to upper lower extremities. Cranial nerves 2-12 within normal limits. Psychiatric: Normal affect. Mood not labile nor depressed. Skin: No rashes, lesions, or wounds appreciated on exposed skin. á ED Course & Clinical Decision Making: 43 year old female with PMHx as listed in HPI presents with intermittent numbness after receiving the coronavirus vaccination. á - History of present illness also notable for symptoms started 20-30 minutes after receiving the coronavirus vaccination. á - Vitals reviewed and all wnl á - Physical exam notable for neurologically intact, no rashes, no airway abnormalities, otherwise unremakrable. á - Given above findings, presentation is concerning for side effects from the coronavirus vaccination, electrolyte abnormality. Will check basic lab work here in the emergency department. Will give symptomatic control with 1 L of IV fluids and Zofran for the nausea. Will monitor here in the emergency department. Disposition pending clinical improvement. á Lab work grossly unremarkable here in the emergency department. Mild hypo phos of 2.6. Electrolytes otherwise within normal limits. No leukocytosis. Hemoglobin of 10.2, no baseline but the patient does have a history of chronic anemia given uterine fibroids. á The patient was able to ambulate with steady gait. She continues to have burning sensation to her left leg and her right arm. She will be given lidocaine patches for symptomatic control. She also be given ibuprofen 600 mg. á Return precautions returning to the patient. At this time presentation does not appear consistent with anaphylaxis. Min presentation most consistent with side effects from coronavirus vaccination. á Patient tolerated p.o. here in the emergency department. She was able to ambulate with steady gait. Symptoms mildly improved after lidocaine patch and ibuprofen. Return precautions given. á Patient re-evaluated and is stable for discharge. á At this time, suspicion is low for acute injury/illness requiring hospital admission or emergent intervention. No indication for inpatient management; No medical or surgical emergent care needed at this time. á However, it was stressed to the patient that symptoms may persist or worsen, in which case she should be reevaluated. Patient should also get appropriate and timely follow up for further evaluation and continuation of care. The patient indicates understanding of these issues. Patient is ready for discharge. Return precautions (advised to return to ER if their symptoms persist, change, or worsen) and follow up plan reviewed with patient and understood. á á"

Left deltoid soreness; This is a spontaneous report from a non-contactable physician (patient). A 28-year-old female (not pregnant) patient received first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EJ1685), intramuscular in left arm on 22Dec2020 08:15 at single dose for COVID-19 immunisation. Facility where the most recent COVID-19 vaccine was administered was Hospital. Medical history included asthma (Prior history of asthma). No allergies to medications, food, or other products. Prior to vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included ethinylestradiol, norethisterone acetate (JUNEL), ascorbic acid, betacarotene, biotin, capsicum annuum fruit, colecalciferol, collagen marine, curcuma longa, cysteine hydrochloride, equisetum arvense, fallopia japonica, hyaluronic acid, iodine, keratin, lysine, methionine, piper nigrum, selenium, serenoa repens, tocotrienols nos, withania somnifera, zinc (NUTRAFOL). The patient not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced left

deltoid soreness (non-serious) on 22Dec2020 10:00. No treatment received for the adverse event. Since the vaccination, the patient has not been tested for COVID-19. The outcome of the event was not recovered. No follow up attempts are possible. No further information is expected.

""""whole body aches everywhere.""/whole body is so sore today, my breast, my back, shoulders, my neck; My throat gets a little sore; I just threw up everywhere; This is a spontaneous report from a contactable consumer (patient). A 65-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730), via an unspecified route of administration on 22Dec2020 08:20 at single dose for COVID-19 immunization. The patient medical history was not reported. There were no concomitant medications. The patient reported that her ""whole body aches everywhere/her whole body hurts."" Healthcare professional (HCP) had not been made aware of this at time of call. The patient further reported that her whole body was so sore today (23Dec2020), my breast, my back, shoulders, my neck. Also, her throat gets a little sore and she just threw up everywhere on an unspecified date in Dec2020. The patient was working in a nursing home. No treatment was given for the events. ""Lab test: Consumer stated, ""No, just the Covid test but I passed it so (sentence incomplete)."" The outcome of the events was unknown."

Anxious, dizzy, hypertensive, lightheaded for 30 min-- monitored throughout -- resolved without intervention -- discharged home

"Facial Tingling 25 minutes after injection. Still with mild tingling.; Face and ears felt very warm; This is a spontaneous report from a contactable nurse (patient). A 55-year-old non-pregnant female patient received her first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), via an unspecified route of administration on 21Dec2020 13:30 at single dose on her left arm for covid-19 immunization. Medical history included gastrooesophageal reflux disease (GERD) and known allergies included Latex, epinephrine (""epi""), shell fish. Concomitant medication in two weeks included fexofenadine hydrochloride (ALLEGRA), lansoprazole (PREVACID), plantago ovata (METAMUCIL), dextran sulfate sodium (DSS). The patient previously took epinephrine and experienced drug hypersensitivity. The patient experienced face and ears felt very warm. Facial Tingling 25 minutes after injection on 21Dec2020 14:00. No treatment was received. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient has not been tested for COVID-19. The outcome of the events was recovering."

2 inch diameter at injection site; swelling, redness, tender for 3 days after; 2 inch diameter at injection site; swelling, redness, tender for 3 days after; 2 inch diameter at injection site; swelling, redness, tender for 3 days after; This is a spontaneous report from a contactable other health professional (patient). A 40-years-old female patient (not pregnant at the time of vaccination) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscularly on 17Dec2020 16: 30 at single dose on left arm for COVID-19 immunization in hospital. Medical history included attention deficit hyperactivity disorder (ADHD), idiopathic retinitis. Concomitant medication included amfetamine aspartate, amfetamine sulfate, dexamfetamine saccharate, dexamfetamine sulfate (ADDERALL), gabapentin, naproxen sodium (ALEVE), ergocalciferol (VIT D), magnesium supplement and multivitamin.

The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced 2 inch diameter at injection site; swelling, redness, tender for 3 days after, stated from 18Dec2020 12:00 PM. Then gone. No treatment received for the adverse events. The events outcome was recovered in Dec2020. No COVID prior vaccination, since the vaccination, the patient hadn't been tested for COVID-19. The seriousness was reported as no. The information on the batch number has been requested.

Tachycardia up to 160 with exertion. Some shortness of breath noted. Returns to normal heart rate with rest. Cardiac monitor, CXR, CBC, TSH, CMP in the Emergency Department and physician evaluation. Returned to work same day without restrictions. Will follow up with personal provider.

left arm soreness a little; This is a spontaneous report from a contactable nurse (patient). A 55-year-old female patient (not pregnant at the time of vaccination) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730), intramuscularly on 22Dec2020 16:30 at single dose at left arm for COVID-19 immunization. Medical history was none. The patient's concomitant medications were not reported. The most recent COVID-19 vaccine was administered at Hospital. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient did not receive any other medications within 2 weeks of vaccination. The patient experienced left arm soreness a little on 22Dec2020 16:30. There was no any treatment received for the adverse event. The case safety report was non-serious per the reporter. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient hadn't been tested for COVID-19. The outcome of the event was recovering.

joint pain; fatigue; headache; sore arm; This is a spontaneous report from a contactable pharmacist (patient). A 27-year-old female patient (not pregnant) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number= EH9899), via an unknown route of administration on 22Dec2020 09:00 AM in left arm at single dose for COVID-19 immunization. The COVID-19 vaccine was administered at hospital. The patient's medical history and concomitant medications were unknown. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced joint pain, fatigue, headache, sore arm on 23Dec2020 09:00 AM. The patient received Ibuprofen as treatment. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient was not been tested for COVID-19. The outcome of events was unknown.

oral lesions; This is a spontaneous report from a contactable nurse. A 48-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EH9899), via an unspecified route of administration on 21Dec2020 at single dose for covid-19 immunization. Vaccine location was right arm and it was the first dose. The facility type vaccine was hospital. None medical history. No known allergies. Patient was not diagnosed with COVID-19 prior to vaccination nor tested for COVID-19 since the vaccination. Concomitant medication included acetylsalicylic acid, caffeine, paracetamol (EXCEDRIN MIGRAINE) within 2 weeks of vaccination. The patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced oral lesions on 22Dec2020 with outcome of not recovered. Patient didn't receive treatment for the adverse event. The action taken in

response to the events for BNT162B2 was not applicable. The date report was first received from source was 23Dec2020. The event was reported as non-serious.

I woke up in the middle of the night after my vaccine; experienced a rapid heartbeat; This is a spontaneous report from a contactable healthcare professional. A 50-year-old female patient received BNT162B2 (Pfizer-BIONTECH Covid-19 Vaccine), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient stated that she received the first injection of the vaccine on Monday and experienced a rapid heartbeat on Monday night (unspecified dates). She further stated that she woke up in the middle of the night after her vaccine with her heart rate at 127. She wanted to know about this side effect if it was the true side effect and if it could happen again after receiving the second dose of the vaccine. Outcome of the events was unknown. Information on the lot/batch number has been requested.

chills, muscle soreness, left arm pain/injection site pain. injection site hard started around 7pm 12/28/20, currently 12/29/20 no longer have chills still have generalized muscle soreness, left arm pain/injection site pain, injection site hard

fever accompanied by severe chills for 12 hours; fever accompanied by severe chills for 12 hours; This is a spontaneous report from a non-contactable Other healthcare professional (HCP) reporting for herself. A 25-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 22Dec2020 at single dose for covid-19 immunization. Vaccine location was Right arm and it was the first dose. The COVID-19 vaccine was administered at Hospital. Medical history included the patient was diagnosed with COVID-19 Prior to vaccination. Concomitant medications included escitalopram oxalate (LEXAPRO), trazodone, acetylsalicylic acid (BABY ASPIRIN), ibuprofen. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced fever accompanied by severe chills for 12 hours on 22Dec2020 07:00 PM. Since the vaccination, the patient was not been tested for COVID-19. No treatment received for the events. The outcome of the event was recovering. No follow-up attempts are possible; information about lot/batch number cannot be obtained. No further information is expected.

drop in platelets; This is a spontaneous report from a Pfizer-sponsored program. A contactable pharmacist reported that a patient of unspecified age and gender started to receive bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot/batch number not reported), via an unspecified route of administration on an unspecified date at a single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. Pharmacist on the line calling about COVID 19 Vaccine. He was doing some administrative work and noticed they have patient who received the COVID 19 vaccine and has since experienced a drop in platelets. He wanted to know if we have any information about any other reports of this occurring. The COVID 19 vaccine was given and then noticed patient had a drop in platelets. The reporter stated he does not know when the patient experienced the drop in platelets. He was provided with this question yesterday, so it's possible the drop occurred yesterday, but he does not know. It was unknown to the caller if the drop in platelets is still ongoing or has resolved. The outcome of the event was unknown. Information on the lot/batch number has been requested.

Pain at injection site

nausea; Headache; fever; chills; body aches; This is a spontaneous report from a contactable Nurse (patient). A 42-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number E12573C) , intramuscular in Left arm on 21Dec2020 at 19:00 at single dose for COVID-19 immunization. Medical history included COVID-19 (the patient diagnosed with COVID-19 prior to vaccination); since the vaccination, the patient has not been tested for COVID-19. No follow-up attempts are possible. No further information is expected.

fever, headache, nausea, extreme fatigue lasting 24 hours No treatment besides ibuprofen. Symptoms began aboue 20 hours after injection and gone 26 hours later

12-26-2020 uncomfortable heart palpitations, tired and disruption of sleep x 2 days.

Extreme body aches, has to stay in be, severe headache, eyes hurt, swollen lymph nodes under right arm, fever to 99.2

Moderate/severe fatigue; muscle discomfort at injection site; muscle discomfort at injection site; This is a spontaneous report from a non-contactable other health professional (patient). A 25-years-old female patient (not pregnant) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number: EH9899), intramuscularly on 22Dec2020 08:00 at single dose on left arm for COVID-19 immunization. Medical history included polycystic ovarian syndrome (PCOS), sinus tachycardia, anxiety. Concomitant medication included propranolol, fluoxetine hydrochloride (PROZAC), spironolactone (ALDACTONE A), all from Dec2020. The known allergy included metoclopramide (REGLAN). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced moderate/severe fatigue, muscle discomfort at injection site on 23Dec2020 05:45 AM. No treatment received for the adverse events. The events outcome was not recovered. No COVID prior vaccination, since the vaccination the patient hadn't been tested for COVID-19. It was not reported as serious. No follow-up attempts are possible. No further information is expected.

she felt cold, then hot; she felt tired and weak; feel hot; she felt tired and weak/weakness; she felt cold/cold sensation; chills; headache; have a temperature of like 99 to 99.1/temperature went to 99.1; This is a spontaneous report from a contactable physician (patient). A 41-year-old female patient

received first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK5730, Expiry Date: Mar2021), intramuscular in left deltoid on 16Dec2020 around 2:00 or 2:30 in the afternoon at single dose for COVID-19 immunisation. Medical history included none. Concomitant medications included colecalciferol (VITAMIN D), ascorbic acid, ergocalciferol, nicotinamide, retinol, riboflavin, thiamine hydrochloride (VITAMINS [ASCORBIC ACID;ERGOCALCIFEROL;NICOTINAMIDE;RETINOL;RIBOFLAVIN;THIAMINE HYDROCHLORIDE]). The patient previously took flu shot on 16Oct2020 at age of 41-year-old for immunization. Caller asking if is possible to see side effects days later after getting the vaccine. Caller report her symptoms which the caller reports started 4-5 days after receiving the vaccine. Symptoms included were chills, weakness, headache and temp. Caller on the line a doctor, MD, calling about the COVID Vaccine. She mentioned she got the shot last week, 16Dec2020. Almost like the fourth day after getting the vaccine, that Sunday (20Dec2020), she started to experience chills and have a temperature of like 99 to 99.1. She did not get the vaccine through her doctor. She got the vaccine at the hospital she works at. She explained on Sunday (20Dec2020) night, she felt cold. She had to use a couple of blankets and wear a sweatshirt which was not usual for her. On Monday 21Dec2020, she felt tired and weak. That afternoon and evening she felt chills as well. It was like all of a sudden she had a cold sensation. She commented her normal temperature always runs like 97.6 to 98. Her temperature went to 99.1, something like that. However, she confirmed it did not go above that. She would feel hot at times and chilly at times. She also mentioned she experienced headaches. Yesterday (22Dec2020) morning she felt better. Last evening it was not that bad. She mentioned with chills she felt cold, then hot. She checked her temperature and it was 98.8 something like that. Just a little higher than her normal. Outcome of chills: Stated this morning she was fine, but in the evening it is worse. Felt weak: She mentioned there was time where she was fixing lunch and after it was cooked she felt weak and like she had to sit right away. Headache: Had an episode Sunday (20Dec2020) night and it happened again yesterday. The headaches for short periods. Caller confirmed this was the first dose received of the COVID vaccine. She confirmed she does not know if the chills, feeling weak, headache, or temperature is related to the COVID vaccine. She mentioned she has no other symptoms like cough. She also added she was tested for COVID and it was negative. She had the test done on 22Dec2020. At end of call, caller questioned, it was asked if it is possible to have side effects days later after getting the COVID vaccine and it be related to the vaccine. She stated she's read it's common for it to occur like two days after, but not this long afterwards. Vaccination Facility Type was Hospital. Vaccine Administered at a Military Facility was No. Additional Vaccines Administered the Same date of the Pfizer Suspect was None. No AE(s) require a visit to the Emergency Room or Physician Office. The outcome of the event weakness was not recovered. The outcome of the event have a temperature of like 99 to 99.1/ temperature went to 99.1 was recovering. The outcome of other events was unknown.

The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was feeling tired after the vaccine on 23Dec2020, Stated he just got the vaccine and he was now just really tired, not sick or anything and he was at work. He was considering going home from work and they told him he had to call Pfizer. Reported he received the COVID 19 vaccine today at work at the at 0900 23Dec2020 in the left arm. About 20 minutes after the injection he started to feel tired and like he wanted to go home from work. His feeling was staying the same. The outcome of the event was not recovered.

I started feeling a lump in my throat, not really bad but it got worse it did not affect my speech or my breathing. But after a while I realized I was having a hard time swalowing, I asked the nurse for Benadryl and it took about 10 min to receive, they took my vitals, they watched for about 45 min and once I told them my throat was feeling better I was realized to go back to work.

Sore arm only; This is a spontaneous report from a non-contactable other HCP (patient). A 39-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EJ1685) via intramuscular on 22Dec2020 08:30 on left arm at a single dose for COVID-19 immunization. The patient allergy to Percocet and medical history included hypothyroidism. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine and did not receive any other medications within 2 weeks of vaccination. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient has not been tested for COVID-19. The patient experienced sore arm only on 23Dec2020 18:00 and no treatment received. The outcome of the event was recovered in Dec2020. No follow-up attempts are possible. No further information is expected.

Difficulty breathing, itchy mouth rash, very bad cough, fever (103)

chills; fatigue; headache; arm pain; body aches; Fever; This is a spontaneous report from a contactable nurse(patient). A 29-year-old female patient received the first dose of BNT162B2 (Lot number: EL0140), via intramuscular, in arm left, on 22Dec2020 18:15 at single dose for COVID-19 immunization. Facility where the most recent COVID-19 vaccine was administered was hospital. Medical history included Covid 19, pneumonia, anxiety/depression. Prior to vaccination, the patient was diagnosed with COVID-19. Since the vaccination, patient was not tested for COVID-19. No allergies to medications, food, or other products. No other vaccines were received within 4 weeks prior to the COVID vaccine. The other medication that the patient received within 2 weeks of vaccination was MULTIVITAMIN, sertraline hydrochloride(ZOLOFT), VITAMIN D3, ZINC, VITAMIN C. The patient experienced fever, chills, arm pain, body aches, headache, fatigue on 23Dec2020 09:00 AM. No treatment was received for the events. The outcome of the events was not recovered.

"Chills; sweats; aches and pain; Reports she was up all night opening the window and tuning on the heating blanket during the night; This is a spontaneous report from a contactable consumer (patient). A

67-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number ""CJ1685 and 228255"" pending clarify), via an unspecified route of administration on 22Dec2020 08:30 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that she got the covid-19 vaccine yesterday (22Dec2020) at 08:30 A.M. Reported that all night long (22Dec2020) she had chills, sweats, aches and pains. She was told that she should be fine by Christmas. She was up all night opening the window and tuning on the heating blanket during the night. She was wrapped in blankets. Patient was advised to contact healthcare professional for treatment recommendations. Patient declined any treatment to the events. Patient also mentioned that her doctor did not want her to get the vaccine. She works as a certified nurse assistant (CNA) in the hospital. For the lot number, NDC number, and expiration date, she provided details from the card she was given for the vaccine. She read first dose COVID-19: ""CJ1685 and 228255"". She put her glasses on to read the card. The patient she wanted to lay down. The outcome of the event chills, aches and pains was not recovered, for event sweats was recovering, for the rest of event was unknown."

At about 15 minutes the patient experienced nausea, headache, then face flushing.

fever/steady fever/Caller says his fever got as high as 101.5 degrees Fahrenheit; This is a spontaneous report from a contactable Other Health Professional (patient) from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). An 82 years old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot EL0140) via an unspecified route of administration on 21Dec2020 at single dose in left arm for COVID-19 immunisation. Medical history and concomitant medications were none. Warm transfer in regards to the COVID vaccine which he received Monday morning. Agent reports caller said since then he has had a steady fever and has questions in regards to side effects. As for Height: Caller says he is shrinking, he is about 5 feet 9 inches tall. No further details provided about shrinking. Caller clarifies his doctor title and says that he is not a physician or medical doctor, he has a PhD in psychology. Caller says he doesn't have a prescribing provider, he got the vaccine at a retirement home called (facility name and location). Caller says that his fever started the day he got the shot. He says he got the shot that morning, clarified to being about noon, and had a fever that evening. Caller clarifies that he takes Advil, not Aspirin for his fever. He says when he takes the Advil it goes away, it gets rid of it, but when the Advil wears off the fever comes back again. He says he has no idea what side effects of this drug are, so he thought he would give a call because others were worried about it and pressured him to ask. Caller says the only information he has is the card, the COVID-19 Vaccine Record Card, which says Pfizer, then below it EL0140, which could be either 0 or letter O, probably 0. He says it has the date 21Dec2020 on it from when he got it and he got it in his left arm, it was his first injection of it, he has another to come. Caller says his fever got as high as 101.5 degrees Fahrenheit on 22Dec2020, and he also has a fever right now. Therapeutic measures were taken as a result of fever and included treatment with Advil. Outcome of event was not recovered.

after 2 hours headache lasted for 3-4 hours; left arm injection site soreness worse at night unable to raise arm due to pain lasted up to 48 hours from time of injection; unable to raise arm due to pain; This is a spontaneous report from a contactable other hcp (patient). A 64-year-old male patient received bnt162b2 (Lot: EK5730), via an unspecified route of administration at Left arm, first dose on 20Dec2020

10:30 at single dose, for COVID-19 immunization. Medical history included diabetes, high cholesterol and hypertension (HTN) from an unknown date. Prior to vaccination, the patient was not diagnosed with COVID-19. No Known allergies. Concomitant medication included metformine, lisinopril, atorvastatin and finasteride. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. It was reported that after 2 hours headache lasted for 3-4 hours left arm injection site soreness worse at night unable to raise arm due to pain lasted up to 48 hours from time of injection. The adverse event start on 20Dec2020, at 12:15 PM. The events are reported as non-serious. Therapeutic measures were taken as a result of after 2 hours headache lasted for 3-4 hours left arm injection site soreness worse at night unable to raise arm due to pain lasted up to 48 hours from time of injection, treatment included ibuprofen. The outcome of the event was recovering.

After a few minutes started experiencing a headache pressure feeling and dry mouth

redness at the site that was more noticeable; some tenderness; This is a spontaneous report from a contactable nurse (patient herself). A female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot #: EH9899), via an unspecified route of administration on 21Dec2020 at single dose for immunization. The patient's medical history and concomitant medications were not reported. The patient experienced redness at the site that was more noticeable, and some tenderness in Dec2020 with outcome of unknown.

Patient woke up with nausea, vomiting, and a headache this morning. OTC treatment, not see by physician.

Groggy/sleepy; mild cognitive impairment; mild unsteady gait; light headed; malaise; tired; This is a spontaneous report from a contactable other health professional (patient). A 55-year-old female patient received the first of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number: EJ1685), intramuscularly on 22Dec2020 06:30 AM at left arm, at single dose for covid-19 immunization. Medical history included Rheumatoid arthritis, hypothyroid and remission of DM2, known allergies: Penicillin. Concomitant medication included arginine hydrochloride, ascorbic acid, calcium, calcium pantothenate, cyanocobalamin, ferrous fumarate, folic acid, magnesium, methionine, nicotinic acid, phosphorus, potassium, pyridoxine hydrochloride, retinol, riboflavin, selenium, thiamine hydrochloride, tocopheryl acetate, triticum aestivum, zinc (MULTI VITAMIN), methotrexate, thyroid, sertraline. The patient previously took tramadol and experienced drug hypersensitivity. The patient was not pregnant at the time of vaccination. The patient experienced Groggy, mild cognitive impairment, mild unsteady gait, light headed, malaise, tired, sleepy on 22Dec2020 11:00 AM. No treatment was received for all events. The patient underwent lab tests and procedures which included covid test: negative on 21Dec2020 (Nasal Swab). The outcome of the events was recovering. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No seriousness criteria: no Results in death, no Life threatening, no Caused/prolonged hospitalization, no Disabling/Incapacitating, no Congenital anomaly/birth defect.

Sore injection site; This is a spontaneous report from a contactable other HCP. A 45-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), Intramuscularly on 22Dec2020

02:45 PM in left arm at single dose for covid-19 immunization. The COVID-19 vaccine was administered at hospital. Medical history included diabetes. The concomitant drugs were not reported. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced sore injection site on 23Dec2020 05:00 AM. No treatment received for the event. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient was not been tested for COVID-19. The outcome of event was recovering. No follow-up attempts are possible. Information on Lot/Batch number cannot be obtained.

Extreme headache, as bad as I has while sick with covid. Exhaustion, shortness of breath while talking

Slightly elevated heart rate - most of that afternoon through early morning Slightly elevated blood pressure - most of that afternoon through early morning Palpitations at night - when I went to bed that's when I noticed it up until 1:30'ish in the morning I took one (1) 500 mg tylenol at around 1:00 am and felt a bit better; that was it

headache; ear neck back pain; ear neck back pain; ear neck back pain; chills/shivers; sweaty; nausea; vomiting; diarrhea; dizzy; weak; sore muscles; heavy feeling in both arms; tingling in lower legs; This is a spontaneous report from a contactable Nurse reported for herself. A 62-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, EK5730), intramuscular on 21Dec2020 08:30 AM at single dose for covid-19 immunization. Vaccine location was Right arm and it was the first dose. The COVID-19 vaccine was administered at Hospital. Medical history included rheumatoid arthritis and high blood pressure. Concomitant medication included quetiapine, metoprolol succinate, cyclobenzaprine, levothyroxine, omeprazole, tofacitinib citrate (XELJANZ). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient's Known allergies included Iodine, Morphine. The patient experienced headache, ear neck back pain, chills, shivers, sweaty, nausea, vomiting, diarrhea, dizzy, weak, sore muscles, heavy feeling in both arms, tingling in lower legs on 21Dec2020 11:00 AM. No treatment received for the events. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient was not been tested for COVID-19. The outcome of the events was recovered on an unknown date in Dec2020.

Headache; felling warm; This is a spontaneous report from a non-contactable other HCP. A 23-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899) via intramuscular on 22Dec2020 15:30 on left deltoid at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient denied any history of previous adverse reactions to vaccines. The patient was given the Pfizer vaccination in the left deltoid muscle. During her 15 minutes waiting period after the injection, the patient began to experience headache and felling warm. She denied rash, hives, welts, difficulty breathing, difficulty swallowing, wheezing, throat tightness, hoarseness, stridor, itching, lightheadedness, dizziness, facial swelling, lip swelling and tongue swelling. This provider was notified of patient reaction and she was then assessed in the emergency bay area. Monitored patient for severe reaction symptoms, including respiratory distress with stridor, wheezing, dyspnea, increased work of breathing, persistent cough and cyanosis. The patient was told to receive Tylenol and no side effects.

The patient was stable to go home and follow up with PCP. The outcome of the events was unknown. No follow-up attempts are possible. No further information is expected.

heart rate increased to 100BPM; This is a spontaneous report from a contactable Other Health Professional (patient). A 47-year-old female patient received 1st dose BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot EJ1685) via an unspecified route of administration on 18Dec2020 04:30 PM at single dose in left arm for COVID-19 immunisation. Medical history included Asthma, Known allergies: Sulfa, Peanuts, Shell Fish and Peas. Concomitant medications included cetirizine hydrochloride (ALEGRA), montelukast sodium (SINGULAIR), fluticasone propionate (FLOVENT) and ascorbic acid, tocopheryl acetate, xantofyl, zeaxanthin, zinc (AREDS) and Probiotics. The patient previously took Iodine and Erythromycin and experienced known allergies. At 18Dec2020 04:45 PM, her heart rate increased to 100BPM and continued for 45 min, and this result in Emergency room/department or urgent care. The patient underwent lab test and included EKG and heart rate count. Therapeutic measures were taken as a result of event and included treatment with Pepcid, Benadryl, EKG and Monitored her heart rate. Outcome of event was recovered on Dec2020.

3 hours after patient received vaccine on 12/27/2020 @ 2pm she started to feel flushed in the face and hands. She also started to get blisters on both hands. Pt. took a 25mg tab of Benadryl by mouth and symptoms resolved. She awoke at 3:30 am and felt that her carotid artery was pulsating. Patient informed Primary Care Physician's office on 12/28/2020 of symptoms who then prescribed patient an Epi-pen. Advised to receive emergency medical service if symptoms worsened. On 12/29/2020 patient feels good and all symptoms have subsided.

her upper face was swollen, clarifying more on the left side, and mostly around her eyes.; her upper face was swollen, clarifying more on the left side, and mostly around her eyes.; her eyes are a little red; This is a spontaneous report from a contactable consumer(patient). A 61-year-old female patient received BNT162B2 via an unspecified route of administration at Deltoid Right on 22Dec2020 14:00 at the 61 years old at single dose for COVID-19 immunization. The medical history included Type 2 diabetes mellitus from 1995 and ongoing(diagnosed about 25 years ago, controlled diabetic with a Hemoglobin A1C of 5) and Blood pressure high from 1995 and ongoing (diagnosed with high blood pressure about the same time as her diabetes, clarified as 25 years ago. She stated she has controlled blood pressure). The concomitant medications were not reported. The patient previously received a flu shot in Oct2020. On 23Dec2020 the patient reported her upper face was swollen, clarifying more on the left side, and mostly around her eyes. She said her eyes were a little red, too. She said she normally takes a Benadryl 30 mg tablet every night along with Melatonin for sleep. She said she has a big bottle of the generic Benadryl 30 mg at home and the bottle is almost empty. She said she rather take the Benadryl and Melatonin. The outcome of the events upper face was swollen and mostly around her eyes was Recovering, the event eyes were a little red was Not Recovered. Information about batch/lot number has been requested.

Employee c/o of sudden loss of vision and fell forward on the floor. Employee states he did not have any lunch yet. Emergency team called and assess the employee. Client refused to be taken to the ER for further evaluation. VS monitored and stable . No SOB, no difficulty of breathing. No Taking po fluids. Client d/c with steady gait and no c/o.

Anxiety; Anxiety; dizziness; rapid breathing; This is a spontaneous report from a non-contactable other health professional. A 34-year-old female patient received the first of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899) intramuscularly on 22Dec2020 14:00 at left arm, at single dose for covid-19 immunization. Medical history included anxiety and took Hydralazine prn (As needed). The patient's concomitant medications were not reported. The patient denied any history of previous adverse reactions to vaccines. The patient was given the vaccination in the left deltoid muscle. During her 15 minute waiting period after the injection, the patient began to experience dizziness on 22Dec2020. She denied rash, hives, welts, difficulty breathing, difficulty swallowing, wheezing, throat tightness, hoarseness, stridor, itching, facial swelling, lip swelling and tongue swelling. This reporter was notified of patient reaction and she was then assessed in the emergency bay area. The patient presented with rapid breathing and anxiety. Monitored patient for severe reaction symptoms, including respiratory distress with stridor, wheezing, dyspnea, increased work of breathing, persistent cough and cyanosis. The patient's breathing slowed and felt less anxious by the time she left. The outcome of the events rapid breathing and anxiety was recovering, the outcome of the other event was unknown. No seriousness criteria: no Results in death, no Life threatening, no Caused/prolonged hospitalization, no Disabling/Incapacitating, no Congenital anomaly/birth defect. No follow-up attempts are possible. No further information is expected.

The day after on 12/18 soreness at at the injection site. On 12/19 symptoms exp headache and fatigue. Then on 12/20 started chills, fever and headache. I went to see the doctor on 12/21 and got several test Covid ,Flu and Strep results positive for all. Since then symptoms has continued. I have had to miss 6 days of work.

muscle aches; chills; Fatigue; This is a spontaneous report from a contactable nurse (patient). A 51-year-old female patient received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, expiration date: 31Mar2021), via an unspecified route of administration on 19Dec2020 19:30 at single dose to prevent Covid. Medical history included COVID-19 from 30Oct2020 to 24Nov2020. There were no concomitant medications. Eight hours after getting the vaccine (20Dec2020 03:30), she had muscle aches and chills, she also had fatigue on 20Dec2020. She was worried. She was concerned that she had done something crazy. She was through Covid for sure. She wasn't able too much. She was off work that day and didn't have to do anything. She would not have been able to work. The muscle aches were rivaling the worst days of Covid. She had Covid for 3 weeks. Then she had to wait another 10 days to get over the symptoms. She never had to go to the hospital. These muscle aches that she experienced after the injection were as intense as when she had Covid. The Lot on the patient card was difficult read. The information was hand written and squished in. She was unsure if it was EK5B30 or EK5030 or EK5730. The patient underwent lab tests and procedures which included COVID test: positive on 30Oct2020, negative on 24Nov2020. The outcome of muscle aches and chills was recovered on 21Dec2020, fatigue was recovering. The event muscle ache reported as serious, with serious criteria medically significant.

Information about lot/batch number has been requested.; Sender's Comments: The Company considers there is a reasonable possibility that the reported muscle ache is related to the administration of BNT162B2, based on the plausible temporal association and the known safety profile of the suspect. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

Low-grade fever and chills (99.5 Fahrenheit); Low-grade fever and chills (99.5 Fahrenheit); headache; This is a spontaneous report from a contactable nurse (patient). A 29-year-old female patient received her fist dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number not provide), intramuscularly on right arm at 09:30 AM on 21Dec2020 at single dose for COVID-19 immunization. Medical history included deep vein thrombosis (DVT), covid-19 prior vaccination. Concomitant medication included escitalopram oxalate (LEXAPRO), rivaroxaban (XARELTO), atenolol, multivitamins. The patient experienced severe headache at 18:00 on 21Dec2020. Low-grade fever and chills (99.5 Fahrenheit) Q (every) 90 mins from 22:00 21Dec2020 till 04:00 22Dec2020. The events were assessed as non-serious. Since the vaccination, the patient had not been tested for COVID-19. The outcome of event headache was recovered in Dec2020, the outcome of events chills and low grade fever was recovered at 04:00 on 22Dec2020. Information on the Lot/Batch number has been requested.

dizziness; This is a spontaneous report from a non-contactable healthcare professional. A 21-year-old male patient started to receive bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, lot number: EH9899, expiry date not reported), intramuscular on the right arm (right deltoid muscle) on 22Dec2020 18:15 at a single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. The patient experienced dizziness on 22Dec2020. He denied rash, hives, welts, difficulty breathing, difficulty swallowing, wheezing, throat tightness, hoarseness, stridor, itching, facial swelling, lip swelling and tongue swelling. The provider was notified of patient's reaction and he was then assessed in the emergency bay area. The patient was monitored for severe reaction symptoms, including rapid progression of symptoms, respiratory distress with stridor, wheezing, dyspnea, increased work of breathing, persistent cough and cyanosis, vomiting, abdominal pain, hypotension, dysrhythmia, chest pain and collapse. Therapeutic measures were taken as a result of dizziness that included water and rest. The patient was stable to go home. Clinical outcome of the event was unknown. No follow-up attempts are possible. No further information is expected.

I felt a little flushed; My heart is breathing; This is a spontaneous report from a contactable consumer (patient). This female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration at single dose on 21Dec2020 for Covid-19 immunisation. The patient medical history and concomitant medications were not reported. The patient stated: I felt a little flushed and my heart is breathing on an unspecified date with outcome of unknown. Information on the lot/batch number has been requested.

dizziness; This is a spontaneous report from a non-contactable healthcare professional. A 72 year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, lot number: EH9899),

intramuscular on the right leg (right deltoid muscle) on 22Dec2020 17:30 at a single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. The patient experienced dizziness on 22Dec2020 17:45, during her 15 minute waiting period after the injection. She denied rash, hives, welts, difficulty breathing, difficulty swallowing, wheezing, throat tightness, hoarseness, stridor, itching, facial swelling, lip swelling and tongue swelling. This provider was notified of patient reaction and she was then assessed in the emergency bay area. The patient was monitired for severe reaction symptoms, including rapid progression of symptoms, respiratory distress with wheezing and dyspnea, vomiting, abdominal pain, hypotension, dysrhythmia, chest pain and collapse. On an unspecified date, the patient underwent lab tests and procedures which included blood sugar: 108 and vital signs measurement: normal. No therapeutic measure was taken as a result of the event. Clinical outcome of the event was unknown. No follow-up attempts are possible. No further information is expected.

About 10 minutes after vaccine a red injection site appeared and then also was red further up around the shoulder (noticed because shoulder was itchy). I also felt warm. I have been diagnosed in the past with exercise induced asthma. Asthma started to flare up shortly after but did not require intervention. Was monitored by a doctor at facility where vaccine was given and symptoms did not worsen. No medication required. I noticed unusual muscle aches starting the next morning and persisted for a week after vaccine. Left arm where vaccine was given did not hurt, but other right arm, shoulders and thighs were aching. Hands seemed arthritic with movement at work. Feet occasionally felt tingly when walking for 5 days after vaccine. Asthma flare-ups continued after vaccine. Had to stop and rest after climbing stairs which is unusual for me. The worst asthma flare-ups persisted for up to 5 days. After 10 days at time of reporting adverse effects, asthma is still triggered but to a lesser extent. Can climb stairs without pause now. Airways have not fully recovered yet and I have a residual cough. Started self treating with albuterol rescue inhaler if needed.

Developed swollen lymph node under right arm; This is a spontaneous report from a contactable nurse (patient). A 35-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EK5730) intramuscularly at right arm on 20Dec2020 at 10:15 a.m. at a single dose (dose number=1) for COVID-19 immunization. Medical history and concomitant medications were not reported. The patient was not pregnant. Facility type vaccine was at hospital. No other vaccine in four weeks. The patient developed swollen lymph node under right arm on 21Dec2020 at 11:00 a.m. The event was reported as non-serious. with outcome of recovering. No treatment received for the event. No COVID-19 diagnosed prior vaccination and no COVID-19 tested post vaccination. No known allergies (no allergies to medications, food, or other products). No follow-up attempts are possible. No further information is expected.

Chills and body aches

Headache; nausea; This is a spontaneous report from a contactable other health professional (other HCP) (patient). A 60-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730) via an unspecified route of administration at right arm on 21Dec2020 at 10:00 a.m. at a single dose (dose number: 1) for COVID-19 immunization. Medical history included hypothyroid and

hyperlipidemia. Concomitant medications in two weeks included levothyroxine, simvastatin (ZOCOR), ergocalciferol (VITAMIN D), ascorbic acid (VITAMIN C) and calcium (reported as calcium mul, to be clarified). No other vaccine in four weeks. The patient was not pregnant. Facility type vaccine was hospital. No COVID-19 diagnosed prior vaccination and no COVID-19 tested post vaccination. No known allergies (no allergies to medications, food, or other products). The patient experienced headache, nausea on 22Dec2020 at 12:00 p.m. with outcome of resolved in Dec2020. The events were reported as non-serious. No treatment received for events.

Bilateral parasthesia to fingers 4 hours post injection. This passed in 15 minutes, About 7 Pm on 12/28/20, bilateral parasthesia to hands & feet. On 12/29/20 (AM) foot pain--painful to walk, went away in about 5 minutes, but still felt tingling to both feet. Still having tingling sensation to both feet (constant) and both hands (intermittent)

Pain injection site; numbness in both hands; This is a spontaneous report from a contactable consumer (patient). A 30-years-old male patient started to receive first dose bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number: EK5730), via an unspecified route of administration on 22Dec2020 14:00 at single dose (Anatomical Location of Administration: right shoulder) for COVID-19 immunization. Medical history included ongoing allergy, allergic to Sulfa drugs, Clindamycin, and Vancomycin. Concomitant medication included ongoing fluticasone propionate (FLONASE [FLUTICASONE PROPIONATE]) for Allergy and ongoing loratadine for Allergy. Prior vaccinations within 4 weeks was none. The patient experienced numbness in both hands on 22Dec2020 about ten minutes after the injection, pain injection site on 23Dec2020 09:00. He had an interesting side effect that was not listed on the fact sheet. He mentioned he did not want his information going to any third parties. He clarified the interesting side effect that he did not see listed on the fact sheet as, received the COVID 19 vaccine yesterday (22Dec2020) around 2 pm, after getting the shot he felt fine initially, but then he started to experience both of his hands go numb. He was not sure if had any effect on the nerves, but it effected his hands. Then he noticed today (23Dec2020) he had some pain at injection site. He stated that was normal and saw it listed. It was the numbing of his hands that was weird to him. His left hand felt better, but right hand felt the same. He was calling to see if due to this if he should still take the booster shot or not. He also wanted to see if these details had been reported before. Pain at injection still hurts a good amount and unable to provide outcome. He mentioned the card he received with the lot number the person who wrote on it had terrible hand writing, so he was not sure of the lot number. He stated these reactions are not severe, it is kind of annoying. The action taken in response to the events for bnt162b2 was not applicable. Relevant Test was None. The outcome of the events was not recovered.

anxiety; chills; generalized feelings of not feeling quite right; nausea; nervousness; This is a spontaneous report from a non-contactable other hcp. A 34-years-old female patient received first dose bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number: EH9899), intramuscular on 22Dec2020 13:45 (vaccine location: Right arm) at single dose for covid-19 Vaccination. Past medical history includes anxiety for which she took venlafaxine (Effexor) on a daily basis as well as type 2 diabetes, diagnosed approximately seven or 8 years ago during a pregnancy, she was on oral medication during the day and insulin at nighttime. Concomitant medications were not reported. She did take her oral medication today (22Dec2020) and last ate a pasta lunch right before arriving to the vaccine clinic. Last A1c was 6.

During her 15-minute waiting period after the injection, the patient began to experience generalized feelings of not feeling quite right as well as anxiety/nervousness, nausea and chills. She denied difficulty breathing, throat tightness, dizziness, chest pain, or other GI complaints. This provider noticed her raising her hand from across the waiting area and tended to her where she noted the above complaints. she was then assessed in the emergency bay area. She was monitored for severe reaction symptoms, including rapid progression of symptoms, vomiting, hypotension, chest pain, collapse and Respiratory distress. The action taken in response to the events for bnt162b2 was not applicable. The outcome of the events was unknown. No follow-up attempts are possible. No further information is expected.

Upset stomach; Nausea; Mild headache; This is a spontaneous report from a contactable nurse reporting for herself. This 26-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number: EJ1685) on 22Dec2020 14:25 at a single dose intramuscularly in the left arm for COVID-19 immunization. The patient medical history was not reported. Concomitant medication included sertraline hydrochloride (ZOLOFT). Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The patient experienced upset stomach, nausea and mild headache on 23Dec2020. The events were non-serious, no treatment received for the events. The patient was recovering from the events.

Patient was under the age of 18 when Covid-19 vaccine was administered

dizziness; This is a spontaneous report from a non-contactable healthcare professional (HCP). A 63-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EH9899) on 22Dec2020 17:30 intramuscularly at a single dose in the left arm (in the left deltoid muscle) for COVID-19 vaccination. No relevant medical history. The patient denied any history of previous adverse reactions to vaccines. The patient's concomitant medications were not reported. During her 15 minute waiting period after the injection, the patient began to experience dizziness. She denied rash, hives, welts, difficulty breathing, difficulty swallowing, wheezing, throat tightness, hoarseness, stridor, itching, facial swelling, lip swelling and tongue swelling. She was then assessed in the emergency bay area, monitored for severe reaction symptoms, including rapid progression of symptoms, respiratory distress with stridor, wheezing, dyspnea, increased work of breathing, persistent cough and cyanosis, vomiting, abdominal pain, hypotension, dysrhythmia, chest pain and collapse. Vitals were normal, glucose was 100. The event dizziness was non-serious. The outcome of the event was unknown. No follow-up attempts are possible. No further information is expected.

Swollen lymph nodes; Injection site pain; Tiredness; This is a spontaneous report from a contactable Nurse(patient). A 31-year-old female patient received first dose of BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL0140), via an unspecified route of administration on 22Dec2020 20:45 at single dose at left arm for COVID-19 immunization. The patient was not pregnant. There were no known allergies or other medical history. There were no other vaccine in four weeks. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. Concomitant medication included ascorbic acid (VITAMIIN C), ergocalciferol (VIT D), vitamin b complex (SUPER B COMPL); reported as prenatal. The patient experienced swollen lymph nodes,

injection site pain, tiredness; all on 23Dec2020 14:00 with outcome of not recovered. The events were non-serious. No treatment received for the events.

Moderna COVID-19 Vaccine EUA Day1- none Day2- Injection site: soreness, firmness, and weakness. General symptoms: none Day3- Injection site: bruising, tenderness. General symptoms: fatigue Day4- Injection site: bruising, tenderness. General symptoms: fatigue, body aches, joint pains, difficulty waking in the morning Day5- Injection site: bruising, tenderness. General symptoms: fatigue, body aches, joint pains, difficulty waking in the morning Day6- Injection site: bruising, tenderness. General symptoms: fatigue, body aches, joint pains, difficulty waking in the morning I am currently on day 6 from getting the Moderna COVID-19 Vaccine and the injection side bruising and tenderness still persist along with the general symptoms of fatigue, body aches, joint pains, and difficulty waking up in the morning.

had only a sore arm; muscles were sore.; This is a spontaneous report from a contactable physician (patient, psychologist, work as a healthcare provider in a prison system). A 69-year-old male patient received a single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot number reported as: E316, either 05 or 85) via an unspecified route of administration on 21Dec2020 (between 13:15 and 13:30) in the right arm for COVID-19 immunization. Medical history included flu, not recently, several weeks ago. Concomitant medications were reported as none. The patient had only a sore arm on 21Dec2020 as a side effect. The patient also reported muscles were sore on 21Dec2020. The outcome of the events was unknown. Caller stated he wanted to check and make sure he wasn't supposed to have side effects. He had seen on TV people complaining of chills, fever and headache. As he was looking at the document he was given, he may have called the wrong number for the question to ask: he was lucky enough as a healthcare professional to be administered his first shot of Pfizer's COVID vaccine, and with the exception of where the site where it was injected, his right arm being a little sore, like with any shot, he had not experienced side effects, like headaches or nothing, and today he noticed he didn't get a check in, he got texts. But his question was: if he didn't feel side effects, did it mean the vaccine was not necessarily taking, if no side effects, did it mean it will not be effective? Stated it was just minor, like any other shot. He did not mind participating in this study, for information, since Pfizer may be counting soreness in the arm, but he did not perceive this as a problem. He got the vaccine on Monday 21Dec2020, between 13:15 and 13:30, and then it was just like, he had a flu shot, not recently, several weeks ago, and to the same point. No further details provided. Like within a couple, three hours, it started, and it was difficult to sleep on it, just sore, no redness/inflammation, he could not tell where the skin was punctured, just his muscles were sore. He called the number on the sheet, he was just real curious, he did not feel bad, like he hears on TV, and he knew personally people who got symptoms and he no symptoms, that he can ascertain. No further details provided. His appointment was 1:15, it may have been in his arm at 13:25, or 13:30 or something, he went and sat for his 15 minute wait time, at 1:30, so it was between 13:15 and 13:30. Outcome reported as it was OK during the daytime, but to sleep on that side, it can feel sore, and he turned to the other side, it did not keep him from typing, lifting, writing, working, emptying the dishwasher. He had a registration code, was given a card. Read from his vaccination card: provided date of vaccination 21Dec2020, vaccine name Pfizer COVID 19, stated lot was written in ink, looked like it was E316, stated he can't read, it was smeared, but then said next dose is 11Jan2021. States it was E316, either 05 or 85. He didn't have the sore arm before he got it,

and it is going away now, or it would go away. Information on the lot/batch number has been requested.

she broke out in hives 4 hours after she received the vaccine; This is a spontaneous report from a contactable other-healthcare professional (HCP) (patient). A 34-year-old female patient received a single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot #: EL1284) as the first dose via intramuscular on 23Dec2020 13:00 in the right arm for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient did not receive any other vaccines within 4 weeks prior to the vaccine BNT162B2. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The patient reported that she broke out in hives 4 hours after she received the vaccine on 23Dec2020 (also reported as at 16:00). The event was reported as non-serious. No treatment was received for the event. The outcome of the event was recovering. No follow-up attempts are possible. No further information is expected.

"This is a spontaneous report from a contactable nurse (patient). A 33-year-old female patient received BNT162B2 (Pfizer-BioNTech Covid-19 vaccine) on 22Dec2020 11:30AM at left arm for COVID-19 immunization. The patient had known allergies to sulfa and was currently breastfeeding. The patient had concomitantly received ascorbic acid, honey, melatonin, zinc gluconate (ZARBEE'S ALL NATURAL COUGH SYRUP NIGHTTIME) (reported as "" Zarbees elderberry immune syrup"") in two weeks. The patient experienced fatigue, myalgias, headache, arm soreness, brain fog at 3:00PM on 22Dec2020. Patient received ibuprofen 400 mg as treatment for the adverse events. The outcome of the events was resolving at the time of reporting. Information on the lot/batch number has been requested."

headache; fatigued; lightheaded/dizzy(the room was spinning); nauseous; chills; hot flashes; This is a spontaneous report from a contactable nurse reported for herself. A 24-year-old adult female patient (pregnant: no) was received the first dose BNT162B2 (brand: Pfizer, Batch/lot number: EK5730) via unspecified rout of administration on left arm on 23Dec2020 13:00 at single dose for COVID-19 immunization. Medical history included asthma, Bipolar Disorder, known allergies: Latex, milk, bananas, blue dye 2&, COVID-19 (Prior to vaccination, was the patient diagnosed with COVID-19? :Yes). Concomitant medication in two weeks included lamotrigine (LAMICTAL), fluoxetine hydrochloride (PROZAC), cetirizine hydrochloride (ZYRTEC [CETIRIZINE HYDROCHLORIDE]) and ascorbic acid, ferrous fumarate, folic acid, retinol (PRENATAL [ASCORBIC ACID;FERROUS FUMARATE;FOLIC ACID;RETINOL]). No other vaccine in four weeks. After the vaccination patient became lightheaded, dizzy (the room was spinning), nauseous and got chills and hot flashes. After 30minutes or so she began to get a headache while the other symptoms wore off and then became fatigued. Adverse event start date was 23Dec2020 01:00 PM. the most recent COVID-19 vaccine was administered in Hospital. Since the vaccination, the patient has not been tested for COVID-19. Treatment received for the events included ibuprofen (MOTRIN), Meclizine, ondansetron (ZOFRAN) and paracetamol (TYLENOL). Patient was recovering from the events. It was reported as non-serious. No results in death, life threatening, caused/prolonged hospitalization, disabling/Incapacitating nor congenital anomaly/birth defect.

woke up with mild fever, and severe headache, lasted through the day, was gone upon waking next morning.

Joint ache and tiredness on the next day after vaccination; Joint ache and tiredness on the next day after vaccination; This is a spontaneous report from a contactable other healthcare professional (patient). A 27-years-old female patient (not pregnant) received BNT162B2 (lot number: EK5730) first dose on 18Dec2020 12:45 PM intramuscularly on Left arm at single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. No Known allergies to medications, food, or other products. Facility type vaccine was Hospital. Other medications in two weeks was No. Patient experienced Joint ache and tiredness on the next day after vaccination (19Dec2020). Patient had no covid prior vaccination. Patient had covid tested post vaccination on 21Dec2020, Nasal Swab, the result was negative. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No treatment received for the events. The outcome of the events was recovering. The seriousness was reported as no.

soreness at site of injection; This is a spontaneous report from a contactable nurse (patient). A 39-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 17Dec2020 intramuscularly on right arm at single dose for COVID-19 immunization. Medical history included ongoing Psoriatic arthritis, patient received allergy shots (Unable to provide the names, NDC. Lot, or expiry for the allergy injections she received. It's the regular one for pets (cat and dog dander), trees, mold and dust. No food allergy. Mentions having an allergy to sulfur), unspecified sulfur products-wheezing, rash, itching. Concomitant medications included adalimumab (HUMIRA) and methotrexate, both ongoing for Psoriatic arthritis. She Is having soreness in her arm where she received it and she got it last Thurday (17Dec2020). Today (23Dec2020), she went to get her allergy shots and not sure if she should have waited or if she is missing something in the literature about doing the allergy shots after. It didn't say. She knows that it is the same when she has to get a flu shot she waits about a week to get her allergy shots. Received the vaccine early last Thurday evening and the allergy shots today at 2pm. Received the vaccine through her workplace. The soreness started on Friday morning (18Dec2020) and by Monday afternoon (21Dec2020) and it had gone away. She is just worried because she got the allergy injection today in the same arm that the vaccine was given. Clarifies that the soreness is around the injection site of where the vaccine was given, not where the allergy shots given. Worried that she should have waited and doesn't want to go to bed and wake up with something wrong. States this is her first shot. Unable to provide the names, NDC. Lot, or expiry for the allergy injections she received. It's the regular one for pets (cat and dog dander), trees, mold and dust. No food allergy. Mentions having an allergy to sulfur. Has wheezing airway and the first time was when she was a kid and she got a rash, redness, and itching. The doctor now knows not to prescribe anything with sulfur because the second time was when she was 20 something she had the wheezing. Vaccination Facility Type was Hospital. Vaccine Administered at Military Facility was No. History of all previous immunization with the Pfizer vaccine considered as suspect (or patient age at first and subsequent immunizations if dates of birth or immunizations are not available) was none. Additional Vaccines Administered on Same Date of the Pfizer Suspect was none. No AE(s) require a visit to Emergency Room or physician office. Prior Vaccinations (within 4 weeks prior to the first administration date of the suspect vaccine(s)) was none. The outcome of the event was recovered on 21Dec2020. The seriousness was reported as no. Information on the Batch/Lot number has been requested.

woke up with mild fever, and severe headache, lasted through the day, was gone upon waking next morning.

Severe body aches; chills; low grade fever 100.7; fatigue; muscle pain; This is a spontaneous report from a contactable nurse (patient). A 34-year-old female patient (pregnant: no) was received first dose BNT162B2 (brand: Pfizer BioNtech, lot number: EJ1685), via unspecified route of administration at arm right on 17Dec2020 12:30 PM at single dose for COVID-19 immunization. Medical history included Complex Migraines, prior to vaccination, the patient was diagnosed with COVID-19. Concomitant medication in two weeks included verapamil, amitriptyline, fish oil, magnesium, vitamin b2 [riboflavin], no other vaccine in four weeks. Patient previous took amoxicillin clavulanic acid (AUGMENTIN), butalbital caffeine paracetamol (FIORICET) and eletriptan hydrobromide (RELPAX) and had allergies to them. Patient experienced severe body aches, chills, low grade fever 100.7, fatigue, muscle pain on 18Dec2020 03:00 AM. the most recent COVID-19 vaccine was administered in Hospital. Since the vaccination, the patient has not been tested for COVID-19. No treatment received for the events. Patient was recovered from the events. It was reported as non-serious. No results in death, life threatening, caused/prolonged hospitalization, disabling/Incapacitating nor congenital anomaly/birth defect.

soreness at site of injectio and droziness

"Fever up to 100.4; Headache; Chills; Muscle pains; This is a spontaneous report from a contactable physician (patient). A 57-year-old male patient was received first dose BNT162B2 (reported ""Active Drug substance names: COVID 19"", lot number: EJ1685), via unspecified route of administration at left arm on 18Dec2020 05:15 PM at single dose for COVID-19 immunization. Medical history included hyperlipidaemia and COVID-19 (Prior to vaccination, was the patient diagnosed with COVID-19?:Yes), No known allergies. There are no other medications in two weeks and no other vaccine in four weeks. Patient experienced fever up to 100.4, headache, chills, muscle pains on 19Dec2020 12:00 PM (20Dec2020 00:00). the most recent COVID-19 vaccine was administered in Hospital. Since the vaccination, the patient has not been tested for COVID-19 (COVID was not tested post vaccination). Treatment for the event included paracetamol (TYLENOL). Patient was recovered from the events. It was reported as non-serious. No results in death, life threatening, caused/prolonged hospitalization, disabling/Incapacitating nor congenital anomaly/birth defect. Pfizer is a marketing authorization holder of COVID 19 vaccine in the country of incidence or the country where the product was purchased (if different). This may be a duplicate report if another marketing authorization holder of COVID 19 vaccine has submitted the same report to the regulatory authorities."

Patient reports that about 25 minutes after receiving the vaccine she began to feel like her throat was swollen and the her voice was changed and she had a feeling of pressure on her vocal chords. She also noted that she seemed to have an increase in heart rate. She took a dose of Benadryl and no further symptoms were experienced. She reports that these symptoms resolved by next day but she felt extreme fatigue for the next few days.

fever; Headache; fatigue; This is a spontaneous report from a contactable Other healthcare professional (patient). A 59-year-old male patient received BNT162B2 (lot number: EJ1685) first dose on 22Dec2020 07:30 AM on left arm at single dose for COVID-19 immunization. Medical history included HTN (Hypertension) and Allergies to PCN (Penicillin) and Sensitive to morphine. Concomitant medications included venlafaxine hydrochloride (EFFEXOR), atenolol, ergocalciferol (VIT D) and multivitamin. Facility type vaccine was Hospital. Patient had other vaccine (Trial) in four weeks, patient had it on 02Dec2020 first dose on Left Arm. Patient had other medications in two weeks: Effexor, atenolol, multivitamin, vit D. About 16 hrs (22Dec2020 11:00 PM) after injection patient began fever 100-101. Lasted about 20 hours. Relieved with ibuprofen. Headache and fatigue also. All resolved about 36 hours after injection. Patient did not have covid prior vaccination and no covid tested post vaccination. No treatment received for the adverse event. The outcome of the events was recovered. The seriousness was reported as no.

Patient received the vaccine, waited 15 minutes and had no difficulties. He presented back to the injection area with complaints of dizziness, slight chest and neck tightness. BP was slightly elevated. He was given 2 benadryl an taken to the ED where they monitored him. No further medication intervention needed.

Felt a little achey and a sore arm; This is a spontaneous report from a contactable consumer. An adult female patient of unspecified age was received first dose of BNT162B2 (Brand: Pfizer/BioNTech, lot number: unknown) via unspecified route of administration at single dose for COVID-19 immunization. Medical history and concomitant medication were unknown. It was unknown if other vaccine in four weeks. Patient felt a little achey and a sore arm on 21Dec2020. It was unknown if the patient diagnosed with COVID-19 prior to vaccination, it was unknown if the patient been tested for COVID-19 since the vaccination (unknown covid tested post vaccination). It was unknown if treatment received for the event. Outcome of the events was unknown. It was reported as non-serious. No results in death, life threatening, caused/prolonged hospitalization, disabling/Incapacitating nor congenital anomaly/birth defect. Information on the Batch/Lot number has been requested.

"Vertigo; Dizziness; Sore arm; This is a spontaneous report from a contactable Other healthcare professional (patient). A 63-year-old female patient received BNT162B2 (lot number EL0140) on 21Dec2020 2:30""pm on arm left at single dose for COVID-19 immunization. Medical history was none. Concomitant medications included multivitamin. She doesn't know if it is a side effect but today she has had vertigo that she has never had before, and a little bit of dizziness on and off. The vertigo started about 4:30am this morning (23Dec2020) when she got up to go to the bathroom. Everything was just spinning so she didn't go to the bathroom, she just laid down. She had it 2 more times but not anymore after that. Now she is just having some dizziness from time to time (Dec2020). She also specified that soreness is ""normal"" for her to experience ""after injection"". She has takes multivitamin but nothing that would be related to this event. She has just never had this happen before. It was given in his left upper biceps area. With previous vaccines she has had a sore arm but with this vaccine the sore arm wasn't that bad. It was sore that day (21Dec2020) and yesterday but today there is nothing, no soreness. She received no other vaccines that day or within 4 weeks of the vaccine. There is no significant family history. There have been no treatments for the events. The outcome of event vertigo and sore arm recovered on 23Dec2020. The outcome of event Dizziness was not recovered."

Shaking chills; body aches; nausea; vomiting; vertigo; This is a spontaneous report from a contactable Other-healthcare professional (patient). A 57-year-old female (not pregnant) patient received BNT162B2 (lot number: EH9899) first dose on 17Dec2020 02:00 PM intramuscularly on left arm at single dose for COVID-19 immunization. Medical history included Colon Cancer, Hypothyroidism, Allergic Rhinitis, Weight Loss Surgery, GERD, BPPV. Concomitant medications in two weeks included Levothyroxine, cetirizine hydrochloride (ZYRTEC), Escitalopram, MVI, Calcium, colecalciferol (VIT D3), cyanocobalamin (VIT B12). No Known allergies to medications, food, or other products. Facility type vaccine was Other. No other vaccine in four weeks. Patient experienced Shaking chills, body aches, nausea, vomiting and vertigo on 18Dec2020 03:30 AM. Patient received Zofran, Meclizine, Phenerga as treatment. Patient did not have covid prior vaccination and no covid tested post vaccination. The outcome of the events was recovering. The seriousness was reported as no.

Within two days of vaccine, shortness of breath on light exertion (talking, walking), ?revved up? like on steroid or medrol. Anxiety, increased resting HR, abdominal cramping, diarrhea, agitation, palpitations, fatigue, dazed, premenstrual spotting.

Temp 103, and very sore arm for 3 days; Temp 103, and very sore arm for 3 days; This is a spontaneous report from a contactable nurse reported for herself (patient). A 57-year-old female patient (pregnant: no) was received BNT162B2 (brand: Pfizer, Lot number: unknown) via unspecified route of administration on 19Dec2020 10:30 AM at single dose for COVID-19 immunization. Medical history included COVID-19 (Prior to vaccination, was the patient diagnosed with COVID-19?:Yes). Concomitant medication in two weeks of vaccination included simvastatin, acetylsalicylic acid (BABY ASPIRIN), docusate sodium (COLACE) and fish oil (FISH OIL OMEGA 3). no other vaccine within 4 weeks prior to the COVID vaccine. Patient used took ciprofloxacin (CIPRO) and had allergy. Patient experienced temp 103, and very sore arm for 3 days on 20Dec2020 02:00 AM. the most recent COVID-19 vaccine was administered in Hospital. Since the vaccination, the patient has not been tested for COVID-19. Since the vaccination, the patient has not been tested for COVID-19. Treatment received for the events included ibuprofen. Patient was recovered from the events in Dec2020. It was reported as non-serious. No results in death, life threatening, caused/prolonged hospitalization, disabling/Incapacitating nor congenital anomaly/birth defect. Information on the lot/batch number has been requested.

"12/28/20 called to observation area at 12:05. she had already waited 15 minutes after vaccine. reports tingling top of tongue, tingling ums, back of mouth/throat scratchy. 12:10 states no change, 12:12 rapid response and supervisor arrived - talked with her. decided to not go to ER unless worse, agreed will not go back to work or leave for home until sx resolved. 12:20 states gum tingling decreasing. 12:30 states sx resolved - left observation with instruction to return if sx. 12/29/20 came to vaccine area at 1045 to report injection site with 1"" redness, firm to touch. blanches, tender w/ pressing outer edge redness. arm size unchanged, noted when got up this morning. states sore, able to move arm. 1050 evaluated by rapid response and nursing supervisor. states otherwise feeling ok, no sx. supervisor drew circle around redness. suggested ice/anti-histamine. talked with her - to wait 30 minutes, to contact PCP if spreads. 1130 states no change, decided to RTW"

Severe arm pain at injection site.; No swelling but can barely move arm; Chills; fatigue; moderate headache; This is a spontaneous report from a non-contactable nurse (patient). A 27-year-old non-pregnant female patient receive first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899), via an unspecified route of administration at left arm on 22Dec2020 at 10:00 AM at single dose for COVID-19 immunization at pharmacy or drug store. Medical history was none and there was no known allergies. Concomitant medication included oxybutynin hydrochloride (OXYBUTYNIN) and birth control received within 2 weeks of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced severe arm pain at injection site, there was no swelling but can barely move arm, chills and fatigue and moderate headache, all on 22Dec2020 at 09:00 PM. There was no treatment for the events. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The outcome of the events was not resolved. No follow-up attempts are possible. No further information is expected.

He was diagnosed with COVID 19; He was diagnosed with COVID 19; This is a spontaneous report from a contactable consumer (front line hospital worker) reporting for himself, received via a Pfizer sales representative. This male patient of unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on an unspecified date in Dec2020, at single dose, for COVID-19 immunization. Medical history and concomitant medications were not reported. On an unspecified date in Dec2020, after vaccination, the patient was diagnosed with COVID 19 with unknown outcome. Information on the lot/batch number has been requested.

Pain at the injection site; This is a spontaneous report from a contactable Other Health Professional (patient) via Pfizer sales representative. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced pain at the injection site after Covid 19 vaccine on an unspecified date with outcome of unknown. Information on the Batch/Lot number has been requested.

Lightheadedness; This is a spontaneous report from a contactable Nurse (patient). A 60-year-old female patient (not pregnant at the time of vaccination) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL1284), intramuscularly in arm left on 23Dec2020 16:30 at single dose for COVID-19 immunization. The patient medical history was not reported. Concomitant medication the patient received within 2 weeks of vaccination included colecalciferol (VIT D3), smilax aristolochiifolia (SARSAPARILLA), ascorbic acid (VIT C), dioscorea villosa (WILD YAM), multi collagen protein. The patient previously took codeine and experienced allergies: Codeine. The patient experienced lightheadedness on 23Dec2020 17:15 with outcome of recovered in Dec2020. Facility where the most recent COVID-19 vaccine was administered: Hospital. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No treatment received for the adverse event. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. Identification of the case safety report: Serious: No; Seriousness criteria-Results in death: No; Seriousness criteria-Life threatening: No; Seriousness criteria-Caused/prolonged hospitalization: No;

Seriousness criteria-Disabling/Incapacitating: No; Seriousness criteria-Congenital anomaly/birth defect: No.

I begin chilling the next day after I received the vaccine and started running a low grade fever of 100.5-body aches, headache, fatigue and pain in the arm where I received vaccine x 2 days.

Tiredness; Chills; mild joint pain; Nausea; feeling unwell; he hasn't eaten; threw up; This is a spontaneous report from a contactable consumer (patient). A 28-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration by injection once in the left arm, near shoulder on 18Dec2020 at single dose for COVID-19 immunization. Medical history included asthma from 2009 and ongoing (Has asthma but he has no breathing symptoms, no runny nose, no dry cough, no shortness of breath, no COVID symptoms). There were no concomitant medications. The patient experienced tiredness on 20Dec2020 with outcome of not recovered, chills on 20Dec2020 with outcome of recovered on 20Dec2020, mild joint pain on 20Dec2020 with outcome of recovered on 20Dec2020, nausea on 20Dec2020 with outcome of not recovered, feeling unwell on 20Dec2020 with outcome of not recovered, he hasn't eaten in Dec2020 with outcome of unknown, threw up in Dec2020 with outcome of unknown. No runny nose, cough or anything. Investigation Assessment: No. The patient took the COVID vaccine and was having mild symptoms, which he wished to report, and he was seeking recommendations. He had the print out thing given with all the symptoms that may happen, he had tiredness, chills, mild joint pain, nausea, and feeling unwell. He was a COVD tester, which is why he got it last week. This is not his first date of symptoms. Nausea: He threw up Sunday and Monday, was nauseous on Tuesday, is nauseous now but feels better, he missed work on Monday, he went for 2 hours yesterday and was sent home, he didn't go in today, but is feeling more normal, but has been perpetually nauseous since Sunday, like 24/7, in the middle of the night, middle of day, for no reason. He ate yesterday, he hasn't eaten today, because he feels nauseous. States feeling unwell goes along with nausea, he can't separate the two. What kind of medicine should he take, like over the counter or Pedialyte. What would a person potentially take if they were nauseous. Pedialyte, fluid or something. States this is Pfizer, he guesses any guidance is medical. Information on the Lot/batch number has been requested.

"positive rapid COVID testing positive/COVID-19 PCR test positive; positive rapid COVID testing positive/COVID-19 PCR test positive; This is a spontaneous report from a contactable nurse (patient herself). A 42-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899, Expiration date: Mar2021), intramuscularly at site of right deltoid at 08:00 on 16Dec2020 at single dose for COVID-19 immunization. Medical history included ongoing high blood pressure. The patient received a flu shot in Oct2020. The patient's concomitant medications were not reported. The patient was tested positive for rapid COVID-19 testing on 21Dec2020 and was also positive for COVID-19 PCR test on 22Dec2020. No treatments after positive testing and patient was not hospitalized. The outcome of events was not recovered.; Sender's Comments: The reported ""tested positive for rapid COVID-19 testing"" after 4 days of immunization with BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) is considered related to BNT162B2 administration."

soreness at the injection site; slight fever; tiredness; This is a spontaneous report from a non-contactable consumer. A female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 22Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced soreness at the injection site, slight fever and tiredness on 22Dec2020. The outcome of events was recovered in Dec2020. No follow-up attempts are possible; information about batch/ lot number cannot be obtained.

Mild symptoms such as muscle soreness; This is a spontaneous report from a Pfizer-sponsored program. A contactable physician (patient himself) reported that a 31-year-old male patient received the first dose of BNT162B2 (Pfizer-BioNTech COVID-19 vaccine, lot# EJ1685), via intramuscular on 17Dec2020 20:00 in right arm at single dose for routine vaccination. There were no medical history and concomitant medications. Vaccination facility type was hospital, not a military facility. No additional vaccines were administered on same date of the Pfizer suspect. Prior Vaccinations (within 4 weeks) was none. Event following prior vaccinations was none. Relevant test was not tested. Patient was calling about COVID vaccine. He got the vaccine last Thursday and experienced mild symptoms such as muscle soreness around 6 am on Friday, 18Dec2020. On Sunday, his family became symptomatic and got tested for COVID and tested positive. He wanted to know if the COVID vaccine could produce false positive and if he can get the second dose. Caller did provide medical information's number and patient would need to be transferred over. There was no prescriber. It was given as routine from the hospital that he worked at. ER (emergency room) or physician's office required was none. Outcome of event was recovering.

Just letting you know it felt like a bad flu shot, sore enough to avoid sleeping on, but it went away after a few days :) thank you for your hard work, let?s hope after Jan 20 you can do your jobs without restriction.

felt weak; Nauseated; unable to sleep; was sick for about 2 hours; got so cold and couldn't get warm/felt cold to her bones; This is a spontaneous report from a contactable consumer (patient herself). A 64-year-old female patient received BNT162B2 (Pfizer-BioNTech COVID-19 vaccine), via an unspecified route of administration on 21Dec2020 at single dose for covid-19 immunisation. There were no medical history and concomitant medications. Investigation assessment was no. Caller received the Covid-19 vaccine Monday (21Dec2020). She was sick for 2 hours yesterday (22Dec2020). She got so cold and couldn't get warm, after a while she felt better. She felt cold to her bones. Today (23Dec2020) she felt weak and was nauseated. She worked at hospital. She was a tech at the hospital. She was a frontline worker. When a vial became available, she was given the vaccine. She was also unable to sleep last night (22Dec2020). She was up most of the night. She clarified that when she said she was sick for about 2 hours she was referring to being cold. Outcome of cold was recovered on 22Dec2020, and outcome of other events were unknown. Information on the lot/batch number has been requested.

Lymphadenopathy; Injection site pain/pain and tenderness under her arm; Lethargy; tired/did not feel like getting out of bed; Headache; arm was swollen/her sleeve was tighter, 1.5-2 inches bigger than her other arm; This is a spontaneous report from a contactable nurse reporting on behalf of herself. This 50 years old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot EJ1685) on

19Dec2020 at 11:15, at single dose, in right deltoid, for COVID-19 immunization. No other vaccine was given on the same date or within 4 weeks before. Medical history included ongoing epilepsy, ongoing depression and anxiety, COVID in late Oct2020 early Nov2020 (so her manager advised her to get the vaccine), allergies as a child, ongoing allergy to penicillin that showed up on an allergy test, ongoing allergy to house dust and trees, things like that. She previously received influenza vaccine in Oct2020, for immunization. AE(s) following prior vaccinations: none. Family medical history relevant to AE(s): none. Concomitant medications included topiramate (TOPAMAX) and brivaracetam (BRIVIACT), both for years, for epilepsy and duloxetine HCl (CYMBALTA) from Aug2020, for depression and anxiety. The reporter related Cymbalta use to COVID. The patient experienced lymphadenopathy on 21Dec2020, headache on 20Dec2020, injection site pain on 20Dec2020 at 03:00, lethargy on 20Dec2020, tired on 20Dec2020, arm was swollen on an unspecified date in Dec2020. Lymphadenopathy was reported as medically significant. The other events were reported as non-serious. The reporter stated it was painful but everyone told her it would be so she expected that. At about 3 A.M. on 20Sun2020 she woke up to her arm hurting when she tried to turn on her right side. She had taken 2 of the arthritis strength paracetamol (TYLENOL) the night before because she was told it was going to hurt, that might have been the reason she did not notice it before then. This was just injection site pain. At this point, she still had some injections site pain and it was tender if bumped but it was better than before. On 20Dec2020 she did not go to church because she felt tired and did not feel like getting out of bed, she also had a headache but these things were expected by her. She stayed in bed till noon. She went to work on 21Dec2020 and in that morning when she went to apply deodorant she noticed pain and tenderness under her arm. Her arm was swollen and she noticed that her sleeve was tighter so she had her husband measured her arm and it was 1.5-2 inches bigger than her other arm. It was tight and tender, actually at this point it was more than tender when she put her deodorant on. She was also giving the vaccine. No other treatments were given and she had not called her doctor about this. No emergency room or physician office visit were not required. Relevant tests: none. Headache and lethargy resolved on 20Dec2020. Injection site pain was resolving. Lymphadenopathy had not yet resolved and was reported as aggravated. The outcome of the other events was unknown. The reporter considered there was a reasonable possibility that headache, injection site pain, lymphadenopathy, lethargy were related to BNT162B2 vaccine.; Sender's Comments: Based on available information, a possible contributory role of the subject drug cannot be excluded for the lymphadenopathy and the other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Tachycardia

was tired and slept more than usual; was tired and slept more than usual; Soreness in left arm; This is a spontaneous report from a contactable consumer reported for himself. A 71-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in left arm on 22Dec2020 13:50 at single dose for covid-19 immunisation. There were no medical history or concomitant medications. The patient got it at 1:50 pm, and got home and was really tired, so he said he was going to bed at 6pm and woke up at 7:30 feeling pretty refreshed. He then told himself, if he didn't get up, he wouldn't sleep at night, so he got up until 11:00 and slept until 8am. The patient was tired and slept more than usual on 22Dec2020 at 16:00. The only side effect was that he got a little bit more rest than normal. The other side effect is he got soreness in left arm and it was pretty sore unspecified date in Dec2020. He did not have any headaches or anything else. He was pretty satisfied. The outcome of the events was tired and slept more than usual was recovering while for other event was unknown. Information on lot/batch number has been requested.

rash on his forearm by his elbow/He said that the rash is also on the back of his of calf; injection site soreness; a little achy; tired; itching; could not sleep well; This is a spontaneous report from a contactable consumer (reporter). A 50-year-old male patient received bnt162b2 (BNT162B2, lot number EK5734), via an unspecified route of administration on 18Dec2020 18:30 at single dose for COVID-19 immunization. Medical history included asthma. He said that he took no other medication except for a multivitamin and his asthma medication. The patient said that within 5 hours of receiving the vaccine, he was a little achy and had injection site soreness. He said that he felt a little tired on Friday (18Dec2020) and Saturday (19Dec2020), but by Sunday (20Dec2020) it was gone. He said that starting Monday (21Dec2020), he noticed a rash on his forearm by his elbow. He said that his skins was normally sensitive and dry. He thought maybe it was not the vaccine and said that he used hand sanitizer that may have bothered it. He said that the rash was on the back of his tricep now though. He said that the rash was also on the back of his of calf. He said that it was itching. He stated that he treated it with triamcinolone cream for rash from his kid and it did not do anything. He said that he was following up with this primary care physician about this. He stated that it was so itchy and he could not sleep well. The outcome of the event tired was recovered on 20Dec2020 while for other events was unknown.

test positive for COVID-19; test positive for COVID-19; This is a spontaneous report from a contactable consumer (patient). A 26-year-old female patient received the first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 20Dec2020 at single dose in left arm for covid-19 immunization. There was none medical history or concomitant medications. The reporter reported that she got the vaccine on the 20Dec2020 and found out Monday (21Dec2020) that she was exposed to someone who was positive so they used a rapid test post exposure on the 22Dec2020 that the result was positive for COVID-19. She reported she knew that the vaccine would not have given her COVID, and it was likely she had it before she got the vaccine and didn't know she had it because she didn't have symptoms. The outcome was unknown. Information about lot/batch number has been requested.

Sore left arm the day of the vaccination near the site. Throughout the next morning I felt a progressively worsening sore neck, that evolved into a stiff neck by early afternoon. My neck is a bit swollen, on the same side I received the vaccination (Left).

arm feels sore and heavy; arm feels sore and heavy; This is a spontaneous report from a contactable nurse (patient). A 36-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient reported that arm felt sore and heavy on an unspecified date after vaccination. The outcome was unknown. No follow up attempts are possible; information about lot/batch number cannot be obtained.

the arm was quite sore; This is a spontaneous report from a contactable consumer (patient's friend). A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730, expiration date: Mar2021), via an unspecified route of administration on an unspecified date at single dose in arm for covid-19 immunization. The patient's medical history was and concomitant medications were not reported. The patient was a frontline healthcare worker, the patient said the arm was quite sore (far more than expected) after vaccination, but no problem after an hour or so. The outcome of the event was resolved.

head ache; sore arm; This is spontaneous report from a contactable nurse (patient). A 43-year-old female patient (non-pregnant) received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot #: lot number Eh9899), via an unspecified route of administration on 22Dec2020 at single dose for immunization. Medical history was none. The patient's concomitant medications were not reported. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, patient was not diagnosed with COVID-19. Since the vaccination, patient has not been tested for COVID-19. The patient experienced head ache after 24 hours, sore arm on 23Dec2020 18:00 with outcome of unknown. Patient didn't receive treatment for events. The report is considered non-serious. Information on Lot/ Batch number has been requested.

Slight alteration in smell. Smells are not as pungent and some smells are different then what they should be.

lymphadenopathy in left lower neck area above clavicle/swelling of lymph nodes; sick; sore throat; This is spontaneous report from a contactable other-healthcare professional (patient). A 45-year-old female patient (non-pregnant) received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot #: lot number Eh9899), via an unspecified route of administration on 16Dec2020 19:00 at single dose at left arm for immunization. Medical history included known allergies/shellfish. The patient's concomitant medications were not reported. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine, patient didn't receive other medication within 2 weeks of vaccination. Prior to vaccination, patient was not diagnosed with COVID-19. Since the vaccination, patient has not been tested for COVID-19. On 21Dec2020 07:00 AM, the patient experienced lymphadenopathy in left lower neck area above clavicle. Patient had never had this before but had felt sick since patient took the vaccine mainly the first day but sore throat not sure if related, then the swelling of lymph nodes. Patient didn't receive treatment for events. Outcome of events was not recovered. The report is considered non-serious.

Arm soreness; slight aches; slight fatigue; Large lump (lymph node maybe) under arm pit left arm; This is a spontaneous report from a contactable other health professional (patient). A 47-year-old male patient received first dose of BNT162B2 (Lot number: Eh9899) intramuscularly in left arm on 21Dec2020 10:00 at single dose for COVID-19 immunization. Medical history included COVID-19 from an unknown date and unknown if ongoing (COVID prior vaccination: Yes). There were no concomitant medications. The patient experienced arm soreness, slight aches, slight fatigue, large lump (lymph node maybe) under arm pit left arm all on 23Dec2020 03:00 AM. Treatment was not received. The patient underwent lab tests and procedures which included COVID test: COVID on an unspecified date. The outcome of events was not resolved. Facility where the most recent COVID-19 vaccine was administered in hospital. Prior to vaccination, the patient was diagnosed with COVID-19.

pain that worsened at injection site; pain that worsened at injection site; This is a spontaneous report from a non-contactable consumer (patient). A 43-year-old patient of an unspecified gender received BNT162B2 via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced pain that worsened at injection site over time on an unspecified date with outcome of unknown. No follow up attempts are possible; information about lot/batch number cannot be obtained.

dry mouth; my arm is sore at the injection site; my temperature is also slightly above baseline; It feels like I am dehydrated; my arm is sore at the injection site; This is spontaneous report from a contactable other health professional (Patient). A 32-year-old male patient received first dose of BNT162B2 (lot number: EJ1685), via an unspecified route of administration in left arm on 22Dec2020 17:45 at single dose for COVID-19 immunization. Medical history included psychiatric history, partially empty selle tursica, no other major Illnesses. Concomitant medication included testosterone, emtricitabine, tenofovir disoproxil fumarate (TRUVADA) for prevention. On 23Dec2020 09:00 AM, the patient was experiencing a dry mouth. This was unique because he never had this problem but his arm is sore at the injection site and he had a dry mouth, his temperature is also slightly above baseline, but not significantly. It felt like he was dehydrated but he was drinking lots of water. He had about 3/4 of a gallon today and his mouth was still dry. Almost like a cotton mouth feeling but very mild. It was only 3/10 on how bad it's bothering him. Treatment was not received. The patient underwent lab tests and procedures which included body temperature: slightly above baseline on an unspecified date. The outcome of events was not resolved.

--- 12/29/2020 11:02 AM by NOT AUTHENTICATED--- 1809: Patient is a 54 year old female presents requesting vaccination for COVID-19. Patient's identity was verified utilizing two patient identifiers. Allergies reviewed and patient has no history of severe allergic reactions. Patient reviewed vaccine information and given opportunity to ask questions: Yes Patient wants vaccine: Yes Pfizer-BioNTech COVID-19 vaccine # 1 in series administered, see Immunizations activity for vaccine details. Patient tolerated well and will remain for observation period to monitor. 1815: Patient is a 54 year old female COMPLAINED OF NO FEELING STRANGE, WITH TINGLING IN NECK ON BOTH SIDES. ADULT EMERGENCY WAS CALLED AND WATER WAS OFFERED TO PATIENT. RADIAL PULSE READ 110 BPM. SHE WAS TRANSFERRED TO HOSPITAL FOR EXTENSIVE OBSERVATION. NO APPOINTMENT WAS MADE FOR

SECOND VACCINE. 1817: Staff present and transported via w/c for eval. Pt. treated as noted below. Triage Note: C/O feeling ? Strange?. Tingling in neck. Pulse:110 Upon arrival, (Triage Note) Member received COVID vaccine, and shortly thereafter began to experience SOB, tingling in bilateral hand and back of neck and head, and elevated heart rate. Feels like symptoms have improved. Pt speaking in complete sentences, in no acute distress. Given Benadryl 25mg IV, Famotidine 40mg PO. Improved, Observed. D/C home at 2242.

area of swelling, erythema, induration, one inch by 2.5 inches from the injection site and downwards, noted 24 hours after injection; area of swelling, erythema, induration, one inch by 2.5 inches from the injection site and downwards, noted 24 hours after injection; area of swelling, erythema, induration, one inch by 2.5 inches from the injection site and downwards, noted 24 hours after injection; This is a spontaneous report from a non-contactable physician (patient). A 31-year-old female patient received BNT162B2 (lot number: e51685), via an unspecified route of administration in left arm on 22Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced area of swelling, erythema, induration, one inch by 2.5 inches from the injection site and downwards, noted 24 hours after injection in Dec2020. The outcome of events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

muscle soreness; fatigue; This is a spontaneous report from a contactable nurse (patient herself). A 42-year-old female patient (non-pregnant) received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number: EK5730), intramuscular on 22Dec2020 07:30 at single dose at left arm for immunization. Medical history included PCOS, allergy to ragweed, grass. The patient's concomitant medications were not reported. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, patient was not diagnosed with COVID-19. Since the vaccination, patient has not been tested for COVID-19. On 22Dec2020 10:00 AM, the patient experienced muscle soreness and fatigue. Patient was unsure if the fatigue was from lack of sleep before working 12 hours and then getting the vaccine, or from the vaccine itself. Patient was recovered from all events in Dec2020, and didn't receive treatment. The report is assessed as non-serious. Information on the lot/batch number has been requested.

Woke up next morning after vaccine with chills and sweats and bodyaches. He has been fatigued. He has been nauseated and headache as well. Fever of 102.4 degrees and chills and sweats back and forth.

Headache; muscle aches; fatigue; possible fever; This is a spontaneous report from a contactable other healthcare professional (hcp) (patient). A 26-year-old female non-pregnant patient received first dose of BNT162B2 (Pfizer-BIONTECH Covid-19 Vaccine, lot number: EH9833), intramuscularly on 22Dec2020 10:30 at a single dose in left arm for COVID-19 immunization. There was no medical history. Concomitant medication included fluoxetine received within 2 weeks of vaccination. There were no other vaccines received in four weeks. No known allergy. The patient experienced headache, muscle aches, fatigue, and possible fever, all on 23Dec2020 18:30. No treatment received for these events. The patient did not have COVID prior vaccination. Since the vaccination, the patient had not been tested for COVID-19. The outcome of events was unknown.

severe myalgias, fever of 100.6*F, malaise, fatigue for the past 12 hours (approximately 12-18 hours after receiving the vaccine). Patient of note, had COVID19 infection in July 2020. She tested negative for COVID19 this morning (screening done/ordered after reporting her initial symptoms).

skin reaction of circles on forearm and trunk; This is a spontaneous report from a contactable nurse (patient). A 46-year-old male patient received BNT162B2 (Pfizer-BIONTECH Covid-19 Vaccine), via an unspecified route of administration on 22Dec2020 09:15 at a single dose for COVID-19 immunization. He is fair skinned. There were no medical history or concomitant medications. The patient experienced skin reaction of circles on forearm and trunk on 23Dec2020. The outcome of event was unknown. This case is reported as non-serious by reporter. The causality between event skin reaction of circles on forearm and trunk and BNT162B2 is related by Primary Source Reporter per Global Introspection. Information on the lot/batch number has been requested.

Cough; voice sounded different; not feeling great; Chest congestion; Nasal congestion; sore arm; Fatigue; body ache; This is a spontaneous report from a contactable consumer, the patient. A 27-year-old non-pregnant female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EK5730), via an unspecified route of administration in the left arm on 20Dec2020 (at the age of 27-years-old) as a single dose for COVID-19 immunisation. The patient did not have any relevant medical history. She never had any reactions to any vaccines prior. Prior to this vaccination, the patient was not diagnosed with COVID-19. The patient's concomitant medications included loratadine (CLARITIN) and unspecified birth control. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 21Dec2020, the patient experienced sore arm, fatigue, and body ache. On 22Dec2020, the patient developed nasal congestion and chest congestion. On 23Dec2020, the patient had a cough, her voice sounded different, and was not feeling great. Since the vaccination, the patient had not been tested for COVID-19. However, in May2020, she was tested for COVID-19 antibodies and was negative. The clinical outcomes of fatigue, body ache, nasal congestion, chest congestion, cough, voice sounded different, and not feeling great were not recovered; while that of the sore arm was recovered on 22Dec2020.

Employee started exhibiting sx 10 minutes after vaccine administration. She started having chest heaviness, difficulty breathing and became tachycardic. Employee was sent to the emergency room.

Fever 100; cough; fatigue; This is a spontaneous report from a contactable Nurse (patient). A 33-year-old female patient (not pregnant) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EJ1685), intramuscularly in right arm on 20Dec2020 16:15 at single dose for COVID-19 immunization. Medical history included Hashimotos, PCOS, hyperlipidemia. Concomitant medication the patient received within 2 weeks of vaccination included levothyroxine sodium (LEVOTHYROXIN), neomycin hydrochloride;polymyxin b sulfate (neomycin and polymyxin b sulfates otic solution). The patient previously took ciprofloxacin hydrochloride (CIPRO) and experienced drug allergy. Facility where the most recent COVID-19 vaccine was administered: Hospital. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The patient experienced fever 100, cough, fatigue, all on 22Dec2020 13:00 with outcome of not recovered. The

patient underwent lab tests and procedures which included pyrexia: fever 100. AE resulted in: None of the above. It was unknown if treatment received for the adverse event. Serious (NO). Seriousness criteria-Results in death (NO). Seriousness criteria-Life threatening (NO). Seriousness criteria-Caused/prolonged hospitalization (NO). Seriousness criteria-Disabling/Incapacitating (NO). Seriousness criteria-Congenital anomaly/birth defect (NO).

Symptoms clarified as body aches and pains like her bones aching; Symptoms clarified as body aches and pains like her bones aching; This is a spontaneous report from two contactable consumers (one was patient herself). A 54-year-old female patient received the first dose of NT162B2 (Pfizer-BioNTech COVID-19 vaccine, lot# EJ1685), via an unspecified route of administration on 21Dec2020 in right arm at single dose for vaccination. Medical history included hypertension. Concomitant medication included lisinopril from 2017 and ongoing for hypertension. This Medical Assistant called to report on behalf of herself, not a healthcare professional. She had her first dose of Pfizer COVID-19 Vaccine on 21Dec2020. She reported she developed symptoms which she clarified to be body aches and pains like her bones aching. Symptoms clarified as body aches and pains like her bones aching: onset 22Dec2020 around 10:00am. By around 8:00pm on 22Dec2020 this event pretty much went away, but she can still feel the body aches and pains like her bones aching on and off; event had improved now. She was taking paracetamol (TYLENOL) 1000mg every 6 hours for this event. She was scared she was gonna not be alive after getting this vaccine; because she was very sensitive with flu shots. She clarified that she got flu shot on 30Oct2020 at the institution where she worked and did not get sick with that flu shot. Second dose in series scheduled for 11Jan2020-she did not plan to change dose at this time. Outcome of events were recovering.

Myalgias; Left leg sensitivity; Fatigue; This is a spontaneous report from a non-contactable Other Health Professional. A 38-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EJ1685), intramuscularly on 21Dec2020 at single dose for COVID-19 immunization. Medical history included COVID from an unknown date and unknown if ongoing (Prior to vaccination, was the patient diagnosed with COVID-19: Yes). The patient's concomitant medications were not reported. Facility where the most recent COVID-19 vaccine was administered: Hospital. Did the patient receive any other vaccines within 4 weeks prior to the COVID vaccine: No. Was treatment received for the adverse event: No. Since the vaccination, has the patient been tested for COVID-19: No. The patient experienced myalgias, left leg sensitivity, fatigue on 21Dec2020 with outcome of recovered in Dec2020. AE resulted in none. Serious: No: Seriousness criteria-Results in death: No. Seriousness criteria-Life threatening: No. Seriousness criteria-Caused/prolonged hospitalization: No. Seriousness criteria-Disabling/Incapacitating: No. Seriousness criteria-Congenital anomaly/birth defect: No. No follow-up attempts are possible. No further information is expected.

Pt reports approximately 5-6 hours after waking he begins to feel very flushed and hot. After that, he begins to have severe dizziness, to the point that he is unable to ambulate, instead having to crawl across the floor. He checked his blood pressure and blood sugar, both of which were within normal limits. The dizziness can last several hours and is only resolved if he goes to sleep.

Injection site soreness; This is a spontaneous report from a contactable other healthcare profession (hcp) (patient). A 54-year-old non-pregnant female patient received first dose of BNT162B2 (Pfizer-BIONTECH Covid-19 Vaccine, lot number: EJ1685), intramuscularly on 21Dec2020 16:30 at a single dose in left arm for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. No known allergies. The patient experienced injection site soreness on 21Dec2020 17:00. No treatment received for this event. The patient underwent lab tests and procedures which included COVID test type post vaccination (Nasal Swab): negative on 14Dec2020. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. This is a non-serious report. The outcome of event was recovering.

Dizziness for about 1 hour; This is a spontaneous report from a contactable other health professional (patient herself). A 43-year-old female patient (non-pregnant) received the first dose of BNT162B2 (Pfizer-BioNTech COVID-19 vaccine, lot# EJ1685), via an unspecified route of administration at 23Dec2020 01:00 in left arm at single dose for covid-19 immunization. Medical history included slightly elevated BP (blood pressure) and gastrooesophageal reflux disease (GERD). Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. Concomitant medication included omeprazole (PROTONIX) and lisinopril. The patient experienced dizziness for about 1 hour on 23Dec2020 01:30 with outcome of recovering. No treatment was received for the event.

rash; This is a spontaneous report from a contactable pharmacist. A patient of unspecified age and gender received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for immunization. The patient's medical history and concomitant medications were not reported. The patient experienced rash after first vaccine on an unspecified date with outcome of unknown. Information on the lot/batch number has been requested.

Pt reports approximately 5-6 hours after waking he begins to feel very flushed and hot. After that, he begins to have severe dizziness, to the point that he is unable to ambulate, instead having to crawl across the floor. He checked his blood pressure and blood sugar, both of which were within normal limits. The dizziness can last several hours and is only resolved if he goes to sleep.

Chills; dizziness; high blood pressure; This is a spontaneous report from a contactable nurse (patient). A 50-year-old female patient (not pregnant) received first dose of BNT162B2 (lot number: EJ1685), via an unspecified route of administration in right arm on 22Dec2020 16:45 at single dose for COVID-19 immunization. Medical history included GERD (gastrooesophageal reflux disease) from an unknown date and unknown if ongoing. Concomitant medication included omeprazole (PRILOSEC), cetirizine, ascorbic acid (VIT C), ergocalciferol (VIT D), zinc, magnesium. The patient experienced chills, dizziness, high blood pressure on 22Dec2020 17:30. Treatment fluids was received. The patient underwent lab tests and procedures which included blood pressure: high on 22Dec2020. Facility type vaccine: Hospital. The patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. The adverse event result in emergency room/department or urgent care visit, treatment was received for the adverse event (fluids). The outcome of events was resolving.

Experienced right arm tingling and the tingling went up into the right side of her neck. Experienced a few minutes of chills and heart racing.

Dizziness; Headache; chest pain; This is a spontaneous report from a non-contactable physician (patient). A 40-year-old female non-pregnant patient received BNT162B2 (Pfizer-BIONTECH Covid-19 Vaccine), intramuscularly on 23Dec2020 13:00 at a single dose in arm for COVID-19 immunization. Medical history included known allergies: roasted chestnuts. Concomitant medication included ascorbic acid, betacarotene, biotin, calcium carbonate, calcium phosphate, chlorine, colecalciferol, cupric oxide, ferrous fumarate, folic acid, iodine, magnesium oxide, manganese sulfate, molybdenum, nickel sulfate, nicotinamide, pantothenic acid, phosphorus, potassium chloride, pyridoxine hydrochloride, retinol acetate, riboflavin, selenium, silicon, thiamine, tin, tocopherol, vanadium, vitamin b12 nos, zinc oxide (MULTIVITAMINS & MINERALS PLUS LUTEIN) within two weeks of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced dizziness, headache, chest pain, all on 23Dec2020 21:30. No treatment received for the event. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. The outcome of events was recovering. This is a non-serious report. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

Swollen, firm, tender infraclavicular lymph node on side ipsilateral to injection site. Swollen to the extent where it is visible without need for palpation.

I had a very mild soreness on my right jaw at about 10 mins about my shot.

Headache; Pain and swelling at the injection site.; Pain and swelling at the injection site.; This is a spontaneous report from a contactable nurse (patient) from a Pfizer sponsored program. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 19Dec2020 at single dose for COVID-19 immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient experienced pain and swelling at the injection site on 19Dec2020. They told her she could only take paracetamol (TYLENOL). Then she was reporting a headache on 23Dec2020 and was asking if she could take ibuprofen (ADVIL) as well. The outcome of the event was unknown. Information on the lot/batch number has been requested.

Minor headache; This is a spontaneous report from a contactable nurse (patient). A 39-years-old male patient started to receive bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) , intramuscular at 10:30 22Dec2020 at the first single dose for covid-19 immunisation. Vaccine location was Left arm. The patient medical history was not reported. No covid prior vaccination; No covid tested post vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient's concomitant medications were not reported. The patient experienced minor headache in Dec2020. The outcome of event was unknown. Information on the lot/batch number has been requested.

Mild/moderate nausea starting 24 hrs after vaccine, continuing for 10 hours now and has not subsided. Mild injection site soreness; Mild/moderate nausea starting 24 hrs after vaccine, continuing for 10 hours now and has not subsided. Mild injection site soreness; This is a spontaneous report from a contactable

other health professional reported for herself. A 40-year-old female patient (pregnant at the time of vaccination was reported as No) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscularly on 22Dec2020 13:00, on Right arm, at single dose for COVID-19 immunization. Medical history included migraines, anxiety. Concomitant medications included fluoxetine, Vit B complex, ergocalciferol (VIT D), cetirizine hydrochloride (ZYRTEK). The patient previously took Iohexol and experienced allergies. The patient reported mild/moderate nausea starting 24 hrs after vaccine on 23Dec2020 13:00, continuing for 10 hours now and had not subsided. Also reported Mild injection site soreness on 23Dec2020 13:00. No treatment was received for the adverse events. The outcome of the events were not resolved. Information on the lot/batch number has been requested.

Went to the PMD a day later for routine blood work and found I have significantly elevated LFTs with ALT and AST 400s

Within 6-8 minutes of receiving vaccine, looked at cell phone to text husband and could not focus on the keys (Blurred vision), then felt a rush/tingling sensation thru whole body, as if the medication starting/moving from my arm all the way down my legs, some dizziness and heart rate increased - I believe to 120. No increased BP, SOB, itchiness, closed throat feeling, hives. Heart felt like it was racing for about 10 minutes. RN at site checked BP and heart rate 5 times in 40 minutes. Left facility and was able to drive myself home. Later that evening, soreness at injection site for 36 hours. No fever, chills, body aches.

"Fast heart rate, heart rate kept fluctuating went to 120 then 112 then 90 and 80, it went high for like at least half an hour, I kept feeling that palpitation; Sweaty; Tired; Body pain and ache; This is a spontaneous report from a contactable Consumer (patient). The 39-years-old female patient received bnt162b2 (BNT162B2), unknown on unknown date in Dec2020 at single dose for COVID-19 immunisation. Medical history and concomitant medications were none. Consumer stated, ""I am calling because I got the COVID Vaccine yesterday morning and then after I got the vaccine I had a fast heart rate and then my heart rate kept fluctuating, it went to 120 then 112 then 90 and 80 and it kept, it went high for like at least half an hour not more and then I kept feeling that palpitation and then today I am still feeling sweaty, tired, body pain and ache. So, I want to see what should I do regarding that? Is that considered like a severe allergic reaction and I need to do something about it or what should I do? So, I contact my employee health and they told me I need to contact you guys."" The outcome of the event Palpitation was unknown and was not recovered for the rest events. Information on the lot/batch number has been requested"

Moderna COVID-19 Vaccine EUA: injection site soreness for 36 hours

Chills/chills in the night; Headache, very severe headache very painful; Pain at the injection site; Little bit of stomach cramping and pain; probably a fever too; Little pain; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730), via an unspecified route of administration on 22Dec2020 at single dose for Covid-19 immunisation. The medical history and concomitant medications

were not reported. The patient experienced chills, headache, very severe headache very painful, pain at the injection site, little bit of stomach cramping and pain and probably a fever too, little pain and chills in the night in Dec2020. The outcome of the events was unknown.

notable pain at the injection site; This is a spontaneous report from a contactable consumer (patient) via Pfizer Sales Representative. This 40-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 23Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the COVID vaccine on 23Dec2020, that evening he was having notable pain at the injection site. The outcome of the event was unknown. Information on the lot/batch number has been requested.

body aches, chills, rigors, headache, fatigue, lymphadenopathy on the side of the injection

"I started getting achy; Headache; Joint pain; I started developing congestion; Cough; Sore throat; Fatigue; This is a spontaneous report from a contactable consumer (patient). A 23-years-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number: EH9899) via an unspecified route of administration in right arm on 17Dec2020 at single dose for COVID-19 immunization. There was no medical history. There were no concomitant medications. The patient got the vaccine (Covid vaccine) on this past Thursday the 17 and he first didn't show any symptom or anything like that and then later at night and then in the beginning of morning of 18Dec2020, he started showing some symptoms. He started getting achy, he guessed little bit joint pain and started to get headache and didn't take too much of it neither of those side effects and as he found out last night apparently he had a positive exposure on the 18th the following day and didn't find out until last night but after the 18th he started showing different symptoms, he can't find better with the vaccine so he started developing congestion, cough, sore throat and a little bit of fatigue (all on Dec2020). He is going to get tested now and they have told him that the test, the vaccine should not affect the test itself. He received a medication for his headache. Treatment reported as the only thing he took was Tylenol. His height was about 5""8 or 5""9. Events outcome was unknown."

Continued fevers after 24 hrs after injection and body aches; Continued fevers after 24 hrs after injection and body aches; This is a spontaneous report from a contactable nurse(patient). The 25-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular on 22Dec2020 09:45AM at single dose(dose number was 1) at left arm in workplace Clinic for covid-19 immunisation. Medical history and concomitant medications were none. She was not pregnant, no known allergy to medications, food, or other products. There is no Covid prior vaccination, no covid tested post vaccination. There is no other vaccine received in four weeks, no other medications in two weeks. The patient experienced continued fevers after 24 hours after injection and body aches on 23Dec2020 06:00AM. There is no treatment received. Outcome of events was not recovered. Case considered non-serious. Information on the Batch/Lot number has been requested.

soreness in the injection; headache; This is a spontaneous report from a Non-contactable Nurse reported for herself. This female patient of an unspecified age received the first dose of BNT162B2

(PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for Covid-19 immunisation. The medical history and concomitant medications were not reported. The patient had the first dose of the vaccine and mentioned that she experienced the expected adverse events of soreness in the injection site and headache. She said she felt better after multiple ibuprofen (ADVIL). The outcome of the events was recovering. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

Moderna COVID-19 Vaccine EUA

she felt sleepy and cold; she felt sleepy and cold; a bit dizzy; This is a spontaneous report from a contactable consumer reported for cousin. A female patient of unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 23Dec2020 at single dose (lot number: Ek5730) for COVID-19 immunization. Medical history and concomitant medications were unknown. The patient got the vaccine on the morning of 23Dec2020. She said she felt sleepy and cold. The patient said she felt better this afternoon. A pinch, the patient felt cold and sleepy. She could take a nap. The patient felt a bit dizzy when she got out of her chair just now. Outcome of the events was recovering. No follow-up attempts are possible. Information about lot/batch number cannot be obtained.

Drowsiness; This is a spontaneous report from a contactable pharmacist reported for self. This 43-year-old female patient (not pregnant) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on an 23Dec2020 14:15 on Arm left at single dose for covid-19 immunisation. Medical history included Seasonal allergy. No allergies to medications, food, or other products. Concomitant medications were none. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No any other medications the patient received within 2 weeks of vaccination. The patient experienced drowsiness on 23Dec2020 16:30. Prior to vaccination, was the patient did not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. No treatments were received for the event. Outcome of the event was Not recovered. Information about lot/batch number has been requested.

"Patient notified me this morning that his clavicle (on the same side as injection) is ""very swollen."" Patient was advised to follow up with his PCP and report event through V-Safe."

Left arm/shoulder pain; Left arm/shoulder pain; Sternal pain; Fatigue; Headache; This is a spontaneous report from a contactable Other HCP (patient). A 33-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on left arm on 23Dec2020 16:00 at single dose for COVID-19 immunization. The patient medical history was not reported. There were no known allergies, no allergies to medications, food, or other products. The patient's concomitant medications were not reported. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19, since the vaccination, the patient has not been tested for COVID-19. The patient experienced left arm/shoulder pain, headache, sternal pain, and fatigue on 24Dec2020. No treatment was received

for the adverse events. Events outcome was not recovered. Information on the lot/ batch number has been requested.

Night sweat; Soreness of the thighs; This is a spontaneous report from a contactable Nurse (patient). A 47-years-old female patient received bnt162b2 (Batch/lot number: EJ1685), via an unspecified route of administration on 22Dec2020 16:30 at single dose for covid-19 immunisation. Medical history was none. There were no concomitant medications. The patient experienced night sweat on 22Dec2020 with outcome of unknown, soreness of the thighs on 22Dec2020, which was ok with outcome of recovered on Dec2020.

Onset of body aches 12h after vaccination, lasted for 24h; This is a spontaneous report from a contactable other healthcare professional reporting for a patient. A 26-year-old female patient (no pregnant) received her dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Batch/lot number: EH9899), via an unspecified route of administration on 21Dec2020 at single dose for COVID-19 immunization. Medical history was not reported. The patient had no allergies to medications, food, or other products. The patient's concomitant medications were not reported. The patient experienced onset of body aches 12h after vaccination on 21Dec2020, lasted for 24h. No treatment received for the event. The event was reported as non-serious. The most recent COVID-19 vaccine was administered in Hospital. The patient had not received any other vaccines within 4 weeks prior to the COVID-19 vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The outcome of the event was resolved in Dec2020.

Arm soreness lasting 24 hours; This is a spontaneous report from a contactable Nurse reporting for herself. A 48-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Lot number EK5730, intramuscularly on 15Dec2020 14:00 at the right arm at single dose at workplace clinic for COVID-19 immunisation. There were no medical history and no concomitant medications. There were no allergies to medications, food, or other products. The patient did not receive any other medications within 2 weeks of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient had no COVID prior vaccination. The patient did not have COVID tested post vaccination. The patient experienced Arm soreness lasting 24 hours on 15Dec2020 16:00. The event was reported as non-serious. Treatment was not received for the adverse event. The outcome of the events was recovered on an unspecified date in Dec2020.

Tenderness in injection site; This is a spontaneous report from a non-contactable Other HCP (patient). A 34-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Lot number EJ1685, via Intramuscular route of administration on 23Dec2020 11:15 at single dose on left arm for COVID-19 immunization. Medical history included Gastrooesophageal reflux disease (GERD), Postpartum Depression. Concomitant medication included sertraline. The patient previously received nickel, amoxicillin, penicilline, hepatitis b vaccine and had allergies. The patient had not received other vaccine in four weeks. The patient had no covid prior vaccination. The patient had no covid tested post vaccination. The patient experienced Tenderness in injection site on 24Dec2020. The outcome of the event was resolving. No follow-up attempts are possible. No further information is expected.

provided for the events lightheadedness and confusion. The outcome of the events lightheadedness and confusion was recovered on 22Dec2020. No follow-up attempts are possible. No further information is expected.

Employee developed a severe headache approximately 10 minutes after vaccine administration.

Extreme fatigue and nausea and vomiting; Extreme fatigue and nausea and vomiting; Extreme fatigue and nausea and vomiting; This is a spontaneous report from a contactable nurse. A 40-years-old female patient started to the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), Batch/lot number: Unknown, intramuscularly on 23Dec2020 11:30 (at the age of 40-years-old) as a single dose in the right arm for COVID-19 immunization. The patient did not have allergies to medications, food, or other products. Concomitant medication included metformin, zolpidem tartrate (AMBIEN), venlafaxine hydrochloride (EFFEXOR XR). The most recent COVID-19 vaccine was administered in the hospital. The patient was not pregnant at the time of vaccination. Prior to vaccination, the patient was not diagnosed with COVID-19. On 23Dec2020 14:30, the patient experienced extreme fatigue and nausea and vomiting. The extreme fatigue and nausea and vomiting did not result in death, was not life-threatening, did not cause/prolonged hospitalization, was not disabling/incapacitating and did not cause congenital anomaly/birth defect. No treatment was received for the event. Outcome of the event extreme fatigue and nausea and vomiting was recovering. Since the vaccination, the patient has not been tested for COVID-19. Information on lot/batch number has been requested.

muscle ache, fatigue, hoarse throat, flushed skin, chills

Sore arm; nausea; This is a spontaneous report from a contactable nurse reporting for self. A 43-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), Lot# EH9899, via an unspecified route of administration in the right arm on 19Dec2020 at 15:30 (at the age of 43-years-old), as a single dose for COVID-19 immunization. The patient was not pregnant at the time of vaccination. The vaccine was administered in a hospital facility. There was no prior COVID-19 vaccination. The patient was not diagnosed with COVID-19 prior to vaccination & not COVID tested post vaccination. Medical history was none. Concomitant medications were not reported; however, there were no other medications the patient received within 2 weeks of the vaccination. The patient did not receive any other vaccine within 4 weeks prior to the COVID vaccine. There were no known allergies to medication, food, or other products. The patient experienced sore arm for 24 hours, then from about 34-72 hours had nausea. The onset date and time for the events was reported as 19Dec2020 at 15:30. The events were reported as non-serious. There was no treatment for the events. The patient recovered from the sore arm and nausea on an unspecified date.

"hearing in his left ear started sounding muffled; I was given the shot and instantly, within 30 seconds felt a slight numbing feeling radiating up my arm, then to my neck and up the left side of my face.My tongue felt a little numb but not swollen; had that ""metal"" taste in my mouth, but that did not return; This is a spontaneous report from a contactable other HCP. A 58-year-old male patient received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine) (lot number EL1284), intramuscularly in the left arm on 23Dec2020 at 07:00 (at the age of 58-years-old) as a single dose for COVID-19 immunization.

Medical history included high blood pressure from an unknown date and unknown if ongoing and latex allergy from an unknown date and unknown if ongoing. There were no other vaccines received within 4 weeks of the BNT162B2 vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medication included nebivolol hydrochloride (BYSTOLIC), fish oil (FISH OIL), naproxen sodium (ALEVE) and bifidobacterium lactis (PROBIOTIC [BIFIDOBACTERIUM LACTIS]). On 23Dec2020 at 07:00 (within 30 seconds of the vaccination as reported), the patient felt a slight numbing feeling radiating up his arm, then to his neck and up the left side of his face. Then, within 15 minutes, his hearing in his left ear started sounding muffled. His tongue felt a little numb but not swollen. It was reported when he first started feeling the numbing feeling, for about a split second, he had a metal taste in his mouth, but that did not return. It took about 1.5 hours for the numbness to go away. No therapeutic measures were taken as a result of the events. Clinical outcome of the numbness was resolved on 23Dec2020 at 08:30. Clinical outcome of the metal taste in his mouth and hearing in his left ear sounded muffled was unknown. It was also reported that since the vaccination, the patient tested negative for COVID-19 on 23Dec2020."

Headache, body aches and pain, lower back pain, high blood pressure, injection site soreness

severe shoulder pain/injection in left shoulder once, close to shoulder higher up; states it was not on the deltoid, it was given higher than normal; This is a spontaneous report from a contactable consumer (patient). A 61-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Lot number EJ1685, on 23Dec2020 13:30 at single dose by injection in left shoulder once, close to shoulder higher up for COVID-19 immunization. Medical history and concomitant medication were none. The patient received the shot yesterday, and her only experience she was having was severe shoulder pain, and she was wondering if it was possible to just take Aleve, they mentioned taking Tylenol, but she was wondering if Naprosyn was ok to take. Towards yesterday evening, she noticed the severe shoulder pain, she received it at 1:30 in the afternoon, and noticed probably around 9PM, all night was just pain like as if someone or else you overexert with exercise, that kind of pain. She hadn't taken anything, she wondered if it was ok to take Aleve, no one seemed to know. She stated the dose was not given on the deltoid, it was given higher than normal. The outcome of severe shoulder pain was not resolved.

Weakness in the left side of face; and fatigue. 1112 am went to observe patient in her room. Laying in the bed with left side droopiness to face. Weakness on left side only, nurse taking care of her stated just happened. On observation it appears to be Bells Palsy reaction. No treatment at the time, Hospice nurse is to visit her today and check on her. Staff will check on her every 30 min for the next few hours and do a pulse oximeter check every hour for next few hours. 1205 second check on patient in room prior to staff leaving. Patient squeezed my hand and opened her eyes on command. Pulse saturation was 95 per staff. Patient resting comfortable with no signs of trouble breathing.

"I don't feel so good; This is a spontaneous report from a non-contactable consumer, the patient. A female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on an unknown date as a single dose for COVID-19 vaccination. Medical history was unknown. The patient's concomitant medications were not reported. On an unknown date, the

patient reported ""I don't feel so good and I don't want to go to the hospital."" The clinical outcome of "" don't feel so good"" was unknown. No follow-up attempts are possible. Information on the lot/batch number cannot be obtained."

pruritic rash in pubic area moving up; This is a spontaneous report from a contactable nurse (patient). A female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number:EH9899), via an unspecified route of administration in the left arm on 21Dec2020 at 11:00 AM as a single dose for COVID-19 vaccination. Medical history included cardiomyopathy and hypothryroid. The patient did not have any allergies to medications, food, or other products. The patient was not pregnant at the time of vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient's concomitant medications were not reported; however, there were other medications the patient received within 2 weeks of the vaccination. The patient did not receive any other vaccine within 4 weeks prior to the vaccine. On 22Dec2020 at 08:00 AM, the patient experienced pruritic rash in pubic area moving up. The report was reported as non-serious. The patient was not treated for pruritic rash in pubic area moving up. The clinical outcome of pruritic rash in pubic area moving up was not recovered. It was also reported that since the vaccination, the patient had not been tested for COVID-19.

chills; body aches; fatigue; This is a spontaneous report from a contactable consumer. This consumer reported that a 54-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration in the right arm on 23Dec2020 at 03:00 PM ((at the age of 54 years-old) as a single dose for COVID-19 vaccination. Medical history was unknown. The patient was not pregnant at the time of vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient's concomitant medications were not reported. The patient did not receive any other vaccine within 4 weeks prior to the vaccine. On 23Dec2020 at 10:00PM, the patient experienced chills, body aches, fatigue. The report was reported as non-serious. The patient was not treated for chills, body aches, fatigue. The clinical outcome chills, body aches, fatigue was recovered on an unknown date in Dec2020. It was also reported that since the vaccination, the patient had not been tested for COVID-19. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

Fever; Headaches; Chills; Aches and pains; This is a spontaneous report from a contactable consumer (patient herself). This 60-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 23Dec2020 at 08:30 AM at single dose for COVID-19 immunisation. Vaccine location was left arm. The patient was vaccinated at hospital, age at vaccination was 60-year-old. She was not pregnant. No other vaccine was received in four weeks. Relevant medical history included diabetic, allergies to eggs, chicken and latex. It was reported that prior to vaccination, she was diagnosed with COVID-19. Relevant concomitant medications included insulin aspart (NOVOLOG) for diabetes. On 24Dec2020, at 02:30 AM, the patient developed fever, headaches, chills, aches and pains. The patient was treated for the events. Nasal swab, COVID test (rapid) was performed on 24Dec2020 and was negative. The outcome of the events was unknown. Information on the lot/batch number has been requested.

I noticed onset of a mild rash down my bilateral arms and along my hips, back and legs. This rash worsened upon inspection on 24Dec2020 with associated itching and warmth along the rash site; warmth along the rash site; I noticed onset of a mild rash down my bilateral arms and along my hips, back and legs. This rash worsened upon inspection on 24Dec2020 with associated itching and warmth along the rash site; This is a spontaneous report from a contactable Other HCP. ED notes had a normal neuro exam POCT glucose was normal at 83 resolved after minutes to hours in ED"

Vaginitis; This is a spontaneous report from a contactable healthcare professional. A 22-month-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration at the left arm from 23Dec2020 13:00 at a single dose for COVID-19 immunization at a hospital. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient experienced vaginitis on 24Dec2020 13:00 which was reported to be treated with an unspecified OTC. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination

and was not tested for it since the vaccination. The patient was recovering from the event. Information on the batch number has been requested.

Headache; This is a spontaneous report from a contactable consumer (patient). A 61-year-old female patient received the first dose on BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), on 18Dec2020 at single dose for COVID-19 immunization. Medical history was reported as none. Concomitant medications were not provided. Patient stated that she had her COVID shot on 18Dec2020 (reported as last Friday) and she had a headache ever since. Patient was just taking Ibuprofen trying to get rid of the headache. Outcome of the event was unknown. Information on lot/batch number has been requested.

developed some tingling, kind of a shock that comes and goes in her arms and in her back; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899) via an unspecified route of administration on 23Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient took the vaccine yesterday on 23Dec2020 and she developed some tingling, kind of a shock that comes and goes in her arms and in her back. She watched it for a long time, as nurses like to watch, and she finally feel asleep, so she wanted to tell this, she didn't know if this is any danger to her, she didn't think so, she was breathing well and can talk, but she was concerned because the tingling was almost like a little shock that comes and goes, not permanent. The reporter wanted to know if anyone has reported this. She was about to go out, but decided to call, agent can't say if this is something reported and she need to go to the local hospital. The outcome of the event was unknown. Information on the Lot/batch number has been requested.

UTI; This is a spontaneous report from a contactable consumer. A 65-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), via an unspecified route of administration, left upper arm on 22Dec2020 12:30 at a single dose for COVID-19 immunization at a hospital. Medical history included urinary tract infection (UTI) in 2018 (2 years ago). There were no concomitant medications as the patient does not take any prescription drugs. Patient thinks her urinary tract infection (UTI) started to develop, 28-29 hours after receiving the vaccine so the onset was 23Dec2020. Patient stated the UTI came on fast and she has an appointment with an urgent care and may need antibiotics to treat the UTI. Patient was drinking a lot of fluids to try to flush the UTI out of her system. She said she doesn't feel as bad and felt like the UTI was getting better, and just woke up a short time ago. Patient also stated that she is concerned the antibiotic will mess up the vaccine, and wanted to know if she can take an antibiotic so soon after receiving the vaccine. The patient was recovering from the event. . .

Rash all over body, very itchy; Rash all over body, very itchy; This is a spontaneous report from a contactable nurse reporting for herself. A 62-year-old female patient received bnt162b2 (BNT162B2, Batch/lot # EJ1685) at single dose at left deltoid on 20Dec2020 in the afternoon around 13:30-13:45 for covid-19 immunisation, administered by a nurse at a tent outside of the hospital. The patient medical history was not reported. There were no concomitant medications. No additional vaccines administered on same date of BNT162B2. No prior vaccinations within 4 weeks. The patient got Flu shot a long time ago for immunisation. No events occurred following prior vaccinations. The patient experienced bad

rash all over body, very itchy on 20Dec2020 in the evening. The rash was driving her crazy.The reporter assessed the events were not really life threatening, not requiring hospitalization. Therapeutic measures were taken as a result of events: patient just bought Benadryl cream. No invesitgations. The outcome of events was unknown. She wanted to know if she has to get the second dose.

Arm pain on the left side, back pain, neck pain, headaches and then a dry cough developed several days later.

Headache; Body ache; Joint pain; This is a spontaneous report from a contactable consumer (patient). A 31-year-old male patient received the first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular, on 22Dec2020 at 11:00 AM at single dose for COVID-19 immunisation. Age at vaccination was 31-years-old. Medical history and concomitant medications were reported as none. On 22Dec2020, the patient developed headache, body ache, and joint pain. The patient reported the body ache has gotten worse, headache is still the same. The patient was treated with Advil. Outcome of all events was not recovered. Information on lot/batch number has been requested.

Shortly after vaccination (within 15 min), patient experienced warmth and itching at injection site, some radiating pain. Patient asked to stay longer to be observed, but eventually returned back to work without progress in symptoms. Approximately an hour later, she was prompted by her supervisor to return to vaccine area when she developed a headache and tingly lips. She was given 50mg of diphenhydramine PO. In no apparent distress after dosing

Fatigue, Headache, Nausea, sore throat

Achy pain at injection site; This is a spontaneous report from a non-contactable Other health care professional (HCP) (patient). A patient of an unknown age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), on unknown date at single dose for COVID-19 immunization. Medical history and concomitant medications were not provided. On unknown date patient experienced achy pain at injection site. Outcome of the event was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

GI problems; This is a spontaneous report from a contactable consumer (patient). A 46-year-old female patient (weight 74.39 Kg) received the first dose of BNT162B2 (Pfizer-Biontech covid-19 vaccine, Lot. EK5730) on 18Dec2020, in the left upper arm, at single dose, for COVID-19 immunisation. Relevant medical history included thyroid disorder. Concomitant medications were unknown. On 18Dec2020, the patient experienced gastrointestinal (GI) problems. Clinical outcome of the adverse event was unknown at time of this report.

Some problem with my arm; that is red; This is a spontaneous report from a non-contactable consumer (patient) This patient of an unknown age and gender received BNT162B2 (Pfizer-BioNTech COVID-19 at a single dose for COVID-19 immunization.Medical isotry and concomitant medication were not provided.The patient stated as follows:I have some problem with my arm that is red .The patient was wondering if it was an allergic reaction.The outcome of the event was unknown at the time of the report. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

Patient experienced dizziness/lightheaded, pale, body wide shaking, face tingly, hypertensive, tachycardic from patient reported baseline.

"Paresthesia in right hand (received covid-19 vaccine in right arm); Numbness; ""pins and needles""; This is a spontaneous report from a non-contactable nurse, who is also the patient. This 25-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration in the right arm on 23Dec2020 at 13:00 at single dose for COVID-19 immunisation. Vaccination facility type: workplace clinic. The patient did not receive other vaccines in four weeks. Relevant medical history included allergy to latex, mango and naproxen. Concomitant medication included unspecified oral contraceptive pill. On 23Dec2020 at 13:30, the patient experienced paresthesia in right hand (received COVID-19 vaccine in right arm), numbness and ""pins and needles"" which continued on and off for 48 hours. The patient did not receive corrective treatments for the reported events. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, she had not been tested for COVID-19. The patient recovered from the events in Dec2020. No follow-up attempts are possible; information about lot/batch number cannot be obtained."

headache; This is a spontaneous report from a contactable consumer received via Medical Information Team. A 61-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 18Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient experienced headache on 23Dec2020. The patient outcome of the event was not recovered. Information about Lot/Batch number has been requested.

The following day had arm pain and fatigue for three and a half days, nasal congestion, dry eyes and itchy throat. Got tested for COVID one week later and is positive.

fever on and off; arm pain; body aches; chills; joint pain; This is a spontaneous report from a contactable nurse who was also the patient. A 55-year-old female patient received bnt162b2, lot:EK9231, via an unspecified route of administration on 23Dec2020 at an single dose for covid-19 immunisation. The patient's medical history was none. The patient's concomitant medications included unspecified vitamins. On 23Dec2020, the got the vaccine and the fever (on and off) started that night and had some arm pain too. The patient also had body aches, some chills and joint pain in Dec2020. The nurse stated that the thing should have gone better. She was just wondering how long she could have that side effects because it's been 3 days. Therapeutic measures were taken as a result of fever on and off pyrexia, body aches pain and chills were Tylenol and Motrin (patient did not clarify the improvement after taking the treatment). The outcome of the events was not recovered at the time of the report.

Feeling nauseous, throwing up; Feeling nauseous, throwing up; don't have the strength to keep talking right now; This is a spontaneous report from a Pfizer-sponsored program. A contactable female consumer, who is also the patient, of an unspecified age reported that she received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 23Dec2020 at single dose for COVID-19 immunisation. Relevant medical history and concomitant medications were not reported. In Dec2020, the patient started been feeling nauseous, throwing up and she wanted to double check if

she needed the second dose of the vaccine. The patient further specified that she didn't have the strength to keep talking. At the time of the report, the outcome of the events was unknown. The information on the lot/batch number has been requested.

"Tingling in her tongue and in her arm; Tingling in her tongue and in her arm; This is a spontaneous report from a contactable other health professional (patient) from Pfizer-sponsored program. A 33-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular on Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. On Dec2020, the patient experienced tingling in her tongue and in her arm, the patient reported that: ""after getting the vaccine but it looked like the tingling in my arm was probably within an hour and the tongue was all like that in evening"". The patient outcome of the events was recovered. Information on Lot/Batch number for the product has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2020516692 same reporter, different patient/drug/event"

Pt woke up morning on 12/23 at0800 with rash on arms, thighs and legs. Called Nurse Manager, and primary doctor. Took 25mg PO Benadryl at 0815. Claritin 10mg PO at 0820. Took Pepcid 20mg at 0915. Had telehealth visit with primary doctor at 1000. Primary doctor informed patient that he believed this was an allergic reaction as the rash was spreading, patient was itching and had trouble swallowing pills in AM (unusual for patient to have that problem, resolved 1 hr post benadryl). MD informed patient to take 25mg PO of benadryl Q4H until rash disappeared. Ordered steroid dose pack if patient felt the benadryl did not help. Rash went away after 5 doses of 25mg PO Benadryl.

24hrs Soreness at injection site; This is a spontaneous report from a contactable consumer. A female patient of unknown age received on an unknown date BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) at single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. On an unknown date the patient had 24hrs soreness at injection site. Outcome was unknown. Information on the batch number has been requested.

Patient received Pfizer vaccine at approximately 12:00 PM and drove to observation area. Observer reviewed safety measures with patient. Observer stated that patient c/o tingling at injection site. At approximately 12:05PM observer stated that she saw patient slightly waving paddle and went to assess patient, upon arrival to patient's car, patient was unresponsive. Emergency measures implemented. Epi administered via IM route, Oxygen applied, vital signs taken and EMS called. Patient remained unresponsive up EMS arrival. Patient was transported to the ER via EMS.

"I started running a fever; This is a spontaneous report from a contactable consumer (patient). A 63-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot EH9899) intramuscular in the arm on 22Dec2020 at single dose for COVID-19 immunization. Medical history included depression, allergy, high cholesterol, asthma, thyroid disorder. Concomitant medication included sertraline, bupropion and atorvastatin for High cholesterol. The patient started running a fever (non-serious) on Dec2020. Patient worked at the day care center that provided care for the Doctor's and Nurses Children. She worked at a healthcare site, she was not a doctor or a pharmacist, so that's how

she got a vaccine.Patient stated she got vaccine on 22Dec2020 and on 26Dec2020 she took her son, he was 24, to the doctor and he tested for Covid, now up to that point she had no side effects or anything, he did not get a vaccine so she wasn't surprised when he came down with it on his own but well she was surprised, last night she started running a fever so she was wondering ""will the vaccine effect a Covid Test?"" (as reported). Patient was treated with paracetamol (TYLENOL) and final outcome of the event was unknown."

Constant headache; This is a spontaneous report from a contactable nurse (patient). A 42-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EH9899) on 24Dec2020 at 09:00 at single dose for COVID-19 immunization. Medical history was none. Concomitant medication included multivitamin (unspecified) . The patient experienced constant headache on 24Dec2020 at 15:00. The patient, who was a health care worker front line (nurse), received the vaccine on 24Dec2020. She started having a headache, bad like afternoon around 6 hours after she was given the vaccine. The headache has not gone away. It was not like a terrible headache. It was a constant headache like if she took some paracetamol (TYLENOL) it went away but it came back. Patient stated she did not suffer from headaches and she had been having a constant headache since 24Dec2020, when she received the vaccine. The final outcome of the event was reported as not recovered.

Rushed to ER. Has now been tubed and put into the ICU and has had full-cardiac arrest less than 24 hours after receiving the vaccine.

nausea; chills; This is a spontaneous report from a Pfizer-sponsored program a contactable consumer (patient). This female patient of unknown age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route od administration, on 19Dec2020 at single dose for COVID-19 immunisation. Medical history and concomitant medications were unknown. She's experiencing symptoms like nausea and chills. She wants to know how long the symptoms will be. Outcome was unknown. Information on the lot/batch number has been requested.

Nauseous; I did start throwing up; Headache; This is a spontaneous report from a contactable consumer (patient herself). This 65-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 27Dec2020 at 07:30 AM at single dose for COVID-19 immunisation. The patient was vaccinated at hospital, age at vaccination was 65-year-old. Relevant medical history included diabetes, blood pressure abnormal and thyroid disorder. Relevant concomitant medications included insulin for diabetes, levothyroxine for thyroid disorder, and lisinopril for blood pressure abnormal. She was a MRI tech. She stated ''I had COVID Vaccine this morning at 7:30 and a little while ago like about 4'o clock. I work mid night, I got up from bed and I stand little nauseous and I did start throwing up and I have bad headache now but that's it. It is not emergent, but I just want to make sure, I am just checking in because I haven't. I can't get my smart phone to work because it keeps discharging so fast, but I was in bed. I am all right.' She stated ''there is no rash or anything. I just got nauseous which surprised me.'' The second dose is planned for 19Jan2021. No therapeutic measures were taken as result of the events. The outcome of the events was unknown. Information on the lot/batch number has been requested.

Aching in left deltoid hear injection site

Patient received vaccine around noon. She immediately felt numbness and tingling after injection. She reported back to clinic an hour later due to numbness and tingling persisting. She was given oral Benadryl and referred to the emergency department for evaluation.

Pain in left fingers and elbow that occurred within 15 minutes of injection. Numbness in left hand and forearm

0915 Generalized itching walked pt over to EMS Administered 50 mg of diphenhydramine PO

injection site pain, redness around injection site, Fatigue

Pt received first dose of Pfizer Covid 19 vaccine at around 12:45 and within 20 seconds, pt reported feeling sensation of tightness in his throat. Pt was observed for 15 minutes and his symptoms persisted but did not progress. Patient was taken to ED for evaluation. At 30 minutes post injection symptoms resolved. Monitored in ED for approx. 3 hours and discharged.

"Pt began c/o ""not feeling right"" with her tongue ""feeling funny"" and her lips tingling approximately 5 minutes after the administration of the Moderna COVID19 vaccine. Pt was transported to the Emergency Department for care and monitoring and was discharged when symptoms had resolved after approximately one hour."

Severe injection sure pain, jaw pain, hip pain, headache, palpitations, chills, nausea/vomiting, dizziness, fatigue

Left lip, cheek and nare swollen very visible to others. No difficulty breathing or swallowing . She has been taking zertec and this has resolved some but not all of the swelling.

Left eye bloody area lateral from iris, approximately 2cm x 2cm

Peripheral sensation loss

Swollen upper arm. Fever, chills with nausea

Extreme chills, muscle aches, joint pain, headache, fever, fatigue

On 12/28, reported that on 12/25 she had swollen lymph glands in her clavical and neck areas. Also, reported extreme fatigue (slept 16 hours following vaccine on 12/24) and significant arm soreness. Is seeking medical attention.

numbness on my right foot right after the injection (it went away) 30 min after swelling of right side of my face and droopy right eye (swelling went away but my eye is still droopy) little body pain, head ache and body felt warm (took Tylenol and it all went away). I'm just a little worried about my eye. Not sure how long it will take this to go away. I didn't take any allergy med because I'm not sure if I can.

High blood sugars, vision change, hearing issues, anxiety

Chest/arms itchy, tingling tongue

Itchiness after her first dose of COVID-19 vaccine this afternoon. Received vaccine around 2:15 PM and may be 30 minutes later just got diffusely itchy. No rashes not swollen anywhere no nausea or vomiting or belly pain no trouble speaking or swallowing or breathing. She got some oral Benadryl 50 mg prior to ED arrival.

Patient received the vaccine Monday, December 21. Patient started getting flu like symptoms on Thursday including cold, cough and headaches. Patient reports on Saturday the left ear and the left side of the throat began to hurt. Today Monday , December 28th, the patient states to waking up with a sore throat and the left side of the neck was swollen as big as a golf ball and remains swollen.

Patient received the vaccine Monday, December 21. Patient started getting flu like symptoms on Thursday including cold, cough and headaches. Patient reports on Saturday the left ear and the left side of the throat began to hurt. Today Monday , December 28th, the patient states to waking up with a sore throat and the left side of the neck was swollen as big as a golf ball and remains swollen.

Cold Like Symptoms

At 9 PM on December 22 I became absolutely exhausted extreme fatigue I went to bed I was woken around 11 1115 something like that every part of my body hurt it hurt to move my fingers it hurt to move everything every joint hurt and if I did move I felt nauseous then I started to throw up I did that for half an hour or so it was if you need to know it was violent and then I got back into bed with a cool cloth on my head at about 4 AM I got back to sleep I woke up at 6 AM to my alarm for work and I felt absolutely fine except my arm was sore just like it is from any regular inoculation.

area around injections, red, raised, warm, tender to touch

Hospitalized 12/29, has now been tubed and put into the ICU

May be in no relation at all but day after vaccination patient woke up with ankle pain. It was hard for the patient to walk/run. During the evening time he reports possible pulling of muscle/ligament while walking in a parking lot at the store during a snow storm.

Approximately 29 hours after the vaccine I developed fatigue, myalgias and chills. Lasted until I went to bed that night (4 hours or so). Resolved as of when I woke up the next morning.

Approximately 29 hours after the vaccine I developed fatigue, myalgias and chills. Lasted until I went to bed that night (4 hours or so). Resolved as of when I woke up the next morning.

Developed a rash on her face and arms; took Benadryl 50 mg immediately when the rash emerged at 9:15 AM; she notified the Employee Health office of the rash at 9:45 AM and was immediately referred for evaluation by an Employee Health medical provider at 9:50 AM; she took Benadryl 25 mg at 7:00 PM and then went to bed; the rash was gone upon waking at 8:00 AM on 12-29-2020; she had a follow-up

evaluation at 9:00 AM on 12-29-2020 with an Employee Health medical provider and was cleared to return to full duty and was discharged from care.

9:30pm on 12/23/20 i started with a severe headache and then an immediate onset of fatigue, i was unable to stand up and felt like i could not walk. thru at the night i had bodyaches, nightsweats, chills and fever. i had a fever or 101.3 on 12/24/20 for most of the day I rotated tylenol and ibuprofen and was only able to get it too 100.3 . bodyaches and headache continued . 12/25/20 fever and burning of eyes. 12/26/20 -12/27/20 fever and headache. all symptoms subsided on 12/28/20

Moderna COVID-19 Vaccine EUA. Around 25 min after injection I started feeling dizzy then had tachycardia, sweating, numbness and tingling in extremities. Given Oxygen and taken to the ER. Symptoms subsided 5 min after arriving in ER except numbness and tingling in hands. About 30 min later I started having dizziness and tachycardia again which lasted a few minutes. EKG, CHest X-ray and labs all normal. Just feel tired.

Patient observed for 15 minutes in the clinic after vaccine with no issues. Patient is a NP and left clinic. 10 min after leaving, was in physician lounge and had tachycardia, dizziness, flushing. Hospitalist in lounge recorded pulse as 180 normal rhythm. Patient taken to ED. In SVT - heart rate eventually reduced. Patient released on cardiac monitor to home. Later that night, patient had increased heart rate again - 160's - while in bed. Admitted to hospital.

Cough, diaeresis; initially only injection site soreness then other symptoms developed

Patient had tingling and numbness of the mouth and throat 20 minutes after receiving the COVID vaccine

Patient reports 2 hours after getting vaccination that she had difficulty moving left arm. Reports having decreased strength in left arm, and decreased ability to lift any amount of weight with left arm. Reports having numbness in left arm that is ongoing. Pt reports symptoms are improving .

Directly after receiving the vaccine I tasted a metallic taste and my tongue started to tingling. My face flushed. Last about ten minutes.

Lethargy & fever 12/29/2020

12/29/20 came to vaccine clinic to report. states had vaccine 7:10 pm, waited 15 minutes, 'felt edgy' but thought maybe nerves. 7:25 pm walked back to her office, felt slightly lightheaded, had worked 12 hours, sx subsided. 7:45 pm walked to her car felt right side jawline numbness that extended to forehead and whole side of face, able to smile, swallow, drove home (30 min) and sx stayed the same. states lingered over the evening, went away by 10 pm. states eyelid felt heavy, was not puffy. did not keep her awake - did report night sweats. 0700 awoke, states no sx, no residual. states arm slightly sore and general joint aches. 1205 came to clinic to report. states feels pretty good, concern is about next shot. Will contact PCP, did vsafe and will complete report.

Right side tongue numbness, tingling and burning in/around lips, elevated heart rate 136+, Blood pressure spike 165/105. Shortness of breath believed to be r/t elevated heartrate. Within 10 mins of shot. Face flushed, redness worsened with some swelling to ears and tongue skin felt like a sun burn rawness. Throat tugging noted. Dispatched an ambulance, had my husband take me around corner to ER where I was treated for anaphylaxis with 1 dose of Epi IM, IV solumedrol, and two rounds of benadryl IV. I was monitored and sent home on steroids, benadryl, and cimetidine for several days. I was issued an Epi Pen at that time. The rash and redness with feeling of burning has come and gone since as well as the tongue numbness on right side.

Red bump, painful and itchy

Cough and injection site soreness

Patient is a physician. He reported palpitations and tachycardia the evening of vaccination (about 4 hours after vaccination) when he was at home. It did subside within 2-3 hours.

I'm not sure if it was the vaccine, I'm a chaplain at the hospital I didn't eat or drink anything before the vaccine. I had a trauma that day and after the shot my arm was tingling when I was driving home I couldn't focus I had a headache, when I got home I ate and immediately went to bed, I slept for 10 hours and the next day I was getting my son ready and I fell asleep sitting up and by lunch time I felt completely normal again.

Generalized itching

Itching and rash/ hives. Itching started approximately 5 minutes after injection, slight at first then itching increased throughout body. Rash hoed later. Mostly only on areas scratched (face, chest and neck). Rash and itching present for 5 days including day injection given. Used over the counter antihistamines round the clock. Used inhaler once evening of injection day and once 3 days later. (Albuterol)

Deltoid pain with movement of arm.

"Co-worker reported a ""sever headache"" and later at 2:05pm she reported she was ""unable to open her right eye due to the severe pain in her head"". She took Benadryl 25mg by mouth. Her mother came and picked her up to take her home after an hour without any additional symptoms. The co-worker reported she still had a ""headache"" the next day, but it was much better."

12/19/2020 0630 AM WOKE UP AND WENT TO REACH FOR PHONE, COULD BARELY LIFT LEFT ARM. HURT ALL WAY DOWN TO WRIST. WHOLE ARM WAS SWOLLEN, HARD. SEVERE HA. GOT UP TO GO TO BATHROOM; BODY ACHES, CHILLS, DIARRHEA. 12/20/2020 AFTERNOON FELT WORSE. FELT LIKE HAD THE FLU BUT 50 MILLION XS WORSE; BODY DIDN'T 'FEEL RIGHT'. GETTING TO POINT OF FEELING WORSE. CALLED HOSPITAL, PHARMACIST. SCARED. COULDN'T STAY AWAY, COULDN'T STOP SLEEPING. COULDN'T WORK. CALLED PCP. TEMP SLIGHT ; 99.5 12/21/2020 WEDNESDAY MIDDAY ALL SIDE AFFECTS WENT AWAY LIKE SOMEONE FLIPPED A SWITCH. 'NOT A GOOD EXPERIENCE' 'I DON'T THINK I CAN GO THRU THIS AGAIN WITH THE SECOND SHOT'

general body itching

Hives, nausea, headache. Given benadryl. Hives resolved. Residual dull headache. Patient sent home with scheduled Benadryl x 24 hours, has Epipen. Encouraged to use prn and to seek medical attention prn.

Day of vaccine- extreme fatigue, pain at injection site Day 1- scratchy throat, extreme fatigue, muscle pain Day 2 - scratchy throat, extreme fatigue, chest tightness, muscle pain, headache Day 3 all symptoms as above with sore throat and fever

Palpitations, dry eyes, vertigo, rash on chest several hours after receiving vaccine. Resolved within a few hours.

Patient reported on 12/29/2020 that she experienced right hand numbness 15-20 minutes after vaccination and this lasted about 5-10 minutes. About 20 minutes after the vaccination she experienced lip tingling which then progressed to mild swelling and redness of the lips. This has persisted to this day and is gradually improving. She has experienced lip swelling in the past, not triggered by any event, medication, or substance, however has never experienced hand numbness or reactions to vaccines in the past. She has not received fillers.

Woke up with a rash over stomach, back, thighs and arms that were like goosebumps and itchy. They would get red and were painful and that would come and go. on the 25th the rash was constant, The rash was not relived with multiple doses of Zyrtec, Allegra or hydrocortisone cream and has persisted and worsened through the weekend. Prednisone was started on Sunday the 27th which seems to have helped however still itchy and the goosebump like rash is still on stomach, back and thighs.

SOB, Asama attack

Headache, muscle pain, joint pain, fever 100.6, fatigue,chills

Sensation of a racing heart

Employee came and report/showed me a raised rash that is on her face, neck and chest that developed the evening of her vaccine. Has been utilized OTC Benadryl. Able to still work.

low grade fever 99.2 after taking Ibuprofen headache sudden hot feeling and then fast cooling off, almost chilled, but I am fine, very mild

Noticed a rash around mouth and cheeks

5-10 minutes after vaccine got mild numbness/heaviness feeling corner of left side of mouth (very pinpoint without migration) that 1-2 hours after vaccine progressed to similar feeling on lateral left side of face and corner of left eye-no motor weakness in face, facial drooping or clinical change in sensation on palpation of skin, intermittent gritty/sandy feeling on tongue/mouth that started about 30 minutes or so after received the vaccine. Intermittent very mild scratchy/sore throat that start 30+ minutes after vaccine, frontal pressure-like headache-forehead/temples/cheeks on face-started within about 30 mins-

1 hr of getting vaccine-can get extremely strong at times. Approximately 12-14 hrs after vaccine got tingling/burning sensation on tongue with complete 100% loss of taste that was transient and 1-2 hours after started has slowly been improving and taste is slowly returning since then. no loss of smell. no tongue swelling or throat closing up sensation. all symptoms improve with taking over the counter antistamines-Zyrtec or benadryl, but haven't resolved yet. all symptoms overall mild (except headache at time) and are waxing and waning in severity (including headache) the entire time since receiving the vaccine. I feel completely fine otherwise.

Tachycardia and throat tightening

I developed a maculopapular rash over my chest, abdomen, back and proximal extremities but sparing my face, hands and feet. I was otherwise asymptomatic and the rash was not painful or itchy. It resolved on its own after 24 hours.

Patient reports arm tingling down from elbow to hand of left arm. A little numbness in left hand. Few hours later patient reports numbness moving down to arm and hand and up to eye with somewhat lessening on the lip. Patient currently experiencing some tingling on the right arm.

I actually am having a hard time lifting up my arm. Cannot put any pressure on the arm or take off clothes in shower. I cannot carry my son. I cannot lift anything. I cannot put my arm in pocket or jacket. If I get beyond 15-30 degrees abduction, I cannot do very well. Beyond that I can.

Sore arm for a week, redness and bump at injection site

Sore arm for a week, redness and bump at injection site

patient had body aches, head ache and shortness of breath. symptoms resolved on own no treatment necessary.

12/19/20 Employee's written report/description of events: shoulder injection site, left shoulder. Including shooting pain from my left wrist into the left side of my face. I have shooting pain into my chest from the injection site which also has included involuntary muscle movement in my neck and face, involuntary muscle movement is painful and this occurs with dizziness. All the pain stems from the injection site itself and always starts there when the pain happens. 12/23/20 saw OHS RN and was improved: states symptoms are better today & no involuntary muscle movements experienced today. Pain at injection site is less also. Has been using OTC Aleve, 1-2 every 12 hours. CMS left hand intact; all digits both hands have pale nail beds with > 2 sec cap refill; skin temp cool to warm. States has been on a medication that can cause Reynaud's disease; and has been concerned this may be occurring. Work comp MD appt. for 12/30/20; has not confirmed.

2:30 PM vaccine listed above given, 3:02 PM cheeks flushed with slight swelling of lips, Benadryl & Pepcid taken per employee. 4:35 PM symptoms resolved, 6:34 PM employee to ER with rash, itching, and trouble swallowing. Treatment received of Benadryl and Solu-Medrol, symptoms improved and employee DC to home. FU this am, employee states she has a HA and has taken med for, no further problems noted.

Strange taste in mouth, heart felt like it was pounding out of chest, blood pressure 195/100 (elevated), dry/burning mouth Was brought to ED and given Benadryl and Lorazepam

Tachycardia. Fever. Sweat. Body aches. Weakness

After I received the vaccine, after I went upstairs to go back to work (about 30 min later) I felt my hands and feet very cold and numb. I also felt dizzy and my hands and feet kept cold. Kept trying water and coke and I was continuously dizzy, a weird dizzy, like I had taken some kind of drug. My coworkers said I had slurred speech, my BP was 180/120 and my heart rate was 140. They sent me down to the ER. As soon as I laid down at the ER I started feeling better and within one hour my symptoms were gone. I also felt very sleepy throughout, as soon as I started feeling dizzy. I was fighting the sleep.

Fever Chills Rash and hive Fatigue

Noticed redness and swelling to vaccination site upon waking up. Site is warm to the touch and hard now about the size of a quarter.

Swelling redness and bump at injection site

Swelling redness and bump at injection site

Patient reported that his arm is tingling, has nausea, chills (no fever) and vomiting. These events all occurred as the patient woke up the morning after vaccination on 12/29/20.

Headache, light headed, dizziness for about 10 minutes

itchy tongue/throat

Right side of face swollen

Palpitations, tachycardia, anxiety several hours after vaccine while at home after awakening from a nap. Resolved after 2 hours.

Chest pain, short of breath. Morphine, sublingual Nitro, IV Nitro drip & Heparin drip

Severe headache, mild fatigue

Tension headache

Patient developed persistent nausea one day after vaccination with Pfizer COVID-19 vaccine. Nausea is ongoing 7 days post vaccination. Patient has not had any vomiting, diarrhea, myalgias, fever, and endorses no pain or tenderness in her abdomen. She has taken promethazine oral with minimal relief of nausea.

Headache body aches dizziness low back pain sore throat diarrhea

12 hrs after vaccine. symptoms runny nose, tenderness on left arm, headache, dry cough

About 7-10 minutes after receiving covid vaccine, I was just talking with other nurses and suddenly felt a rush came over me. Felt lightheaded and dizzy. My pulse and blood pressure spiked. After about 5 more minutes, my forehead became numb. My pulse and BP had come back down. Later on that evening and into the next day my palms of my hands were bright red and itchy.

Flushing for 5-10 minutes

General Hives, sunburn effect, itching

General Hives, sunburn effect, itching

"Blurry vision, RIGHT arm weakness, shortness of breath, feels ""sick."""

Pain at injection site the night after injection. Swelling, pain, heat in the muscle around the injection site the next day.

12/18/2020 9:00PM Body aches, fatigue, headache and chills; Tylenol dose. Symptoms have not subsided; have continued to today 12/29/2020. 12/28/2020 Swollen lymph nodes left armpit, extremely fatigued and headache. 12/29/2020 Clinic visit with NP, Flu -- negative and COVID 19 test taken -- no results yet. Advised to continue Tylenol for treatment.

Received vaccine in left arm at 7:20 am sat for 15 minutes without any incident. At approximately 7:50 am I felt an intense burning sensation to outer aspect of right eye and eyelid. My eye was burning and watering continuously.Reported back to department where vaccine was administered nurse gave my 25 mg of P.O Benadryl. No other symptoms at that time. At approximately 2:00pm same day right eye partially opens,swelling persists to right eyelid with burning sensation and eye watering.

Loss of appetite/nausea

Vertigo, nausea, altered vision within minutes of receiving vaccine. Observed in clinic for 1 hour. Symptoms resolved. Returned to work. Vaccine received around 1150 am - patient had not had anything to eat that morning.

Vertigo, nausea, altered vision within minutes of receiving vaccine. Observed in clinic for 1 hour. Symptoms resolved. Returned to work. Vaccine received around 1150 am - patient had not had anything to eat that morning.

stiff and inflamed joints where i have had previous injuries. Also sore throat and hot flashes.

Fever 103.5, body aches, chills, nausea, vomiting

22 mins after , I was light headed, Accelerated heartrate 170/101. I felt weak and shaky . Chills, I was given Iv fluid. In injection of Benadryl Slight Fever of 98.7

After 24 hours. Chills diarrhea and fever

RASH ON NECK AND LEFT HAND BUMP/ITCHYNESS

"Felt ""fine"" initially, then became ""lightheaded and dizzy"", felt like having an asthma attack. This occurred approximately 20 minutes after immunization. Went to ER, given rescue Albuterol inhaler, given Benadryl IV, Pepcid IV , monitored vitals"

Chest pains and short of breath within one hour of vaccine

Low grade temp 99.5

"Mental confusion. Couldn't gather thoughts. Mental ""fog"". Dizziness while sitting."

Patient received the vaccine on 12/23. Patient reports fever and fatigue from 12/24 ? 12/27 and developed hives on 12/26 and a diffuse red rash on 12/28. Patient was treated in the ED 12/28. On 12/28/20 patient was diagnosed with Diverticulitis, Allergic Reaction. Patient discharged with antibiotics and corticosteroid.

Fever this morning of 103 F. Took 1,000mg of Tylenol and fever went down to 101 F. 4 hours later took another 1,000mg of tylenol and fever is currently down to 100 F. Chills Soreness at injection site Fatigue

Patient received Pfizer Vaccine at approximately 1430 and was in observation area. At approximately 1435 observer stated that patient started to c/o dizziness and became pal.. Patient maintained LOC. Emergency measures implemented. Patient was place on oxygen, vital signs taken, EMSA called. EMSA present and evaluated patient. Patient was able to leave clinic site after evaluation.

Hospitalization 12/26 for Covid PNA

generalized edema, facial redness, slow resolution over next 18 hours

After injection developed swelling in cheeks and under eyes -

Moderna covid-19 Vaccine. Moderna was given to pt Im Left Deltoid 2 10:06 am . during her observation period for 15 min @ 10:20 she complained of itching and red spots on left arm and started on her back until 10:30 when 50 mg of Benadryl given in RD Im . started itching and red spots on rt arm noted. no other c/o , no shortness of breath noted, pt alert, oriented x4, sitting in chair talking to husband and drinking water. 11:00 am pt says I am no longer itching, my husband is going to drive me home. Instructed pt if any other symptoms develop go to Hospital ER . Pt walked out to car with husband to go home. I called pt 3:50 no answer at home number. spoke to pt at 4:10 pm , she also vomited X1, Slight headache.

Left arm put swollen and tender, lymph node

injection site pain

Pt called on 12/29 to report she is in pain. Reports at around 9:30 PM on 12/28 she had headache. They woke up at around 4 AM in severe pain. Her head hurt all over as well as the back of her neck down in her legs. Her entire body ached. She felt like she could not get a good breath. Her SaO2 was decreased. Today she is still in pain. Her pulse is 108 lying down and SaO2 88-92%. Will be going to the ER. Her oncologist is concerned about pneumonnia.

Fever-100.3

prolonged pain at the injection site, the pain increased in intensity 72 hours after the vaccine was administered and is persistent after 10 days. no systemic symptoms, evaluated locally, no findings on exam.

Multiple episode of irregular HR for about 7 hours. Severe pain in the left shoulder and joint, with muscles involvement. The pain extended down the arm to the wrist. Muscles were weak and unable to lift arm higher than chest, unable to perform ADL's with left arm as there wasn't any muscle strength to lift a thin blanket covering. Severe pain lasted about 48 hours with continued joint pain, although much less severe, in the left shoulder. Used Benadryl and Motrin. Didn't notice any different outcomes. Arm remained elevated on a pillow for some pain diminishment.

Near syncope, palpitations, tachycardia, elevated blood pressure

received vaccine at 02:30 pm 12/26/20, by 09:30 12/27/20 had chills, muscle aches, headache, sinus pressure, fatigue, and moderate soreness in arm of injection, symptoms resolved as of 12/28/20 09:30

Patient stated she had her Covid Vaccine on Friday 12/18 at 930am. On Friday night she reports she had a terrible migraine, on Saturday she felt very fatigued. She reports Sunday was her worst day and she felt very achy & her body felt like it was on fire. On Monday (12/21) she reports feeling better, but today 12/22 she reports that she has a bad cough and chest tightness.

Loss of appetite/nausea

"Co-worker reported she brought her ""epi pen"" with her to receive vaccine as she has allergies. Pt was given vaccine and waited 30 minutes and did not report any symptoms. Co-worker returned the next day to the vaccine clinic at approximately 11Am and reported that she was having symptoms of a reaction ""(unable to walk), "". She was taken to the emergency room. Co-worker had already taken Benadryl prior to coming to report the adverse reaction. Co-worker was called the next day by co-worker health 12/23/2020 and she reported that she had symptoms the evening of the day she received the vaccine that consisted of hives on her arms, shortness of breath and felt like ""something was coming on"" and she was disoriented. Co-worker was treated and released from the ED the same day."

"Patient stated that 2 hour after shot stated to develop ""brain fog,"" fatigue, and pain/burning in injection arm. In am, was nauseated, slept all day, arm pain improved as did ""brain fog."" Did not feel this was an allergic reaction, but side effects that needed to be reported"

"Patient stated that 2 hour after shot stated to develop ""brain fog,"" fatigue, and pain/burning in injection arm. In am, was nauseated, slept all day, arm pain improved as did ""brain fog."" Did not feel this was an allergic reaction, but side effects that needed to be reported"

Night sweats, body aches, temp 100, severe fatigue. Symptom onset approximately 6 hours after vaccine, resolution within 24 hours

Patient is first responder (EMT) did not disclose symptoms of illness at time of vaccination or would have been denied. Reported that he developed headache and sinus issues on 12/26/2020. Developed extreme arm soreness in arm of injection site and night-time onset of extreme chills. Presented at local health department 12/29/2020 9 AM for PCR testing and tested positive for SARS-CoV2 negative for Influenza A&B. Chills have subsided was of short duration - arm remains sore. Patient denies known route of exposure . Was active over the recent holiday - significant other (GF) scheduled for PCR during AM 12/30/2020 currently asymptomatic.

Significant exhaustion, headache, flu like symptoms, body and muscle aches, fever, chills

Swollen supraclavicular lymph nodes (2 bumps) 12/28/2020 7:00 pm 1 week after. None other side effects

EE developed tingling in left arm, tingling of tongue and roof of mouth, started feeling like her tongue/mouth was swelling. Was given 50 mg of Benadryl PO at 1255. Symptoms continued to worsen, to Emergency Dept at 1300. Was given IV solumedrol and Pepcid. Oral Zyrtec and discharged home. OK to RTW with out restrictions. Upon f/u EE did report a hive like rash on the right side of her body but this has since resolved as well.

Numbness, tingling of low lip, tongue, right side of face for 5 minutes. Hours later developed temp, 101.2, headache. Took a Claritin.

Fevers-101.3, 99.3, 99.1

On 12/28/20 at approximately 1700 hours I felt slightly drowsy and warm. I checked my temperature with a tympanic thermometer which read 98.4. At around 1900 hours I began to feel I had a fever and chills. Temperature was checked again and it read 101.2. I went to bed around 2200 hours where I continued to experience moderate fever and chills. At around 0100 hours on 12/29/20 I had profuse sweating, headache. I took tylenol PM and awoke at around 0730 hours on 12/29/20 and found I no longer had any symptoms.

Itchy Hands were red Itchy at injection site 2 days later got a migraine. from her elbows up everything was red, not hot or didn't break out in a rash.

Dizziness, migraine, neck pain, jaw pain? all on the right side

12/28/2020 flushed neck to face and R side face paralysis (duration for 30 minutes). symptoms resolved and pt feeling better No further symptoms to report

Nausea, which started around 1pm on the same day of vaccination.

Nausea, which started around 1pm on the same day of vaccination.

Loss of appetite/nausea

Approximately 35 minutes after the patient received the vaccine, she reported a muscle spasm and tremor in her right arm, numbness in her lower lip, nausea, jaw heaviness; numbness, tingling and weakness bilaterally in legs.

5 days after injection have a red welt around injection site 2 in wide by 1 in up and down

5 days after injection have a red welt around injection site 2 in wide by 1 in up and down

Loss of appetite/nausea

10:05am injection of moderna covid vaccine into left arm 1010am- started with tingling of left fingers 10:15 tingling increasing up arm, pressure feeling on left side of head and tongue 10:20am tongue feeling numb on left side 10:21am Benadryl 50 mg given PO Liquid 1030am Cetirizine 10 mg tablet given PO Physician observation for 30 minutes, symptoms resolved, still felt groggy, sent home

She has an area measuring 3x2 inches of red, warm tissue. The area is itchy, but I am concerned with a possible cellulitis brewing.

Loss of appetite/nausea

Stated she developed itching all over her body and a rash on her left side of her body. Was taken to ER for further evaluation. Reported to ER provider history of anxiety and panic attacks and stated she was unsure if she could possibly having and anxiety attack. Reported also having chest tightness. . Given Benadryl 50mg po, Ativan 1mg po, and Solu-Medrol 125mg IM. Relieve of symptoms

Fever, severe headaches, body aches, fatigue

On 12/19 when I got my vaccine at 5:00 pm. When I woke up tingling feeling fingers, feet, face and scalp of head. The following morning I notice a rash around my hairline. I called my associate health was informed to take Benadryl multiple times throughout the day and was prescribed Ativan. The itching is still occurring in my scalp of the head and feet. I dint have to miss any days of work.

Vaccine scheduled for 6:30 pm on 12/28/20. only new loss of taste and smell the next morning approx. 5:15 am of 12/29/20.

Pain in right arm lasting two days, headache lasting two days, dizziness lasting two days, and fatigue lasting three days

Pt presented to COVID Vaccine Clinic for first dose of Pfizer vaccine, which was administered. Pt complained of throat swelling and itching approx. 1 min later. Patient transferred to ED.

"A few minutes after receiving the Moderna vaccine, pt reported feeling ""warm and heavy,"" seeing spots. Felt faint right away. Pt pale and clammy. Does have a hx of anxiety and reports taking propranolol 40 mg prior to vaccination. She had this reaction prior to a Hepatitis A vaccine"

Approximatley 2 hours after injection, after arriving home and starting some housekeeping activities, vertigo started with nausea and sensitivity to light. It is going on 2 hours while lying down with eyes covered and some improvement in that eye motion is no longer sensitive.

Developed high fever of 103.2; body aches, headache at 7:00pm; this morning fever down to 99.7; continues with body aches and fatigue.

Pt described starting to have warm, red, swollen, tingly fingers on both hands and felt that her ears and back of her neck were hot/red. Upon examination - there was no warmth or redness noted on ears or neck; lungs were clear to auscultation. Her hands were a little pink but did not appear swollen. She was able to drink a large cool water and said holding the container in her hands felt good. She also noted her lips were a little tingly. A decision was made to offer her 25 m.g. benadryl p.o. - and she felt some relief within ~ 20 minutes of dose. She was able to return to work but did note she developed a headache and did take excedrin for that. Since this initial episode - she has felt extreme fatigue and body aches and those appear to continue to today (29Dec2020). She also has been experiencing chills and some itching on her torso. She also reported starting to have a bit of a cough and sore throat - so will see if she should go to COVID testing.

severe chills fevers and myalgias.

Monitored x 15 min per guidelines. Began to experience SOB and throat swelling, after which pt presented to the ED for tx, dx acute hypertensive urgency with severe hypertension.

Patient presented back at work with a rash on her chest, mouth felt tingly, had red blotches on her arm about an hour after receiving injection. Patient returned to ER and was given Benadryl and monitored for 3.5 hours.

"Pt presented to receive 1st dose of Pfizer COVID Vaccine, which she received at 1130. She emailed hospital leadership to describe a reaction which is as follows: I feel the need to inform you about a likely reaction I had to the COVID vaccine I received yesterday around 11:30 am. I was feeling fine after the immunization, drove home and took some Tylenol in case of any arm pain (of which I have had none). I ate some lunch, was on the phone talking with a friend and developed sudden onset of lightheadedness, slurred speech and extreme sleepiness. No other focal deficit. I actually got up and walked around to try to shake it off. But I suddenly felt so tired that I could not keep my eyes open. I called my husband and asked him to come home immediately. I laid down and tried to reassure my kids that I was fine. I don't remember much thereafter. Just bits and pieces. It felt like I was under general anesthesia, trying to wake up but not able to open my eyes or move my arms/legs. I could hear some things going on but could not talk. There were times I would ""wake up"" in my mind and I would check to make sure I could swallow and I was breathing ok. I remember mumbling to my husband that I could breathe. He says he was checking my vitals throughout this time and monitoring things. He said my Blood pressure was initially 80/60, pulse 50, and as he keep checking it gradually improved. This lasted about 2 hours and then finally I was able to wake up. I felt a little lightheaded and tired for the rest of the day, but I feel essentially normal today. Please note: age not provided in internal system report; unsure of person's age"

Upper lip numbness, bilateral midline. Possibly associated with very minimal swelling to the upper lip. Lasted a few hours. No other associated reaction.

Dizziness, racing heart , short of breath

Fogginess in the head, dry mouth, increased heart rate 120s-140s No treatment Lasted approximately 3 hours

Weakness, Headache, Chills, Fever, Nausea, Vomiting, Diarrhea

dizziness, chills, fever, muscle aches, tachycardia

Body aches, left arm soreness, chills

Received vaccine 12/26/2020, by 4:45 pm 12/27/2020 started feeling a headache. On 12/28/2020 it had become a migraine with nausea. On 12/29/2020 it is still a migraine with some vomiting and nausea.

The symptoms began 20 min after administration of the vaccine. The symptoms were: throat tightening and tongue swelling which self-resolved within 15 min. He did feel that there was difficulty swallowing which persisted. He had a sneezing fit when he got back to the vaccine clinic. He got very anxious. He felt that his hand was swelling and was cold. He felt that he was having itching in his arm where the vaccine was given.He was in his car when the symptoms began so he turned around and went back to hospital. His BP 153/98, HR 128. At this point, he felt that he had no blood in his hands and he felt he needed to do deep breathing. He was observed for 1.5 hours and the symptoms self-resolved with the exception of his HR which has persistently been > 100. He feels very anxious. No treatment was given. He has no symptoms at this moment, 3.5 h after vaccine administration.

Redness about 2 inches diameter swelling after hour Following several hours tenderness and swelling to bicep to lift and move and tenderness in armpit

Hot flash, tightening to throat, tingling to tip of tongue and lips. Mild to moderate. Began 5 minutes post injection. Increased for about 10 minutes, then leveled off but did not resolve. Seen in ER and given Benadryl 50 mg IV and Solu-Medrol IV, dose of Solu-Medrol not listed on ER visit summary. Observed for about an hour and a half symptoms resolved,and discharged. Rx for Prednisone 40 mg po x 4 days and Epi pen given.

Chills, Headache, Cough, Body Aches

Pain to right leg

So that night throughout I felt feverish around 100.9 the highest was 101F. I would break though and then 1-2 hours later again it would come back. Body chest, couldn't move my arm, the pain was severe. Tuesday I could not even sit down I felt so weak, I had rashes in my face, legs, chest. I was so weak, I fainted and hit my head twice while going to the bathroom and kitchen. I felt like I was constipated, ant then I had diarrhea, I did not have appetite but could not hold anything in, I would throw up. My left side was all numb. I could not feel anything. It was like that the while Tuesday. Wednesday body aches, rashes, numbness, but I had a little bit of a body strength and could walk on my own. Thursday I was able to start eating a little bit and constipation were stating to go way. Friday was just body aches. Sunday the rashes finally went away.

After vaccine started with dyspnea \Tx: Pepcid 20mg Benadryl 50mg Atrovent 0.5mg

Arm was very sore for several days. 6 days after injection -- upper left arm broke out in a red, itchy rash (12/28). On 12/29 the rash is more spread out on the left upper arm and is lighter red.

Chest heaviness, chills, headache, fatigue

ask for auscultation before she goes, found with wheezing Solu-Medrol 125mg IVP slowly Refer to ED

PATIENT STATES FEELS LIGHTHEADED AND FLUSH AFTER INITAL 15 MINUTE WAIT TIME. PATIENT HAD NO INCREASE IN HEARTRATE. PATIENT STATES HAS NOT HAD ANYTHING TO EAT TODAY. PATIENT GIVEN WATER AND PEANUT BUTTER CRACKERS AND OBSERVED ADDITIONAL 15 MINS WITH NO OTHER COMPLAINTS AND FEELS BETTER.

Chills, Shortness of Breath, Chest Pain, Arm Pain

Swelling, warmth, redness to left deltoid at injection site started 12/29/2020. Measures 3.5 inches vertical and 2 inches wide. Ice and advil.

After 15 minutes observation I drove home, ate almonds and took a hot shower. My face turned bright red over my cheeks and forehead and broke out in hives all over my face. I never had a reaction like this to nuts before and believe it may be from the vaccine. The redness lasted one hour the hives slowly subsided after a full day.

Within a short period of time my neck became stiff. I developed a headache and became unsteady on my feet. After sitting longer while being observed by our nurse I was allowed to leave. That night I woke up nauseous and vomited. The next day I develped muscle and joint pain. Similar to flu symptoms. Everytime I ate I felt nauseous again. All the symtoms disappeared about 42 hour later. I have had an annaphilatic shock to penicillin as a child.

Patient felt tachycardia, was hypertensive, HR 200, O2 wnl, skin with red blotches throughout shoulders, face and chest and had cold hands and more blotches on shoulder area, transported to ED urgently for further evaluation

Heachache, chills, muscle pain, and temp of 100.9

Nausea, face tingling

Patient received a Hepatitis B booster within 2 weeks of COVID vaccine.

Slight arm soreness, nausea and decreased appetite

TEN MINUTES AFTER VACCINATION, PERSON BECAME LIGHTHEADED, PALE, NAUSEATED AND C/O HEADACHE. SHE ALSO C/O OF BEING HOT AND COLD. HR AND BP ELEVATED AT 157/100 AND 130 BPM. PERSON SITTING WITH LOWER EXTREMITIES ELEVATED, ICE PACK GIVEN TO POSTERIOR NECK, JUICE AND ICE WATER GIVEN TO PT TO DRINK. RAPID RESPONSE TEAM ACTIVATED. PERSON RESTED AND MONITORED AT VACCINE SITE FOR ONE HOUR WITH IMPROVEMENT IN SYMPTOMS. PERSON STABLE AFTER THIS TIME AND ABLE TO GO HOME.

"Immediately Following vaccine: light headed (resolved) & left jaw pain 1 Day following vaccine: nausea, dizziness, headache - all resolved 2nd day following vaccine: fatigue- all resolved 12 days after vaccine: continued left jaw pain- described as consistent dull ache with intermittent ""nerve shock"", weird taste in mouth, left ear pain feeling full with ""crackles"". Patient has not reported symptoms or seen any health care provider since vaccination."

Patient reports having symptoms of nausea headache and Low grade fever.

1237pm- injection of covid vaccine into left deltoid 1240p-hives noted on left arm Benadryl 50 mg given po liquid 1241p-hives spreading rapidly on body physician notified, rapid response called epipen 0.3 mg IM given 1242p tingling of left arm noted 1245- transferred to observation unit on floor with RN/ physician present 1Pm-3pm, itchiness noted, some shakiness due to epipen, hives resolving 145pm 25 ng Benadryl po given one hour post epiepn given itchiness increasing on body, saying throat is itchy 245pm increasing itchiness, discomfort with swallowing solids, taking liquids, says he feels funny, sl lightheaded, did walk to bathroom to void Famotidine given 40 mg PO per Dr 330- remains very itchy, with dysphagia, some hoarsness, breathing comfortably, ambulance called and take to hospital.

CHILLS LIGHT FEVER MUSCLE PAIN ALL OVER MY BODY JOINT PAIN ALL OVER MY BODY GAIT BALANCE

Rash, itching

Itching, cough. Given benadryl 50mg and epinephrine 0.3 in vaccine clinic, and taken to ED for further tx.

Intense arm pain, site redness and swelling, site was warm to touch, increased nausea, decreased appetite, slight shortness of breath, and fatigue

Patient stated she felt experiencing potential angioadema and scratchy back of throat, additionally she was tachycardic and hypertensive

Elevated Blood pressure, dizziness, fatigue, Headache, Light headed , Nausea .

Headache, Fatigue, light chills. taking Tynenol. it is improving slowly.

Headache, Fatigue, light chills. taking Tynenol. it is improving slowly.

With five minutes of vaccine Increased heart rate shot up to 198 bpm. Regular resting heart rate for me is in the 50s. Left pupil dilated completely, right people constricted to pin size. Extremities went numb and ice cold. Went to emergency room Per request of EMTs at vaccination center. Was given high-dose Benadryl and Saline IV. Heart rate return to normal and all other symptoms disappeared after treatment.

Headache, Chills, vomiting

All other symptoms resolved, continued arm redness

Developed chest tightness, slight fever and headaches

Patient experienced hives all around her body she was give benadryl and within 5 minutes the allergic reaction seemed to resolve

After vaccine started with chest pain, dizziness and dry mouth Tx: Solumedrol 125mg Benadryl 50mg

PATIENT FELT LIGHTHEADED AFTER INITIAL 15 MINUTE WAIT TIME. PATIENT WAITED ADDITIONAL 15 MINS UNTIL HE FELT BETTER. PATIENT SYMPTOMS RESOLVED BEFORE HE LEFT.

Swollen lymph node under clavical on left side

Soreness at injection site starting 30 min after the infection.

Itching in hands, head and back of neck, dizziness. Benadryl 25mg given and taken to ED for further tx.

Patient is reporting injection site discomfort, body aches and a tactile fever (unable to measure fever due to no thermometer).

Chills, fever, running nose, fatigue, joint pains, muscle pain, nausea, loss of appetite; lasted two days. Took Tylenol

"Significant redness/rash to chest and back with itching, lips numb, dry mouth, itchy hands, ""feels like I've been hit by a truck"" 2 doses of Benadryl 25 mg IM administered at 11:42 am and at 12:19 pm. 3 hours later, patient still reports feeling like she'd been hit by a truck"

Pt reported feeling of lightheadedness, dizziness and had sweating a few minutes after receiving the injection. Pt is breastfeeding just an FYI.

Right arm pain. Nausea, body and joint aches.

Jaw pain Numb lips Hives over face and neck Hard to breath

Jaw pain Numb lips Hives over face and neck Hard to breath

Tingly lips and around mouth Swollen bottom lip 10 minutes post infusion Right top of mouth tingly

n/v headache T 101 on 12/27/20

soreness in arm of injection, about a 6 inch area

fever of 103F the morning after the vaccine, chills

covid vaccine given at 1030am 12/28/20 bed ridden from pain, dizziness, nausea, and lightheadedness from 2pm 12/28/20 to 4pm 12/29/20. severe muscle pain in L upper pain which peaked around 1230am generalized muscle aches dehydration even though constant fluid drinking nausea, lightheadedness, dizziness if speaking more than one sentence at a time, shortness of breath vitals (taken 5pm 12/29/20) BP 131/87 (normal is usually 116/56) HR 95-105 (normal resting is around 70s-80s)

Client received vaccine,while scheduling next appointment got hot , heart felt like it was pounding, felt like her throat was slightly tight. She immediately took a benadryl from her purse. When writer arrived client's B/P was 150/78 heart rate 98. Respirations even and unlabored. Skin pink,warm and dry. Client was kept for further monitoring. Upon discharge B/P 110/68 no signs or symptoms of distress. Informed to seek medical advice if any further problems.

Metallic taste in the mouth for 10-15 minutes post vaccination; started 10 minutes after vaccination. About 5.5-6 hours after vaccination, experienced rhinorrhea and epiphora for about 1-2 hours, which then progressed to mild nasal congestion and mild chest congestion. Also experienced mild headache and mild fatigue around the time of the congestion. Notable puffiness/swelling of the hands and face set in about 10 hours post vaccination; resolved by the next morning upon waking.

The evening following administration of the vaccine, patient had left-sided rib 2-7 muscoskeletal pain.

Severe cold symptoms beginning 2 days post vaccine, runny nose, cough, shortness of breath leading to ER visit on 12/28, covid test results still pending as of time of this submission

Received COVID vaccine on 12/19/2020. On 12/20, she experienced chills and fever (100.9) and body aches (shoulders, HA). UC visit on 12/21 and doing much better, essentially normal. Clinical Impression: Post-vaccination syndrome. Tested for COVID and flu on 12/21, received negative results on 12/22

Nausea, Fatigue, Minor Chest Pain

I got it on the 21st and ten mins after I had tingling sensation all the way down to my hands, dizzy 190/101 blood pressure, I was sent to Urgent Care and they did a EKG and it was normal I was discharged with BP 180/90, I had cold clammy hands that day, weakness, the next day I was week and fatigued. The 23rd I started having chills and numbness on the left arm. I never had a fever. I'm still not 100% back I'm still tired and I've been having palpitations. I have an appt with my primary Dr today 12/29/20 in the evening.

Patient reports dizziness, hot/flushed, and ears ringing; Patient placed supine x 15 minutes and provided water as requested. BP 128/72 HR 76 O2 sat 100% Patient denies any symptoms after 10 minutes. Observed sitting for another 15 minutes

Patient is a 40 y.o. female with no known past medical history brought to ED with concern for ALOC after getting the COVID vaccination 30-40 minutes PTA. Pt is a nurse and experienced decreased level of consciousness following her COVID vaccinationn. Pt reports h/o anaphylaxis. She was given epinephrine PTA. Denies SOB, oral swelling, CP. BGL within normal limits. Pt denies any other complaints or symptoms at this time.

"got flushed, trying to ""clear"" throat, labored breathing, bp elevated, pulse 120's 15 minutes after vaccine administration. Given 50 mg of po benadryl and at the advice of her physician, 0.3mg epi im in R thigh. After epi, patient breathing slowed, flushing slowed, BP and pulse remained elevated. Pt. expressed feeling better. History of multiple allergies and seen in clinic. Encouraged by physician to receive vaccine."

Strong migraines, fatigue, muscle pain, chills. Pain, tenderness, and swelling at vaccine sight.

Patient received the Moderna Vaccine within 5 minutes complained of throat tightness and not feeling well. The patient was noted to be pale and hypertensive. She was placed on a stretcher, placed on oxygen and a Rapid Response was called. MD responded and initiated IV fluids and administration of Pepcid 20 mg IVP. Patient was transported to the Emergency Department (ED) for further evaluation. In the ED, patient received Methylprednisolone succinate 125 mg IV x 1 dose and Diphenhydramine 25 mg IV x 1 dose. Patient reported relieve of throat tightness and upper chest pressure. Patient was discharged with prescriptions for oral Prednisone x 3 days, Pepcid 20 mg oral twice daily and Benadryl 25 to 50 mg every 6 hours as needed for and recurrent symptoms.

12/29/2020. 0430 I awoke with facial swelling including eyes/nose/lips. Slight wheezing, coughing & my skin felt like I had been sunburnt. I took Benadryl 25mg, Pepcid 20mg, Prednisone 10mg and I did an Albuterol Neb treatment. When I awoke at 0830, the swelling ,wheezing & burning had subsided. I was extremely fatigued & I had a 99 degree fever. The fever subsided ,but I remain fatigued. (12/29/20 @ 1615) It's important to note my past severe allergic reactions have always been delayed by 8-14 days. I do carry an epi-pen.

Body aches & sore left upper and lower arm.

About 28 minutes after receiving I started getting hot, I could feel my heart racing in my chest, my breathing quickened, rapid response was called taken into another room by then my fingers had cramped up to where I couldn't work then arms and legs felt like pins & needles. Sent by ambulance to nearest ER where I was given benadryl and Solu-Medrol by IV, given another dose before being discharged with a prescription for Methprednisolone a few hours later.

Difficultly breathing sweats then passed out

Cloudy vision in left eye

Immediately after getting the vaccine she complained of headache. She had warm feeling at injection site She H/A Thursday, Friday and Saturday at mid-day her boyfriend called and said weakness in Right arm right face droop, no speech she was taken to the ER at 1 pm approximately. She was admitted and was dx was CVA . 2 TIA on left side of brain. Stopped Birth control and physician said it could be a combination of both birth control and vaccine.

26 hours after injection, the person had hives on bilat upper ext, pt's back had some redness

Patient (aRN) felt dizzy was tachycardiac stayed in area for 1 hr symptoms persisted then was taken to ED there was no evidence of Anaphylaxis is. Patient stateds she was given to large of dose RN administering denies states gave 0.5 IM she was monitored for several hours because patient has cardiac history

We requested pt wait 30 min due to her hx of severe allergies. Initially after vaccination, she felt nauseated and looked a little flush. Gave her cold compress and she felt better and wanted to leave. We made her wait and around 20-25 post vaccination, she reported feeling itchy all over and then said her throat felt funny. We were administering the vaccine for a clinic for their hcp staff. Rather than using our benadryl and ER kit, we walked her down to the ER since we were right in the hospital.

Fever, chills, arm pain, horrible body aches and congestion

Headache, chills, vomiting

Difficulty catching my breath, stiff joints in legs

5 minutes post-vaccination, struggled to breathe, felt itchiness in throat, light-headed, dizziness, & tightness in chest.

I have had intermittent numbness in my left hand for about 1 week. The first 2 days were the worse. It is also resolved but still feels different from my right hand. I have not had any weakness.

Pt reported her lip swelling and lip tingling a few minutes after receiving the injection.

Throat numb and swollen metallic taste back of tongue numb chest tightness

Pt c/o nausea and headache. Reported very nervous about getting vaccine. 1013 Vital Signs - 139/80; HR 96, Spo2 99. 1018 reported I may be hungry VS - 129/75; HR 86: SPO2 100. 1025 VS 125/75; HR 86, sp02

100 reported HA, Warm, I am so nervous. At 1030 VS 130/83, HR 97 SPO@ 100 pt reported All I want to do is eat.

Body aches, chills, L arm pain (lasted 2 days-until 12/26) Swollen lymph nodes L arm (lasted at least 5 days, current)- have added warm compress.

"Received the COVID-19 vaccine 12/19/2020 and felt great the next few days with zero symptoms. About 3-4 days later I felt some chest discomfort especially when taking a deep breath in. This occurred on both the front side and back side of chest. This continued for the next 5-7 days. Kept experiencing pain with deep breaths and my exercise tolerance was diminished. When I would hike up a small incline I felt I was not getting enough air and was a bit winded. Finally made an e-visit with my healthcare provider on 12/28/2020 after 5-7 days of symptoms. Knowing I work in healthcare my provider asked if my pain felt like, ""pleuritic chest pain"" and I think that is a spot on description of how it felt. Based on my symptoms he told me the most likely diagnosis is a mild case of pericarditis and prescribed me ibuprofen 400 mg by mouth 3 times daily for a few days. After ~36 hours of ibuprofen I'm feeling 80-90% better but still have some discomfort with deep breaths or exertion."

Soreness in injection site arm, headache, sore throat

Headache, chills, vomiting, temp 100.3

I had my vaccine at 0910 and was instructed to wait 15 minutes post-injection to monitor for any reaction. While seated, at 0920 I felt suddenly extremely lightheaded, dizzy, and nauseous. I had a feeling in my chest like my heart was racing and I check my HR on my watch and it read 120-125 bpm. My baseline HR is 60-70 at rest. I notified staff immediately and was placed onto a stretcher. The rapid response team was called and I was brought to the emergency department on site for evaluation. In my recollection, my heart rate came down to the 70?s/80?s within the hour at which time the feeling like my heart was racing had subsided. The nausea was treated with 4mg IV Zofran. My lightheadedness, dizziness, and nausea resolved with a 1,000 mL NS Bolus. I was discharged home at approximately 1145 with a mild to moderate headache and generalized fatigue.

metallic taste, tongue tingling and numbness began within minutes and numbness took the longest to resolve--hours

patient received a dose of Moderna vaccine after receiving the Pfizer vaccine.

1037 Pt c/o dyspnea, metal taste in mouth and dizziness; 50 mg Benadryl given.. 1039 vs 160/112, HR 123; rr 20; spo2 98 - pt reports metal taste gone. 1044 VS 148/107; hr 94; rr 20; sp02 96; 1052 vs 162/106, 90 sp02 97 - pt said he felt fine and wanted to drive home. no further reports of any s/s first reported.

Started with nausea and racing heart rate on 12/21/20 then lymph node under left arm became swollen, warm and tender on 12/23/20 and continued through 12/28/20

I started on Sunday 12/27/20 with chills, body aches, headache (that was all over) reaction on my arm, felt like my arm was the size of baseball. I figured it was all from the shot because I, myself work in the health field so I knew these were all reactions. However, as the day went along the worse I got to feeling. I kept taking Tylenol (only thing I can take because of not having a spleen and having a bleeding disorder) and my headache would not go away. So, then at midnight I ended up checking my temperature and it was 100.4. As the night went on I still wasn't able to get rid of my headache and I had even started adding Benadryl along with my Tylenol and still wasn't able to get rid of it. I ended up talking to my Hematologist and she had recommended me to go to the ED to be checked out.

Chills and temp of 101

Pfizer-BioNTech COVID-19 Vaccine EUA About 3.5 hours after vaccine was administered pimple like rash appeared on right hand and wrist. Slight itch associated with rash. Rash still present on second day after administration.

"Patient felt a migraine aura that started about 8-10 min post-vaccination. She was experiencing pain around her left eye and some vision disturbance although no nausea which she stated she usually has. Patient was still at clinic waiting since it had not been past her 15 min time yet. We gave her some tylenol and had her move to a room that was a little darker and quieter and kept her for another 30 min (45 min total). Patient said she still felt like it was the ""beginning of a migraine"" and not feeling well. We called someone to come drive her home and sent her home for the rest of the day."

"12/29/20- Spoke to CG. Received Pfizer COVID-19 vaccine, dose #1 on 12/23/20 @ 4pm. Stayed in Observation area for 15 minutes without any problem. Suddenly, on 12/26/20 (3 days after receiving the COVIID vaccine), CG felt ""itching to throat, gum, mouth and body; itching head to toe"", also noticed ""lip, mouth swelling"" as well as ""wheezing"". Stated she has history of ""asthma"". CG then self-medicated with ""Claritin and Albuterol inhaler"" without much improvement on 12/26/20. Then the next day, on 12/27/20, itching to throat and mouth is resolving but still had shortness of breath and itching body. On 12/28/20, CG came to work but still experienced itching body and ""hard to breath"" when wearing surgical mask (required at work). CG was sent home and saw primary care physician (PCP) via virtual visit. Per PCP's evaluation, CG has had ""delayed allergic reaction"" to COVID-19 vaccine. PCP recommended CG to continue with Benadryl and Albuterol inhaler until recheck on January 4 for re-evaluation and discussion on preparation of 2nd dose with steroid and EpiPen. CG would like to complete the vaccination series to receive 2nd dose. As of today, 12/29/20- CG stated she still has shortness of breath and itching and will be off work until re-evaluation by PMD on Jan 4, 2021. Reviewed CG?s consent form of COVID-19 Vaccine- Date received 12/23/20 @3:37pm. Answer of NO to question ?Do you have a history of severe allergic reaction (e.g. anaphylaxis) to another vaccine or injectable medication??"

Fatigue Headaches Muscle pain Joint pain Fever Soreness at injection site

throat discomfort/ irritation

Arm soreness, same day Fever and chills, same day and 1 day after Fatigue, same day and 1 day after

Sore arm at injection site, about 6 hours after injection, ongoing Next morning stiff neck on left side, about 19 hours after injection, ongoing Swollen lymph node in neck area, collar bone, left side about 21 hours after injection, ongoing Tiredness, off and on, about 7 hours after injection, sporadically ongoing

Hot flushes with rash to chest

headache, 100.0 temperature

I got the shot at 115PM I waited and within a couple of mins I tasted metal on the left side of my tongue. the back of my tongue and my left cheek started to go numb and I was taken to the ER, my vitals were taken and was normal and was monitored for a couple hours, triptase was taken and they did bloodwork, the numbness climbed to the left side of my face from my eye to my jaw, they gave me antihistemines for the next 48 hours and was sent home. Saturday morning I went to the gym and felt fine and 24 hours later I felt complete fatigue like I had been hit by a bus, Sunday I had congestion and still numbness on my face. On Monday I got a call from an allergist, they couldn't figure out if it was an allergic or adverse reaction. I was put on a high dose of Allegra to see what it could be. Tuesday the congestion went into my lungs and was out of breath and was having trouble breathing. My PCM called me and asked me to video call and said I looked terrible. my pulse oximeter was 99. Wednesday when I woke up my difficulty breathing was starting to get better. I was tested for covid twice on Wednesday and both were negative. Wednesday to 12/28 I continued to have serious fatigue and I'm very active I feel much better 12/28 and 12/29 I feel better but I've had the numbness on my left side of my face this whole time and it feels like I've had Novocain I can't get rid of it.

PATIENT received the covid vaccine on 12/28/2020. He had two episodes of nausea and vomiting at 2 pm and at 3:30 pm on 12/28/2020 (about 3 hours after vaccination). Nausea and vomiting have resolved. Has bodyaches today. Denies fever, chills, cough, sore throat or HA.

SHORTLY FOLLOWING THE VACCINATION, PATIENT COMPLAINED OF ITCHING, REDNESS ON HER FACE, SCALP AND MOUTH. LEGS AND TORSO ITCHING ALSO.

Patient rec'd first dose of the Pfizer Covid-19 vaccine. About 5 minutes after she reported a hot peppery taste and her tongue felt hot. No other reported symptoms. Had the patient sit in observation for a total of 45 minutes with no worsening or new symptoms. Called patient 2 hours after event and symptoms have resolved.

Client reported dry mouth occasional cough and feeling warm after. Water provided leg elevation cool compress to neck reports feeling much better

sore throat, cough

2 minutes after she received the vaccine, she felt numbness at injection site that radiated across her chest and down her right arm. She was sent to the ED, no treatment needed and symptoms had resolved prior to her leaving the ED.

First day of vaccine, I had a really sore arm. Next day after vaccine, felt very fatigued that continued for 3 days. On 3rd day after vaccine, developed mild cold symptoms/sinus congestion. Day 5 after vaccine, lost taste and smell and tested positive for COVID-19.

1st day - muscle tenderness in injection site. 2nd day - around 11am headache, fatigue, chills, joint pain

Patient was nauseated and warm Ice pack to neck Denies further symptoms

Anxiety, arm soreness and chills

No adverse event. The vaccine was given 22 hours after the vial was punctured. The event was discovered three days later which was a Sunday at 10pm at night. The patient was notified the next day (12-28-20). The patient reported no side effects and was feeling felt great.

Took Benadryl at home before arriving at shot clinic - began to feel tightness & burning sensation in throat shortly after injection - taken to ER for observation and was administered prednisone

Extreme fatigue, fever, chills, headache, body aches and pain at injection site. I know they are all listed I just didn?t know if I needed to report them

headache, chills 100.0 temperature

"Patient was monitored for >15 minutes after vaccination. Patient told a nurse that her knees felt weak. Patient then fainted and was laying on the floor when i arrived. Patient reported she felt like she was ""floating"" and she did not want to ""fall"". She was also nausea and wanted to vomit and did not end up vomiting anything up. Patient fainted several more times. Her BP was around 143/80 and unsure about the pulse. Patient then become unresponsive for 20-30 seconds."

1:00 am to 5:00am the night after vaccine in morning. Chills and shivering severely. Body ache. Headache. No fever. Chills subsided. Mild Headache only symptom for remainder of day.

Moderna COVID-19 Vaccine EUA Approximately 16 hours after receiving the vaccine (8 AM), I was woken to hot flashes, sweating, and fever-like symptoms. My arm was also very sore and slightly bruising had occurred. My temperature at this point was 99 degrees. After taking Tylenol at 4 AM for arm soreness and Motrin at 8 AM, symptoms of aching and soreness subsided. At 2 PM I had not had medicine since 8 AM and symptoms resumed. My temperature was 100 degrees and I experienced chills and body aches. It is currently 6 PM and symptoms have mostly subsided, however, my arm is still sore and I feel faint fatigue and soreness all over.

Developed 2 hive like welts on chest that I thought might be bug bites because they were very painful itchy and swollen with fluid in them. After a few days more of them developed until there were about 22 on my legs, arms and chest. Very painful and inflamed and itchy. They are as painful as shingles but there are none on the midline or abdomen. I saw physician and he determined it was a reaction to the vaccine. I have never had a reaction to a vaccine before nor have I ever had welts as painful or like these. He prescribed prednisone which I am taking now. I have only finished one day of oral prednisone

and the swelling on the site have started to improve but I still have pain itching and have 3 new ones that have come up. One on the lateral breast and the other two on the anterior breast (superior).

headache, chills, temp 100.7

headache, chills, temp 100.7

Within 1-2 minutes: left hand felt numb and my body became very warm. Within 5-10 minutes: a huge headache. Within 30 to 45 minutes: Blood Pressure fluctuated, headache became worse, and chills started to occur. Within 1 hour to 1.5 hours: the headache became a huge migraine and my head felt like a bowling ball (I was still at work at this time.) Eventually, I could not lift my head off the desk. About 2 hours to 2.5 hours later, I felt so bad that I could not continue to work and head to leave work and go home. Upon arrival at home, the chills, aches, pains, migraine, some fever, eyes could barely stay open, and diarrhea started. About 7 hours later, a full blown Lupus flareup seemed to have started and/or it seemed to feel like a full blown case of the flu (if that makes any sense at all.) By the time I wrote this, all the symptoms have remained the same. I have had chicken soup, Gatorade, and bananas and treating this like the flu. I have continued to take my medication except for the Prednisone because I was told not to take the prednisone at the time that I was given the COVID19 shot at 9am this morning. I have stayed at home since I arrived at home around 1:30 or so...

Headache, body aches, chills, nausea and vomiting. Tool Ibuprofen at start of symptoms, and an additional dose later in the day.

Approximately 10 minutes after administration of vaccine, patient reports having dry mouth and some tightness and closure of esophagus (similar to what happens when patient eats shell fish), but not as severe. Patient was offered Benadryl, but declined. Patient drank some water to help relieve dry mouth. Blood pressure @4:30pm was 136/84. At approximately 35 minutes after symptoms started, patient reports being able to produce a little more saliva. Blood pressure @4:55pm was 118/87. Clinically stable. Symptoms are not progressing.

Individual began feeling dizzy and reported feeling painful sensation in her neck within approximately 5 minutes after receiving the vaccine. She was tachycardic in the 120s. She was encouraged to take deep breaths, offered water, and given 50 mg Benadryl IM in the right deltoid. After several minutes post Benadryl administration, her symptoms resolved. She was taken home by a family member.

Approximately 7 minutes after administration of vaccine, patient reports having tingling sensation on head and face. Symptoms lasted for approximately 10 minutes. Blood pressure @4:34pm was 140/87, HR=71. Blood pressure @16:52 was 150/73, HR=105. At 5:10pm, patient clinically stable. Symptoms have completely resolved. Patient released from vaccination clinic at 5:14pm.

headache

Vaccine administered at 7AM on 12/26/20. 12:00 noon, 101 fever, chills, joint and muscle aches same day. Took Ibuprofen to reduce fever, temp down to 99 by 6PM 12/26/20. Next day, 12/27/20, at 5AM temp back up to 101. Took Ibuprofen again and fever was gone by 5PM. Muscle aches and fatigue

continued through 12/28/20. 12/29/20 woke up feeling like I have a minor cold with some congestion. No fever as of 3:20PM on 12/29/20

During the observation time after receiving the vaccine, the employee report that her ears were read and warm. Employee noted to be squeezing her ears at time of concern. Employee evaluated by RN staff, no swelling, SOB or difficulty swallowing noted. Employee then reported onset of itching to her neck and ears. Employee was escorted to the Emergency Room for evaluation. Per ED physician note: 46 yo F c/o R ear redness, swelling and generalized itching. sudden onset just PTA. pt had COVID-19 vaccine approx 20 min ago. denies throat/tongue tingling/swelling or SOB. O2 sat = 100%, no acute distress, lungs clear, respirations non-labored, breath sounds equal, speaking in full sentences, no pharyngeal erythema or exudate.. Treated with diphenhydramine 50mg IV, famotidine 40mgIV, methylprednisolone 125mg IV and NS 1000 ml x 1.

patient experienced dizziness, lightheadedness approx 20 minutes after dosing. VS WNL BP 100/70, HR 80. Pt sat and drank water and put ice on her neck for approx 30 mintues

After administration of vaccine at 1:00 pm, I looked up and saw patient had fainted in chair, that time was maybe around 1:01 pm. When I rushed over to her, she regained consciousness, noticed she was not able to speak well, nurses removed her mask and we noticed her lips were swollen and was having an anaphylactic reaction, I then administered one dose of Epi-pen at 1:04 pm and called 911. We took her BP but it was high due to the Epipen injection, we tested her blood sugar. When the EMT arrived, they took over and took her to the ER.

Hives on neck takes Benadryl and refused to be seen

Loss of taste that evening only, some dizziness at time of vaccination - fatigue, muscle aches, nausea and declined in appetite. Symptoms have cont as of time of generating this report 12/29/2020 but has lessened in severity each day.

DAY ONE 12/22/2020- SORE INJECTION SITE, DAY 2 TOTAL BODY ACHES ON 12/23/20, FELT FINE ON 12/24/2020, 12/27/20 SWOLLEN LYMPH NODES AROUND THE CLAVICAL AREA WITH SORENESS IN THE INJECTION SITE, NUMBNESS AND TINGLING TO THE EXTREMITIES.

received injection at 13:04, went to observation area. reported brief dizzy spell at 13:20. Drank water, BP right arm 184/101, BP left arm 166/90 at 13:25. Patient reported only brief episode of dizziness and no further dizziness. User reports they ate lunch 1.5 hours earlier. BP 173/90 at 13:30. User reports she feels fine and will recheck BP when she gets home and follow up with her PCP. User waited 5 additional minutes before leaving with no further adverse effects. Total time of observation post injection was 30 minutes.

About 15 hours after the injection I developed sudden onset of chills, headache, nausea, dizziness and low back pain. The site of the injection was also throbbing. I had no side effects prior to this. It was severe enough that I had to call off of work. Symptoms resolved about 6 hours later. I have had no further symptoms since that time.

Fever 102.1 Chills Muscle aches Cough Headache

Fever, coughing, tachypnea, tachycardia

Right after vaccine, felt like she was freezing. Got home from work, took Tylenol felt achy, went to bed, woke up about 11:00 pm shivering really bad, breathing heavily, temp was 102.3, took more Tylenol. Up all night off and on with body aches, headaches, chills and fever. Felt the same way as when she had COVID.

Frontal headache, shivers, body aches, fever to 101.6F.

Received vaccine at 13 15. At 1351 c/o mild chest pain. 1353 c/o throat fullness and anxiety; 1354 bp 148/81 HR 99 O2 sat 100% c/o difficulty swallowing, SOB and itching. Rapid response called. Benadryl 50 mg IVP given at 1355. 1356 Solumedrol 125mg given IV; 1357 Epinephrine given; 1358 Pepcid 20 mg given. 1400 Normal saline 250 mg IV; 1415 transported by ambulance to local ER. In waiting area in local ER no attention. Came back to Hospital and admitted to observation

Developed skin reaction (hives). Treated with 25 mg of Diphenhydramine orally and observed for additional 30 minutes. Hives subsided and patient released.

developed headache, body aches and fever - has since resolved

headache/chills/weakness

Patient reported that immediately after receiving the vaccine she felt lightheaded, dizzy, like she might pass out. She felt as though her throat was more swollen and she had difficulty swallowing. She had no hives, shortness of breath, or difficulty breathing. No myalgias, sore throat, cough, or wheezing.

Facial/ arm numbness and tingling

Soon after IM vaccine c/o sore & swollen arm for 2 days. Also felt weak, shaky and tired for those 2 days

About 4 hours after injection, pain at injection site started. 5 hours after injection, fatigue, body aches, and fever and chills occurred. Symptoms subsided for several hours until night time. Severe nausea occurred sometime around 1:30 am, a little 12 hours after injection. Vomiting happened at 5am. The entire next day after injection I experienced nausea, fatigue, sore throat, headache and fever.

High fever to 102 with uncontrollable shivering and chills beginning apx 12 hours after injection, improved with ibuprofen but not resolved, fever continued x 16 hours

18 min after injection. Throarlt began tonitch and feel tight, chest pressure. Light headed. Epi 0.3 given, sent to er, provided with solumedrol, benadryl, pepcid, ativan and 1750 cc of fluid. Released from hospital at 330.

- arm tenderness. Initially felt like routine flu vaccine. After 12 hours, arm started to increase in tenderness, more similar to other vaccines such as TdaP or tetanus. Gradually resolved at 72 hours. - Mild malaise developed at 24 hour mark (1st day post injection). Checked temperature at 28 hour post

injection with 1 degree Fahrenheit higher than normal forehead temperature using Exergen thermometer. Subtle myalgia during the evening. Symptoms resolved after sleeping, which should be at 40 hours after injection. Slightly less than normal physical stamina between 40-50 hours post injection (2nd day post injection). Symptoms have completely resolved after the second night sleep (66 hours post injection or 3rd day post injection). Injection was on Saturday 2:00pm. Completely symptom free on Tuesday.

Next day after the vaccination, the patient(staff member) came back to the vaccination clinic and stated that she felt numbness and tingling along the smile lines of her face and around her lips. She was monitored for about 40 minutes then she reported difficulty of swallowing. At first reported symptom of swallowing difficulty she as administered diphenhydramine 50 mg oral liquid by mouth. After about 30 minutes of continued monitoring, epinephrine 0.3 mg IM was administered. At the same time 911 emergency response was called and the patient was transferred to the acute care hospital.

Four hours later after received vaccination he complaints of tingling sensation in both cheeck with associated edema and redness. Treated with Solumedrol 125 mg IV and Benadryl 50 mg IV. Patient improved and was discharge with instruction .

Sustained slight but rapid muscle twitching in the deltoid muscle of the injection (left) arm. Noticable the afternoon of post injection day #1. Twitching continued for approximately 1 hour then ceased. No other side effects reported other than minimal arm soreness that didn't interfere with daily activity

Received dose @ 1445; 1458 had a cough and itchy throat and flushed; Bp 162/103 HR 86 Sat 99%; At 1459 gave IV push solumedrol 125 mg; 1510 bp 150/93 hr 80; sat 99%; feeling better

Hives on neck, face, upper chest, and back. Increased heart rate. Metal taste in mouth. Zyrtec given and monitoring Relief after about an hour

Onset of herpes zoster (shingles) - right anterior thigh

Moderna COVID- 19 Vaccine: During observation period after receiving the vaccination patient reported headache, nausea, and dizziness. Vital signs: blood pressure: 111/73 mmHg, pulse: 56 beats per minute, oxygen saturation 100%. Patient reports that she is typically hypotensive and does become nauseous somewhat frequently. Patient offered water and snacks. No loss of consciousness or respiratory symptoms reported. Patient observed for at least 30 minutes and left vaccine clinic in stable condition.

fever 102

nauseated; sensitivity to light; sweaty; hypertensive; tachycardic.

Received vaccine on 12/22/20, on 12/25/20 noticed redness, hives, and itching on the left arm where received vaccine. Took Benadryl on 12/25/20 and 12/26/20. Reported on 12/29/20, and feels itching with some redness subsiding, no pain.

12/24 EVENING c/o being so cold causing shivering. Not normal for pt. Also arm pit area swelling for a bit. All symptoms resolved on 12/25/20.

Morning of day after vaccination had headache, fever, chills, joint pain, muscle aches. 2 days after vaccination same symptoms also diarrhea and positive COVID-19 test.

Moderna COVID - 19 VACCINE Sorearm in left arm Chills Severe headaches Nausea and vomiting

flushed and nauseous and anxious and dry cough; dizzy; hypotensive

METALLIC TASTE IN MOUTH ABOUT 10 MINUTES AFTER VACCINE. NO OTHER SX.

Feeling dizzy and light headed 30 mins after injection. One hour later felt nausea and dizzy. BP 177/73, and 156/70-72 w/ repeat. Symptoms improved with Tums.

fever 103'

"Patient received the covid vaccine on 12/22/2020. No problem with the vaccination. Reported new onset of ""dry cough"" and nasal congestion started on 12/29/2020. Denies fever, chills, HA, body aches, or fatigue. Last covid test on 12/17/2020 was negative."

Complains of left arm swelling and pain. She had the COVID-19 vaccine on December 23. The next day she had some mild pain at the injection site. She massaged it and use Tylenol. On December 24 he developed pain down all of her left arm. On the 25th she had complete loss of sensation and feeling in her left hand for about 3 hours. Then the arm seemed to tingle and feeling came back. That night she developed pain down in her wrist. Complains of some swelling in the left forearm. That area is burning and throbbing. Pain is affecting her sleep. She has tenderness to palpation on her wrist area. She also has pain with with wrist movements. . .

Pain in area of inyection (left arm), mild rash in chest area

Approximately 5-7 minutes after receiving vaccine, I experienced a rapid increase in heart rate along with a head rush. I then was shaky and lightheaded and was told extremely pale. I then noticed the back of my tongue was slightly swollen and I had a tightness/itchy feeling so n my throat. My pulse was checked at 120bpm, Approximately 10 minutes later my lips were tingling and numb. I was given Benadryl and prednisone. 1.5 hours later since my symptoms did not go away I was escorted to the ER for epinephrine.

12/28 Difficulty falling asleep, Awake in middle of night w/ achiness - couldn't get comfortable. This morning c/o headache, feeling exhausted and weak.

staff member received his first injection in the left arm. As staff was waiting for his time of observation, he stated he could feel his blood pressure rising. When assessed, his blood pressure was 196/119. Staff member stated to the MD he takes medications for hypertension but was unable to state what that medication was. He says he just takes what he was given. Staff member stated he was having a hard time breathing due to his blood pressure and was given supplemental oxygen at 3L per nasal cannula.

O2 was 98% throughout. 911 was called to assist staff member to ED for evaluation of symptoms. While taking staff member to meet the ambulance, via wheelchair, he stated he believes he forgot to take his medication for the day. Ambulance took staff to ED with no noted complications.

Immediately after receiving the dose, I developed lightheadedness, nausea, sweating. This worsened for 15 minutes, then slowly subsided over several hours. The next day, I was a little fatigued, but returned to baseline by the evening. On the 2nd day after vaccination, I developed uncontrollable violent rigors and PACs, along with fatigue and vertigo. These symptoms improved on days 3-5 after the vaccine, but returned on day 9 with worsening rigors and PACs. I also developed substernal chest pain on day 5. Now, day 9 post vaccination, and I'm feeling unwell. Main symptoms are chest pain, PACs, intermittent rigors, vertigo.

Pfizer-BioNTech COVID 19 Vaccine Starting at 20-minutes post vaccination and lasting for approximately two hours, patient experienced episodic tachycardia (HR 123-200), flushing of face and arms, and tingling sensation in upper body lasting up to 5-minutes per episode. Episodes were 20 minutes apart and decreasing in severity. Patient medicated after second episode with 25mg/Benadryl, 40mg/prednisone, and 20mg/pepcid. Side effects resolved within 40 minutes of medicating.

Pfizer-BioNTech COVID-19 Vaccine: Soon after vaccine administration patient reported dizziness, trouble swallowing, paresthesias in both hands, shortness of breath, anxiety, and one episode of vomiting. Patient was transferred to the emergency department where initial vital signs were: blood pressure 161/84 mmHg, pulse 97 beats per minute, temperature 36.9 degrees Celcius, respiratory rate 16 breaths per minute, and oxygen saturation 98%. The patient presented alert and oriented in no acute distress. On exam no rash, edema of the uvula or tongue, respiratory distress, wheezing, rhonchi, or rales were noted. Patient was administered one dose each of lorazepam and ondansetron and was discharged.

I previously had covid the first 2 weeks of november** Symptoms of adverse reaction included: -severe pain and limited movement of injection site - large amount of redness and swelling at injection site - fever of 101.2 - body aches and chills - headache

drooping OF LEFT EYE, twitching, weeping of left eye. Upper eyelid of left eye puffy and red. Chest tightness

"""Pfizer-BioNTech COVID-19 Vaccine"": left-sided facial bell's palsy; facial drooping mostly resolved, minimal eye drooping on left side; headache; Tylenol taken for headache; headache has resolved;left-sided sensitivity to loud noises; hearing sensitivity resolved"

Mild headache, significant fatigue, runny nose

Severe headache, nausea almost to vomiting, body aches, injection site inflamation/pain,

itching (full body), sore throat, L ear pain

Diarrhea

physician/patient with history of anaphylaxis to shellfish - symptoms of tingling tongue & syncope. no longer carries epi pen sue to ability to avoid food. 10 minutes post vaccination pt/physician experienced tongue tingling similar to prior anaphylactic events. administered 25 mg. Benadryl po. no further issue, vital signs stable throughout & later in evening.

chest tightness, tongue tingling, tachycardia, hives on left arm

Unilateral facial numbness, tingling, and swelling

"Metallic taste in mouth, dizziness, weakness, altered mental status, difficulty raising arms, ""heavy like a slug"", HR 81, BP 112/78. reaction immediately after vaccination. Symptoms did not resolve after an hour. Patient taken to ER for evaluation."

rash, dizziness, neck pain, hypertension, vomiting, mydriasis, diaphoresis: neck pain started within 10 mins, while other symptoms proceeded after about 20-30 mins.

Temporary Numbness of facial muscles

Days 1-4 - low grade fever (100.8) swollen lymph nodes and extreme sore throat and lethargic. Day 5 no fever but swollen lymph nodes and sore throat. Day 6 congestion, no taste or smell.

10 MINUTES FOLLOWING VACCINE - SOB, COUGH, TIGHTNESS IN CHEST, THRAOT SWELLING, DIFFICULTY SWALLOWING, LIGHT HEADEDNESS, AND ELEVATED HEART RATE. ORAL AND IM BENADRYL ADMINISTERED, 2 DOSE OF EPINEPHRINE, 2 NEB TREATMENTS, O2 PLACED. 911 CALLED AND TRANSPORTED TO EMERGENCY FOR FURTHER TREATMENT AND MONITORING. AT HOSPITAL IV STEROID ADMINISTERED. SYMPTOMS SUBSIDED WITH SECOND DOSE OF EPINEPHRINE, HOWEVER RETURNED 3 HOURS LATER AND ANOTHER DOSE OF BENADRYL ADMINISTERED. ELEVATED HEART RATE CONTINUED AND IV FLUIDS ADMINISTERED TO ATTEMPT IN BRINGING DOWN HEART RATE. IV FLUIDS WERE NOT EFFECTIVE. HEART RATE (118-120) REMAINED ELEVATED INTO THE OVERNIGHT HOURS AND SUBSIDED AROUND 1:30A ON 12/29/2020. CONTINUED HEADACHE, NAUSEA ONSET, FATIGUE, DIFFICULTY SWALLOWING AND COUGH ON 12/29/2020.

Shingles outbreak mostly lesser occipital nerve distribution

Got shot on Tuesday. On Sunday night had cough and congestion and little fever. Going to do COVID testing this morning. Is feeling better today.

I received my Moderna vaccine 12/28/2020. First symptom began that day with pain, soreness of injection site. Later throughout the day I began to have chills, and body aches. I had a sleepless night. The following morning 12/29/2020, I still felt chills, body. Then, I felt nausea, and headache. I slept most of the day today since I felt fatigue too, but it's better than going through Covid .

Face turned red,sweating,cold clammy skin, throat constricted

Atrial fibrillation

The morning after getting vaccine, patient had high BP 213/159, 92% on room air, shaking, chills, LCTAB with diminishment at bases, emesis. Admitted to hospital for pneumonia.

Muscle tightness to bilat shoulders and neck. Tension headache. Rash across shoulders and chest.

Sore arm, body aches, mild fevers for 48 hours

Bad Headache, nausea, extreme body aches

Pt had felt little tingling effect in mouth and mentioned about having an allergy shot today.

Hives from Head to toes. Swollen ears, slight lip swollen, fever 101

12/23/2020 developed left ear pain and next day experienced drooping of left side of face, difficulty blinking left eye Bells Palsy

Chills, fever, fatigue, headache

Vaccine administered with no immediate adverse reaction at 11:29am. Vaccine screening questions were completed and resident was not feeling sick and temperature was 98F. At approximately 1:30pm the resident passed away.

Injection site pain 4-36 hours after dose. Headache 12-36 hours after dose. Joint pain 12-36 hours after dose. Fatigue 12-36 hours after dose. Chest tickle 24-36 hours after dose. Tooth ache 4-36 hours after dose.

His wife ended up contracting Alpha-Gal by Ticks; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect via contactable consumers (patient's husband, and patient herself). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient ended up contracting alpha-gal by ticks on an unspecified date. The reporter asked about the ingredients of the COVID-19 vaccine, if it contains mammalian cells, dairy, guinea pig 1 cell, or cholesterol origin. Outcome of the event was unknown. Information on the lot/batch number has been requested.

near syncope episode, orthostatic; feels a little foggy; This is a spontaneous report from a contactable Physician. A 38-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), via an unspecified route of administration on unspecified date in 2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The emergency medicine physician was monitoring a patient that came in from a vaccination event, stated that it was Pfizer BioNTech Covid 19 vaccine. The patient had a near syncopal episode. They did orthostatics (unspecified) and found that she was orthostatic (near syncope episode, orthostatic). There was no anaphylaxis reaction or allergic reaction. She still felt a little foggy. The physician did a blood glucose, labwork and EKG that look good. The physician wanted to know if there was any data for things that they should looking for with the vaccination and will direct the patient to

contact Pfizer to report it. The outcome of the events was unknown. Information on the lot/batch number has been requested.

Sore arm; Dizziness; Tiredness; nausea; fever of 102¦F; severe headache; This is a spontaneous report from a contactable consumer (patient). A 20-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899, expiration date unknown) intramuscular at the left arm on 18Dec2020 at a single dose for COVID-19 immunization in the hospital. Medical history included allergy to Sulfa from an unknown date. Concomitant medications included escitalopram and clonazepam. The patient did not receive any other vaccines within 4 weeks prior to the vaccine. It was unknown if the patient was diagnosed with COVID-19 prior to vaccination. The patient experienced sore arm after first 8 hours; dizziness, tiredness, nausea, fever of 102 F and severe headache all on an unspecified date in Dec2020 (reported as 12Dec2020 at 01:15 AM). The patient was tested for COVID post vaccination and had a nasal swab with negative results. The patient recovered from sore arm, dizziness, tiredness, nausea, fever of 102 F and severe headache all on an unspecified date in Dec2020.

Fever of 101.0; sore throat; light headedness; aches; chills; excessive sweating; nasal congestion; This is a spontaneous report from a contactable healthcare professional. A 32-year-old female patient received BNT162B2 (lot number and expiry date unknown) at a hospital, at age 32-year-old, intramuscular, on the left arm on 21Dec2020 19:45, at single dose (dose 1), for COVID-19 immunization. Medical history included anemia, anxiety, and urticaria. Patient was also diagnosed with COVID-19 prior to vaccination. Patient is not pregnant at the time of vaccination. Patient did not receive any other vaccines within 4 weeks prior to the COVID-19 vaccine. Concomitant medication included ethinylestradiol, norgestimate (ORTHO TRI-CYCLEN), lorazepam (ATIVAN), clonazepam (KLONOPIN), and diphenhydramine hydrochloride (BENADRYL) from unspecified dates. The patient previously took hydrocodone/acetaminophen (VICODIN), oxycodone / paracetamol (PERCOCET), pseudoephedrine hydrochloride (SUDAFED) on unspecified dates and had known allergies. On 21Dec2020 at 23:00 , the patient experienced fever of 101.0, sore throat, light headedness, aches, chills, excessive sweating and nasal congestion. No treatment was received for the events. Since the vaccination, has the patient has not been tested for COVID-19. The outcome of the events was recovering. Case is reported as non-serious. Information on the lot/batch number has been requested.

hives and sore throat the day after receiving COVID19 Vaccine; hives and sore throat the day after receiving COVID19 Vaccine; This is a spontaneous report from a contactable Nurse. A 46-year-old female patient started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number: EL0140, Expiry Date: 31Mar2021), intramuscular (injection left deltoid) on 18Dec2020 (around 1621) at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient has no prior vaccinations. The patient experienced hives/ She had body hives all over and sore throat the day after receiving COVID19 vaccine on 19Dec2020, within 24 hours. The patient took BENADRYL and was fine. Reporter was not sure if the patient would receive the second dose. The adverse event did not require a visit to the emergency room nor physician office. Outcome of the event was recovered on 19Dec2020.

headache; fever/as high as 102.9 degrees Fahrenheit, now (22Dec2020) it's just over 100.0 degrees Fahrenheit; This is a spontaneous report from a contactable nurse. A 31-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), lot number: EK5730, via an unspecified route of administration, at the right arm, from 17Dec2020 18:30 at a single dose for covid-19 immunization. Medical history included attention deficit hyperactivity disorder (ADHD), osteoarthritis (OA); patient already suffer joint pain and her current joint pain is no worse than usual, Raynaud's, palpitations and joint pain. Concomitant medications included amfetamine aspartate monohydrate, amfetamine sulfate, dexamfetamine saccharate, dexamfetamine sulfate (MYDAYIS); amfetamine aspartate, amfetamine sulfate, dexamfetamine saccharate, dexamfetamine sulfate (ADDERALL); and ibuprofen (IBUPRO). It was reported that the patient has had fever daily. Initially on 18Dec2020 at 9:00, it was as high as 102.9 degrees Fahrenheit, now (22Dec2020) it's just over 100.0 degrees Fahrenheit. She also has had a headache daily(reported as started on 18Dec2020 at 9:00), but today's headache is much worse than previous days. The patient underwent lab tests and procedures on 18Dec2020 which included sars-cov-2 test/COVID-19 test/nasal swab with negative result. Outcome of events was reported as not recovered. Therapeutic measures were taken as a result of events headache and fever included OTC medications (unspecified). Follow-up attempts are completed. The information on the batch/lot number was obtained.

Chills; joint pain; muscle pain; This is a spontaneous report from a contactable other healthcare professional (patient). A 21-year-old female patient (not pregnant) received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), intramuscular (Left arm) on 22Dec2020 09:30 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient was not diagnosed with COVID-19 prior to vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. There were no other medications received within 2 weeks of vaccination. The patient experienced chills, joint pain, and muscle pain on 22Dec2020 (19:00). There was no treatment received for the adverse event. The patient has not been tested for COVID-19 since the vaccination. The outcome of events was recovering. This case is non-serious.

Fever; chills; body aches; headaches; malaise; chest pain in side-lying; cough; diminished appetite; This is a spontaneous report from a contactable healthcare professional. A 30-year-old male (also reported as female) patient received the first dose of BNT162B2 (Pfizer-BIONTECH Covid-19 Vaccine; Lot number: EH9899), intramuscular in the left arm on 17Dec2020 at 15:45 at a single dose for immunization. The patient had no relevant medical history. The patient din not have Covid prior to the vaccination and had no known allergies to medications, food, or other products. The patient's concomitant medications were not reported. It was reported that the patient had no other medications in two weeks and did not receive any other vaccines within four weeks prior to the COVID-19 vaccine. The patient experienced fever, chills, body aches, headaches, malaise, chest pain in side-lying, cough, and diminished appetite starting at 11pm (23:00) on 17Dec2020 and gradually decreasing mild symptoms still present on 22Dec2020. The patient received no treatment for the adverse events and was not tested for COVID-19 after the vaccination. The facility where the most recent COVID-19 vaccine was administered was at the hospital. The outcome of the events was recovering. The case was reported as non-serious (did not

result in death, was not life-threatening, did not cause or require prolonged hospitalization, was not disabling/incapacitating, and did not result to any congenital anomaly/birth defect).

Left arm pain; generalized malaise; i was wiped out and wanted to sleep all day; This is a spontaneous report from a contactable Nurse. A 52-years-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number: EJ1685), via an unspecified route of administration on 22Dec2020 07:15 at a single dose (dose number 1, left arm) for COVID-19 immunization. Medical history included HIV+ and COVID-19 from an unspecified date. Concomitant medication included bupropion hydrochloride (WELLBUTRIN), trazodone, oxazepam (SERAX), valaciclovir hydrochloride (VALTREX), and ibuprofen from an unspecified date for an unspecified indication. The patient has allergies to Tegretol and AZT. The patient was diagnosed with COVID-19 prior to vaccination. The patient had no other vaccine in four weeks. The patient experienced left arm pain, generalized malaise (he was wiped out and wanted to sleep all day) on 22Dec2020 09:00. Treatment was not given. Event outcome was recovering. Since the vaccination, the patient has not been tested for COVID-19. The events were assessed as non-serious.

"vertigo; left facial tingling; lip tingling/tingling in the left corner of the mouth; he feels hazy/Haziness; facial numbness; heaviness and tingling in the left corner of the mouth; This is a spontaneous report from a contactable physician (patient). A 32-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EL0140), via an unspecified route of administration on 18Dec2020 08:15 am at single dose for covid-19 immunization. Vaccine location was left deltoid and it was the first dose. The facility type vaccine was hospital. Medical history included raynaud from an unknown date. The patient clarified that Raynaud's is not officially diagnosed. When he was in medical school and would take Methylphenidate to study his fingers would get pale and in cold weather he gets it in his hands. No known allergies. Patient didn't do relevant test. There were no concomitant medications. The patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. Physician stated that received COVID-19 Vaccine on Friday. A couple of hours later he had left facial tingling and lip tingling that lasted about an hour. The left facial tingling and the lip tingling started between 9AM and 10AM. It felt like facial numbness and heaviness and tingling in the left corner of the mouth. It was less tingling and more of a heaviness. Vertigo started on the second night (19Dec2020). Whenever he sit back in a chair quickly he has vertigo as well as when he laid back in the bed at night. He took no medications. Throughout the day he felt hazy. Haziness that is consistent. The best way to described it is if you drank a lot of alcohol and were well hydrated. The next morning you feel fine, but there is something there and feels off, but you can't put a finger on it. There was no adverse event require a visit to emergency room or physician office. The action taken in response to the events for BNT162B2 was not applicable. The outcome of events ""left facial tingling"" and ""lip tingling"" was recovered on 18Dec2020 and were reported as non-serious. The outcome of event Vertigo was not recovered, it was reported as serious-Medically significant. The outcome of other events was unknown. The drug result of events ""Vertigo"", ""left facial tingling"" and ""lip tingling"" was Related.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of event Vertigo cannot be totally excluded. The case will be reassessed if additional information becomes

available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

cold tingling sensation in right hand; sore right arm; This is a spontaneous report from a contactable consumer. A 56-years-old female patient receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number: EK5730), via an unspecified route of administration on 18Dec2020 at a SINGLE DOSE (injection to right arm one time) for COVID-19 immunization. Medical history included Pencillin allergy, diagnosed with a sulfur allergy in her 20s and developed a rash (ongoing). There were no concomitant medications. The patient experienced cold tingling sensation in right hand in hand in same that had the injection, and sore right arm, few minutes after the injection on 18Dec2020. Treatment for sore right arm included, 24 hours after took ALEVE and did gentle stretching exercises. Event outcome was recovered completely on 18Dec2020. Event outcome was recovered on 18Dec2020.

Head cold; cannot smell or taste anything; cannot smell or taste anything; This is a spontaneous report from a contactable nurse (patient herself, ICU nurse). A female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, lot number and expiry date not reported), via an unspecified route of administration on 18Dec2020 at a single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. After receiving the vaccine on 18Dec2020, she had a head cold, she cannot smell or taste anything. Clinical outcome of the events was unknown. Information about Lot/Batch number has been requested.

hoarseness; throat tightness; flushing; This is a spontaneous report from a contactable consumer. An adult female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, lot number and expiry date not reported), via an unspecified route of administration on 23Dec2020 at a single dose for COVID-19 immunisation. Medical history was none. Concomitant medications were not reported. On 23Dec2020, the patient experienced hoarseness, throat tightness and flushing. Therapeutic measures were taken as a result of the events that included epinephrine, steroid, and Benadryl. Clinical outcome of hoarseness was recovering, while for the other events was unknown. Information on the lot/batch number has been requested.

experiencing tingling sensation in my throat and some tightness; experiencing tingling sensation in my throat and some tightness; This is a spontaneous report from a non-contactable pharmacist. A 41-year-old female patient started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number: EK5730), via an unspecified route of administration on 22Dec2020 15:30 at SINGLE DOSE (right arm, dose number 1) for COVID-19 immunization. The patient has no medical history. The patient's concomitant medications were not reported. Patient has no known allergies. The patient experienced experiencing tingling sensation in her throat and some tightness on 22Dec2020 15:30, 1 to 2 minutes after vaccine administration. After 10 min symptoms started going away and completely disappeared in 30 minutes. Patient did not had other vaccine in four weeks nor other medications in two weeks. Patient has no prior COVID vaccination and was not tested for COVID post vaccination. Patient is not pregnant.

Treatment was not received. Outcome of the event was recovered on 22Dec2020 16:00. Events were reported as non-serious. No follow-up attempts are possible. No further information is expected.

Fatigue; This is a spontaneous report from a contactable nurse (patient). A 50-year-old male patient received first BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), intramuscular (left arm) from 21Dec2020 (09:45 AM) to 21Dec2020 at single dose for COVID-19 immunization. The patient's medical history included hypertension, hyperlipidemia, and Type 2 diabetic. No known allergies. Concomitant medications included amlodipine besilate, olmesartan medoxomil (AZOR), atorvastatin calcium (LIPITOR), metformin, insulin glargine, lixisenatide (SOLIQUA), and empagliflozin (JARDIANCE). The patient was not diagnosed with COVID-19 prior to vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced fatigue on 22Dec2020 12:00 with outcome of recovering. There was no treatment received for the adverse event. The patient has not been tested for COVID-19 since the vaccination. This case is non-serious.

I have some aches which feels like the same I had; This is a spontaneous report from a contactable Other HCP (patient). This 52-year-old female patient reported that she received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via intramuscular at left arm on 23Dec2020 at 12:45 AM at single dose for COVID-19 immunization. Medical history included patient diagnosed with COVID-19 in Oct2020. No allergies to medications, food, or other products. Concomitant medication was none. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient received no other medications within 2 weeks of vaccination. Since the vaccination, the patient had not been tested for COVID-19. After vaccination, patient had some aches on 24Dec2020 07:00 AM, which felt like the same she had since she did have Covid the first part of Oct2020. It was reported as non-serious. No treatment was received. Outcome of event was unknown. Information about Lot/Batch number has been requested.

severe body aches; chills; fatigue; cervical and left axillary lymphadenopathy; left axillary lymphadenopathy; muscle weakness; This is a spontaneous report from a contactable physician reported for herself. A 48-year-old female patient received first dose of BNT162B2 (Pfizer product), intramuscular on 21Dec2020 10:15 at single dose on left arm for COVID-19 immunization. Medical history included High cholesterol, insomnia, ongoing penicillin allergy, covid-19 from 13Nov2020 to an unknown date and pneumonia from an unknown date (the patient was tested positive for covid on 13Nov2020 and was hospitalized on 23Nov2020 with pneumonia). Concomitant medication included atorvastatin calcium (LIPITOR), zolpidem tartrate (AMBIEN), escitalopram oxalate (LEXAPRO), colecalciferol (VITAMIN D), fish oil (FISH OIL OMEGA 3) , zinc (ZINC), ascorbic acid, dexpanthenol, ergocalciferol, nicotinamide, pyridoxine hydrochloride, retinol, riboflavin, thiamine hydrochloride, tocopheryl acetate (MVI) and bifidobacterium lactis (PROBIOTIC). The patient previously took niacin and experienced drug allergy. The patient received injection at 1015 am at 0300 am on the following day (22Dec2020) she experienced chills, severe body aches, fatigue, cervical and left axillary lymphadenopathy and muscle weakness, woke up the next day and was asymptomatic except the left axillary lymphadenopathy which is still present today on 24Dec2020. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No covid tested post vaccination. No treatment was received for the events. The outcome of the event left axillary lymphadenopathy was not

resolved while of other events was resolving. The reporter assessed the events as non-serious. Information about lot/batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of event severe body aches cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

back pains; back spasms; This is a spontaneous report from a contactable physician. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration on 21Dec2020 as a single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. It was not reported if the patient was pregnant nor if any other vaccines were received 4 weeks prior to the vaccination. The patient reported that she had the COVID-19 vaccine last Monday (22Dec2020) and was told to stop taking NSAIDS. Now, she is experiencing back pains, so she wants to know when she could restart taking NSAIDs. She doesn't think her back spasms are from the COVID-19 vaccine. The clinical outcome of the back pains and back spasms was not reported. It was also not reported if the patient had been tested for COVID-19. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.

Tingling sensation in my fifth digit that radiates up to my arm; This is a spontaneous report from a contactable physician, the patient. This 28-year-old female patient received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine) (lot number: EK5730), intramuscularly in the left arm on 23Dec2020 at 12:00 (at the age of 28-years-old) as a single dose for COVID-19 vaccination. It was unknown whether the patient received any other vaccine within 4 weeks prior to the vaccine. Medical history included asthma from an unknown date and unknown if ongoing. The patient was not pregnant at the time of vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient did not have any allergies to medications, food, or other products. The patient did not receive any other vaccines within four weeks prior to the vaccination. Concomitant medication included escitalopram oxalate (LEXAPRO). On 24Dec2020 at 06:00, the patient experienced tingling sensation in her fifth digit that radiates up to her arm. No therapeutic measures were taken as a result of the events. The clinical outcome of the tingling sensation was not resolved. It was also reported that since the vaccination, the patient had not been tested for COVID-19.

"Small itchy blister/zit like bumps. Started on back of legs and back. Now some sporadically showing up on arms, belly, shin.; Small itchy blister/zit like bumps; This is a spontaneous report from a contactable Other Health Care Professional (HCP). A 48-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Batch/lot number: EJ1685), intramuscularly at an unspecified dose in the left arm on 18Dec2020 at 04:00 (at the age of 48-years-old) for COVID-19 immunization. Medical history included allergy to sulfa drugs from an unknown date and unknown if ongoing. The patient did not have any allergies to medications, food or other products. Prior to the vaccination, the patient was not diagnosed with COVID-19.The patient was not pregnant at the time of

vaccination.The patient was administered the vaccine in the hospital. Concomitant medication included cetirizine hydrochloride cetirizine hydrochloride (ZYRTEC). The patient did not receive any other vaccines within four weeks prior to vaccination. On 21Dec2020 at 20:15,the patient experienced small itchy blister/zit like bumps which started on back of her legs and on her back. Some are sporadically showing ""now"" up on arms, belly and shin.The patient did not receive any treatment for the events.The clinical outcomes of small itchy blister/zit like bumps was not recovered. It was also reported that since the vaccination the patient had not been tested for COVID-19."

woke up with Chills, body/ joint pain, chest pain with mild difficulty to breath; woke up with Chills, body/ joint pain, chest pain with mild difficulty to breath; woke up with Chills, body/ joint pain, chest pain with mild difficulty to breath; woke up with Chills, body/ joint pain, chest pain with mild difficulty to breath; take smaller breaths because Rib cage hurts every time she took a deep breath; An hour after the vaccine developed a headache; woke up with Chills, body/ joint pain, chest pain with mild difficulty to breath/mild body aches; back also had moderate pain.; This is a spontaneous report from a contactable other healthcare professional (HCP) reporting for herself (patient). A 45-years-old female patient started to the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), lot number unknown, intramuscularly on 22DEC2020 13:45 (at the age of 45-years-old) as a single dose in the left arm for COVID-19 immunization. Medical history included drug allergy to vancomycin. Concomitant medication included nebivolol hydrochloride (BYSTOLIC), duloxetine hydrochloride (CYMBALTA), hydrochlorothiazide, levothyroxine. The patient previously took vancomycin and experienced drug allergy. The most recent COVID-19 vaccine was administered in the hospital. The patient was not pregnant at the time of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. An hour after the vaccine the patient developed a headache and mild body aches on 22Dec2020 14:45. Two days after (24Dec2020) she woke up with chills, body/ joint pain, chest pain with mild difficulty to breath. She had to take smaller breaths because her rib cage hurts every time she took a deep breath. Her back also had moderate pain on unspecified date in Dec2020. The events an hour after the vaccine developed a headache, woke up with chills, body/ joint pain, chest pain with mild difficulty to breath/mild body aches, take smaller breaths because rib cage hurts every time she took a deep breath and back also had moderate pain did not result in death, were was not life-threatening, did not cause/prolonged hospitalization, was not disabling/incapacitating and did not cause congenital anomaly/birth defect. No treatment was received for the events an hour after the vaccine developed a headache, woke up with chills, body/ joint pain, chest pain with mild difficulty to breath/mild body aches, take smaller breaths because Rib cage hurts every time she took a deep breath and back also had moderate pain. Outcome of the events an hour after the vaccine developed a headache, woke up with chills, body/ joint pain, chest pain with mild difficulty to breath/mild body aches, take smaller breaths because Rib cage hurts every time she took a deep breath and back also had moderate pain were unknown. After the vaccination, the patient has not been tested for COVID-19. Information on the lot/batch number has been requested.

developed a tingling sensation 45 minutes post vaccination. Came on gradually and increased in sensitivity; Lips also had a tingling sensation similar to a sunburn feeling on lips/But lips Continue to have a weird sensation to lips; This is a spontaneous report from a contactable nurse (patient). A 49-

years-old female patient started to the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), lot number EK5730, intramuscularly on 23Dec2020 16:00 (at the age of 49-years-old) as a single dose in the left arm for COVID-19 immunization. Medical history included hyperactive thyroid for which was treated with radioactive iodine thus makes her hypothyroid. Concomitant medication included levothyroxine sodium (SYNTHROID). The patient previously took hydrocodone/acetaminophen (VICODIN) and experienced drug allergy. The patient did not have allergies to food.The most recent COVID-19 vaccine was administered in the hospital. The patient was not pregnant at the time of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. On 23Dec2020 16:45 the patient developed a tingling sensation (45 minutes post vaccination). It came on gradually and increased in sensitivity. Her lips also had a tingling sensation similar to a sunburn feeling on lips. Tingling sensation gradually subsided to body lasted 4 hours. Tingling sensation to lips also gradually decreased 6 hours later but lips continue to have a weird sensation to lips. The events developed a tingling sensation 45 minutes post vaccination. Came on gradually and increased in sensitivity, Lips also had a tingling sensation similar to a sunburn feeling on lips/but lips continue to have a weird sensation to lips did not result in death, was not life-threatening, did not cause/prolonged hospitalization, was not disabling/incapacitating and did not cause congenital anomaly/birth defect. No treatment was received for the events tingling sensation 45 minutes post vaccination. Came on gradually and increased in sensitivity, lips also had a tingling sensation similar to a sunburn feeling on lips/but lips continue to have a weird sensation to lips. Outcome of the event developed a tingling sensation 45 minutes post vaccination. Came on gradually and increased in sensitivity was recovered on 23Dec2020 20:45. Outcome of the event lips also had a tingling sensation similar to a sunburn feeling on lips/but lips continue to have a weird sensation to lips was not recovered. Since the vaccination, the patient has not been tested for COVID-19.

left arm pain at injection site throbbing pain; This is a spontaneous report from a contactable other HCP (healthcare professional) who reported for a patient. A 53-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot #: EJ1685) intramuscularly on 23Dec2020 at 15:45 (at the age of 53-years-old) as a single dose in the left arm for COVID-19 vaccination. Medical history included known allergies to shrimp from an unspecified date and unspecified if ongoing. The patient was not pregnant at the time of vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications were not reported; however, there were no other medications the patient received within 2 weeks of the vaccination. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 23Dec2020 at 20:00, the patient experienced left arm pain at injection site throbbing pain. It was reported that the event was non-serious and did not require hospitalization. The patient did not receive any treatment for the event. The clinical outcome of the event left arm pain at injection site throbbing pain was recovering/resolving. It was also reported that since the vaccination, the patient had not been tested for COVID-19.

Minor rash on chest; This is a spontaneous report from a contactable health professional, the patient. A 20-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration in the left arm on 22Dec2020 at 02:00 or 14:00 as

reported, pending clarification (at the age of 20-years-old) as a single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient was not pregnant at the time of vaccination. The patient did not have any allergies to medications, food, or other products. Prior to the vaccination, the patient was not diagnosed with COVID-19. On 24Dec2020 at 08:00 the patient experienced a minor rash on chest. The patient did not receive treatment for the event. Since the vaccination, the patient had not been tested for COVID-19. The clinical outcome of the minor rash on chest was resolving. Information about lot/batch number has been requested.

numbness of the lower left face, cheek and area around the mouth (peri-oral and mandibular numbness); numbness of the lower left face, cheek and area around the mouth (peri-oral and mandibular numbness); This is a spontaneous report from a contactable physician reporting for a patient. Very sore arm for about one day.; Dizzy for one hour, five hours after the vaccine; Chills and body aches for about one hour 10 hours after vaccine with one hour of fatigue also; Chills and body aches for about one hour 10 hours after vaccine with one hour of fatigue also; Chills and body aches for about one hour 10 hours after vaccine with one hour of fatigue also; This is a spontaneous report from a contactable healthcare professional. A non-pregnant 48-year-old female received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration in the left arm on 21Dec2020 09:15 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. There were no other vaccines within four weeks of the suspect product. The patient previously took mefloquine hydrochloride (LARIAM) and experienced allergies. On 21Dec2020 14:15, the patient experienced very sore arm for about one day, dizzy for one hour, five hours after the vaccine. On 21Dec2020, the patient experienced chills and body aches for about one hour 10 hours after vaccine with one hour of fatigue also. There was no treatment received

for the events. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient has not been tested for COVID-19. The outcome of the very sore arm for about one day was recovered in Dec2020 and of dizzy for one hour, five hours after the vaccine and chills and body aches for about one hour 10 hours after vaccine with one hour of fatigue also was recovered on 21Dec2020. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.

can't raise her arm up; pain at the site of the injection; During the night she couldn't sleep; This is a spontaneous report from a contactable nurse (patient herself) via the Pfizer Sponsored Program. A 69-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), lot number: EK9231, via an unspecified route of administration on left arm from 23Dec2020 10:10 to 23Dec2020 10:10 as single dose for COVID-19 immunization. The patient medical history was not reported. There were no concomitant medications. The patient previously took tetanus toxoid and got red and was itching (clarified she had a reaction to a tetanus shot several years ago). Reports she received the first dose of COVID 19 vaccine at the hospital where she works on 23Dec2020 at 10:10AM in left upper arm. She started having pain at the site of the injection in the afternoon at around 3PM or 4PM 23Dec2020. During the night she couldn't sleep because of the pain no matter where she turned. The patient states the pain was probably 8 out of 10 on the pain scale. Adds she had no redness or swelling. The pain today (24Dec2020) is still the same and now she can't raise her arm up. No treatment has been applied. No cold or heat applied. The outcome of the event pain at the site of the injection was not recovered; while the other events was unknown. Information about lot/batch number and expiration date requested.

headache; Had soreness in arm; This is a spontaneous report from a non-contactable consumer. A female patient in her 60s received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), lot/batch number and expiration date not reported, via an unspecified route of administration from 23Dec2020 to 23Dec2020 as single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced had soreness in arm and a headache on 24Dec2020. The outcome of the events was unknown. Information about lot/batch number has been requested.

Fever; Chills; Myalgia; Headache; Feeling weak; anorexia; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot number: EH9899), via an unspecified route of administration on 22Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced fever, myalgia, feeling weak, anorexia and headache in Dec2020. The patient reported that the symptoms lasted over 48 hours. The outcome of the events was unknown.

"Vertigo; Headache; High temperature; Woke up in the morning with vivid nausea and vomiting and threw up constantly; Woke up in the morning with vivid nausea and vomiting and threw up constantly; Body aches; This is a spontaneous report from a contactable consumer (patient). A 70-year-old female patient (weight: 81.65 Kg, height: 173 cm) received BNT162B2 (Pfizer-Biontech covid-19 vaccine, Lot. EL0140) on 21Dec2020, at single dose, for COVID-19 immunisation. Relevant medical history included

pulmonary arterial hypertension. Concomitant medications included furosemide (LASIX) 20 mg, daily and potassium 20 meq, daily. The patient experienced the following reactions: body aches on 22Dec2020; nausea and vomiting on 23Dec2020 at 02:00 described as ""she woke up in the morning with vivid nausea and vomiting and threw up constantly all on the 23rd and most of the day 24th""; headache and high temperature on 24Dec2020 and vertigo on 25Dec2020. The patient recovered from nausea and vomiting on an unspecified date, in Dec2020, while clinical outcome of the other events was unknown."

Resident extremely confused. BP 125/66; Pulse 124, Temp 99.7; 02 at 92% (around 10:00a.m.) BP 138/84; Pulse 125, Temp 99.5, O2 at 95% (around 1:00p.m.)

Increased heart rate majority of day, low bld sugar, nausea and headache late evening of vaccine. Hives appeared Rt arm - elbow, neck to eye. Took Benadryl 50mg at 7:30 pm another dose at 10pm. Awoke 12-29-20 all hives gone but feels hot, fluctuating heart rate, stiff neck, short of breath. Called MD, will monitor symptoms next 24 hours.

In middle of night had strong headache, then day following vaccination was headache-y (mild), light-headed, tired and with body aches. Two days after had mild body aches and mild light headed-ness; day 3 I was clear.

"Patient contacted our pharmacy and noted that ""the day after his Moderna dose, he experienced fever and chills of 100.3 Deg. Pain at the site of injection, and Vomitting."""

Pt experienced Weakness, dizziness, vomiting, headache soreness @ inj. site.

Pt developed a rash about an 30mins to an hour after receiving vaccine. Pt took Loratadine & Benadryl. Next day pt felt better. Soreness @ inj. site.

Patient left hospital and complained of dizziness outside. Patient brought back to vaccine Pod. Patient's blood pressure taken, patient given snack and water and felt better.

Patient felt tingling in left hand. Patient's blood pressure taken. Patient monitored by RN and seen by Resident. As per patient tingling went away

Patient complained of dizziness. Patient's blood pressure taken. Patient given water and snack and felt better.

Bell?s Palsey about 4.5 hours after injection.

10 minutes after receiving vaccine patient complained for being jittery and having an elevated heart rate. monitored BP, heart rate and 02 saturation; patient chose to leave with her friend and drive to Medical Center for evaluation

Starting around 1700 the day I was vaccinated, I started to experience body aches and a sore throat. As the night progressed, I had a fever of 102F. The fever lasted throughout the night until it broke the next

morning. It is currently 2125 the day after vaccination and I still am experiencing body aches and fatigue after sleeping for 18 hours. I have taken Tylenol to help relieve these symptoms.

1 hour after vaccine itching, redness, elevated small bumps in arms. 6.5 hours after the vaccine had flushing and tachycardia up to 130. Had to call FIRE RESCUE .,Took tachycardia meds

headache, nausea, light headed, swelling of the hands Patient was given 1000mg of acetaminophen and 25mg diphenhydramine. Patient was monitored for 60 minutes.

Fevers, chills, night sweats, fatigue, malaise, body aches

Approximately 5 minutes after the injection, I suddenly began experiencing tachycardia (felt like I had way too much coffee). The nurse took my pulse and summoned the attending physician who sat with me for more than 30 minutes. I felt good enough to leave but did experience a somewhat rapid heart rate on and off through the afternoon. Upon leaving, I was told to call my allergist to have my Epi-Pen refilled (my current Epi-Pen had expired), which I did. Eleven hours post injection I'm feeling fine except for the expected arm soreness. In terms of my allergic history, I had previously discontinued allergy shots last year due to repeated systemic reactions to very low dose vials (itchy roof of mouth, swollen throat, etc).

I received my vaccine on 12/18/2020. The side effects I experienced were initially as expected. Mild headache, muscle pain at the injection site. However, the muscle issues have not subsided, and have actually gotten worse. Day 3 I began having a burning sensation in my underarm area radiating back towards my triceps. Muscle spasms continued to increase and spread to include deltoid, trapezius, and SCM muscles. Yesterday I developed a fever and began having a burning sensation down my triceps muscles and radiating into my forearm (radial side). No visible rash noted. Slight weakness in left arm.

On the second day I had a sore arm and I woke up with a headache that lasted 2 hours.

Muscle aches, headaches, chills, vomiting, shakes

Developed metallic taste in mouth within 5 minutes of vaccine administration that persisted for 1 to 2 hours. Developed palpitations and flushing within 10 minutes of vaccine administration that resolved after 1 minute. Palpitations and flushing recurred along with development of burning sensation in distal extremities within 15 to 20 minutes of vaccine administration. Palpitations were forceful and pronounced enough to cause chest tightness, lightheadedness, and weakness. These symptoms resolved without intervention after less than 5 minutes.

Maculopapular Rash beginning not long after vaccine, began with hives and itching on hands, did not speculate vaccine relation until following day, hives appeared on hands and continued non-uniform across forearms, armpits, chest, abdomen, pelvic/thigh crease, buttocks, and behind knees, approx 50-60% of body experienced hives and maculopapular rash within 0-4 days after vaccine, minor swelling occurred where rash was present and was most prevalent 3 days post injection.

Short-term memory loss consistent with Transient Global Amnesia

Had shot at 7:45am and around 3:45pm started having severe itching in mouth , ears and skin. Took oral zyrtec without relief. Was scratching myself raw and bleeding. Went to ER and got solumedrol 125 and 25mg IV Benadryl. Next day had wheezing and rash on chest. Went on prednisone oral taper and albuterol.

One week after vaccine administration I developed lymphadenopathy on the left side - very painful and has lasted 4 days and is ongoing. Antibiotics were started on day 4.

Swollen Lips, throat, foot, sore throat, body aches, chills, head aches, Feeling that can not keep eyes open, pain on administration site, on/off body itching.

Fever within 16 hours of vaccine lasting for 48 hours, general muscle aches lasting under 48 hours, fatigue, non-productive cough persisting more than 3 days

severe chills, hot sweats, muscle and joint pain, headache, fever, vertigo

pt received dose 1 of pfizer/biontech covid-19 vaccine on 12/29/20 at approx 14:04. after 10 minutes of observation pt developed a left upper trunk rash. patient's HR was elevated and BP elevated. pt was nervous. Benadryl 25 mg PO and Pepcid 20 mg PO was given and patient had no other reactions. after 30 additional minutes of observation, pt was able to go home as spouse was driving her home

10:30 AM After receiving the COVID-19 vaccine, the patient experienced an anaphylaxis reaction that included, throat closing and tongue swelling sensation, itchiness, and hives on her bilateral arms and legs. Patient received 65 mg of Benadryl IV, 125 mg SoluMedrol IV, two doses of 0.3 epinephrine IM, 1 mg of Ativan, and 4 mg of Zofran, then taken to the ED for further monitoring. Patient was on 2L NC for comfort, sats in mid 90s off oxygen, and monitored the patient for a few hours. Patient discharged to home with stable vital signs off oxygen and a steady gait.

Unusually high level of fatigue / exhaustion. Feeling ?fluish? Headache Feeling feverish but no actual fever. Has lasted So far from 12/24 to 12/29. Six days. A bit better day 6.

Extreme gas and diarrhea.

Arm started hurting a few hours after injection. A headache and nausea a few hours after that.

Pt. developed tachycardia, hypertension and felt weak with decreased verbal responsiveness, alert but lethargic. She complained of dry throat, took a sip of water then began persistent coughing and wretching also C/O itching of her throat. She denied difficulty breathing, there were no cutaneous signs of edema, tongue enlargement, etc.

Pt. began to feel weak with palpitations about 8-10 minutes after vaccination, her pulse was extremely fast, she then began to complain of lower mid-esophageal burning

LEFT AXILLARY LYMPH NODES TO LEFT ARM SWOLLEN AND PAINFUL. WARM COMPRESS APPLIED. CONTINUE TO MONITOR

Pfizer-BioNTech COVID-19 Vaccine EUA Itching and hives on upper arms, upper legs, and sides of torso x48 hrs thus far, controlled with oral otc Benadryl and pep I'd.

Muscle pain in left deltoid, vomited at 1:22am. No treatment taken

Syncope, severe bradycardia followed by 20+ hours of chills, fatigue, weakness, body aches

Began developing flu-like symptoms about twelve hours after receiving first dose. I started having body aches, chills, fever, and fatigue. Ibuprofen has helped manage symptoms.

About 15 hours after I received the vaccine I started getting body aches and chills. Low grade fever. After 24 hours I was shivering, aches and temp of 102.4. Symptoms lasted a total of 48 hours from first onset of body aches.

On Dec 28th I received the shot & initially didn't feel anything. When I woke up on the morning of Dec 29th I had a really bad headache, felt burning up & cold at the same time. My right arm (shot arm) and my left hip were super soar. I couldn't keep liquids down. I passed out the first time between 6:55 A.M. & 7:05 A.M. Later that morning I passed out a second time for 2 mins. I still plan to get the second dose on Jan 25th 2021. Since I'm a contact tracer I texted my supervisor. I was advised to take the day off & report it just in case it was related to the vaccine.

Started with sudden headache which gradually worsened. Dizziness/light headed followed by progressive foggy thought process, severe arm soreness, and general aches all worsening through the night.

I received the vaccination on Saturday morning. The following day around 10:00a.m., I started feeling weak with a headache and severe left arm pain around the injection site. Around 2:00p.m., I started getting chills and spiked a temperature of 100.6. I was taking ibuprofen and Tylenol interchangeably. The fever and chills resolved that night but still with a headache and weakness. Only the headache remained the following day but the rest of the symptoms subsided.

30 seconds following IM injection, felt warm, flushed, lightheaded, vision dimming., near syncope. Symptoms improved lying supine. Blood pressure measured to be 90's systolic, Heart Rate 60's. NO RASH, NO ANGIOEDEMA, NO Shortness of breath. Symptoms resolved completely within in 3 minutes.

Rig he arm sever pain at elbow. Swelled and painful right axilla lump nodes

mild arm soreness low grade headache

Large lymph node about size of lime in left armpit

lost of taste and smell

Swollen lymph nodes in armpit and side of chest, extreme pain in swollen area Pain at injection site, but not nearly as severe as armpit pain

Large red, swollen area at site of injection Nausea, diarrhea, stomach cramping

"""Increased skeletal pain, Shinbone, back, muscle tightening swelling in back, sharp pains throughout knees and shinbones. These are ongoing medical issues but over the pat week they increased to the point where I stayed in bed with warm compresses and analgesic topic creams from Christmas through Monday the 28th. Currently working and taking 3 advils every six hours to deal with back pain."""

2 days after vaccine had significant back pain. Lower back with excruciating pain. Chest muscles became stiff Was difficult to walk or sit. Then the next day was having breakfast and had an allergic reaction to food that I have eaten regularly. I had an allergic reaction for the first time in September to a different food but it was same reaction. Significant periorbital edema to where my eyes were almost completely swollen shut. No breathing issues.

lethargy chills/sweats pain at injection site for multiple days nausea headache

Moderate myalgia of arms, shoulders, neck and upper back; milder myalgia of lower back and thighs. Treatment is rest, acetaminophen and massage. Outcome to be determined; symptoms still present at 48 hours.

Patient c/o of tingling in the legs about 15 mins after receiving the vaccine. Patient also c/o of warmst in the chest area

My arm was very sore all night and when I woke up I had two raised, red patches on my right arm. One patch was at the injection site, one was slightly below the injection site. The injection site is also still very sore and hard.

Developed a lump in my throat soon after receiving the injection. Feel like I have to keep swallowing and clearing my throat. Some fullness in my ears that resemble having water in your ears when swimming. Some chest tightness, but mild. No shortness of breath. No rashes. Reported this to the nursing staff at the Covid Pod site around 12:15pm. Ate lunch, drank water, and took Benadryl at 1230. Developed chills and fever of 100.1 at 2:30pm.

Fever to 101.5F reported evening of vaccination. No other symptoms reported yet.

Red, raised rash noted to right arm, hands bilaterally, and neck area. Swelling noted to bilateral hands 6 days post injection. Patient given Decadron for symptom relief per PCP.

Patient reported headache immediately after injection. Within 5 minutes, reported headache radiating down neck and arms to elbows with tingling down arms lasting about 10 seconds. 30 minutes after injection, patient declined further care while complaining of persistent sharp frontal headache radiating down neck. Patient was very anxious prior to receiving vaccine.

103.5 fever Vomiting Chills Muscle spasms Headache Difficulty walking

I got the vaccine around 12:35 on 12/29/2020. Around 3 in the morning I started having sever body aches. Now its 12/30/2020 7:32 in the morning, I have sever body pain, Dont have fever but I feel very

warm, My hands are very warm it feels like I have a high fever, chills and very tired with no energy. It feels like I have flu.

Severe Chills, fatigue, blinding headache, pain at ejection site,

Arm pain, chills, headache, fatigue

hives, itching; seen in ED given po Benadryl,, Pepcid with relief discharged on po Benadryl, Rx Decadron if needed Improved and back to work in 2 hours; will follow up with health clinic.

Moderna COVID?19 Vaccine EUA Pain, swelling, warmth to injection site. Chills, body aches and headache onset the next morning.

Fatigue, low grade fever 99.3, chills, muscle and joint pain ,and nausea. At vaccine site bruise and right arm pain

On his drive home, his cheeks started to swell up, throat swelled, the roof of his mouth didn't feel right & he had difficulty swallowing. He went to the ED and his throat closed.

2hours after receiving injection developed a uticarial rash on upper body. Treated with zyrtec 10mg and 25mg of benadryl. Resolved after 30 minutes of receiving benadryl.

Symptoms started on Monday when the test site of my arm was extremely sore and I had a mild headache. Tuesday I started getting additional symptoms of respiratory symptoms with a runny nose and cough, chills, and headache.

Itching to face and legs. Rash to left leg. States she applied Hydrocortisone cream to areas. Side effects have improved.

Fever (100.1 F when first taken), chills, body aches, headache, soreness at injection site. Fever and chill started during the night, woke up about 1am with sweats, chills, and headache. Took 400 mg ibuprofen and headache went away. Low grade fever and chills still persist.

8 hours post injection developed mild injection site/arm pain and soreness 13 hours post injection developed fever, tax 102.7F, chills/rigors, severe body aches

Confused, dizzy, heavy tongue feeling, pale skin, weakness.

Pt developed anaphylaxis, was given IM Benadryl, and was sent to the ED. Pt spent 1 night in the hospital, went home, and has come back and is in the ICU. Pt had hives, itching, chest tightness, swollen lips.

Shortness of breath Hives, Fever, chills joint pains. I was Tx in the ER with Pepcid IV Solumedrol IV, Benadryl IV ,Tylenol and IV fluids. I was discharged on prednisone , Benadryl and Tylenol.

12/29/2020 07:00AM Mild body aches, low grade fever 100.0; 12/29/2020 PM same day-- fever 102.6, severe body aches and fatigue and headache, Tylenol and ibuprofen-- some relief to fever. 12/30/2020 mild headache, left armpit swollen, tender knot -- all other symptoms have resolved.

Approximately 15 minutes after IM injection, patient developed chest tightness. Patient was taken to the Emergency Department for treatment. Was given sublingual nitroglycerin and subsequently admitted to the hospital for observation. Patient discharged home the following morning in good condition.

Several minutes after vaccine started feeling tightness in her throat and a rapid heart rate. Administered epinephrine pen and when to the emergency department. Received oral Benadryl and steroids. Was discharged home later.

My grandmother died a few hours after receiving the moderna covid vaccine booster 1. While I don?t expect that the events are related, the treating hospital did not acknowledge this and I wanted to be sure a report was made.

About 3 am after the injection I woke up with severe chest pains and headache and went to the ER. I was admitted for 2 days and was released with a prescription of Isosorb Monoer, Metroprol, aspirin which is used as a blood thinner. The diagnosis and prognosis was severe migranes and cardioartery disease.

Shortness of breath , Erythema within 30 minutes of vaccine per provider note

Left side of my face went numb. 5 minutes later tongue was dry and tingly. Went back to place of work and went to monitoring room. Went to ER to be checked out. Got better over that day. I was admitted the same day and discharged the next day.

anxiety, tachycardia, flushing, diaphoresis, HTN, SOB

Patient administered Pfizer-BioNtech vaccine, dose #1 in series at 810AM, without notable concerns for 10 minutes. At 10 minutes post vaccination, patient developed itching and some blotching, throat becoming scratchy. No known allergies to components listed in vaccine, though does have a listed allergy to contrast dye, does not carry an epi-pen. Patient was walked to urgent/emergency care in the clinic, where she was seen immediately. Patient was given diphenhydramine 25 mg IV, pantoprazole 40 mg IV, with mild uticaria continuing. Patient notes she feels her 'back is on fire'. Patient was then given methylprednisolone 125 mg IV. At this time, no SOB is noted, uticaria is still present. 0930 patient reports swelling in throat and respiratory difficulties at this time with visible edema in the neck. 0.3 mg Epinephrine given at 0935, epinephrine drip and racemic epinephrine neb given. 1006 Patient on epinephrine drip 2.5 mics/hour. Patient transferred to Medical Center ICU, where she remains at the time of this report.

BP of 176/126mmhg/persistent severe hypertension/continued severe elevation of BP of 178/130mmHg; intermittent chest pains; severe nausea; rash and hives on left side of arm where injection site was, as well as left side of face; rash and hives on left side of arm where injection site was,

as well as left side of face; rash and hives on left side of arm where injection site was, as well as left side of face; rash and hives on left side of arm where injection site was, as well as left side of face; mild progressive headache; body aches; chills; fatigue; fever of 100 degree F; This is a spontaneous report from a contactable Other Health Professional (patient). A 29-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) lot number: unknown, intramuscular in the left arm, first dose on 18Dec2020 12:30 at a single dose for immunisation. Medical history included ongoing gestational hypertension in 2016 that never recovered, with controlled hypertension, asthma/COPD, and seasonal/animal allergies. Concomitant medication included sertraline hydrochloride (ZOLOFT) and losartan. The patient is not pregnant. The patient previously took and had allergies to erythromycin and nitrous oxide. It was reported that within 20-30 minutes of receiving covid vaccine on 18Dec2020, the patient developed mild progressive headache, body aches, chills, fatigue, fever of 100 degree F. At approximately 8:00 p.m. same day of vaccination, she developed rash and hives on left side of arm where injection site was, as well as left side of her face. Immediately following this, she had intermittent chest pains in which she took a BENADRYL 25 mg with some relief. Next day (19Dec2020), progressive headache persisted to a severe headache, severe nausea, persistent chest pains and a BP of 176/126mmhg. Reported to a place for evaluation with persistent severe hypertension and severe headache treated by toradol, compazine, and Benadryl. She was released from the ER with improved blood pressures and reduced headache. The following day Sunday Dec2020, progressive and severe headache occurred with continued severe elevation of BP of 178/130mmHg. Current treatment of losartan 50 mg was increased to 100 mg to attempt control. She was then placed on chlorthalidone/amlodipine. The events resulted in doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. The outcome of the events mild progressive headache, body aches, chills, fatigue, fever of 100 degree F, rash and hives on left side of arm where injection site was, as well as left side of face, intermittent chest pains, severe nausea, and BP of 176/126mmhg/persistent severe hypertension/continued severe elevation of BP of 178/130mmHg was not recovered (reported as symptoms persist). The patient was not diagnosed with Covid 19 prior to vaccination and she had not been tested since vaccination. Information on the lot/batch number has been requested.; Sender's Comments: Based on the compatible time association, the hypertension aggravated is possibly related to bnt162b2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

blood pressure was super elevated, in the 190/110 range; It was getting close to stroke level; woke up and felt restlessness and agitation; Headache; felt really restless and anxious; felt really restless and anxious; was not able to sleep/ could not go back to sleep; This is a spontaneous report from a contactable consumer (patient). A 53-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) lot number: EK5730, expiration date: Mar2021 intramuscularly in left deltoid from 17Dec2020 at single dose for COVID-19 immunization. Patient medical history included seasonal allergy. Concomitant medication included mometasone furoate (FLONASE) via nasal from 2018 (about 2 years ago) and ongoing at 1 spray each nostril, 1x/day for seasonal allergy. The patient previously received flu

shot, on Oct2020 (2 months ago) for immunization. Patient was a firefighter and reported that he received the vaccination in the afternoon of 17Dec2020. On that afternoon, he was on duty and felt really restless and anxious and was not able to sleep. He did not sleep at all that night. He maybe got like an hour or 2 on Friday after his shift. Friday night he had the same kind of deal and it continued on into Saturday. He did crash and burn (pending clarification) on Saturday night. On Sunday, he got up and felt normal again. A few hours later on Sunday, it started up again and then it went away. He said that after dinner Sunday evening it started up again, but he was able to get some sleep. He said that Yesterday, 21Dec2020, he was fine. He took off yesterday. This morning on 22Dec2020 at 0200 he woke up and felt restlessness and agitation and he could not go back to sleep. He said that he had a headache and his blood pressure was super elevated, in the 190/110 range on 22Dec2020. It was getting close to stroke level. He said that he thought about going to the ER, but did not experience any stroke or cardiac symptom's, although his blood pressure is still high, but not as high as it was. He has not gotten any sleep since then. He said that he has an appointment to see his physician this afternoon at 1300 22Dec2020. It was reported that all events require physician office visit. Got his flu shot like 2 months ago and nothing like this happened. He said that he heard with the second round there are supposed to me more symptoms like flu like symptoms with the Covid vaccine like fever, muscle aches. Outcome of the events was reported as unknown.

"diagnosed with COVID-19; diagnosed with COVID-19; This is a spontaneous report from a contactable pharmacist. A female patient of an unspecified age (reported as 62 without unit) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiration date not provided), via an unspecified route of administration on 16Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Reporter requested information on the administration of the second dose of the COVID-19 vaccine to a patient. The patient received vaccine first dose 16Dec2020; she was diagnosed with COVID-19 on 18Dec2020; started taking the medication ""Bamlanivimab"" on 21Dec2020. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: There is not a reasonable possibility that reported ""diagnosis with COVID-19"" is related to BNT162B2 vaccine. Event developed 2 days after vaccination. The event is most likely intercurrent medical condition."

Patient had dizziness when she got down to the emergency department.; transient ischemia attack (TIA); Hypertensive emergency; This is a spontaneous report from a contactable pharmacist reporting for two patients. This is the second of two reports. A 53-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot number: EH9899), intramuscular at 0.3 mL, single in the arm on 23Dec2020 for Covid-19 immunisation. Medical history included hypertension, allergies to sulfa, morphine and cipro. There were no concomitant medications. The patient experienced hypertensive emergency on 23Dec2020 with outcome of unknown, patient was getting her blood pressure checked and the patient was in the 170s systolic on an unspecified date with outcome of unknown, patient had dizziness when she got down to the emergency department on an unspecified date with outcome of unknown. The events were described as follows: Patient was getting her blood pressure checked and the patient was in the 170s systolic. She was taken down to the emergency department. She had a blood pressure of 191/105 in the emergency department. Patient had dizziness when she got down to the

emergency department. She does not have further details to provide since the patient is being worked up right now to see if she experienced a transient ischemia attack (TIA). Patient has a history of hypertension. The vaccine was administered at Hospital Facility. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine.; Sender's Comments: While the patient is a known hypertensive and events may be intercurrent events, the causal relationship between BNT162B2 and the events hypertensive emergency, dizziness and transient ischaemic attack cannot be completely excluded due to temporal association. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2020510735 Same reporter/different patient/similar events

positive COVID-19 test with no symptoms; positive COVID-19 test with no symptoms; This is a spontaneous report from a contactable other HCP. A 93-year-old male patient received fist dose of BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 18Dec2020 at single dose by injection at arm for COVID-19 immunization. Medical history and concomitant medications reported as none. The patient was not been treated with immunomodulating or immunosuppressing medications or received any other vaccines around the time of COVID-19 vaccination. The patient, nursing home had turned positive after the getting the vaccine. The patient was tested negative for COVID 19 before getting the vaccine on 18Dec2020, then took his first dose of COVID vaccine. The patient had no reaction to the vaccine. The patient got on the plane on 19Dec2020 and tested positive on 22Dec2020. PCR test for COVID 19 was done on 22Dec2020 and received the results on 23Dec2020 and it was detected(PCR test was positive). Event reported as non-serious. The patient still had had no symptoms before the test and none after the test came back detected. He was pretty healthy. It was unknown if patient would receive the second dose but he was scheduled to receive it. Patient was not admitted to an Intensive Care Unit. Patient did not display clinical signs at rest indicative of severe systemic illness. Patient did not require supplemental oxygen (including high flow or ECMO) or receive mechanical ventilation. Patient had no any new or worsened symptoms/signs during the COVID-19 illness experienced (including date of onset/worsening). The patient did not receive any additional therapies for COVID-19. The event did not require the initiation of new medication or other treatment or procedure. Patient's outcome with COVID-19 reported as not currently ill. The outcome of the event was unknown. Information on the Batch/Lot number has been requested.; Sender's Comments: The patient received BNT162B2 on 18Dec2020 and took plane on 19Dec2020. The patient was tested positive for COVID-19 on 22Dec2020. The event occurred only 4 days after first vaccination and therefore the patient was not under full protection by vaccine.

"patient tested positive for COVID 19 the same day; patient tested positive for COVID 19 the same day; This is a spontaneous report from a non-contactable Nurse. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The relevant medical history and

concomitant medications were not reported. The COVID 19 vaccine was administered to the patient and the patient tested positive for COVID 19 the same day. Patient did not have a fever and reported feeling tired. The nurse wanted to know if the immune response would be affected by having COVID 19 at the time of vaccination and will the symptoms be exacerbated because of receiving the vaccine. The outcome of the events was unknown. No follow up attempts are possible. Information on Lot/Batch could not be requested. No further information is expected.; Sender's Comments: The patient tested positive for COVID-19 on the same day when receiving BNT162B2 vaccine. And therefore there is not a reasonable possibility that reported ""tested positive for COVID 19"" is related to vaccine."

tested positive for COVID; positive for COVID; positive for COVID/asymptomatic; This is a spontaneous report from a contactable nurse reporting for herself. A female patient of an unspecified age received the 1st dose of bnt162b2 (BNT162B2) at single dose on 18Dec2020 for Covid-19 immunisation. The patient medical history and concomitant medications were not reported. She was tested positive for COVID, through the rapid COVID test on 27Dec2020. She stated being asymptomatic and being scheduled for her 2nd dose on 08Jan2021. She asked can she still receive the 2nd dose of the vaccine or should she repeat the vaccination series. The outcome of event was unknown. Information on the Lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with suspected vaccine in this patient cannot be completely excluded. Further information like confirmative COVID 19 Nucleic acid/ PCR test are needed for full medical assessment.

10 minutes after receiving vaccination, a significant increase in HR was noted, along with a tingling sensation through out body. Also, scratchy throat was noted. Alert by patient made to staff at vaccination site. Sweating noted and shortness of breath at that time. Epi pen given via L thigh IM. PIV started and benadryl and solumedrol given. Relief of symptoms noted very shortly after Epi administration. Taken to ER for 4 hour observation. Sent home after 4 hours and given prednisone to be taken at home, 50mg daily for 4 days. No further adverse symptoms noted.

decreased range of motion in vaccinated arm: unable to raise left arm above shoulder x 72 hours now due to pain. no associated numbness or swelling. I am a surgeon and this impacts my work and driving. I would not have been able to operate during these last 3 days and while the pain is better 72hrs later, my arm is still out of commission. I think we need to inform healthcare providers who perform procedures that they may want to schedule the vaccine when no planned procedures for at least 72 hrs. Due to this issue I will be unable to proceed with the second dose, unless I can take it a week later than the scheduled January 24, 2021. It is taking too long to regain full function of the arm but i expect it will be back to normal as it is better today 72 hrs later.

Facial numbness radiating down left side of neck to left arm, elbow and chest. Went to ED, admitted for observation overnight.

Bell's palsy; experienced sudden flushing; tachycardia; the left side of my tongue became numb and tight. The numbness and tightness radiated to my left cheek, ear, jaw, and neck; the left side of my tongue became numb and tight. The numbness and tightness radiated to my left cheek, ear, jaw, and

neck; the left side of my tongue became numb and tight. The numbness and tightness radiated to my left cheek, ear, jaw, and neck; The numbness lasted for approximately 45 minutes with resulting jaw and ear pain for 3-4 days after injection; The numbness lasted for approximately 45 minutes with resulting jaw and ear pain for 3-4 days after injection; New lymph node tenderness at day 4.; This is a spontaneous report from a contactable other healthcare professional (patient). A 31-year-old female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), via an unspecified route of administration on left arm at 11:30 AM on 18Dec2020 at single dose for COVID-19 immunization. Medical history included seasonal allergy. Concomitant medication included fluticasone propionate (FLONASE), loratadine (CLARITIN) both for seasonal allergies. The patient had sudden generalized flushing, tachycardia, and the left side of her tongue became numb and tight. The numbness and tightness radiated to her left cheek, ear, jaw, and neck at 11:45 AM on 18Dec2020. She hadn't found any similar reports/reactions documented. Spoke briefly per document below regarding Bell's palsy. The numbness lasted for approximately 45 minutes with resulting jaw and ear pain for 3-4 days after injection. New lymph node tenderness at day 4 in Dec2020. No shortness of breath, dysphagia, or facial drooping associated. All events were reported as non-serious. The patient was not diagnosed with COVID-19 prior to vaccination. Since the vaccination, the patient had not been tested for COVID-19. The patient did not receive any treatment for events. The outcome of events was unknown. Explained that Pfizer would not be able to provide treatment recommendations and referred to her HCP to discuss the 2nd dose.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of event Bell's palsy cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

lips were tingly and swollen; lips were tingly and swollen; fatigued; allergic reaction; passed out; breathing fast; her brain felt like a rock, like she was there but not there; head was so heavy,wouldn't open her eyes; her throat started to tighten up; chest pain; nauseous; headache; felt a little lightheaded, a little wobbly; palpitations; sweaty; This is a spontaneous report from a contactable consumer (patient) via Pfizer Sponsored Program. A 48-year-old female patient (no pregnant at the time of vaccination) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899) via an unspecified route of administrationon 22Dec2020 on left shoulder at single dose for COVID-19 immunization. The patient's medical history included pernicious anemia and She had problems with B12 and Vitamin D like 10 years ago, she had none in her body, everyone said she was deficient and this year with her new primary care, they sent her to do some antibody tests, and found out she has pernicious anemia, allery to MRI and CT contrast. MRI and CT contrast NDC, lot, expiry unknown. Her CT contrast allergy happened when she was 9 and 12 years old. It turns out to be her dad has an allergy the same way, his airways close. Whenever she needs a CT, they do without contrast, if she does need, they prep and give her Benadryl and keep an eye on her. This only happened once, that she needed with contrast, and with prep she was ok. With the MRI, this happened 4 or more years ago, maybe like 5 years ago. She

needed an MRI, they said she would be fine, they injected contrast, she felt pretty hot, then she doesn't know, 20 minutes into it, she couldn't handle her gown, she looked at her chest, her whole chest was red like a burn. They gave her the IV Benadryl, she guesses, and it went away, now she knows, she doesn't know if her dad is allergic to MRI dye, but she knows she got the allergy from him for the CT contrast. The concomitant drugs was not reported. The patient was taken to ER with a severe allergic reaction. She had an allergic reaction on 22Dec2020: she passed out, said her brain felt like a rock, like she was there but not there, she then received an Epi Pen shot, when she got to the ER, her throat started to tighten up, lips were tingly and swollen, she was breathing fast, she had chest pain, she scaled it from a scale of 1-10, as about a 3 to 4 for chest pain, she felt nauseous, sweaty, and had a headache. She went to bed last night, and woke up, feeling better but a little fatigued on 23Dec2020. She is wondering if she should take the second dose, and wants to be in the clinical trial for this type of reaction. She needs transfer to Regulatory Authority. Caller confirmed details. Caller states she works in a hospital, and all this happened at the hospital, and her doctor was not involved. Outcome of allergic reaction: asks what does lasting effects mean? Right now she has a little fatigue and headache, but she knows they are regular symptoms she can have with the vaccine, are those lasting effects? She was discharged from the ER to home. She mentioned to the nurse she has, she went to get the shot, she told the registration nurse, she said she has a severe allergic reaction to CT contrast, her airway closes and she has a severe reaction to MRI contrast, her skin burns, it turns red and feels like a horrible burn, she cannot handle anything to contact her skin, it burns, and she mentioned that to the nurse, she said, instead of staying 15 minutes, said to stay 30 minutes there to observe just in case. She got the vaccine, and 10 minutes after the vaccine, she felt a little lightheaded, a little wobbly, but she didn't think much, it was mild, and on the mark at 30 minutes, the nurse asked her to stand, and that is when she started feeling, like her head was so heavy, the only way to describe, was like her brain was like a rock, she had to lay down, and when they laid her down, she wasn't there, she was there but wasn't, and they didn't wait at all to give her the Epi Pen, she had a feeling of heaviness that got worse, she wouldn't open her eyes, she was able to answer questions, but it was not her there, it was weird, then she didn't have. she breathed fast, had palpitations, chest pain, so they called a Rapid Response team, they were keeping an eye on her breathing, which was super fast, and they rushed her to the ED, and the doctor did what they were doing, giving her IV of whatever medication, and she was also very nauseous, then at one point in the ED, she started feeling, like imagine if fists were on throat, pushing her throat, a little bit, and she tried to tell to the ED doctor, but guessed she was calling everyone to give her things, and didn't catch it, but it didn't last long, at the same time, she started to feel her lips tingly, so she thinks that, because they gave the Epi Pen so quickly, they wasted no time, she didn't have the airways closing like she does when she gets the CT contrast, they were quick. NDC/lot/expiry: She reads from the card they gave her: states first dose COVID-19 EH9899, states it doesn't specify lot, but she can find that out, they just gave her a vaccine record card. EPi Pen: NDC, lot, expiry unknown, states everything happened so quickly, she didn't think to get this information before calling, but she can get it. There at the hospital, she went to see the occupational health doctor, and based on guidelines from the CDC, he read supposedly she cannot get the second dose, but the doctor said because it is so new, and she has to wait the 3 weeks she guesses, things can change, and she wanted to be proactive. The outcome of the events, allergic reaction, passed out, throat started to tighten up, lips were tingly and swollen, chest pain, nauseous,

headache, lightheaded, palpitations, sweaty was recovering. The outcome of other events was unknown.

COVID test positive two times; COVID test positive two times; Pain in bum, back; Pain in bum, back; Last night I was feeling so bad; Skin like a rash; This is a spontaneous report from a non-contactable consumer (patient). This patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot EK5730) on 21Dec2020 at 1:36 P.M., at single dose, for COVID-19 prevention. Medical history and concomitant medications were not reported. On an unspecified date in Dec2020 the patient experienced pain in bum, back, last night was feeling so bad, skin like a rash. On 22Dec2020 the patient did COVID test which was negative. She did another test on 23Dec2020 and it was negative. The patient did not feel any fever. But last night, on an unspecified date in Dec2020, when the patient went to the emergency for work, the lady did COVID test two times and the patient was positive. Events outcome was unknown. No follow-up attempts are possible. No further information is expected.

Tested positive for covid after the first dose of the vaccine; Tested positive for covid after the first dose of the vaccine; This is a spontaneous report from a contactable Pharmacist. A patient of unspecified age and gender received the 1st dose of bnt162b2 (BNT162B2) at single dose on 18Dec2020 at single dose for Covid-19 immunisation. The patient medical history and concomitant medications were not reported. The patient experienced Tested positive for covid after the 1st dose of the vaccine on an unspecified date. The outcome of unknown. Reporter wanted to know if the patient should receive the 2nd dose. Information on the lot/batch number has been requested.; Sender's Comments: The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Patient presented to the ER on 12/26/2020 with complaints of fever, chills and SOB for about 3 days. Stated it was a gradual onset and has been intermittent. Also reported some nausea and chronic loose stools, mild loss of smell and sinus drainage, non productive cough. Discharged to observation and then home on 12/27/2020. Patient readmitted to hospital on 12/30/2020.

Within 3 minutes of vaccination patient became fully flushed head and neck, with rapid heart rate (112), and feeling like her airways were tightening.. Nurse immediately called for response, administered Epipen, when response arrived applied oxygen and transported to ED. Solumedrol 125 mg, Bendadryl 25 mg, and Famotidine 20 mg, she responded well and was released home with Rx Prednisone 40 mg x 3 days. Only residual effect was a dry/sore throat.

12/30 9:30 am developed angioedema. Swelling of face, lips, tight throat. Also had bright red rash over body trunk and arms. Both palms were red, hot and painful.

Weakness, fatigue, decreased appetite, upper extremity shaking, sternal red blotchy rash, decreased mental status, non-verbal, decreased level of conscious, mottling, left side facial droop, hypertensive, fever, unable to follow commands

headache 15 minutes after receiving vaccine, 3 to 4 hours later broke out in rash on upper extremities, ABD pain, itchy, and arm swelling, throat hurts. SOB

Left sided weakness, fatigue for 3 days post immunization. Patient was seen by health care provider on 12/30/2020. Provider transferred patient to Hospital ER for further evaluation.

At about 6am after receiving the shot I felt very tender at the injection site almost as if it was bruised. Then over the course of the day I started to feel very itchy all over my body but mainly on my right side. 10pm I got up for work, and could barely move, I'm feeling intense back pain on my lower back on the right side. I can walk but its all very limited motion, I can really only manage by putting all my weight on my left side.

I developed severe abdominal pain and was diagnosed with colitis. I was seen in ER. I have no idea if the vaccine called this.

Patient presents with ? Altered Mental Status ? Headache á á HPI Patient presents to ER by EMS ambulance after family called 911 as patient was incomprehensible with slurred speech and moaning on the phone this evening. On arrival of EMS patient was asleep in bed and reportedly unresponsive other that to localize to pain. EMS transferred patient to ER. On arrival to ER patient had GCS 7. Reportedly patient is locum nurse who works in a Nursing Home and patient reportedly received COVID vaccination 2 days ago and that night reportedly began complaining to family on the phone of headache, nasal congestion, sore throat, cough, fever, chills, nausea, emesis, myalgias, and lethargy. Per the medical record patient has history of seizures, migraines, and sciatica. No other information is known on patient arrival to ER. 1. Peripheral IV right dorsal hand placed by EMS in route to ER. 2. On arrival to ER GCS 7 (E1M5V1) and roving eye movements with episodic lateral conjugate and at times disconjugate gaze concerning for seizure activity. Arms and legs with moderately increased tone but no clonic movements and patient able to localize bilaterally. 3. Ativan 1 mg IVP for seizure, then further 2 mg IVP for persistent seizure. 4. Fosphenytoin 1,000 mg IVPB in ER for loading dose of antiseizure medication. 5. Patient had significant improvement following completion of Ativan 3 mg IVP and GCS improved to 14 (E3M6V5) from GCS of 7 (E1M5V1). 6. Patient able to communicate after improvement as above and reports she has had headache or migraine for past several days as well as dysuria with bilateral CVA pain and has significant pain on percussion of bilateral CVA and moderate pain on palpation of bilateral flanks. No nuchal rigidity or pain with ROM of neck. Additionally, she complains of severe headache and diffuse pain of back and abdomen/pelvis. She reports a history of seizures in the past and reports she had one last month and was treated at a hospital in her home state. She denies antiseizure medications. Additionally, patient reports nonproductive cough, sore throat, nasal congestion, fever, chills, myalgias, lethargy, nausea, and episodic emesis over the past 2 days. She has anterograde amnesia following seizure and does not recall events. 7. Normal saline 1,000 mL IV bolus, then 100 mL/hour in ER. 8. CT of head with and without contrast performed and negative for intracranial hemorrhage, lesions, stroke, or other acute pathology. 9. CT of chest/abdomen/pelvis with IV contrast shows no acute pathology or notable abnormalities. 10. Lactic acid drawn and normal. 11. UA and urine microscopy collected by straight catheterization and culture collected and pending. 12. Blood cultures x 2 collected and pending. 12. Rocephin 2 mg IVPB in ER after blood cultures collected. 13. Vancomycin 20 mg/kg (1,500 mg) IVPB

following Rocephin. 14. Dexamethasone 10 mg IVP in ER. 15. Duoneb nebulizer in ER. 16. Called to discuss with patient's daughter and the family's preferred contact who is 23 years old. She reports patient had COVID vaccination 2 days ago and beginning that night patient has complained of headache, fever, chills, nonproductive cough, sore throat, nasal congestion, myalgias, and lethargy. Additionally, she reports patient has history of seizures on at least 1 occasion in the past a few months ago but is not on antiseizure medications. She reports patient had MRI and MRA of her brain at that time and reportedly and intracranial aneurysm was identified at that time. 17. Called to request transfer to another facility and spoke with hospitalist who states there is no neurologist there and suggests transfer to larger tertiary care facility with neurology. 18. Called to request transfer and accepted by ER provider. 19. Transfer by ALS ground ambulance with telemetry, pulse oximetry, O2 to keep > 02%, vitals every 30 minutes, normal saline at 100 mL/hour, Rocephin 2 grams IVPB, vancomycin 20 mg/kg (1,500 mg) IVPB in ER. á DISPOSITION Patient Stabilized and Transferred Data Unavailable Wed Dec 30, 2020 2:12 AM CST

PATIENT WAS OBSERVED FOR 15-20 MINUTES IN THE PHARMACY POST INJECTION, AND HAD NO SYMPTOMS. PATIENT ALSO HAD BROUGHT ALONG HER EPI-PEN TO THE APPOINTMENT AS SHE WOULD BE PREPARED IF SHE HAD ANY PROBLEMS. ON HER WAY HOME, APPROXIMATELY 30 MINUTES AFTER HER VACCINATION, SHE HAD SOME MILD CHEST PAIN AND FELT SOME THROAT TIGHTNESS. SHE DID ADMINISTER 1 DOSE OF HER EPI-PEN 0.3 MG INJECTION AT THAT TIME. SHE EXPERIENCED RELIEF OF HER SYMPTOMS, AND APPROXIMATELY 1 HOUR AND 30 MINUTES LATER WHEN I CALLED HER, SHE WAS STILL FEELING UNUSUAL SENSATION IN HER THROAT, BUT WAS MUCH BETTER. I ENCOURAGED HER TO TAKE SOME HYDROXYZINE , WHICH SHE HAD AVAILABLE AT HOME, AND TO CONTACT THE EMERGENCY ROOM IF HER SYMPTOMS DID NOT RESOLVE COMPLETELY OR SEEM TO BE GETTING WORSE.

Anaphalaxis reaction, stridor an unable to breathe. Happened in 30 seconds

Spouse awoke 12/20 and found spouse dead. Client was not transferred to hospital.

Resident in our long term care facility who received first dose of Moderna COVID-19 Vaccine on 12/22/2020, only documented side effect was mild fatigue after receiving. She passed away on 12/27/2020 of natural causes per report. Has previously been in & out of hospice care, resided in nursing home for 9+ years, elderly with dementia. Due to proximity of vaccination we felt we should report the death, even though it is not believed to be related.

Within 24 hours of receiving the vaccine, fever and respiratory distress, and anxiety developed requiring oxygen, morphine and ativan. My Mom passed away on the evening of 12/26/2020.

Near syncopal episode approximately 2.5 hours after vaccination. Sudden onset of dizziness, nausea, and diaphoresis. Was admitted to ED and observed overnight. Full cardiac work up was done and shown to be within normal limits. I have no pre-existing conditions and considered to be a healthy adult.

On Dec. 20, 2020 around 11:30 PM, 2 days after patient received her COVID-19 vaccination, she was found on the bathroom floor , obtunded, very pale, diaphoretic, nauseous, and complaining of severe chest pain. Paramedics was called and patient was transported to the nearest emergency room.

According to paramedics, on the way to the ER while patient was in the ambulance,she was noted with a sudden drop in heart rate about 19 beats/minute and have to be given Atropine IV Push, oxygen and was connected to transcutaneous pacing which improves her heart rate. In the ER patient continued to have chest pain and she was given Morphine, Oxygen, Nitroglycerine and Aspirin. IM had an EKG which showed Sinus Bradycardia with a Right Bundle Branch Block. She had serial ekgs, a chest x-ray, laboratory testing which included Troponin. Her first Troponin level came back elevated prompting her hospital admission to Telemetry. Her next 2 Troponin level improved and return to normal range and her chest pain has resolved.. She underwent a Stress Test which came back negative. Patient was admitted for a total of 20 hours in the Telemetry unit with Cardiology consultation before being discharged home last . She was re-evaluated by the cardiologist yesterday which diagnosed her a chest pain of unknown origin.

RESIDENT CODED AND EXPIRED

Rash, Itching and swelling of left arm. Progressed to tachycardia in the 150's, hypertension 200/114. Tingling of lips, dizziness

Went to Emergency room on 12/28/20 because he was short of breath. Tested positive for COIVD_19 and was admitted with hypoxia.

Approx 20 min after vaccination patient developed itching at the site and this progressed to include chest, neck. EMS evaluated patient who recommended transport and patient agreed. Benadryl offered by EMS and IV started. Pt with concurrent treatment for valley fever noted. ED administered medications - famotidine 20mg iv, methylprednisolone 125mg iv, NS 1000ml bolus. Prescribed prednisone 20mg po daily x 2 days.

Injection given on 12/28/20 - no adverse events and no issues yesterday; Death today, 12/30/20, approx.. 2am today (unknown if related - Administrator marked as natural causes)

Death by massive heart attack. Pfizer-BioNTech COVID-19 Vaccine EUA

Moderna COVID?19 Vaccine EUA - Metalic taste - Lump in her throat- felt like swelling - Nausea and then vomiting - Shaking and started to become unresponsive.

pt passed away with an hour to hour and 1/2 of receiving vaccine. per nursing home staff they did not expect pt to make it many more days. pt was unresponsive in room when shot was given. per nursing home staff pt was 14 + days post covid

pt was a nursing home pt. pt received first dose of covid vaccine. pt was monitored for 15 minutes after getting shot. staff reported that pt was 15 days post covid. Pt passed away with in 90 minutes of getting vaccine

The patient had COVID19 infection diagnosed 12/14/2020, and he stated 5 to 10 days after this, he developed shortness of breath. Had vaccine on 12/24/2020. Hypoxic and short of breath with COVID19

pneumonia on 12/29/2020. I do not know if this is an adverse effect or temporally related or if the vaccine activated prior infection.

"my left arm and breast were tender with some mild body aches and low grade headache/Arm soreness; my left arm and breast were tender with some mild body aches and low grade headache/ left breast was increasingly painful with swollen palpable lymph nodes; my left arm and breast were tender with some mild body aches and low grade headache/ left breast was increasingly painful with swollen palpable lymph nodes; my left arm and breast were tender with some mild body aches and low grade headache/ left breast was increasingly painful with swollen palpable lymph nodes; my left arm and breast were tender with some mild body aches and low grade headache; body soreness and stiffness; This is a spontaneous report from a contactable healthcare professional. A 34-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), via an unspecified route of administration on 18Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient stated, ""the day after the injection, my left arm and breast were tender with some mild body aches and low grade headache. Sunday Arm soreness went away but left breast was increasingly painful with swollen palpable lymph nodes, with body soreness and stiffness. Monday left breast is still remarkably tender with palpable lymph nodes"" on 19Dec2020 (reported as Seriousness criteria-Caused/prolonged hospitalization: Yes, on an unspecified date in Dec2020). The outcome of the event was not recovered.; Sender's Comments: The reported information is limited. Based on the close temporal relationship and the description of the events, there is a reasonable possibility that the events are related to BNT162 vaccine. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

got COVID vaccine from Pfizer, next day got COVID tested with mild symptoms and positive; got COVID vaccine from Pfizer, next day got COVID tested with mild symptoms and positive; This is a spontaneous report from a contactable physician (patient). A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient reported that he is a physician and got COVID vaccine from Pfizer, next day got COVID tested with mild symptoms and positive. The patient stated so he got vaccinated probably while having COVID. The patient wanted to know any concerns from the vaccine standpoint efficacy side effects. Outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

"asking on how to differentiate between side effects from COVID vs vaccine side effects/also wondered if he needs to quarantine; asking on how to differentiate between side effects from COVID vs vaccine side effects/also wondered if he needs to quarantine; swelling of glands in throat/lymphadenopathy in throat; headache; Feeling a little fluish; This is a spontaneous report from a contactable healthcare professional (patient). A 61-year-old male patient received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine, batch/lot number and expiry date were unknown), via an unspecified route of administration on 21Dec2020 18:06 at a single dose for COVID-19 vaccination. Medical history included diet controlled Type 2 Diabetic diagnosed 5 years ago in 2015. There were no concomitant medications. The patient previously got Shingles vaccine and it was a two dose vaccine. He felt a little bit like he did now after receiving the second vaccine. He felt fluish for 8-12 hours the day after receiving the vaccine. He has gotten lots of vaccines like Flu and has no responses. The patient does not have prior vaccinations within 4 weeks. The patient received the vaccine yesterday (21Dec2020), and maybe an hour ago on 22Dec2020, he started feeling swelling of the glands in throat or lymphadenopathy in throat and a little bit of headache. He has a question that he cannot find the answer to anywhere. The patient is asking on how to differentiate between side effects from COVID vs vaccine side effects? His temperature was 98.1 on unspecified date. He did not have an exact time frame for when it began. He stated, ""you get swelling in glands and then you notice it."" He noticed about 2 hours ago and it is getting worse. Now he is feeling like he is sick. He has been volunteering and giving the vaccines over the past two days himself. He is feeling now a little fluish. He doesn't know how to say it other than tired and just doesn't feel good. He would go to work like this and does not feel it is medically significant. He does feel like he is deteriorating but that is only a guess. He felt a little worse than an hour ago. He also wondered if he needs to quarantine because he is signed up to give the vaccines and would not want to do that if he should not. No ER or physician's office required. The outcome of the events was not recovered. Information on batch/lot number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of reported events cannot be totally excluded. The case will be reassessed if additional information becomes available."

tested positive for Covid; tested positive for Covid; This is a spontaneous report from a contactable consumer (patient) from a Pfizer-sponsored Program Pfizer First Connect. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Lot number Unknown, via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient was upset. She was part of the COVID Trial in and this past week (in Dec2020) she started to get sick and tested positive for COVID. They gave her a diary which she had to fill out weekly, so she filled it out and put that she had COVID. She never heard from anyone. She stated the testing site people and snarky attitudes and when they went no one was wearing masks. She was told by the testing site, they couldn't make people wear them. Relayed that she could do an escalation and have someone reach out to her in regards to this. The patient underwent lab tests and procedures which included Covid test: positive on unspecified date in Dec2020. The event outcome was unknown. Information on the Batch/Lot number has been requested.

Itchy throat, red eyes after 30 minutes. EMS on site gave IV Benadryl, epi pen shot and took to ER for monitoring. Vitals were good so he was discharged.

Hives/swelling/itchiness/redness at injection site about 5 inches long a week after injection.

"Chills, Fatigue, ""hot"" feeling eyelids when I close eyes, muscle/joint pain, injection site pain. No treatment besides rest and a hot shower."

Pt felt hot and short of breath . Pt recieved EPI in office and EMS was called . Pt was transported to the Hospital

Sore arm-2days , headache -current on and off , light sensitivity 2 days

Currently have shortness of breath, chest pain, fatigue, nausea, body aches, joint pain, and injection site pain.

Dizziness, Equilibrium was off. This started within an hour of the vaccine and lasted 24 hours. Had to take the following day off of work. Also, burning in the chest (like heartburn) lasted 48 hours.

Weakness, headache, high level myalgias, fever, nausea, cold intolerance, shaking

Onset was 10 min post vaccination. Symptoms experienced over an hour, in this order. Went to the ED. Some still continuing within 14 hrs past time of shot. Severe headache. * same night Dizziness and lightheaded. * same night Nauseous Clammy Cheeks flushed Itchy Chills Short of breath / slight wheezing * same night Fatigue * same night

Extreme vertigo occurred suddenly around 9:00 pm. Continuous dizziness continues. Unable to walk straight lines. Wobbling and loss of balance when I walk. I have eaten and been drinking fluids. Side effect still continues.

Normal resting heart rate of 58-61. At 10 PM, heart rate increased to 137 while watching TV, heart rate continues to average at 102 bpm for 120 minutes + and counting. Body feels warmer than usual

About 4 hours after receiving this vaccine I experienced burning down my left arm and up into my chest. I had chest tightness and over the course of the day it became worse. I developed a fever of 100.9 and I woke in the night to SEVERE body aches and a migraine headache. Fever and chills I also had a runny nose earlier that day. It is now the second night after the vaccine and I am still experiencing severe pain in my joints back and kidneys. Also muscle pain If I have a fever in the am, should I wait to go back to work?

Fever of 102 with onset at midnight after vaccination,a long with chills, muscle aches, some nausea,--subsided after a few hours. headache and tiredness the morning after

Raised, hardened, hot bump on arm 24 hrs post injection with pain and swelling

I have an autoimmune disease, psoriatic arthritic and osteoarthritis. This caused my flare up. My knees and ankles swelled to the size of grapefruits. I could not move legs for about 18 hours. From Friday to

Sunday, I could not get out of bed. Monday night, I really started feeling better and was able to take care of my kids again on Tuesday. I went back to my normal shift on Wednesday. I was under the care of my PCP and Rheumatologist.

10 minutes after receiving vaccine, patient reported numbness across upper lip which progressed to her tongue. Felt tingling and dryness of tongue and swelling. No difficulty breathing or swallowing, no chest pain, no wheezing, no rash, no itching. Taken to ED and given methylprednisolone 125mg IV, diphenhydramine 50mg IV, famotidine 20mg PO. Patient improved and monitored x 4 hours with resolution of symptoms. Prescribed prednisone 50mg po x 4 days.

erythema, tachycardia, tachypnea, headache, uncontrolled dystonic shaking

Developed sudden onset of shaking chills and fevers as high as 103.0. She has developed a small circular 5 x 5 area of erythema and firmness at the injection site of her left upper arm.

Dizziness, Hives on entire body

pt received vaccine at covid clinic on 12/30 at approximately 3:30, pt vomited 4 minutes after receiving shot--dark brown vomit, staff reported pt had vomited night before. Per staff report pt became short of breath between 6 and 7 pm that night. Pt had DNR on file. pt passed away at approximately 10pm. Staff reported pt was 14 + days post covid

Sent home from work after receiving vaccine. I immediately developed sore throat. First 3 days I was miserable and then this whole week everything has bad. Outside of ears were burning. Stomach turned immediately. I thought I was going to vomit. Top of my head started spinning. I am still foggy. Breathing was never altered.

Received my vaccine on December 22nd, 2020 at around 830 Am. That afternoon, about 3 PM, I started to have a reaction. It started with tingling/numbness in my right hand which progressed up my arm into my elbow. About 10 minutes later, it then progressed into my right foot, and my left foot. About 10 minutes after that, I started to get flushed and a neck rash (diagnosed from Dr.). I took Benadryl and Ibuprofen 800mg PO every 6 hours for the next 24 hours. The numbness in my right foot and left foot along with the flushness went away a couple hours later. Although, the numbness in my right hand never went away. It came and went for the next 4 days until December 27th and 28th when it started getting worse. On December 28th evening, it got so bad that I was debating going to the emergency room around 1 am. The numbness and tingling was in my right hand and started shooting up my arm. The nerve pain around my wrist was unbearable. I finally fell asleep and the next morning, it was not nearly as bad, but was still there. The numbness and tingling moved from my right hand mainly to right hand, right foot, right leg, left foot and left hand today (12-30-2020).

angiodema. hospitalized overnight. During the hospitalization pt was started on an epi gtt and given MTP 125 mg. He had subsequent hyperglycemia, and increased his rate on his insulin pump to 2 U/hr (from 0.83 U/hr). Pt then decreased his rate to 1.4 U/hr while on the epi gtt, and then to 1.1 U/hr when off of the epi gtt. He also strengthened his carb ratio from 1:12 to 1:10 last night.Pt reports he had

postprandial hyperglycemia overnight after his meal, but then BG corrected overnight. Pt reports fasting this morning is in the 110s. This morning's breakfast on 1:10 CR with well controlled BG.

Resident received vaccine per pharmacy at the facility at 5 pm. Approximately 6:45 resident found unresponsive and EMS contacted. Upon EMS arrival at facility, resident went into cardiac arrest, code initiated by EMS and transported to hospital. Resident expired at hospital at approximately 8 pm

Due Date unknown/6-7 wks pregnant -nausea -Body felt heavy -headache -in & out consciousness -Fatigue, severe -Heart Racing

Patient had an anaphylactic reaction to the vaccine the day after it was given and went to the nearest ER.

Patient stated he stopped his blood pressure medications 3 days prior to vaccination due to a previous reaction to losartan, a medication he was no longer taking. Patient took aspirin and a MVI on day of vaccination and drank lemon water. Patient developed tingling sensation in his mouth after eating dinner around 18:00. Patient stated he ate tacos with apple cider and noticed tingling after dinner. Patient stated he took two benadryl with no relief. His tongue continued to swell and he took two additional benadryl at 22:00. Once he developed difficulty swallowing he went to the emergency department. Patient presented to the ED with tongue swelling and difficulty swallowing. At 23:57 he was adminsitered 0.3mg of epinephrine IM, diphenhydramine 25mg IV, famotidine 40mg IV, dexamethasone 10mg IV at 0114, methylprednisolone 60mg q6hrs started at 0417, diphenhydramine 25mg q6hrs IV started at 0416, albuterol 2.5mg via neb q6hrs started at 0710

Patient died within 12 hours of receiving the vaccine.

Resident received vaccine in am and expired that afternoon.

Started feeling a reaction immediately after the vaccine, felt blurred vision, dizziness, racing heartbeat, chest rash and face, itching all over, difficulty swallowing, tongue tingling and wheezing. Sent to ED. EPI and Benadryl. 1800 Went to see her in the ED, room 33. She has red rash to neck, shaky hands itching to neck and chest. ED Dr to discharge, she stated husband to pick her up and she will follow up with OH tomorrow. ----------RN ED gave her Epinephrine 0.3 mg, Methylprednisolone 125mg, Diphenhydramine HCL 50 mg, Zofran 4mg, Lorazepam 1 mg, Hydroxyzine HCL 50 mg Sumatriptan 6mg , Discharge from ED at 1902 ---------- ---------- RN 12/29/2020 1715 called to check on patient. left voicemail for her to call OH. ???????..? 12/29/2020 1838 left voicemail for patient to call OH. ??????????????????????. 12/30/20 2030 spoke with her. Tuesday 12/29 3pm-4pm dizziness, confusion, sob. Wheezing. Ambulance called. Hospital admitted. Intubated for less than 24 hours. Breathing treatments, epi drip. Now just on steroids and walking around and feeling better. Still admitted at hospital. Hoping discharged tomorrow. ----------RN

Patient received dose 1 of COVID vaccine 12/24. He developed symptoms consistent with COVID infection on 12/25. He was seen in the emergency room at Hospital on 12/27,was diagnosed as COVID positive, and was discharged to home. He returned to the emergency room on 12/29 and was admitted to the hospital for treatment related to COVID infection. He is currently admitted to Hospital.

10 minutes after vaccine numbness and tingling in left foot, hand and left side of face. Spacing out feeling. Feel like i'm going to pass out.

EDD - 4/1/2021 - Contractions at 26 w 3 days sent to L&D to be monitored on 12/28/20. Covid-19 Sars Vaccine given 1st dose 12/27/20. Patient was diagnosed with Fetal Hydrops. Patient Hospitalized 12/28/20 - current MFM consulting in hospital & outpatient

EE has a history of anaphylaxis reaction to Latex. EE states she was intubated in Mexico over this in the past. Pfizer-BioNTech vaccine given, 20 minutes later EE c/o dizziness. EE places on cot and starting wheezing and being short of breath. Lungs sound tight and wheezy throughout. á 1052- Epi 0.3mg IM given in Right Deltoid 1053- Benadryl 50mg IM given in Left Deltoid á 1054- EE getting restless and starts feeling chest tightness. Epi 0.3mg IM given in Right Deltoid á Code Green Team arrived at 1054. á BP 197/126, HR 88, RR 44, blood sugar 109 á 1058- EE getting wheezing and short of breath again. Epi 0.3mg IM given in Right Deltoid and Benadryl 50mg IM given in Left Deltoid. á 1059- EE transferred to ED on stretcher, escorted by ICU RN and ICU MD. In ED- patient given solumedrol, epi, benadryl, phemodidine, ativan, zofran x 2 and ee sent home with medications as well.

Redness about 1 1/2 inches around injection site, edema to right arm, r side of neck, r breast, r shoulder, temp 99.3, increased blood pressure. Patient went to primary care physician. She was then sent to the ER. She was Covid (+) in July 2020

Shortly after receiving the vaccine (within 10 minutes) the patient's tongue swelled, facial redness, gasping for air. This resident was marked for a 30 minute observation due to previous anaphylaxis type reaction. Immediately administered 0.3mg epinephrine x 1 dose. Then administered 50mg IM Diphenhydramine. This treatment course resolved the adverse reaction. Patient was monitored onsite at facility. Her husband came to pick her up and take her home. Tried to reach patient several hours after but was unable to at this time.

I had shortness of breath

approximately 30 minutes after receiving vaccination i began to develop tongue and lip swelling as well as difficulty swallowing and breathing , i then proceeded immediately to the nearest er

Patient complained of a headache, then patient was losing consciousness and gasp for air. EpiPen was utilized due to being unresponsive then began to seizing. Patient started to flatline and an AED was used while a paramedic came. Patient was put on her side then facility gave something for seizures. Lastly, ,ambulance took her to the hospital.

Patient started having myalgia, chills, nausea on the next day of the vaccination. on 2nd day (12/29) patient had chest pressure which made her present to Hospital ED. She had troponin elevation to 1.14.

Cardiac Catheterization was done which was negative. On Trans Thoracic Echocardiogram, patient was found to have hypokinesis of the mid and distal segment with some sparing of apex proving Takotsubo (stress induced) cardiomyopathy. Patient did not have any underlying emotional or physical stress going on in her life or family. Till now extensive infectious as well as inflammatory work up is done to rule out any secondary causes of cardiomyopathy which till date have remained negative. As a diagnosis of exclusion, her presentation seems to be COVID-19 vaccine induced Takotsubo Cardiomyopathy

Pt received 1st dose of Moderna vaccine in am at COVID vaccination clinic. On presentation to clinic he stated he was feeling well. Pt was brought to ER in pm with hypoxic, requiring 15L supplemental O2. Per pt's family, pt was not feeling well for the last couple of days but didn't think it was related to COVID. Abbott COVID + in ER. Possible vaccine reaction, though seems unlikely.

"15-20 mins after receiving the vaccine she reported she had difficulty swallowing and difficulty breathing and was ?shaking."" a PA wrote in her note that when she ran in to help, she found the patient to be tachypneic, diaphoretic, warm with some red blotchy patches on face, chest & neck. Able to speak easily c/o trouble breathing & sensation of throat swelling & extremities feeling abnormal. No stridor. No facial edema noted by that clinician. Administered epi-pen 0.3mg - IV started , Benadryl 50mg IVP and solumedrol 125mg IVP. Patient reports she subsequently arched her back and had rigidity of her arms/legs and tremors. Clinic PA reports that while she was there, pt was never hypotensive. Initially hypertensive after epi as expected with some favorable response after 10-15 min Staff there gave her IM epinephrine, IV Solu-Medrol and 50 mg IV Benadryl. EMS was contacted and transported to the emergency room. She arrived at the ER, was monitored for 2 hours, was started on pepcid and benadryl and discharged from the ER. She had a diffuse itchy rash. The following day she again developed recurrence of throat swelling. Went back to a different ER. Developed dyspnea immediately prior to arrival at ER. There was again given solumedrol and benadryl and pepcid and developed muscle rigidity and arched back for 10 minutes. Symptoms of SOB and dyspnea resolved with epinephrine. Was discharged from the ER with prednisone after being monitored for 5 hours. Is continuing to take prednisone and benadryl. Rash is still present but improving with scheduled benadryl. Has new redness at injection site today. Continues to feel some throat swelling but no tightness today. This information was gathered from talking with pt today for a phone appt and also from her medical chart regarding her vaccination visit and two ER visits."

Acute appendicitis, onset morning of 1/1/2021 (Reporting this because Pfizer covid vaccine had 3-4x higher risk of appendicitis, although data not reported for Moderna covid vaccine)

on dec 22 I felt some myalgias, chills, fatigue, HA --quite normal. That evening, noted small amount swelling R hand --I iced and took acetaminophen. By Dec 25, hand very swollen and painful with decreased ROM all fingers

Within 15 minutes of receiving the vaccine I began to get very itchy and blotchy with a hoarse voice. The paramedic downstairs walked me up to the emergency room. I was treated with medications to help calm the itching and burning feeling. By 940 I went anaphylactic and had several doses of epinephrine to help calm this. I continued to have rashes and the feeling of my throat closing. I was transferred by

ambulance to medical center in the ICU. I am still here and have had two toner anaphylactic episodes since. I have been on a epi drip, steroids, famotidine, Ativan and Benadryl. I also had a picc like placed.

Anaphylaxis. Immediately experienced shortness of breath, rapid heart rate, and rash. I am a Nurse Practitioner in the emergency department. Had went down to the temporary vaccine station to receive my vaccine, immediately returned to the ER and began to experience symptoms of anaphylaxis. Was immediately placed in a treatment room and received treatment by the ER physician, which included oxygen, intravenous Benadryl, Solumedrol, and Normal Saline. Was observed for several hours and then eventually sent home with prescription for Prednisone and Pepcid. I do have a allergy to shellfish, was never asked about my allergies and nothing on the paperwork I was given prior to the injection noted a concern for shellfish allergies.

Vaccine on 12/22/2020 and started feeling bad on 12/27/2020 and tested positive on 12/30/2020 for COVID 19 Was advised to fill this out by my PCP

Flushing, sweating, increased heart rate proceeded to feel difficulty swallowing and clearing my throat. I was taken to the ER. The symptoms progressed to feeling dizziness, difficulty speaking, and chest pressure with increased SBP/DBP. General nausea and feeling very unwell.

CAREGIVER RECEIVED FIRST VACCINE DOSE AND SOON AFTER BEGAN TO FEEL DIZZY AND HER EYES BEGAN TO TWITCH, FOLLOWED BY UNCONTROLLED SHAKING, WITH HIGH FEVER FOLLOWED BY SEVERE SHORTNESS OF BREATH AND GASPING, WITH TIGHTNESS AROUND THE CHEST. TRANSPORTED TO EMERGENCY DEPARTMENT. HAD MULTIPLE EPISODES OF ITEMS LISTED ABOVE WHILE IN ED, INCLUDING HEAVINESS IN HER LEGS AND TINGLING IN ARMS. SHE WAS DISCHARGED FROM ED AT 10:30PM BUT WAS READMITTED ON 12/24 TO ED FOLLOWING SIMILAR ISSUES. TO DATE SHE HAS HAD 5 RAPID RESPONSES IN HOSPITAL DUE TO REPEAT OF SIGNS/SYMPTOMS. CT AND PULMONOLOGY CONSULT SCHEDULED FOR 12/28/2020.

Patient is a 55 year old male with no past medical history who presents with complaint of sudden onset of left-sided nonradiating chest discomfort of sudden onset approximately 1 hour prior to presentation while doing administrative work at rest. He describes the pain as a dull heaviness sensation and approximate 3/10 pain severity. Chest discomfort was associated with a feeling of flushing that was quite transient but chest discomfort was persistent. Patient immediately presented to the ED for further evaluation. He denies experiencing any chest pain upon waking up this morning. Does note that he did have a transient episode of epistaxis on his way to work for which he had to pull over and apply pressure to his nose but this subsequently subsided and he attributed this to dry air as he has experienced epistaxis in the past but with less severity previously. In the ER, vital signs noted for BP 133/76, pulse ranging 91-114, respiratory rate 16-20, 96% on room air. Initial laboratory parameters were completely normal including normal CBC, CMP, LFT, lipase, UA, and normal D-dimer. Initial troponin was negative x1. EKG with sinus tachycardia, heart rate of 115. Noted Q waves inferiorly. No acute ST or T wave changes appreciated. Chest x-ray with mild increased density in the left lower lobe. Given this, patient was tested for rapid Covid which was negative but PCR was positive for COVID. CT of the chest noted for focal subsegmental groundglass infiltrate at the superior segment of the LLL, likely infectious versus

inflammatory. Also noted small nonspecific groundglass attenuation with focal septal thickening at the right upper lobe which could be infectious or inflammatory, bibasilar atelectasis. Patient was treated with aspirin 324 mg in the ED. Of note, patient actually just received the COVID-19 vaccination on 12/24/20. He denies any shortness of breath, no cough, denies any nausea or vomiting, denies any change in taste or smell nor change in appetite. Does note 1 single episode of loose stool but otherwise denies any diarrhea. Does report that he had approximate 48 to 72-hour period of fatigue and soreness at the site of the left deltoid injection following the vaccination but otherwise no further symptoms. It is also noted that he does have a positive family history of coronary artery disease as his dad had an MI at the age of 49. Patient has never undergone a cardiac catheterization in the past but does report having a negative stress test at the age of 42. He is being admitted under the hospitalist service for further management Patient was initially admitted under observation for chest pain obs. However patient's Covid test came back positive and patient also had dynamic EKG changes concerning for possible unstable angina. Patient was treated with aspirin Plavix full-strength Lovenox along with beta-blocker and a cardiology consult. Serial troponins were negative. Echocardiogram revealed normal EF of 55 to 60% with no hemodynamically significant valvular disease. Cardiology felt that patient likely has underlying coronary artery disease have recommended discharge home with aspirin and Plavix with outpatient stress testing given his positive Covid testing. At the time of discharge patient denied any chest pain or shortness of breath. Patient was borderline diabetic with a hemoglobin A1c of 6.1. Patient was discharged home with Metformin along with glucometer, glucose strip, lancets. Given patient's tachycardia patient's Metformin 25 mg twice daily was changed to Toprol 25 mg daily. (Please note clarification in comparison to discharge home med list. Toprol XL 25 mg daily was called to pharmacy in place of the metoprolol.)

The vaccine was received at 1:12 PM, and I felt fairly fine, aside from injection site pain and some tingling in my left arm until I had sudden significant elevation of heart rate, with shortness of breath, and throat swelling/tightening at approximately 1:26PM. I cold compress was applied to my forehead and I was put in a reclining position & then received Epinephrine at 1:28PM. EMS (present onsite) arrived for transport at 1:31PM. 4L of oxygen was applied after O2 sat of 89% noted by EMS. Blood pressure was elevated to >200/100 initially by EMS. Symptoms improved quickly following epinephrine, with some residual feelings of very mild throat fullness, and I developed chills which improved over time. I was transported to emergency department where I was evaluated (symptoms mostly resolved at that time, but ED physician noted a little swelling remaining in my uvula), then IV Benadryl and Decadron were given. Later acetaminophen was also given for headache that developed during my ED stay. My vitals were monitored throughout and observation occurred until I was discharged at approximately 5:00PM, as symptoms had not recurred.

HIVES, SOB, THROAT CLOSING UP, WHEEZING

12/28/2020, Pharmacy staff administered Moderna COVID Vaccine. 12/29/2020, he had not eaten breakfast or lunch but did consume fluids and take his medications. BP =150/70, Temp. = 101.6, Pulse= 102, Respirations= 18 and Oxygen saturation= 97%. Tylenol 650 mg given. It was difficult for him to swallow. Also had no use of right upper extremity and unable to move lower extremity, mouth was drooping and was drooling. Physician in attendance and ordered to send to ER. 1/1/2021, received

information from nurse at hospital that patient received a Peg Tube this afternoon and Clinical indication of a stroke.

I received the vaccine at 6:30pm on 12/27. I worked atb7pm and took lunch at 2:00am. After lunch, I immediately felt sick to my stomache and threw up. I went home after my shift and went to bed. After 5 hours, I woke up and went to the couch to lay down while kids watched TV. Next, I woke to several people in my house. I had a seizure and my son had called 911. I was taken to emergency department. I was admitted and stayed 2 nights in the hospital.

After vaccination, patient tested positive for COVID-19. Patient was very ill and had numerous chronic health issues prior to vaccination. Facility had a number of patients who had already tested positive for COVID-19. Vaccination continued in an effort to prevent this patient from contracting the virus or to mitigate his risk. This was unsuccessful and patient died.

A little over ab hour after receiving the vaccine I noticed a burning sensation in my sinuses. By 130am 1/1/2021 I awoke from my sleep terribly dizzy, shaking violently and experiencing a fever of 101.3 F. I took advil and tylenol and fell asleep about an hour later. I woke up with similar symptoms at approximately 830am on 1/1/2021 took an additional dose of advil and tylenol and slept till 12p. I woke up with a bad headache and coughing fits similar to when I had covid back in March. I went to an urgent care who assessed me and ordered me to the ER. medical center administered IV fluids, an inhaler, steroids, epinephrine and benadryl and a few hours later my symptoms had subsided for the most part and a dose of IV antibiotics was administered. I am currently admitted for observation with likely discharge on 1/2/2021.

30YO F ICU nurse obesity (BMI 35) COVID 19 on Dec 2 symptoms, Dec 3 tested positive for COVID-19. never hospitalized, outpatient only. 12/12 completed isolation 12/21 received vaccine 12/7 developed Fever chills diarrhea SOB cough Urgent care visit. RLL consolidation on CXR given doxycycline 100 mg po bid worse, fever 40 targetoid lesions to LE (started before doxy) WBC 22K tachycardic tachypneic admitted requiring 2-4L oxygen CT angio without clot, diffuse ground glass and RML dense infiltrate DDimer 7.8 LDH 599 CRP 41 procal 0.67 ferritin 500 Viral respiratory PCR negative Sputum cx with oral flora (pending) COVID ag testing neg COVID PCR 1/3 targets positive (called as indeterminate).

Within 5 minutes of the vaccine, patient had wheezing, shortness of breath and chest pain. patient given epi x 4, decadron, fluids with some improvement and then hospitalized. IN the hospital, patient continued to have chest pain and satting well but with protracted course and is still in the hospital.

Vaccine given at 7:05am 12:00noon, 5 hours later, I started experiencing severe chest pain, jaw pain and shortness of breath in which EMS was called and I was taken to the hospital. Since then, I lost feeling in my hands and feet, numbness and tingling. I've improved however, during my recovery suffered with spinal pain, shortness of breath, very winded, muscle pain and loss of appetite to especially meat.

Soreness and weakness of left arm for more than 5 days. Intermittent headaches and runny nose

On 12/29: lightheadedness, flushed, felt like I was going to pass out, numbness/tingling down arms and hands, chest tightness, clammy hands and feet.

Anaphylaxis. The COVID shot was given, no reaction then. After 7 minutes, congestion, severe cough, vomiting phlegm, feeling like throat closing started happening. Code was called, Benadryl was immediately given intramuscular in the left arm, blood pressure, pulse ox was taken, and then was taken to the Emergency Department. In the ED, I was given prednisone, one EPI, anti-nausea medication all through I.V. and many more medications given to me via I.V. that I don't sincerely remember. I was under observation for 4 hours. I was discharged after all symptoms dissipated and was given Prednisone 20 MG (3 tabs a day) to take to help my lungs. Management followed up almost immediately, everyone from the moment I had the anaphylactic reaction was quick and prepared.

Patient with a history of thalassemia and Gilbert's disease, developed severe jaundice three days after vaccination. Had mild headache and sore arm but otherwise felt well. Had labs drawn - found to have highly elevated bilirubin (23) and LFTs in the 700s. Was admitted to the hospital and had CT showing Cholelithiasis, choledocholithiasis and minimal intrahepatic biliary ductal dilatation. Left hospital and was admitted to another facility where plan was for ERCP and cholecystectomy. Ultimately unclear if at all related to the vaccination - may be coincidental.

Pt had vaccination at city site. Waitied 15 min after shot and was cleared to go. Reported to wife that he was very thristy, so they stopped at a convenience store on the way home. While there, he felt worse and asked to go to the Emergency room. They chose Methodist to enter. Pt went to triage and while at triage, had syncopal episode, then full arrest. After short course of CPR and defib, he had ROSC. Was taken to cath lab for intervention (stents) and is now in ICU.

At the time of vaccination, there was an outbreak of residents who had already tested positive for COVID 19 at the nursing home where patient was a resident. About a week later, patient tested positive for COVID 19. She had a number of chronic, underlying health conditions. The vaccine did not have enough time to prevent COVID 19. There is no evidence that the vaccination caused patient's death. It simply didn't have time to save her life.

Prior to the administration of the COVID 19 vaccine, the nursing home had an outbreak of COVID-19. Patient was vaccinated and about a week later she tested positive for COVID-19. She had underlying thyroid and diabetes disease. She died as a result of COVID-19 and her underlying health conditions and not as a result of the vaccine.

Tactile fever ,arm pain, headache and malaise in 24 hrs following injection Next day generalized achiness ,retrosternal chest pain and bilateral forearm tingly pain similar to Nov 2019 and went to Hospital UC,CXR and EKG normal but with short PR interval on EKG ,elevated troponin 3.5 Transferred to hospital troponin 12.1 ng/ml IVIG given SARS IGG positive on admission PCR negative

ON 1/1/21 THE DAY AFTER I RECEIVED THE VACCINE I WAS TAKING A NAP AND MY WATCH KEPT SENDING ME ALERTS. HOWEVER I DID NOT CHECK MY WATCH UNTIL 5:30 WHEN I WOKE UP AND I FELT LIKE I WAS HAVING HEART PALPITATIONS. I WENT TO THE EMERGENCY ROOM WHERE I WAS TREATED. I

WAS TOLD THAT I WAS FEBRILE WITH A TEMPERATURE OF 102. I WAS GIVEN IV FLUIDS, CHEST X-RAY, EKG AND LAB WORK. I WAS RELEASED ON 1/2/21 AT APPROXIMATELY 0030 (MIDNIGHT).

"Patient is hospital employee who completed screening form for COVID-19 vaccine by answering ""no"" to all contraindication questions. Approx 10 minutes after receiving COVID-19 vaccine dose # 1, patient was still in vaccine clinic area and complained of dizziness, palpitations and flushing. I observed patient fanning herself with papers. She was escorted out of the immediate clinic room, and assessed by paramedics present as having an anaphylactic reaction. Epinephrine 0.3 mg IM and diphenhydramine 50 mg IV given in clinic, Rapid Response was called overhead and patient immediately transported down the hall to the Emergency Dept. In ED, pt was noted as having swollen tongue, large areas of erythema on face, arms and chest, shortness of breath, nausea, dizziness (per ED physician notes). Pt reported being hospitalized in ICU with COVID disease more than 3 months ago, including intubation (not treated at this hospital), and has been back at work since August 2020. ED physical exam noted bilateral wheezing and patient in acute distress. In ED, pt administered racemic epinephrine 2.25% 0.5 mL via neb, epinephrine 0.3 mg IM, diphenhydramine 50 mg IV, Solu-Medrol 125 mg IV, famotidine 20 mg IV and epinephrine 5 mg/250 mL IV drip (started at 0.118 mcg/kg/min). Acute symptoms reported to resolve in ED. COVID test was negative. ED physician discovered that pt had history of multiple medications, including previous anaphylactic reaction to radiocontrast dye requiring intubation (which was not disclosed on the vaccine screening form). Pt admitted to Telemetry floor for observation. Overnight course was unremarkable, and patient was discharged the following day with prescription for Prednisone taper and prescription for Epi-pen. Advised not to return for second dose of COVID vaccine. EMR updated to reflect possible anaphylactic reaction to Moderna COVID-19 vaccine."

25 minutes after receiving the injection, there was a sudden onset of facial swelling, hives, itching and airway constriction. I had already left the drive-thru vaccination clinic and was driving to the hospital emergency room where I work. I informed my colleagues of my symptoms and was treated for anaphylaxis with IV diphenhydramine and famotidine over several hours. I was given a prescription for a prednisone taper for the next 6 days.

I suffer from lingering SOB with exertion after COVID infection. On the night of 12/31/2020 I began to feel more SOB than usual and was unable to correct my SOB with rescue inhaler. Became more SOB with exacerbated tachycardia and tachypnea, My family had to call 911 because I became aphasic and showing signs of possible stroke. I was taken to the ER and admitted for respiratory recovery and to role out stroke. The stroke was ruled out and I recovered with IV prednisone therapy, twice daily and supplemental oxygen. Released after HR, BP, & respiratory effort returned to normal: 01/03/2021

I was 28 weeks and 5 days pregnant when I received the first dose of the COVID19 vaccine. Two days later (12/25/2020 in the afternoon), I noticed decreased motion of the baby. The baby was found to not have a heartbeat in the early am on 12/26/2020 and I delivered a 2lb 7oz nonviable female fetus at 29 weeks gestation. I was 35 years old at the time of the fetal demise and the only pregnancy history for this pregnancy included a velamentous cord insertion that was being closely monitored by a high risk OB. My estimated due was March 12, 2021.

At around 40 hours post vaccination, developed severe abdominal pain and went to an emergency room for evaluation on 1/1/21. Abdominal pain was eventually diagnosed as appendicitis requiring appendectomy on 1/2/21. Emergency room visit and hospital discharged patient early on 1/2/21. It was then determined that the on-call team covering mis-read the CT scan and acute appendicitis was found. Patient then went to Medical Center on 1/2/21 for appendectomy and was discharged later that night following operation.

Headache, muscle pain on the site of injection, chills, nausea, fever. Started time 01.03.2021 8:15pm.

15 min after the vaccine I was flushed and felt hot , ears felt hot as well. I had a macular rash on chest and arms. My throat felt itchy and they immediately gave me benedryl. I was tahycardic as well. When I got home from the ER that night I had to take more benedryl and then the next morning I was still itchy and my voice was hoarse so I took more xyzal and famotidine. The rash subsided and I continued taking xyzal twice a day , benedryl and famotidine for a week. After my vaccine the itching did not subside for about 48 hours and it was very difficult to control. I had to take max doses of antihistamines to control the hoarseness In my voice and itching

High fever (104.2 degrees) at present, fatigue, chills

Blood pressure and pulse rate increased to 164/64, 85

1/1/2020: Residents was found unresponsive. Pronounced deceased at 6:02pm

Approximately 11:00pm on 12/29/20: Hives/itching on bilateral hands/wrists/forearms/lower legs/ankes, red face/swelling on face, rapid pulse, headache, nausea, extreme fatigue.

At about almost 4 hrs after receiving the injection I started to experience a tingly feeling to my lips, some lip swelling and tightness in my throat. I had my epi pen on hand incase I needed it but I ended up taking 25mg of Benadryl, then 50 mg of Benadryl 5 hrs later. The following morning my lips where feeling tingly again so I took 25mg of Benadryl again and continued for the next 48 hrs at the advice of my doctor.

About 5 minutes after injection: fast growing wave of internal burning sensation throughout body, feeling that I would pass out, lightheafdedness, increased heart rate and blood pressure, mild difficulty with speech/thought/concentration, freezing hands, wabbly/shaky., chest tightness, very slight throat soft tissue sensation

Fatigue, sore muscle

extreme body aches, fever of 101 degrees F, pain at injection site, severe headache

Swollen painful lymph node left clavicle

Redness and swelling an inch away from the injection site, hives on face

Migraine with nausea and dizziness preceded by visual aura, severe left arm pain (could not raise arm without significant pain), left wrist pain

about 1 hour and 15 minutes post injection (I waited in area as recommended for thirty minutes because of hx), I had the sudden onset of itchy runny nose and chest tightness and wheezing of significant intensity that I needed to use inhaler then and again later in the day. Noteworthy, I had as a precaution taken prednisone 20mg p.o about 2 hours before the injection. I had to take more later that afternoon because of symptoms. I then seem better but several times since the vaccine I have needed to uses the inhaler and take prednisone more than I have except after an infection about 6 years ago that precipitated similar symptoms to now. Today I had a flare significant enough that except for covid I might have gone to the ER or urgent care.

Resident noted with right sided facial swelling and lip droop. diagnosed as bells Palsy

Slight headache a few ours later after vaccination. The next morning I had headache, some joint/muscle pain, right arm pain and a Fever. That evening/night Fever and chills. The following morning still had a fever and chills. All symptoms were gone later that evening (within 48 hours of initial vaccination time)

4 hours after vaccine, sore arm, fatigue, headache, blurred vision 12 hours after vaccine, full body tremors, fever of 102, extreme muscle weakness, fatigue, deep chest cough, shortness of breath. fatigue, weakness and cough continued for three days after vaccine before subsiding

on the following day after the vaccination, I developed chills, awful headache, body aches, extreme fatigue, malaise, no fever

Fatigue, headache, body aches, chills, localized rash

I received the shot around 0730 on 12/30/2020. Went home and got ready for work. Around 12am 12/31/2020 my arm started to radiate at the injection site and was very tense. I placed a heat pack on the right harm but the pain did not dissipate. My arm continued to be in pain for the rest of the night. Around 0240 I ate dinner, had water and still had some arm pain. Around 0345 my arm started to flare up and sent pain sensations throughout my body. My right arm was increasingly discomforting, I could barely move it. The sensations spread to my legs, numbing them and my throat had felt as if it were closing up. I got up to get the attention of the nurse and was able to flag her down. She said I was pale as a ghost. My vision was very blurry, I could not hear anything because my ears had filled up and everything was muffled. My head had begun to ring and I was on the brink of fainting when a chair was given to me. My eyes had become extremely sensitive to the light, I was given water and spoken to about what had happened leading up to the event. I was greeted by the paramedics who drew my blood, placed an IV and transferred me to the Acute Care portion of the Emergency Department. My vitals were 76/49, 80/50, 90/56, 100/60 before being brought to the ER. On 1/1/2021 My thighs have been sore/tense, my knees and ankles have been stiff and just feeling sickly. On 1/2/2021 much of the same symptoms are present. The soreness in the muscles isn't as prevalent, however joints still are stiff On 1/3/2021, congestion and runny nose are still present, stiffness in ankles and now shins are prevalent.

On 12-22-2020, approx. 2 days after vaccine, I noticed several non-tender lumps under my chin/adjacent to left jaw line ~ small gum drop size lumps seemed to congeal together over next 9 days into a single half-dollar dollar sized lump - not completely round.

Headache Chills Temp (101.6) Body aches Skin hurts to touch Soreness in arm (injection site)

Hospitalized with COVID-related pneumonia on 03 Jan 2021. Close contact exposure on 25 Dec, with positive COVID PCR test on 29 Dec... managed as outpatient until respiratory sxms prompted hospitalization on 03 Jan. Care team anticipates at least 4 inpatient days... but patient remains hospitalized at date of this report.

Patient developed SVT 15 minutes after receiving vaccine. Admitted to ICU. ER presentation: BP: 160/109 heart rate 132. No e/o anaphylaxis or allergic reaction.

Sore throat, cold symptoms 3 days after, bone pain

The vaccine was given in the deltoid tendon/shoulder bursa area NOT in the deltoid muscle.

Jan 3, 2021 mild pain at injection site, diarrhea all day, chills in morning , no fever, temp 97.6 Jan 4, 2021 significant arm pain at injection site (awakened by it at 3 am) with chills, temp 99.6. Took One tablet ALEVE followed by temp 98.6

Rash on sides started Thursday. Woke up Friday and rash is all over body itching red and hurts. Taken Benadryl, pepsid and hydrocortisone cream. Called tele doc they gave prednisone nothing is working getting worse

Patient is a 49 y.o. female with a PMHx of AAT deficiency, HPV infection, DVT, Vitamin D Deficiency, Hypercholesterolemia and Anxiety with complaints of acute left arm numbness that radiates into her left digits and chest tightness that began 12-13 min after receipt of the COVID-19 vaccine. She noted numbness radiation into the left side of the neck and the bilateral ears. She voices she has also developed chest tightness and wheezing. Evaluated in the emergency department treated with diphenhydramine 25mg, epinephrine 0.3mg and dexamethasone 10mg

sore arm at injection site for about 1 day

"Pain and swelling in arm where injection was received. Lymph nodes in axilla and in neck were also swollen and painful. Eyes were described as ""glassy"", Two medications prescribed Lidocaine Patch and Naproxen"

Patient had swollen lymph nodes under his left arm 3 days after injection was administered. He stayed he had surgery to remove lymph nodes in June 2020.

Arm pain at injection site, fatigue, mild headache, swollen lymph nodes

riggors, fever,, severe body aches, flank pain, headache, eyes hurt

"Patient was anxious when arrived. After receiving the vaccine, felt light headed and revealed he has ""spells"" of anxiety similar to current experience. Became diaphoretic and needed to lie down."

itching, redness and swelling at injection sight. Took Benadryl on 12/31. Reappeared on 1/1, visited Er, got dexamethasone, Pepcid po and bendaryl

Itchy around the vaccine site, stiff muscle, sore arm

Muscle aches, palm size red ring for 3 days, day 4 rash, Diarrhea, vomiting, arm sore 3 days.

shortness of breath, hypotension, presumed anaphylaxis

Pain at site of injection

Painful/sore joints (shoulders and elbows) for two days. Almost went for treatment after about 48 hrs, but got through a rough night and the next morning it was gone.

Moderate local reaction. Swelling, redness, pain, hot to touch, itchy for 5+ days.

Mild swelling, pain, and itching at the injection site 8 days after injection

MODERNA COVID 19 VACCINE EUA PAIN TENDERNESS SWELLING/ FATIGUE, HEADACHE, MUSCLE PAIN, JOINT PAIN, CHILLS/ THEN CAME THE ALL OVER BODY RASH AND I STILL HAVE THIS

Pfizer-BioNtech COVID-19 Vaccin EUA-. Severe Dizziness, light- headed.

Redness to the area after a week. resolved

Thursday 12/29/20 : Started wheezing, I am using my nebulizer but the wheezing seems to be getting worse My throat also is swollen and red. Fatigue/sleeping a lot Headache

Very swollen lymph node in front of my left ear.

Flue like symptoms but no fever.

I am currently breastfeeding my 11 month old son. On Thursday, December 31st, 2020 (2 days after receiving my vaccine), my son developed a fever x24-36hours and diarrhea that is still on going as of today (1/4/2021). There are no known exposures for my son and his illness. I am reporting this as a possible reaction to the Moderna COVID 19 vaccine I received that could have some how passed through the breastmilk to him.

About 1 week after receiving the vaccine (on 12/31/2020) I developed an itchy, raised, and red hive-like rash at the injection site. It got worse over the next day, and I put some steroid cream on it. It went away gradually and was completely resolved by 1/03/2021

redness and swollen to inj site, rash to hands Benadryl given for sysmptoms

Arm soreness at injection site, worse than a flu shot and starting an hour after the shot and lasting approx 2 days. Increased phelgm production for approx 24 hours following injection.

Moderna COVID-19 Vaccine On day 9 after injection, began to get itching at the injection site. Now on day 10 with red area ~ 5 cm x 3 cm. Mild fatigue on day 9 as well.

Pfizer-BioNTech COVID-19 Vaccine EUA - Patient witnessed another patient with syncope prior to her injection. She was already anxious about receiving vaccination and this increased her anxiety, though she proceeded with immunization. Patient was in 15 min observation window in a chair and began to feel light-headed like she may pass out. A SWAT was called. With RN assistance, patient was lowered to the floor, with no loss of consciousness. Patient was pale and reported anxiety, racing /pounding heart, and felt hot with facial flushing. Patient was transferred to ED and was noted to be tachycardic (120s), but dropped to 80s. She noted that this episode felt different than her prior syncopal episodes associated with anemia. Patient was observed for 5 hours and discharged to home. Patient returned to ED roughly 2.5 hours later complaining of continued dizziness and unsteady gate. Patient was pale and anxious. Patient reported had not eaten/drank enough during her shift and received vaccine immediately post a stressful shift. Additionally, patient witnessed another patient have syncopal episode prior to her receiving her vaccine which made her anxious. Patient was given IV fluids and had electrolytes replacement. Patient additionally received diazepam. Patient was discharged at 2358 on 12/23. Patient returned to ED on 12/24 at 0239 complaining of near syncope and lightheadedness. Patient had tachycardia and self-reported palpitations. Received IV fluids and observation on telemetry with no rhythm disturbance. Patient discharged 1428 on 12/24. On 12/29, patient returned to ED at 0326 for continued dizziness, fatigue and near syncope. Was admitted for cardiac evaluation. Noted to have unprovoked tachycardia and was discharged with a Halter Monitor to evaluate cardiac symptoms. patient was discharged 12/31 at 1619

Received the injection on Wednesday afternoon. I woke up around 3am with an excruciating headache, started vomiting around 6am and continued until 7:30pm. The headache continued and as of this morning 1/4 the headache is still there and my stomach is not settled completely.

Patient received the vaccine and had slight chest tightness, had a slight headache and has mild nausea. He worked the day and still has the symptoms at 1:30 pm

Pt developed urticaria on both arms 4 hours after COVID vaccine administration. Pt received dexamethasone 10mg IM for treatment and diphenhydramine PO 25 mg. Symptoms subsequently resolved.

I received the Moderna COVID-19 vaccine on Tuesday, December 29th at work and on Wednesday, December 30th when I woke up my entire neck had broken out in hives. I did not have hives anywhere else or any other reaction. After taking 25 mg of Benadryl po and applying hydrocortisone cream, the hives had cleared up about 75%. I continued to use the hydrocortisone cream throughout the day, but the hives/redness had fully cleared up by Saturday, January 2nd.

Swollen L armpit, medial, at same side of vaccine. Resolved in 2 days with ibuprofen

Circular redness at injection site about 2 inch in diameter.

Flu like symptoms (fever, chills, aches, fatigue, headache); redness, swelling, warmth and firmness at injection site

Stuffy nose tingling lips tingling face i took 50 mg of over the counter benedryl..symptoms resolved

Arm soreness Arm swelling Headache Right side neck pain Bumps on both cheeks (face)

Patient experienced feeling flushed and nauseated after receiving covid vaccine injection. Declines ED evaluation. No further symptoms reported on 12/19 follow-up

"Pfizer-BioNTech COVID-19 Vaccine EUA - Patient with history of anaphylaxis requiring intubation to benzonatate. Patient answered ""no"" to questionnaire about allergic reactions prior to vaccination. 11 minutes after vaccination, patient reported tingling of lips and swelling of face. Developed hoarseness. SWAT was called and patient given benadryl and taken to ED (1055). Patient received steroids and H1/H2 blockers in addition to epinephrine. Patient brought to ICU for monitoring. Patient continued on therapy and was discharged 1/2 at 1113. Patient returned to ED on 1/3 at 1558 with macular papular rash on leg, chest and back with itching on eyelids and face. No respiratory involvement. Patient given benadryl and predinisone and discharged from ED at 2016."

Generalized body aches that evening, same day as injection. Woke up the next morning, 12/31/2020 with a headache, fever of 100.2, and fatigue

Patient had chills and a fever that started on 12/30/2020 @ 12:00am. The highest fever recorded was 100.6. He took Tylenol on 12/30/2020 @ 6:00am. His symptoms resolved on 12/30/2020 at 8:30pm.

Anterior cervical lymphadenopathy on the ipsilateral side of the vaccination. It seemed to begin on the third day but was most pronounced and painful on the fourth day.

Increasing redness and itchiness, swelling, and discomfort at injection site on R arm, delayed response not present at time of injection, symptoms began 12/27/20 and gradually worsened since then, no improving. Tried Benadryl and cold compresses, as well as Tyelnol.

Body aches, stomach cramping, rash on abdomen, arms. Start of period early (last period 12/22). Itchy all over

Patient developed muscle twitching, fatigue, dizziness and headache minutes after vaccine was given. Day after vaccine given, patient developed small red area around injection site that also had swelling and was warm to touch. No fever or other complication.

Hives and facial swelling. Swelling within the ears. Migrain. Nausea.

Severe joint pain, especially in hips, knees and hands lasting approximately 72 hours after first onset of symptoms. Treatment Tylenol/NSAIDs. Resolved on its own.

Upon injection, vaccine leaked out of syringe at hub site. Stopped injection after noticing after ~0.1mL expelled. Syringe removed, needle noticeably noted to have a curve and retracted into the syringe partially engaged safety.

I received the COVID vaccine on Monday Dec. 21, 2020 at 14:30. By 17:00 I was not feeling well. I was tired, had a headache, muscle aches, nausea and a fever of 101 F. The headache, low grade fever and significant malaise continued through Tues Dec 22 and Wed Dec 23. On Thursday morning Dec 24 at 2:30 AM, I woke from sleep with the urge to use the bathroom. I suddenly felt light-headed and dizzy and had a diaphoresis that soaked my hair and PJs. Fortunately my husband who is a nurse anesthetist helped me through the episode safely and was able to get me back to bed. I am not sure if that event was related to the vaccine or if I happened to be a little dehydrated and had a vaso-vagal event. I did not take any medications because I was allowing my body to have a natural response to the vaccine.

Woke up with a case a vertigo that lasted 30-45 minutes, Headache that lasted around 6 hours that same day

2 Red Area-, itching, burning-the size of a golf ball, the other the size of a quarter- Located at the front of my neck I had vaccine on 12/30/20 at 1:30 pm, and woke up on 01/01/21 at 7am with the red areas.

Patient developed a headache one to two hours post vaccination that lasted approximately 24 hours.

I felt like I was having palpitations, and my blood pressure shot up to 169/119.

About 6 hours after receiving dose, experienced aching in both arms that extended down into both hands - hands was resolved by next morning. Achiness in both arms remained x 48 hours

* TESTED POSTIVE FOR COVID ANTIBODIES 06/2020 - 'STILL HAVE RESIDUAL COUGH' 12/21/2020 - VACCINATION 12/22/2020 9:30 WERE AT WORK; FELT SUPER FLUSHED, SOB, COULDN'T FOCUS, FELT FEVERISH, FELT NAUSEOUS. OCCUPATIONAL HEALTH REFERRED TO URGENT CARE; DR STATED 'NOT TYPICAL RESPONSE'; COVID TEST; NEGATIVE

12/26/20 started to experience covid -19 symptoms.

patient developed fatigue approximately 24 hours after immunization that lasted for about 24 hours. Patient also had soreness at injection site 24 hours after that lasted 24 hours.

first 24 hours: nausea, left arm pain and heaviness 1/2/2021 until present: body aches, very strong headache, sore throat, very tired, coughing with pain, flushed, feel as if my eyes are on fire.

6 days after injection, left supraclavicular lymph node swelling and tenderness and axillary tenderness and swelling

52 year old female received the Pfizer vaccine on 30 Dec 2020. Noticed a slight left sided facial droop as left lower lip numbess on 31 Dec 2020, which has become more pronounced over the past 2 days. She states she spoke to the nurse hotline right before speaking to me who told her to go to the ED (she was on her way). Denies any extremity weakness, numbness, HA or dizziness. No pain to face or ear. Speech

clear on the phone. No recent illness or history of Bell's palsy. NKDA or any prior adverse reactions to immunizations.

Client called clinic on 12/30/2020 in the am requesting us to call in prescription pain medication due to having severe arm pain at the injection site. He stated he had not slept any for the last two nights. Encouraged client to see his PMD if he was in the kind of pain that required a Rx pain medication. Encouraged client to ice down his arm for pain.

"Patinet is a 37 y.o. female ER nurse who received her Covid vaccine just prior to arrival. While being observed at the vaccine site, she developed itching and a rash. She was brought down to the ER for evaluation. Mainly she is itchy all over. She notes a rash across her chest. But she has no cough shortness of breath wheezing. There is no problem swallowing there is no facial swelling. She does not have a history of anaphylaxis, or medication allergies. Review of Systems Constitutional: Negative for chills, diaphoresis and fever. HENT: Negative for congestion, trouble swallowing and voice change. Eyes: Negative for redness and itching. Respiratory: Negative for cough, shortness of breath, wheezing and stridor. Musculoskeletal: Negative for myalgias. Skin: Positive for rash. Pruritus Allergic/Immunologic: Negative for environmental allergies, food allergies and immunocompromised state. Neurological: Negative for headaches. 01/04/2021- Speaking with the patient she states noticed ""hives"" accross chest, right lower extremity, and left upper extremity."

I am breastfeeding-Milk supply significantly decreased (<50% of typical) day of vaccine. Milk supply still decreased 5 days later,

Patient developed fatigue approximately 24 hours after immunization that lasted a couple days.

Approx 25 min after injection I became dizzy and my HR went to the 130?s, at around 30 min post injection my tongue started to swell

Left arm warm, red, sore, swelling noted

dizziness, itching/small hives on forearm (not at injection site) , 30 minutes after vaccine given. Vitals monitored, were normal, sent home and advised to take Benadryl. More hives on upper lip/chin appeared 36 hours after vaccine given. Patient was at home, self-treated with benadryl, zyrtec, famotidine and ice pack applied to area.

Significant neck and upper back pain as soon as 1 hour post vaccine lasting until at least 24 hours - tylenol and heat/ice (no change) chills without fever overnight the night of - no treatment soreness in arm 1 hr post to up to its worst at 24 hours later when I could not abduct >90 degrees for 24 more hours

I got moderna COVID19 vaccine on 12/26/2020. Day 1-3 local pain and swelling, no redness. All resolved after day 3-4. Very tired all week post vaccine,. Day 5-6 noticed ipsilateral axillary lymph node swelling. On day 7 post vaccine I got a localized area of itching swelling and redness as if I had been bitten by a few mosquitoes at injection site that was new. Milder on day 8, less itchy and swollen, but still red and a little raised. Mild shortness of breath.

Really bad headache first 3 days Horrible Chills still ongoing Disoriented and almost like hallucinations Most interesting randomly talking to himself. I mean like a full conversation with someone that isn?t there. He also sometimes feels like when holding something he doesn?t see it or feel it and drops it or vice versa ?.. thinks holding something and isn?t Balance is off Shortness of breath No fever thank goodness and taste and smell are normal

After got vaccinated, I walked out of the clinic to monitoring area approximately 15 walking steps, I felt a little off balance but I was able to make to the chair and sat down. Few seconds later, my heart beat increased faster and faster, my neck turned red. I called for help, they gave me some apple juice to drink and talked to me. About 5 minutes later, my heart beat went back to normal rate and my redness turned back to normal skin color. I only had a little vertigo symptom but I was able to manage myself. About 2 hours later, symptoms disappeared and I was back to my normal health

12/31/20 - cough, sneezing, weakness. Felt ill all weekend. 1/3/21 - called Employee Health with low-grade fever, chills, nausea, weakness and elevated blood pressure 165/104, which had come down by the afternoon to 155/95

Developed Tachycardia approximately 40 minutes post vaccine

patient developed fatigue day after vaccination that lasted about 1 day.

After receiving the vaccine, my arm was in a lot of pain. Then that night and the next day, it was extreme pain, I couldnt lay on it. Then about 3-4 days later, the color is blue and black. Then I started having cold symptoms. Like a head cold. On my left side, my arm and my leg is sore. In addition, my face broke out too. I did not go to the ER. I let Employee health examine my arm . No ER visit

Warm to touch, redness, hard area, sore to touch

patient developed headache and arm pain day after vaccination. Patient stayed and worked from home on this day as a result.

1/2/21 @ 1030: EE called to report she received the vaccine on 12/31/20 between 1030 and 1100. And then around 2330 on 12/31/20 she experienced facial swelling, arm swelling, headache, chills, and dizziness. EE stated she felt it was an allergic reaction to the vaccine and took Benadryl for the next 24 hours to help with the symptoms. EE reported she hasn't had anything since the initial 24 hours, but is concerned about taking the next vaccine. Encouraged EE to contact PCP regarding concern for taking next vaccine. After speaking with Administration, EE encouraged to report vaccine side effects to CDC via V-Safe (https://www.cdc.gov/coronavirus/2019-ncov/vaccines/safety/vsafe.html).

about two inches around the site was red and outlined. Felt slightly raised and was itching. Is still red today 1/4/21

"C/O of ""smokey vision"", outside in parking lot. Sat in car for about 10 minutes before coming into the building. A&O, ambulatory, denies dizziness, HA or lightheadedness. States feels SOB with exertion, ""heaviness in trachea"" increasing with inspiration. Hand off to EMTs. EKG performed, Sinus Tach 108

initially then NSR 80s-90s with occ MF PVCs, couplets. BP 162/94, O2SAT 100% RA, BS POC 208. Patient brought to ER by EMTs"

Within 10 mins. Tongue was tingling lips were swelling and tingling left arm fingers were tingling , headache

Itching, redness and swelling on the injection site. Dr. Prescribed antiniotic Bactrim DS 800-160 Tab

Chills and shaking consistent with flu-like symptoms began about 12 hours following vaccination. The next morning, I had a headache and vomited about 5 times. Over the next several hours, I began to feel better and by that evening, was feeling pretty much normal, except for some lingering fatigue.

This patient is a 56 y.o. female presenting to the emergency department with a chief complaint of a possible reaction to the COVID vaccine onset 2 days ago. The patient states that she has had a fever, chills, adenopathy, and body aches since her vaccination. Her highest recorded temperature was 101F, and she has been taking Tylenol. She states that her biggest concern is the adenopathy under her right armpit which is painful to touch. She denies any masses. She saw her PCP on 12/24 and had blood work done, which showed an elevated white count of 17.

patient developed arm pain day after vaccination that lasted about 1 day.

Left arm soreness, Headache 30 mins after, Fever 100.9 T 5am and 9am, monitoring until now

After initially receiving vaccine 12/28/2020 my arm was sore and slightly red for approx 2 days and resolved on 12/30/20. When I awoke this morning my right shoulder ached and I thought massage might make it feel better - at that time I noted it was swollen and warm tender to touch at site and again appeared red. I did report this to the clinic who administered vaccine

Patient developed arm soreness at injection site day after vaccination

Migraine for 2 days controlled with medication, Severe swollen eyes with discharge from eyes, itchy, red watery eyes began the evening of the vaccine and ongoing. using BENEDRYL and ALLEGRA to decrease symptoms.

Weakness, almost paralysis both lower extremities worse than baseline paresis from ms.

Arm itchy at injection site, warm feeling at injection site

Patient c/o feeling tachycardia, flush and dizziness, flushness upper torso neck region and bilateral upper arms. Rash/hives not present. Placed on stretcher , monitored immediately with BP 156/100, HR 88, O2 99%, alert and oriented x3, verbalizing clearly. Placed on EKG monitor, noted in NSR 80. POC 102. Shortly after at 1001, redness subside ,briefly noted with tingling of bilateral feet and hands for only seconds. Patient was monitored for 40 minutes, returned to baseline 142/81 HR 58 O2 100%. Nutrition given . Discharged to home, ambulatory feeling well.

Asthma-like fatigue, cough due to fatigue, mild.

Noticed itching and slight rash on distal portion of extremities the evening of Dec. 30, rash became worse over next few days and became more inflamed/raised even with Benadryl taken as directed on box. I went to urgent care on Jan 1, 2021 and was started on Steroid taper of 60-40-20 each dose for 3 days. Improvement noted after 2nd steroid dose. No respiratory involvement with vaccine or rash episode

Modern a covid 19

Moderna vaccine received on 12/21 from my workplace. Rash (reddened skin not raised) appeared after vaccine was given (within 24hrs) the size of a quarter and was gone 3 days later. Now on 1/3 the rash (red bullseye not raised) came back the size of a baseball and is warm to the touch. Went to urgent care and physician called it a delayed adverse reaction to the moderna vaccine 1st dose

I got the shot, didn?t feel it at all so it went good. I went to the bathroom and went pee and got my arm back in my long sleeve shirt under my scrub top. I wasn?t anxious about getting the vaccine. Then I went to sit down and be monitored. After about another minute I felt very weird like a warm feeling going all over my body. I started pulling my mask away from my face to get a deep breath. Then I broke out in a sweat from head to toe. I think I became pale (I apparently didn?t look good). I started feeling more ?weird? as I had never felt this way before and I stood up to walk because the nurse there wanted me upstairs near the ED but I was weak so I sat down and had tunnel vision. After that it?s a bit of a blur. After I stopped sweating I got very cold and shaky but vitals were ok. It scared me because I have never had a reaction before to a vaccine.

fever 100.6- 100.5, chills, headache, general weakness, sweating, and loss of appetite.

felt hot, prickly, right arm red. Later felt chest tightness

Starting on Thursday, Dec. 31, patient began having shoulder and neck tightness. That night patient began having chills, and noticed redness at the vaccine sight and then the redness started streaking. Also complaints of itching at the vaccine sight. Started taking Tylenol for the two days following the vaccine, states feels like it is improving. Referred to PCP for evaluation. Has appt. Monday, January 4th

Triage for COVID 19 SEVERE post Vaccine Reaction VAERS reportable Your concerns: Vaccine at noon without immediate effect. Driving home at 1400 developed itching and redness at scalp, face, neck, chest, back, arms and sides. Reports that she did not feel warm but looked like she had a sunburn. It appeared to fade over the next two hours but re-occurred at 1700 with all previous symptoms. She took 50mg of Benadryl and went to sleep. She woke at 0200 the re-occurrence of all symptoms, she did not take any Benadryl as that would make her too sleepy to come to work. The symptoms subsided and when we spoke at 1050 she had only small bumps/hive like spots on her fore arms and cleavage. They do not itch or burn at this time. Discussed with PA and Dr. after which I spoke with patient again regarding pending plan. She will call the clinic if she has any further symptomatic episodes in the near future. We will investigate moving her second dose ahead 2 days from 1/12/2021 (day off) to 1/14/2021 this way she will be here at work should it happen again, she works 0630-1900. Med provider will consult with allergy to determine if further steps are needed for dose #2. Dept: Respiratory Therapy

Have you missed work? #shifts: none Did you seek emergency care? none Date and Time of Vaccine: 12/22/2020 at 1200 Age at time of vaccination, 46 years 6 months Sex: female Was the vaccine received at facility? yes Site of vaccine (LD or RD): RD Type of Vaccine Pfizer (X) Moderna ( ) Other _____ 1st or 2nd dose: first When did your symptoms start? 12/22/2020 at 1400 Please note reported symptoms yes or no, these symptoms are considered mild to moderate and are NOT VAERS reportable Injection site pain no Tiredness no Headache no Muscle Pain no Chills no Joint Pain no Fever (note temp if known) no Injection Site Swelling no Injection Site Redness no Nausea no Feeling Unwell no Swollen Lymph Nodes (lymphadenopathy) no Other: no Employee reports THE FOLLOWING SEVERE post vaccine ADVERSE reactions (reportable): Difficulty breathing no Swelling of your face and throat no A fast heartbeat no A bad rash all over your body yes, see above Dizziness and weakness no If COVID-19 symptoms persist and/or worsen beyond 48 hours consider COVID-19 testing Treatment/Advise: see above Plan: see above If employee was vaccinated at another facility, they need to contact that facility , it is an expectation that the facility that gave the vaccine complete the VAERS report. N/A Employee verbalizes understanding and agreement with plan. yes VAERS report is completed electronically vaccine given at facility. Pending further review. 12/24/2020 01:51pm Follow up to VAER 12/23/2020 Patient called this morning to update regarding vaccine reaction. Yesterday she went home and did some shoveling. Later, around 1900, she developed a itchy, red rash that started on her chest and the right side of her neck which later covered her entire body. The skin on her face was bright red and very hot to the touch, there were small raised hives on her face which were likened to 'petechia if they were raised'. She took pictures of the raised/red areas. She took 50mg of Benadryl and went to sleep, when she woke at 0230 she was asymptomatic. Regarding the bumps on her forearms and cleavage, she has residual mottling on her arms. Updated providers.

Moderna vaccine given 12/28/2020, 6 days after injection have left supraclavicular lymph node swelling and axillary swelling and tenderness

Extreme fatigue, weakness, lightheaded, malaise

Began noticing itching and redness on left had on 1/3 PM. When I woke up on 1/4 the itching in the had was persistent and the redness was about the same. I also noticed a raised, red patch of skin on my right anterior ribs. The rash on the ribs is less itchy than the hand.

receive vaccine on 12/24/2020 arm was red and sore few days. then on 1/1/2021 at injection site a rash developed and had HA, tired , weakness, chills. I continue to feel this way on 1/4/2021

About 1 hour after receiving my first dose of the Moderna vaccine for COVID-19, I started feeling extreme pain in my left shoulder and arm, where the shot was administered. The pain continued to intensify throughout the day and night and was 10/10 on a pain scale. In addition, I began to lose my ability to lift my left arm or use it. It became so weak that I had to use my right hand/arm to pick up my left arm to move it. My left arm was 'hanging and drooping' and my left shoulder was very noticeably lower then my right shoulder. I called my primary care and employee health. My primary care doctor advised me to take advil and go to urgent care if the pain persisted and worsened. I could not sleep at all that evening of 12/29/20 because the pain was so intense and I had to keep picking my left arm up with

my right arm to keep re-adjusting to try and get comfortable. The next morning I went to an orthopedic urgent care where I was diagnosed with nerve damage from the shot and prescribed Methylprednisolone 4mg dosepack. The doctor who saw me explained that he could not assess the extent of the damage at this time because my nerves were so agitated and inflamed. He scheduled a follow up visit with me for Thursday, January 7th and stated he will then proceed with an MRI and further investigation to assess the extent of the nerve damage. During the days that followed my immunization, I was unable to do anything with my left arm and was dependent on my husband to help me get dressed, showered, household chores, etc. It is unknown at this time whether this will be temporary or permanent damage and disability.

swelling, redness that started 1 wk after injection

Moderna COVID-19 Vaccine Vaccine on day 0 GI symptoms on days 1, 2, 3, and 4 including abdominal cramps, constipation, gas Uterine cramps (not related to menstruation) and light spotting on day 2 Soreness at injection site days 0, 1, 2, and 3

arm pain

Injection received at 0815. At 0900 I started getting diaphoretic, clammy, nauseas and my face was flushed. At 0930, I developed hives on my neck, chest and arms. I immediately went back to the vaccination site (I was still in the hospital at work) and was administered 25mg oral Benadryl and monitored for 30 minutes. The hives resolved, but I still felt unwell. At 1600 I noticed a swelling in my right upper thigh about the size of my hand. It was about 2 inches inferior to my inguinal crease and was the width of my thigh. It was mildly painful to the touch. My injection site was red, inflamed and itchy. I continued taking 25-50mg Benadryl Q4 and took 100 mg at night due to itchiness on my eyes, face, neck, chest and arms. This is still present, although less each day, as of Monday 1/4/21 morning. I have felt feverish but have not had a recorded fever. I took some Ibuprofen for the pain in my arm at the injection site. The redness, swelling and itchiness has decreased each day at the injection site, but is also still present as of Monday 1/4/21 morning. I still feel unwell and have continued diarrhea throughout the weekend.

The day of the vaccine I had a initial diarrhea and headache, minimum pain on the site of the injection but at 2AM on the 22nd I woke up from my sleep with chills, and shaking even my teeth were clacking. Took Tylenol and it got better around 30 min later. Felt very fatigued and still nauseated almost threw up. By the end pf the day it resolved itself.

patient developed headache, nausea and abdominal pain day of vaccination that continued for two days post vaccination.

Flu-like symptoms - nausea, sweat. Arm sore immediately after injection - sore for 2 days.

12/17/2020 VACCINE 12/18/2020 SWOLLEN LYMPHNODES IN GROIN, FATIGUE 12/21/2020 EXPERIENCED A STEMI; RUSHED TO ER; FELT LIKE COULDN'T BREATHE, INCREASED HR CARDIAC CATH

Employee states reaction to every vaccine she receives. Employee states ticks, perseveration, uncontrolled laughing and crying which resolve on own. This happened today immediately after vaccine administered. Employee given water, cold pack. Symptoms resolving on own as stated. Will keep longer for observation.

patient developed headache, nausea and abdominal pain day of vaccination that lasted two days following administration.

EE received Covid-19 Moderna vaccine on 12/29/20 at 5:10 p.m. at Covid vaccination site. 12/30/20 at 3:00 a.m.EE had pain in left side, hip and leg waking EE up from sleep . Lesions times two, one on hip and one on posterior upper leg. MD insructed EE to double Vitamin C orally and to place Bacitracin on the two lesions, which at first appeared to contain bloody drainage. Lesions are now dry. VAERS document completed.

fever 100.6, chills, headache

patient developed flu like symptoms such as body aches, chills, fever, as well as arm pain day after vaccination.

Resident found unresponsive without pulse, respirations at 04:30 CPR performed, expired at 04:52 by Rescue

Patient complained of increased shortness of breath, generalized weakness and fatigue with mild cough worsening today and was admitted on 12/25/20. Patient is an employee of the hospital in the ICU and received the covid-19 vaccine on 12/25/20. Patient believes symptoms started after the vaccination. On admission, patient was in sinus tachycardia with O2 saturation 91% on room air. Tested SARs CoV 2 RNA, RT PCR positive on 12/24/20. Transferred to ICU for closer monitoring after transitioning to high flow nasal cannula on 12/26. Patient recovered and discharged on 12/31/20.

Resident became SOB, congested and hypoxic requiring oxygen, respiratory treatments and suctioning. Stabilized after treatment and for the next 72 hours with oxygen saturations in the 90s. On 1/3/2021 was found without pulse and respirations. Resident was a DNR on Hospice.

Two days post vaccine patient went into cardiac arrest and passed away.

syncopal episode - arrested - CPR - death

Severe diarrhea, cold chills, 101 fever, and nausea

""""Pfizer-BioNTech COVID-19 Vaccine"" 12/29 patient developed SOB, fever tmax 103 degrees F, diaphoretic, dry heaves all started approximately 16 hours after vaccination given. patient then transferred to Hospital for further treatment and observation. 12/30 seen at injection site- erythema, swelling, warmth and tenderness Discharged back to home on 1/1 with RX for cephalexin to treat cellulitis of injection site"

"Tingling in lower legs- neuropathy like; Fever 102.9; Tingling in lower legs- neuropathy like; Severe cramping in hands and feet; Severe bone pain; This is a spontaneous report from a contactable other healthcare professional (patient). A 39-year-old female patient received the first dose of bnt162b2 (COVID-19 vaccine) lot no: EL0140, via an unspecified route of administration in left arm on 18Dec2020 15:15 at a single dose for COVID-19 immunization. Medical history included acid reflux and known allergies to PCN, both from an unknown date and unknown if ongoing. The patient was not pregnant at the time of report. Concomitant medication included omeprazole (PROTONIX), ibuprofen (MOTRIN). No other vaccines were administered in four weeks. On 19Dec2020 at 14:30, the patient experienced fever 102.9 ""normal for vaccines i know"", tingling in lower legs neuropathy like, severe cramping in hands and feet, and severe bone pain. The patient recovered from the events in Dec2020. The patient did not receive treatment for the events. The events were reported as non-serious. The patient didn't have COVID prior to vaccination and was not tested post vaccination.; Sender's Comments: A possible causal association between administration of bnt162b2 and the onset of neuropathy like cannot be excluded, considering the plausible temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

Scratchy throat; itching lips; This is a spontaneous report from a non-contactable nurse. A 36-year-old patient of an unspecified gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), lot number EK5730, via an unspecified route of administration on Right arm from 22Dec2020 to 22Dec2020 as single dose for COVID-19 immunization. Medical history included food allergy (Shrimp). The patient's concomitant medications were not reported. The patient experienced scratchy throat and itching lips for approximately 1.5 hours starting 20 mins post vaccine on 22Dec2020. The event caused prolonged hospitalization. The outcome of the events was recovered on 22Dec2020. No follow-up attempts are possible. No further information is expected.; Sender's Comments: Based on temporal association, a possible contributory role of suspect BNT162B2 vaccine cannot be excluded for reported events throat irritation and lip itching. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

delirious; hypoxic; fever; ataxic; incontinent; confused; Chills; HA; anorexia/had no appetite; myalgias; extreme fatigue; slept all and had no appetite; This is a spontaneous report from a contactable physician. A 74-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 15Dec2020 16:00 at single dose for COVID-19 immunization. Medical history included diabetes mellitus (DM). The patient has no known allergies. The patient's concomitant medications were not reported. He was an ER doctor and the medical director of his hospital. The patient was asymptomatic when he got the vaccine on 15Dec2020. 3 hours after the vaccine he began to get chills, HA, anorexia, myalgias, and extreme fatigue. This worsened and he slept

all and had no appetite. On 19Dec2020 he woke up delirious with a fever and was ataxic, hypoxic, incontinent, and confused. The patient was hospitalized due to the events on 15Dec2020. The events also caused prolonged hospitalization due to the events. The patient was not diagnosed with COVID prior to vaccination. The patient was tested for COVID via nasal swab post vaccination with unknown results. The patient did not receive any other vaccines within 4 weeks prior to COVID vaccine. The outcome of the events was not recovered. Therapeutic measures were taken as a result of the events as the patient required oxygen, plasma, and remdisivir. The batch/lot numbers for the vaccine, BNT162B2, were not provided and will be requested during follow up.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of reported serious events might not be excluded, considering the plausible temporal relationship. Fever, chills, headache, fatigue and muscle pain are the known adverse event profile of the suspect product. More information such as detailed underlying medical conditions and concomitant medications are needed for fully medical assessment. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Allergic reaction; Diarrhea; Chills; Palpitation; Tongue and throat swelling; Tongue and throat swelling; This is a spontaneous report from a contactable other healthcare professional (patient). A 38-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: ELO141), via an unspecified route of administration on 21Dec2020 at a single dose for covid-19 immunization. The patient's medical history included asthma and allergy. Concomitant medication included levosalbutamol hydrochloride (XOPENEX) for asthma and cetirizine hydrochloride (ZYRTEC) for allergy. About hour and a half to two hours after the vaccine, on 21Dec2020, the patient experienced had an allergic reaction with symptoms set of diarrhea, chills, palpitations, and tongue and throat swelling. The patient took diphenhydramine (BENADRYL) 25 mg as treatment. It helped some. She woke up this morning (22Dec2020) and still had the symptoms. So, she went to the emergency room. They gave her diphenhydramine 25 mg IV, methylprednisolone (SOLUMEDROL), and famotidine (PEPCID). The patient underwent lab tests and procedures which included blood count and chemistry and lab work which showed normal on 22Dec2020. Outcome of the events was unknown. The patient thinks that the product had causality to the events. Information on the lot/batch number has been requested.; Sender's Comments: The patient's medical history included asthma and allergy. Based on information available, the reported allergic reaction with symptoms set of diarrhea, chills, palpitations, and tongue and throat swelling was likely related to the use of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), due to temporal relationship and clinical course. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

shaking uncontrollably/she was full of shakes to the point the bed was shaking; chills; Woke up in the middle of the night; body aches; as painful as a strep infection; sore throat that was as painful as a strep infection/throat feels sore to the point of Strep/Throat soreness: Felt like sharp razor blades; Feels like she is having an extreme immune response; Feels congestion; severe serum sickness/weird serum sickness; high fever/Had a fever over 101; This is a spontaneous report from a contactable nurse(patient). A 32-year-old female patient received BNT162B2(lot number EH9899) via an unspecified route of administration at Arm Left on 21Dec2020 (from 16:30 to 17:00) at the age of 32 years old at single dose for doesn't want to bring COVID home to her family. The medical history included Migraine headaches. The concomitant medications were not reported. The patient had so many immunizations for international travel, had Yellow Fever vaccine, all of the Guardasil vaccines, had MMR vaccine four times because she never developed immunity to it until the fourth round, got a flu shot yearly,got TDap vaccine every five years because she was an HCP, did Emgality shots(not done it this month. Emgality had a protein inhibitor, was supposed to get Emgality shot on 21Dec2020). On 22Dec2020 the patient experienced severe serum sickness, high fever, body aches to the point that she was shaking uncontrollably, sore throat that was as painful as a strep infection; Caller mentioned she was taking tylenl and benadryl for her symptoms. The patient was a Nurse Midwife. She got the vaccine on Monday evening at 4:30PM. Feeling like she was having a weird serum sickness. Woke up in the middle of the night and she was full of shakes to the point the bed was shaking. She had a fever over 101. Felt like she was having an extreme immune response. She was taking Tylenol and Benadryl around the clock. Woke up this morning and her throat feels sore to the point of Strep. Wondering if she need to distance and get some kind of test. Has been wearing a mask all of the time and doesn't know of anyone people who have COVID that she has been in contact with. Feels congestion and sore throat. Shakes and chills: Began at 02:30. Hard core chills and shakes. High fever over 101: same time as chills and shakes. Woke up from a dead sleep. Didn't have a working thermometer but knows her temperature must have been over 101 by the way she felt. She didn't feel that crappy unless her fever is over 101. She can gauge her own temperature. She experienced throat soreness: Felt like sharp razor blades. The patient was taking numbing throat lozenges. Seriousness: Would say serious. Didn't require hospitalization. She self-treated. Had she not had to work, she would probably have stayed in bed. Has been taking round the clock medicine. The outcome of the events was unknown. The information on the batch number has been requested.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported serious events including severe serum sickness, high fever, body aches, shaking uncontrollably, sore throat that was as painful as a strep infection, feels like having an extreme immune response, congestion, chills, woke up from a dead sleep and the administration of the COVID 19 immunization with BNT162B2, based on the reasonable temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to those, as appropriate.

Have a fever with a high of 99.6 Fahrenheit; felt winded like she has exerted herself more than expected/shortness of air; Coughing/cough got worse; She is covid positive/Tested positive for COVID 19; She is covid positive/Tested positive for COVID 19; Shortness of breath/Shortness of breath was

reported as worsened/feels winded; Tachycardia; Has been sick ever since; Felt like she was in a fog, on a cloud, heavy and out of it; She felt hot and weird but had no fever; Headache; Burning sensations in her legs; Extreme fatigue, want to go to bed; headache went away and she felt like the congestion was clearing up some; Arm was sore; This is a spontaneous report from a contactable ICU nurse (patient [Registered nurse ADN]) via Pfizer-sponsored program. A 38-year-old female patient received single dose of BNT162B2 (lot number: EK5730) , via an unspecified route of administration (right arm) on 16Dec2020 20:30 for immunization (for front line health care worker). Medical history included allergies; acid reflux; patent foramen ovale (PFO); supraventricular tachycardia (SVT) without treatment, vitamin D low and ongoing smoker. The patient had no other history/family history. Concomitant medication included loratadine (CLARITIN) taken for at least 5 years for allergy, famotidine from Dec2020 for acid reflex, and vitamin D taken for 5 or more years for vitamin D low; all given orally and were ongoing. The patient had no other prior vaccines within 4 weeks of Covid vaccination. Patient had been taking Covid tests on and off due to her immunocompromised daughter. On 15Dec2020 she took the PTR that took three to four days for results; she tested negative for Covid and was completely asymptomatic. She then received the COVID 19 vaccine 16Dec2020. Her test was positive for COVID 19 on 18Dec2020 and she had been sick ever since. She received the vaccine at the hospital where she works. The vaccine was not administered at facility. She further reported she was fine after getting the COVID 19 vaccine. Her right arm was sore/ started to hurt about four or five hours later on 16Dec2020 but then was fully after 24 to 48 hours. She started to feel sick on 18Dec2020 (Friday evening). States she went to bed Friday morning after the night shift. She felt fine, better than normal. That same day (18Dec2020) she woke up at 1700 and felt like she was in a fog, on a cloud, heavy and out of it. She walked around for a while and that sensation didn't go away. She felt hot and weird but had no fever. Then at 1830 she got the alert on her phone that told her she was positive for COVID 19. She started to feel other symptoms on 18Dec2020 including headache, shortness of breath, tachycardia, burning sensations in her legs; extreme fatigue, wanting to go to bed that persisted from Friday to Sunday. Then on 20Dec2020, Sunday afternoon, her headache went away and she felt like the congestion was clearing up some. Mentions she did have a fever (onset date unspecified) with a high of 99.6 Fahrenheit; but it went back down to 99.0 Fahrenheit (date/s unspecified). On 20Dec2020 the patient experienced coughing. On 21Dec2020 (Monday) she started coughing more but states her O2 was fine and her breathing was okay. However, when walking around she felt winded like she has exerted herself more than expected. She then clarified that on 21Dec2020, she experienced shortness of air and the cough got worse but it has now plateaued. She did call her HCP and they were holding off on treatment at the time. No investigation assessment was performed. The patient was not admitted to an Intensive Care Unit. The patient did not display clinical signs at rest indicative of severe systemic illness nor did she require supplemental oxygen or receive mechanical ventilation. No preexisting diseases worsened during the SARS-CoV2 infection. The patient considered shortness of breath, and tachycardia as serious: medically significant while the events headache, burning sensations in her legs, fatigue, Coughing, and feels winded were considered as not serious. The events headache, shortness of breath, tachycardia, burning sensations in her legs, fatigue, Coughing, and feels winded were ongoing at the time of reporting. Shortness of breath worsened. The patient recovered from arm was sore on an unspecified date in Dec2020; and was recovering from tachycardia, sick, headache and congestion. The outcome of felt like she was in a fog, on a cloud, heavy and out of it; felt hot, and fever was unknown while not

recovered for the other events.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events due to temporal relationship. However, the reported events may possibly represent intercurrent medical conditions in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including chest x-ray, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

General weakness requiring assistance to stand.; General weakness requiring assistance to stand; Rash on chest/neck; This is a spontaneous report from a contactable Pharmacist. A 33-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EK5730), intramuscularly on 22Dec2020 13:15 at single dose for covid-19 immunization. Vaccine location was right arm and it was the first dose. The facility type vaccine was hospital. None medical history. No known allergies. Patient was not diagnosed with COVID-19 prior to vaccination nor tested for COVID-19 since the vaccination. There were no concomitant medications. The patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine nor received any other medications within 2 weeks of vaccination. The patient experienced rash on chest/neck. General weakness requiring assistance to stand on 22Dec2020 17:00 with outcome of recovered in Dec2020. The date report was first received from source was 23Dec2020. Patient received Fluid bolus, IV benadryl, IV steroid as treatment for the adverse events. The action taken in response to the events for BNT162B2 was not applicable. The events were reported as non-serious.; Sender's Comments: The reported events rash on chest/neck and general weakness requiring assistance to stand were likely related to the use of first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), due to temporal relationship and clinical course. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Flushing; she noticed that there was a ringing in her left ear; Experienced a weird heaviness on her upper chest and arms/ heavy legs and arms/really heavy arms and legs; experienced a weird heaviness on her upper chest and arms; really cold hands; felt really hot at the injection site/really hot sensation at injection site; lightheadedness/Light-headed; Palpitations; Feeling faint; shortness of breath; Her blood pressure went up to 134/100; paleness; went up to her face; felt tired/She was really tired and slept it off; This is a spontaneous report from a contactable nurse, who is also the patient. This 34-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number EK5730) intramuscular in the left deltoid on 20Dec2020 at single dose for COVID-19 immunisation. Relevant medical history included ongoing asthma (diagnosed as a teenager with sports asthma and uses an

inhaler). There were no concomitant medications. The patient experienced lightheadedness/light-headed (medically significant) on 20Dec2020 with outcome of recovering, palpitations (medically significant) on 20Dec2020 with outcome of recovered on 20Dec2020, feeling faint (medically significant) on 20Dec2020 with outcome of recovered on 22Dec2020, flushing (medically significant) on 21Dec2020 with outcome of recovered on 22Dec2020, she noticed that there was a ringing in her left ear (medically significant) on 21Dec2020 with outcome of recovering, shortness of breath (medically significant) on 20Dec2020 with outcome of recovering, her blood pressure went up to 134/100 (non-serious) on 20Dec2020 with outcome of recovered on 20Dec2020, she experienced a weird heaviness on her upper chest and arms (non-serious) on 21Dec2020 with outcome of recovering, really cold hands (non-serious) on 21Dec2020 with outcome of not recovered, paleness (non-serious) in Dec2020 with outcome of unknown, felt really hot at the injection site/really hot sensation at injection site (non-serious) on 21Dec2020 with outcome of recovered on 23Dec2020, went up to her face (feeling hot) (non-serious) in Dec2020 with outcome of unknown, heavy legs and arms/really heavy arms and legs (non-serious) on 21Dec2020 with outcome of not recovered and felt tired/she was really tired and slept it off (non-serious) in Dec2020 with outcome of unknown. The patient specified that she experienced a moderate reaction after having the COVID-19 vaccine. She had the vaccine last Sunday morning 20Dec2020. She was told to wait 20 minutes before leaving. In the waiting area, she felt lightheaded, had palpitations and was feeling faint. After 20 minutes she started feeling better. Then she started to have more intense light headedness. She went to the ER and was given oxygen. Her blood pressure was 134/100 on 20Dec2020. She had an EKG on 20Dec2020 that was normal. They gave her steroids and Benadryl. She had another episode while being injected with the steroids. On Monday 21Dec2020, she experienced a weird heaviness of her upper chest and arm. She had really cold hands and flushing. On Monday night 21Dec2020 she went to work. She experienced a really hot sensation to the injection site that went to her neck and face. Her left ear was ringing. This lasted until Tuesday 22Dec2020. She took Benadryl again on Tuesday 22Dec2020. She had shortness of breath which started on 20Dec2020 and on 22Dec2020 she had shortness of breath that lasted until 11am. She had really heavy legs and arms and went back to the ER. She had a chest X-ray and D-dimer on 22Dec2020 that were normal per the ER. The night before the report, she had some of the same symptoms. She was really tired and slept it off. She didn't take anything. The morning of the report, she was feeling good and better. She still has heavy feeling on upper chest and arms. Caller clarifies that she did not have a heavy feeling in her legs. Her arms feel heavy if she holds her phone too long. She continues to have ringing in her ear. The flushing went up to her face. The patient specified that she developed sports asthma as a child and uses an inhaler. She gets short of breath if she overexerts herself. Additional laboratory investigations on 20Dec2020 included blood work with unknown results and Troponin which was normal. She was provided with a general steroid. She did not know the name of it. She was also given Benadryl and monitored on telemetry. She was given IV fluids again on 22Dec2020.; Sender's Comments: Based on the compatible temporal association and the known pattern of response, the Company considers the reported events are possibly related to vaccination with BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

just kind of having blackout; Severe fatigue/fatigue; Severe myalgia; Some congestion; Severe headache; Haziness; This is a spontaneous report from a contactable other healthcare professional (HCP), who is also the patient. This patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration in Dec2020 at single dose for COVID-19 immunisation. Relevant medical history and concomitant medications were not reported. In Dec2020, the patient experienced just kind of having blackout, severe fatigue, severe myalgia, some congestion, severe headache and haziness. On day six, symptoms improved and suddenly he/she was having symptoms again, severe myalgia, some congestion severe headaches and fatigue. The outcome of the events was unknown. The information about batch/lot number has been requested.; Sender's Comments: This report fails to include the basic information that is required for an independent medical evaluation. Assessment is postponed after receipt of a more complete case report. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Flu like symptoms like myalgia, achy head, mental cloudiness; Flu like symptoms like myalgia, achy head, mental cloudiness; Flu like symptoms like myalgia, achy head, mental cloudiness; Flu like symptoms like myalgia, achy head, mental cloudiness; Deep cough; This is a spontaneous report from a non-contactable physician. A female patient of unspecified age received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on an unspecified date in Dec2020, in left upper arm like deltoid, for COVID-19 immunization. Medical history and concomitant medications were not reported. On an unspecified date in Dec2020, immediately after receiving the vaccine, the patient experienced a deep cough which came on all of a sudden, followed 31 hours post vaccine by flu like symptoms like myalgias, achy head and mental cloudiness. She was feeling a bit better on 22Dec2020 morning and she was back at work. So, it was like a short couple of hours, maybe 24 hours turnaround. The events were resolving at the time of report. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported flu like symptoms like myalgias, achy head and mental cloudiness and the administration of the COVID 19 vaccine BNT162B2 based on the plausible temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified, as appropriate.

Urination bleeding; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received BNT162b2 (Solution for injection, lot number and expiration date not provided), via an unspecified route of administration at single dose on 22Dec2020 for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient experienced urination bleeding in Dec2020 and wanted to know if it was going to be a side effect. The outcome of the event was unknown. Information on the lot/batch number has been requested.

"severe fever; chills; severe night sweats; hives throughout my body; a rash on my face; This is a spontaneous report from a contactable nurse. This nurse reported for helf that the 37-year-old female patient received first dose of bnt162b2 (BNT162B2, product: COVID 19, brand: Pfizer), via an unspecified route of administration on Left Arm on 19Dec2020 10:30AM at single dose for covid-19 immunisation. No Pregnant at the time of vaccination. Medical history included Known Allergies to medications, food, or other products:Cocoa butter. Concomitant medications were unknown. Facility where the most recent COVID-19 vaccine was administered was Hospital. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient reported that ""Starting seven hours after the vaccine, I experienced severe fever and chills. The next morning, despite multiple anti-pyretics, the fevers/chills were worse. Also I experienced severe night sweats, likely related to the fevers. Three days after the vaccine, I began to have hives throughout my body and a rash on my face. Responds to Benadryl, but eventually reappears."" The event started from 19Dec2020 05:30 PM. Treatment was received for the adverse event included Anti-pyretics, anti-inflammatories, anti-histamine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. Facility type vaccine was hospital. No other vaccine in four weeks. The patient recovered with lasting effects. No Covid prior vaccination. No Covid tested post: vaccination. The outcome of the event was recovered/resolved with sequel in Dec2020. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: The reported events severe fever and chills, severe night sweats, and hives and a rash on face were likely related to the use of first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), due to temporal relationship and clinical course. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

Left sides shock like pains in head. Lasts 3-5 seconds and go away. It's a stabbing shock like pain. Started on Thursday 17Dec2020 at 7:45 pm; Left sides shock like pains in head. Lasts 3-5 seconds and go away. It's a stabbing shock like pain. Started on Thursday 17Dec2020 at 7:45 pm; This is a spontaneous report from a contactable nurse reported for herself. A 28-year-old female patient (no pregnant) received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscularly in left arm on 16Dec2020 14:00 at single dose for COVID-19 immunization. Medical history was none. The patient's concomitant medications were not reported. The patient experienced left sides shock like pains in head, lasted 3-5 seconds and went away. It's a stabbing shock like pain. The events started on Thursday 17Dec2020 at 19:45. It was unknown whether treatment was received for the events. The events resulted in doctor or other healthcare professional office/clinic visit. The events were reported as non-serious. The most recent COVID-19 vaccine was administered in hospital. The patient had not received any other vaccines within 4 weeks prior to the COVID-19 vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The outcome of the events was not recovered. Information on the lot/batch number has been requested.; Sender's Comments: Based on the compatible time association, the event left sides shock like pains in head is possibly related to suspect BNT162B2 administration. The impact of this report on the

benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

patient began to experience dizziness/shakiness.; patient began to experience dizziness/shakiness.; This is a spontaneous report from a non-contactable other hcp reporting for a patient. A 58-year-old female patient received first dose of BNT162B2 (Pfizer product, lot number: EH9899), intramuscular on 21Dec2020 16:00 at single dose on left arm for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that during her 15 minute waiting period after the injection (21Dec2020 16:15), the patient began to experience dizziness/shakiness. This provider was notified of patient reaction and she was then transferred to the emergency bay via wheelchair where she was assessed. Monitored patient for severe reaction symptoms, including rapid progression of symptoms, respiratory distress with dyspnea, increased work of breathing, persistent cough and cyanosis, vomiting, hypotension, dysrhythmia, chest pain and collapse. Treatment included no therapy, but did continue with vital checks at approximately 5 minute intervals. Patient discharge: stable to go home and follow up with PCP. The outcome of the events was unknown. No follow-up attempts are possible. No further information is expected; Sender's Comments: Based on the compatible time association, the dizziness and shakiness are possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Small bowel obstruction with diffuse bowel and pelvic lymphadenopathy 36 hours after injection; Small bowel obstruction with diffuse bowel and pelvic lymphadenopathy 36 hours after injection; This is a spontaneous report from a contactable physician (patient). A 61-years-old female patient (not pregnant) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number: EH9899), intramuscularly on 21Dec2020 12:30 to at single dose on left arm for COVID-19 immunization in hospital. Medical history included crohn's disease. No known allergies. Concomitant medications within 2 weeks of vaccination included estradiol, progesterone, colestipol hydrochloride (COLESTID), ustekinumab (STELARA), cyanocobalamin (B12). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced small bowel obstruction with diffuse bowel and pelvic lymphadenopathy 36 hours after injection on 22Dec2020 22:00 with outcome of recovered in Dec2020. The adverse events resulted in emergency room/department or urgent care, hospitalization for 3 days. Therapeutic measures were taken as a result of event included inpatient observation, nothing by mouth (reported as NPO), intravenous fluids. No COVID prior vaccination, COVID test nasal swab was negative on 23Dec2020 post vaccination. It was not reported as serious.; Sender's Comments: There is not a reasonable possibility that reported events small bowel obstruction and lymphadenopathy are related to BNT162B2 vaccine. The patient had underlying Crohn's disease, which put patient at risk of developing the event. The impact of this report on the benefit/risk profile of the Pfizer product is

evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"burst blood vessel in left eye/blood in her eye; This is a spontaneous report from a contactable physician (patient). A 35-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EH9899, expiry date 01Mar2021), via an unspecified route of administration on 23Dec2020 at single dose for covid-19 immunization. Vaccine location was left deltoid. The facility type vaccine was hospital. Medical history included ongoing rheumatoid arthritis for about 8 years. No known allergies. Patient didn't do relevant test. Concomitant medication included duloxetine hydrochloride (CYMBALTA) for rheumatoid arthritis for 2 years, sulfasalazine for rheumatoid arthritis for 4 months, it's unknown if they were ongoing. The patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient received the vaccine yesterday (23Dec2020), which she was very excited about, but today (24Dec2020) she woke up with a burst blood vessel in her left eye, she appears to have blood in her eye. This has never happened to her before. She knows this can occur with patients that have COVID but didn't know if it was a side effect to receiving the vaccine. Patient didn't receive treatment for the adverse event. The action taken in response to the event for BNT162B2 was not applicable. The outcome of event was not recovered. The relatedness between COVID vaccine and event ""burst blood vessel in left eye"" was related by reporter. Pfizer is a marketing authorization holder of [BNT162B2] in the country of incidence or the country where the product was purchased (if different). This may be a duplicate report if another marketing authorization holder of [BNT162B2] has submitted the same report to the regulatory authorities.; Sender's Comments: ""Burst blood vessel in eye"" is not uncommon in general population, and there are many causes of the event. Considering temporal relationship, a contribution role of the injection of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) to the reported Eye haemorrhage cannot be excluded. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

Tachycardia; Intermittent palpitations; Low grade fever/fever; muscle aches; This is a spontaneous report from a contactable physician. A 27-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscularly in unknown arm on 17Dec2020 at single dose for routine mass immunizations (covid-19 immunization). The COVID-19 vaccine was administered at Hospital. Not a military facility. The patient's medical history was reported as none and concomitant medications was none (he was on no other medications). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced tachycardia, intermittent palpitations, low grade fever/fever all started somewhere in the morning of 18Dec2020 and muscle aches on 17Dec2020. Physician assessed tachycardia and intermittent palpitations as serious due to medically significant. Physician stated that one of his workers had the vaccine and proceeded to have tachycardia and low

grade fever. He would like to know if patient should get the second dose. The patient had mostly tachycardia with some intermittent palpitations. Patient was seen in his office on 18Dec2020, and got the COVID vaccine on 17Dec2020. He also reported fever and muscle aches, although the fever was subjective and was not documented. Tachycardia improved and sent him to cardiology on 21Dec2020. It was not life threatening and they did an Electrocardiogram (EKG). His initial heart rate was 130. When he was seen again in their office on 21Dec2020, it was 93, which was baseline. It improved. He never got his temperature. The highest in office was 99.5 degrees Fahrenheit. He had some muscle aches. The physician just sent patient to cardiology because he was having intermittent tachycardia and intermittent palpitations. Two visits to physician office. He was seen on 18Dec2020 and again on 21Dec2020. Relevant tests: they did testing for tachycardia but not related specifically. They did thyroid and EKG in office and he did not know if test were back. EKG was ok. The Thyroid, Complete blood count (CBC) and lipid (all were on an unknown date in Dec2020) were not back and were just done to make sure there were no cardiac issues. The outcome of the events was recovering. The lot/batch number has been requested.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events tachycardia and palpitations cannot be excluded. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

Cellulitis: below left elbow; Soft tissue swelling; This is a spontaneous report from a contactable nurse (patient). A 63-year-old female patient (62 years old at time of vaccination) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number: EH9899), intramuscular in left upper arm on 21Dec2020 13:00 at a single dose for COVID-19 immunization administered in the hospital. Medical history included ongoing hypertension and cervical cancer from 2015 and ongoing. The patient has been taking unspecified concomitant medication/s. The patient previously took amoxicillin and had allergies and nausea. On 24Dec2020 16:00, patient had cellulitis below left elbow and soft tissue swelling. On 25Dec2020, patient went to ER and X-ray was taken and patient was prescribed Keflex 500mg 3x day. Prior to vaccination, the patient was not diagnosed with COVID-19: Since the vaccination, the patient has not been tested for COVID-19. The outcome of the events was recovering.; Sender's Comments: Based on the information currently provided, the vaccination with BNT162B2 might play a contributory role in triggering the onset of cellulitis. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

congestion in the throat and upper lungs; congestion in the throat and upper lungs; This is a spontaneous report from a contactable other healthcare professional (patient). A 61-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EK5730), intramuscular on the left arm on 21Dec2020 09:30 at a single dose for COVID-19

immunization. The patient's medical history included herpes 2. The patient was not pregnant. The patient had no known allergies to medications, food, or other products. There were no concomitant medications. The patient was not diagnosed with COVID-19 prior to vaccination and had not been tested for COVID-19 since the vaccination. On 26Dec2020 09:00, the patient experienced congestion in the throat and upper lungs. Oxygen level was 98 and temperature was 97.7. She had a good diet, no dairy, and no Christmas junk food, so for the patient, it was inexplicable. She was also consistent at mask wearing and all the precautions. No treatment was received for the adverse events. Outcome of the events was not recovered. The events were reported as non-serious.; Sender's Comments: Considering the temporal gap between the vaccination and the event onset, the Company considers the event pulmonary congestion is unlikely related to vaccination with BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

She was hospitalized for a month Occurred after a flu two months prior and a stomach flu 2-3 weeks prior; She was hospitalized for a month Occurred after a flu two months prior and a stomach flu 2-3 weeks prior; This is a spontaneous report from a contactable consumer. A 75-year-old female patient received bnt162b2 (BNT162B2, lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date at a single dose for covid-19 vaccination. Medical history included guillain-barre syndrome from 2011 at the age of 65 and Levaquin allergy. The patient's concomitant medications were not reported. On an unspecified date, the patient was hospitalized for a month that occurred after a flu two months prior and a stomach flu 2-3 weeks prior. The outcome of the events was unknown. Information about lot/batch number has been requested.

I got my left arm pit, lump on it, I have bigger than 1 cm 2 lumps, hidradenitis/Pain under my arm; Patient received Pfizer Covid-19 Vaccine who is a nursing mom; Patient received Pfizer Covid-19 Vaccine who is a nursing mom; Mastitis; I got Myalgia all over the body, especially on my shoulders and back; I had chills but my temperature was normal; This is a spontaneous report from a contactable physician (patient herself). This physician reported information for herself (mother) and baby. This is the mother case. A 40-year-old female patient received her first dose of bnt162b2 (BNT162B2, also reported as Pfizer Covid-19 Vaccine, lot/batch number and expiry date were not reported), via an unspecified route of administration on 20Dec2020 18:30 at single dose for Covid-19 immunisation. The patient medical history and concomitant medications were not reported. The patient informed that she got in her left shoulder and left arm pit, lump on it. It was bigger than 1 cm 2 lumps, hidradenitis under her pits arm same size on 21Dec2020. She also reported that she was nursing mom to her self-kid which is 16 months old. She had Mastitis right now (20Dec2020) and informed that she hadn't it her life before. She got her vaccine on Sunday (20Dec2020) in night. She started to have pain under her arm on monday afternoon (21Dec2020) and then since yesterday (20Dec2020) she had mastitis. The mastitis in the right side, lump and the in the left side, which was the site of the vaccine. She never got a fever but got myalgia all over the body, especially on her shoulders and back and also she had chills but her temperature was normal. The outcome of events was unknown. Information on the Lot/Batch Number has been requested.;

Sender's Comments: Based on the close temporal relationship, the association between the event mastitis with BNT162b2 can not be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2020520371 Fetal case

26Dec2020 continued decreased perfusion added bilateral knee joint pain; 26Dec2020 continued decreased perfusion added bilateral knee joint pain; 25Dec2020 added facial edema; 24Dec2020 ++6 pitting edema on ankles and feet +3 pitting legs and abdomen; 24Dec2020 ++6 pitting edema on ankles and feet +3 pitting legs and abdomen; throat scratchy and tight; throat scratchy and tight; 23Dec2020 slight swelling on feet and ankles; 23Dec2020 slight swelling on feet and ankles; Tingling and best flutter 5 minutes after administration; Tingling and best flutter 5 minutes after administration; This is a spontaneous report from a contactable nurse (patient). A 48-year-old female patient (not pregnant) received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot/batch number: EJ1685, expiration date: Mar2021), intramuscularly on 22Dec2020 at 09:45 at single dose for COVID-19 immunization in hospital. The patient medical history included known allergies: Sulfa, Penicillin; fibromyalgia; hypertension; high cholesterol. Prior to vaccination, patient was not diagnosed with COVID-19. The patient's concomitant medications included other medications was received within 2 weeks of vaccination. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced on 22Dec2020 09:45 tingling and best flutter 5 minutes after administration; 23Dec2020 slight swelling on feet and ankles; 24Dec2020 ++6 pitting edema on ankles and feet +3 pitting legs and abdomen, throat scratchy and tight; 25Dec2020 added facial edema; 26Dec2020 continued decreased perfusion added bilateral knee joint pain. Since the vaccination, patient had not been tested for COVID-19. Therapeutic measures were taken as result of the events included diphenhydramine hydrochloride (BENADRYL) 50 mg every 6 hours. The outcome of the events was not recovered. The report was reported as non-serious, with seriousness criteria-Results in death: No; Life threatening: No; Caused/prolonged hospitalization: No; Disabling/Incapacitating: No; Congenital anomaly/birth defect: No.; Sender's Comments: Flutter occurred 5 minutes after vaccination; a possible causal association between administration of the suspect vaccine bnt162b2 and the serious event onset cannot be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

dizzy/feel faint; perspiring; like blood not getting to my head; had to get on hands and knees, crawl; felt like my heart may be racing 10 min after vaccine/heart felt off beat and like blood not getting to my head/heart rate was 142; felt like my heart may be racing 10 min after vaccine/heart felt off beat and like blood not getting to my head/heart rate was 142; arm sore day #1 and #2- not unexpected; This is a spontaneous report from a contactable Physician(patient). A 48-year-old female patient received first

dose (BNT162B2, lot number EK5730) , intramuscular at Arm Right on 18Dec2020 14:15 at the 48-year-old at single dose for COVID-19 immunization. The medical history included elevated blood pressure , allergic to sulfa, hypertension and Covid. The concomitant products included alprazolam, diphenhydramine hydrochloride (BENADRYL), spironolactone, metoprolol for hypertension, colecalciferol (VITAMIN D 3). The patient previously took nubaine and experienced drug allergy. The patient also happened to be a physician in private practice and received the vaccine at her local hospital. The patient had hypertension which was under excellent control on metoprolol 25 mg. She took it as prescribed every day surrounding the vaccine. On day #1 at the vaccine she felt like her heart may be racing 10 min after vaccine was about 80 on 18Dec2020 14:25. nothing serious. The patient experienced arm sore day #1 and #2 and not unexpected. On about 7 pm the day after the vaccine 19Dec2020 she was tachy at rate of about 105. She took her metoprolol heart rate never came down. At about 9:30 pm on 19Dec2020 when her rate should have been about70- she got up from couch after falling asleep. Upon standing felt like she was very dizzy. Walked upstairs, started to feel faint, perspiring, heart felt off beat and like blood not getting to my head. She had to get on hands and knees, crawl and heart rate was 142 and sustained for almost a minute. It took over an hour for it to come back to 86 and stayed there all night. There was not treatment to all of the adverse events. The outcome of the events was Recovering.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the palpitations, tachycardia and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including EKG, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Severe rash; This is a spontaneous report from a contactable healthcare professional (patient). A 42-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EK5730 (pending clarification)), intramuscularly at the left arm on 21Dec2020 at 16:00 (04:00 PM) at single dose for COVID-19 immunization. The patient was vaccinated at a hospital. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not pregnant at the time of vaccination. The patient's medical history included Diabetic, type 1, allergies to penicillin, and the patient diagnosed with COVID-19 prior to vaccination. The patient was not tested for COVID-19 since the vaccination. The patient previously took codeine and experienced allergies. The patient received other unspecified medications within 2 weeks of vaccination. The patient experienced severe rash on 23Dec2020 at 21:30 (09:30 PM). The adverse event resulted in emergency room/department or urgent care: the patient was treated at local ER with prednisone and benadryl. The event was reported as non-serious. The patient recovered from the severe rash on an unspecified date in Dec2020.; Sender's Comments: Based on the information currently provided, the vaccination with BNT162B2 might play a contributory role in triggering the onset of severe rash. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety

evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Diarrhea persisted 24 hours with mucous and bloody mucous after all fecal material was exhausted.; Did have one episode of chills; This is a spontaneous report from a contactable physician. A 51-year-old female patient received the first dose of bnt162b2 (BNT162B2) lot no: EK9231, intramuscular on 23Dec2020 09:45 at a single dose for COVID-19 immunization in workplace clinic. Medical history included hypothyroid, allergies from bee sting, and covid-19 from Apr2020, all unknown if ongoing. Concomitant medication included levothyroxine sodium (SYNTHROID). The patient did not receive other vaccine in four weeks. On 25Dec2020, in the late evening at 11:45 PM-almost midnight, the patient experienced diarrhea, severe, without nausea or vomiting. Did have one episode of chills that resolved. Diarrhea persisted 24 hours with mucous and bloody mucous after all fecal material was exhausted. The patient had COVID-19 in Apr2020 and had positive antibodies in Jun2020 with high titers. She confirmed with their ID chief that she should proceed to receive the vaccine. Diarrhea resolved in 24 hours. Some lingering increased GI activity. No fever (temp 99.0F) (Dec2020). The patient recovered from events without treatment in Dec2020. The events were reported as non-serious. The patient was not tested for COVID-19 post vaccination.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of diarrhea, severe cannot be excluded, considering the plausible temporal relationship and the known adverse profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate

Difficulty breathing; This is a spontaneous report from a contactable pharmacist. A 54-year-old female patient received her first dose of intramuscular BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 22Dec2020 at 04:15 PM at single dose in left arm for COVID-19 immunisation at the age of 54-year-old. Lot number was ELO140. Medical history was unknown, concomitant medications were unspecified. Patient was not pregnant at the time of vaccination. On 22Dec2020 at 04:30 PM, the patient experienced difficulty in breathing, and she was hospitalized for one day. The patient was treated with EPI for the event. The patient was recovering from the event.; Sender's Comments: Based on the compatible temporal association, the Company considers the event difficulty in breathing is possibly related to vaccination with BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

short of breath; Intense headache; tiredness; body aches; This is a spontaneous report from a contactable other healthcare professional (patient). A 47-year-old female patient (not pregnant) received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: ELO124), via an unspecified route of administration on 23Dec2020 at 14:30 on Left arm at

single dose for COVID-19 immunization in hospital. The patient medical history included Rheumatoid arthritis, lupus. No known allergy, no allergies to medications, food, or other products. Prior to vaccination, patient was not diagnosed with COVID-19. Concomitant medications included baricitinib (OLUMIANT), hydroxychloroquine, prednisone. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced Intense headache, tiredness, body aches, short of breath on 24Dec2020; events were resulted in: Doctor or other healthcare professional office/clinic visit. Since the vaccination, patient had been tested for COVID-19 on 27Dec2020: Nasal Swab, result was unknown. No treatment was received for the events. The outcome of the events was not recovered.

"have COVID; have COVID; bone-crushing-pain; fever; This is a spontaneous report from a contactable consumer reporting for a patient (nurse). A 47-year-old female patient received first single dose of BNT162B2 (Solution for injection, batch/lot number and exp date not reported), via an unspecified route of administration on 20Dec2020 for immunization. The patient's medical history concomitant medications were not reported (unknown). Patient was an ER Nurse and took first dose of vaccine and then described mild/moderate symptoms on day one only. On 23Dec2020, patient posted they have COVID (positive COVID test). Contracted from spouse who got it from work. She further described it as ""hit by a truck."" On Day 4 she describes her COVID symptoms: bone-crushing-pain when fever rises. Symptoms were COVID symptoms, not directly related to vaccine. The events/symptoms started on 20Dec2020. Patient had no Covid prior vaccination. The patient was COVID tested post vaccination. The patient considered the events as non-serious. The outcome of events was not recovered. Information on Lot/Batch number has been requested."

abdominal pain; nausea; high blood pressure; This is a spontaneous report from a contactable consumer. A 93-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL0140), via an unspecified route of administration on 22Dec2020 at a single dose for COVID-19 immunization. Medical history included diabetic and irritable bowel. The patient's concomitant medications were not reported. The patient received the COVID vaccine and had abdominal pain, nausea and high blood pressure within 12 to 18 hours of vaccine received. The events lead to nursing home to emergency room and admitted to hospital. The patient was hospitalized due to events since 23Dec2020. Outcome of the events was recovering.

Golf ball size lump in armpit of injection arm; This is a spontaneous report from a contactable nurse. A 49-year-old female patient received bnt162b2 (BNT162B2), via an unspecified route of administration on left arm on 19Dec2020 18:15 at SINGLE DOSE for COVID-19 immunization. There was no medical history reported. Concomitant medication included estradiol (ESTROGEN), and meloxicam. On 26Dec2020 08:00, the patient experienced golf ball size lump in armpit of injection arm. The patient did not receive treatment for the adverse event. The outcome of the event was not recovered. Information on the lot/batch number has been requested.

I had seizure like 3 times; Vasovagal reaction; Fever; Headache; Weakness; It's just little bit shaky and breathless; It's just little bit shaky and breathless; allergic reaction; This is a spontaneous report from a contactable consumer. A 40-year-old female patient received bnt162b2 (BNT162B2, lot number:

EK5730), via an unspecified route of administration on 24Dec2020 at a single dose for covid-19 vaccination. There were no relevant medical history and concomitant medications. The patient reported that on an unspecified date, she had an allergic reaction. She had vasovagal reaction and seizures. Vasovagal was an allergic reaction that happened, and added that basically it's an allergic reaction. The patient experienced fever, headache, and weakness like right now. It was just little bit shaky, ever since yesterday and she had been way off like she take it as instruction yesterday, weakness, headache and breathless did not stopped from yesterday. The patient had been taking Tylenol for fever and headache. The patient reported that the events persisted. On 24Dec2020, lab work was done at the hospital, and she was told that the lab work was okay and they did CT scan of head because she developed seizure. She had seizure like 3 times so they scanned her brain. The outcome of the events was not recovered.

developed a migraine; nausea; sensitivity to light and sound; sensitivity to light and sound; she developed significant loss of mental clarity (brain fog); On 18Dec in the AM, developed progressive severe soreness at injection site, worse than any other vaccine, hurt even just the the touch. This lasted about a total of 36 hours and progressively improve; brain fog; retroorbital headache/intermittent mild tension type frontal headache; This is a spontaneous report from a contactable physician (patient). A 29-year-old female patient received first dose BNT162B2 (lot number EH9899), via an unspecified route of administration on 17Dec2020 12:00 at 29 years old at single dose at Left arm for COVID-19 immunization. Medical history included Mirena IUD, personal and family history of retinal migraines (without headache). The concomitant medications were magnesium citrate, melatonin, ademetionine (SAME) and fish oil. On 18Dec2020 in the AM, developed progressive severe soreness at injection site, worse than any other vaccine, hurt even just the touch. This lasted about a total of 36 hours and progressively improved. There was no swelling, redness, or other local symptoms. In the afternoon on 18Dec2020, she developed significant loss of mental clarity (brain fog) while at work. In the evening on 18Dec2020, developed mild retroorbital headache (this was actually the first headache of my life). All day 19Dec2020 and about half the day of 20Dec2020 developed a migraine (also the first of my life), experienced as retroorbital pounding headache, sensitivity to light and sound in 19Dec2020, nausea without vomiting in 19Dec2020, and loss of mental clarity. She had intermittent mild tension type frontal headache on 20Dec2020 PM with all other symptoms resolved, all symptoms resolved by 21Dec2020 AM. The patient used naproxen 440 mg and Tylenol 1000 mg on 19Dec2020. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. The patient was not Allergic to medications, food, or other products. The outcome of the events was recovered on 21Dec2020. The information on the batch number has been requested.; Sender's Comments: Based on information available, the reported loss of mental clarity together with other events was likely related to the first dose BNT162B2 due to temporal relationship and clinical course. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"husband and daughter tested positive/after taking the shot, she was feeling sick and had a fever/wondering if the vaccine can give the reaction, or maybe she has the virus; husband and daughter tested positive/after taking the shot, she was feeling sick and had a fever/wondering if the vaccine can give the reaction, or maybe she has the virus; having a lot IO symptoms; fever; has been feeling ""sick""; This is a spontaneous report from a contactable consumer. A 56-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), via an unspecified route of administration on the left arm on 22Dec2020 at single dose for COVID-19 immunisation. The patient's husband and daughter tested positive (COVID-19). There were no concomitant medications. The patient stated, ""had the first vaccine shot, later clarified as Pfizer COVID vaccine, on 22Dec2020, and didn't have any symptoms before that, her husband and daughter tested positive, but she was staying away from that, had no symptoms, but after taking the shot, on 24Dec2020, she was feeling sick and had a fever, and has had a fever ever since, and she is taking Tylenol and Motrin every six hours, and even then she still gets the fever, it hasn't stopped, she is having a lot IO symptoms, and is wondering if the vaccine can give the reaction, or maybe she has the virus. On 24Dec2020 is when the fever started and she was feeling sick. States she filled out a report online, on (Website)"". The outcome of the events was not recovered."

his gums became discolored and turned purple/gums (both sides up and down) remain purple/discoloration to the gums in his mouth; his mouth started hurting; feeling hot; Body aches; Fever; Pain to the gums in his mouth; muscle aches; sore throat; neck pain; This is a spontaneous report from a contactable nurse (patient). A 26-year-old male patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiration date were not reported), via an unspecified route of administration to right shoulder on 24Dec2020 11:30 at a single dose for COVID-19 immunization. There were no medical history and concomitant medications. The patient received vaccine on 24Dec2020. He experienced body aches, fever, and feeling hot with onset of about 3-4 hours after he was administered (24Dec2020). Next day (25Dec2020), his mouth started hurting, his gums became discolored and turned purple. Gums (both sides up and down) remained purple. He will be seeing a dentist. He also reported pain and discoloration to the gums in his mouth on 25Dec2020. He had been experiencing some of the regular side effects such as muscle aches, sore throat, neck pain on an unspecified date in Dec2020. Outcome of the event gum discoloration was not recovered, of the events feeling hot, generelized aching, and fever was recovered on 26Dec2020, of the event gum pain was recovering, and of the remaining events was unknown. He reported seriousness criteria as what he thinks to be medically significant at this point; that they could be medically significant. He is scheduled to receive the second dose of the product which at this point he does not plan to change. Dose change is unknown until he determines cause of these events and on what the doctor and dentist he is going to see recommend. He believes events could be caused by the vaccine. Information on the lot/batch number has been requested.; Sender's Comments: A causal association between BNT162 and the reported events cannot be excluded based on a compatible temporal relation. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

extreme muscle ache that she couldn't move; I couldn't take the pain/severe body ache severe like I couldn't walk; I couldn't take the pain/severe body ache severe like I couldn't walk; extreme muscle ache that she couldn't move; High fever; Lot of chills; Itchiness; Hives; she was crying; This is a spontaneous report from a contactable Nurse (patient). A 44-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date unknown), intramuscular on an unspecified date at single dose for covid-19 immunization. Patient history was no and investigation assessment was no. There were no concomitant medications. The patient had hives and itchiness and then that was the first day that was after 8 minutes and then the next day the patient had severe body ache severe like I couldn't walk, she cried. The patient took Tylenol and Ibuprofen as she couldn't take the pain (further clarification was unknown). The patient had high fever 102.4 and was having a lot of chills. Start date of event was 24th, the 23rd she had the hives and the 24th she had the extreme muscle ache that she couldn't move and she was crying and she had the chills and the fever on the 24th. So it on started 23rd with the hives so then it started with the body aches and the fever on the 24th. Outcome of the events was recovered. The causality between the events and drug was considered as related by the reporter via Global Introspection. Information on the batch/lot number has been requested.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported body ache severe like I couldn't walk, extreme muscle ache that she couldn't move, and the administration of BNT162B2, based on the reasonable temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

"left sided weakness; it has weakened his heart; stutter; severe stroke like symptoms; Ventricular tachycardia/help keep his heart rate at bay; Loss of balance; extreme numbness and tingling in left hand and foot; tingling in left hand and foot; oral motor impairment; mouth weakness and not coordinated/mouth is fatigued easily; Issues finding words and trouble speaking; Issues finding words and trouble speaking; Ejection fraction down to 25%; The initial case was missing the following minimum criteria: adverse event. Upon receipt of follow-up information on 28Dec2020, this case now contains all required information to be considered valid. This is a spontaneous report from a contactable other healthcare professional (HCP). A 29-years-old male patient received bnt162b2 (lot number: EJ1685), intramuscular (deltoid left) on 21Dec2020 at 05:30 at 0.3 mL single (first dose) for Covid. Medical history was reported as ""none"". Concomitant medications were not reported. The patient previously received Flu vaccine in Oct2020 for immunization. The patient is an Occupational Therapist, and he called to report an adverse event that he experienced with the first dose of the COVID Vaccine. He received the vaccine last Monday, 21Dec2020 at 5:30AM before his shift at work, then 20 minutes later, he was having severe stroke like symptoms. He experienced severe left sided weakness, loss of balance, extreme numbness and tingling in his left hand and foot, he had issues finding his words and he couldn't speak, and he had an oral motor impairment where his mouth was weak and not coordinated. The staff at the hospital did a neurological exam on him, and he failed, so he had to go to the emergency room (ER). The patient added that he was already in the hospital when this happened, and the ER doctors suspected that he had a CVA, and they gave him TPA to prevent any permanent brain damage and it

worked. The patient then added that due to the shock of this whole event, from everything that happened, it has weakened his heart. Reportedly, he is a healthy 29 year old man, with no preexisting conditions, and he works out, and he has no heart conditions, but he had to get a cardiology follow up a few days after he got the vaccine, because he started going in to Ventricular Tachycardia, which he had never had in his life. So, the doctors at the hospital went ahead and did an Echocardiogram and an EKG, and he was told that his Ejection Fraction is down to 25%. He stated his heart is so weak, that he cannot work right now, but the structure of his heart is fine and has not had any damage. The hospital staff thought that maybe the patient had a chronic heart issue that he just did not know about, and that the stress of this event maybe made it kick into overdrive, but he states that the cardiologist said that was not the case, because the structure of his heart is fine, and the only thing they can see is that the heart is pumping weak. One physician even suggested that due to the shock of the event, he might have Takotsubo Cardiomyopathy, which is a broken heart, but because the structure of his heart is okay, it should be reversible. He stated that he is hoping he will heal up good, because he is young and has no pre-existing conditions. He added that his heart is in such a state right now; he has to wear an external defibrillator. The patient stated that all these happened about 20 minutes after he received the vaccine, and he was admitted to the hospital from 21Dec2020 to 25Dec2020. His neurological symptoms have resolved except that he has a stutter that he did not have before and his mouth is fatigued easily, so he has to slow down when he is eating, but now he can eat regular for the most part. The patient confirmed that he was not specifically prescribed the product; it was administered to him at his place of work, but it was optional. He stated he considered how he is working with COVID patients every day, and given the circumstance, he thought that it would be a best practice for him to get the vaccine. He had not gone to his primary care doctor in a while because he had been fine and healthy, but he called them and found out that his primary care had retired, so he has to find a new one now. Regarding the issues finding words and trouble speaking, he stated that he has improved, but it is still ongoing, he is just stuck in a plateau zone. With the Ventricular Tachycardia, he stated that this is an ongoing issue, as he has to wear the life vest even though he has no need to activate it yet. He did have one minor bought of the VTach, but because he is a therapist, he knows how to take care of it with relaxation techniques, he knows how to manage it. He had one bought of VTach the evening prior, but he was able to get it under control. The doctors have him on medication to help keep his heart rate at bay. He has never had to use medication before and is on the following medications to help keep his heart rate at bay: Metoprolol 25mg one tablet once daily by mouth and Lisinopril 5mg one tablet once daily by mouth. The VTach has improved, it was good enough he was able to discharge home, but it is still a concern. His cardiologist said that, basically his hope, is that once his body recover from the whole shock of everything, then his ejection fraction will heal, and his heart will heal. He again stated that the doctor told him that the structure of his heart is perfectly fine; he has thick walls in his heart, no leaking valves, and the heart was not conducting any abnormal signals. The doctor just said that right now, his heart is super weak and that it is an acute problem. With the Takotsubo Cardiomyopathy, he states that two doctors mentioned this diagnosis, but he confirmed that he was not actually diagnosed with this issue, he was just diagnosed with Ventricular Tachycardia. The outcome of the ejection fraction down to 25% was unknown to the patient at this time as he has not had another EKG or echocardiogram, but the cardiologist told him that the cardiologist expects that this will not be resolved quickly anyway. The patient confirmed that he did not receive any other vaccines on the same day he received the COVID

vaccine. The only other vaccine he had this year was the flu vaccine which he got back in Oct2020. He has gone on to his online portal and there are the bloodwork results and all the imaging results on there from his CTs and MRIs, but he did not see the EKG or Echocardiogram results yet. He does not have this pulled up at this time, but he does have access to this stuff and can provide it later, if requested. He is curious about the next steps from here to how his case is processed. He is also curious if this information would help Pfizer make modifications to the vaccine if it is found that a lot of people are having the same reaction as he did. He is also wondering, given his situation, that probably he is not going to get the second dose, for his safety, but he is wondering what percentage of effectiveness the first dose does having just covered. The events left sided weakness, loss of balance, extreme numbness and tingling in left hand and foot resolved on 25Dec2020; severe stroke like symptoms and oral motor impairment; mouth weakness and not coordinated/mouth is fatigued easily resolved in 2020. The events ventricular tachycardia/help keep his heart rate at bay and issues finding words and trouble speaking were resolving, stutter had not resolved while the outcome of the events it has weakened his heart, and ejection fraction down to 25% was unknown.; Sender's Comments: The reported information is unclear and does not allowa meaningful assessment of the case. It will be reassessed upon receipt of follow up information. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

Left sided hearing loss; This is a spontaneous report from a contactable physician who was also the patient. A 42-year-old non-pregnant female patient received bnt162b2, lot number and expiration date were unknown, via an unspecified route of administration on 16Dec2020 , 8:30 at a single dose for covid-19 immunization. The patient's medical history included antiphospholipid antibody from an unknown date and unknown if ongoing. The patient's concomitant medications were not reported. On 22Dec2020, the patient experienced left sided hearing loss. It was unknown if patient received treatment for the event. The outcome of the event was not recovered. The patient was not diagnosed with COVID prior to vaccination and has not been tested for COVID-19 since vaccination. Patient has no allergies. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Information on the lot/batch number has been requested.; Sender's Comments: As an individual case report there is not enough evidence to establish a causal relationship with the suspect vaccine. Currently there is no clear biological plausibility between the vaccine use and the even onset. More information such as complete medical history and concomitant medications are needed for fully medical assessment. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

severe hearing loss; This is a spontaneous report from a contactable physician (patient). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an

unspecified route of administration on 16Dec2020 at single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient experienced severe hearing loss on Dec2020 and was inquiring if it was a reported side effect of the vaccine. Outcome of event was unknown. Information about lot/batch number has been requested.; Sender's Comments: A causal association between BNT162 and the reported event cannot be excluded based on a compatible temporal relation. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

tightness in throat and lump in throat/had a tightness and lump in her throat; tightness in throat and lump in throat/had a tightness and lump in her throat; allergic reaction like rash, tightness in throat, and lump in throat; allergic reaction like rash/red rash on her chest and rash was on her arms too; cheeks were flushed; This is a spontaneous report from a contactable nurse (patient). This nurse reported similar events for 3 patients. This is the first of 3 reports. A 23-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) lot number: EK9231, intramuscular in the right deltoid, first dose on 27Dec2020 14:15 at a single dose for covid-19 prevention. Medical history included ongoing asthma and reactive airway which she was diagnosed when she was like 5 years old (2002). Concomitant medication included albuterol [salbutamol] for asthma which started when she was 8 years old or so. The patient wanted to know if she can receive the second dose of covid vaccine after experiencing symptoms of allergic reaction like rash, tightness in throat, and lump in throat. She wanted to know the ingredients and specific proteins in the covid vaccine. The patient received the COVID Vaccine and she developed a reaction. On 27Dec2020, she had a red rash on her chest, and her cheeks were flushed, and the rash was on her arms too, and she had a tightness and lump in her throat, it was not painful to swallow but she could feel the pressure with swallowing. She stated that she did not experience shortness of breath, but regardless, she was seen in the ER and she was given IV SOLUMEDROL, and BENADRYL, and she was watched for 5 or 6 hours and then she was sent home with an Epi Pen, around the clock Benadryl, and prednisone. She asked the ER doctors if they thought it was okay for her to receive the second dose of the product, and they told her to contact employee health for that question. She mentioned that she contacted that employee health and was told to contact her primary care provide which she did. Her primary care doctor instructed the caller to call Pfizer and gather some more information regarding ingredients, as the she may have had the reaction to a particular protein filler. She was also wondering if this is a known reaction to the product. She received the vaccine on 27Dec2020 at 2:15 PM. She reported that the red rash on her chest and arms, and her cheeks being flushed, resolved yesterday after receiving IV BENADRYL. Had a tightness and lump in her throat which was still ongoing, and it was kind of off and on and when the she takes Benadryl it goes away. She reported that this one is medically significant because even though she did not have shortness of breath, it could have affected her airway. She confirmed that she received no other vaccines on the same day as the COVID vaccine. The outcome of the events 'had a tightness and lump in her throat', allergic reaction was not recovered (a s reported); while recovered on 27Dec2020 for allergic reaction like rash/red rash on her chest and rash was on her arms too and cheeks were flushed.;

Sender's Comments: Based on temporal association, the causal relationship between bnt162b2 and the events throat tightness, sensation of foreign body, allergy to vaccine, rash erythematous and flushing cannot be excluded. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2020517134 different patient, same drug and same event;US-PFIZER INC-2020517133 different patient, same drug and same event.

Fever up to 120F; Bodyaches; Headache; dulled taste and smell; dulled taste and smell; Pain at the injection site; This is a spontaneous report from a contactable other HCP. A 25-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (reported as COVID 19 vaccine), intramuscular on 27Dec2020 12:00PM at single dose for covid-19 immunization. Vaccine location was left arm and it was the first dose. The patient medical history was not reported. Concomitant medication included influenza vaccine (FLU) on 16Dec2020 at right arm. Patient was not diagnosed with COVID-19 prior to vaccination nor tested for COVID-19 since the vaccination. The patient didn't receive any other medications within 2 weeks of vaccination. The patient experienced fever up to 120F, bodyaches, headache, dulled taste and smell, pain at the injection site on 27Dec2020. Patient didn't receive treatment for the adverse events. The action taken in response to the events for BNT162B2 was not applicable. The outcome of events was not recovered. The events were reported as non-serious. Pfizer is a marketing authorization holder of [BNT162B2] in the country of incidence or the country where the product was purchased (if different). This may be a duplicate report if another marketing authorization holder of [BNT162B2] has submitted the same report to the regulatory authorities. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: A causal association between BNT162B2 and the event hyperpyrexia cannot be excluded based on compatible temporal relation. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

High blood pressure 187/95; Heart rate at one time 210 bpm; chest pain; Shortness of breath; This is a spontaneous report from a contactable pharmacist (patient) reported for herself that a 45-years-old female patient received first dose of BNT162B2 (lot number: EH9899), via intramuscular in left arm on 22Dec2020 07:00 AM at single dose for COVID-19 immunization. The patient was not pregnant. No known allergies. No allergies to medications, food, or other products. No other vaccine was received within 4 weeks prior to the COVID vaccine. No other medications were received within 2 weeks of vaccination. The patient was not diagnosed with COVID-19 prior vaccination and patient was not tested for COVID-19 since the vaccination. There were no medical history or concomitant medications. The patient experienced high blood pressure 187/95, heart rate at one time 210 bpm, shortness of breath and chest pain on 23Dec2020 10:00 AM. The events resulted in doctor or other healthcare professional

office/clinic visit, emergency room/department or urgent care. Treatment was received for heart rate at one time 210 bpm which included lab works and medication given propranolol to decrease heart rate. The outcome of the event was recovering.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events hypertension, heart rate increased, chest pain and dyspnoea cannot be excluded. The information available in this report is limited and this case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

She had an immediate reaction of accelerated heart rate and elevated blood pressure; She has very slightly elevated heart enzymes.; She had an immediate reaction of accelerated heart rate and elevated blood pressure; She's very anxious and very anxious tonight being alone at the hospital.; This is a spontaneous report from a contactable consumer (patient's father). A 30-years-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 18Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient had an immediate reaction of accelerated heart rate and elevated blood pressure. She was monitored for an hour and it subsided. On unspecified date in Dec2020 at 1:00am in the morning she had racing heart rate and went to ER. She was still in hospital. Things were not entirely stabilized. She had very slightly elevated heart enzymes in Dec2020 with outcome of unknown. They keep her overnight for an echocardiogram in morning. The patient was very anxious being alone at the hospital. Caller questioned if this has been reported with the vaccine. Lot/Batch and Expiry date has been requested.

mental cloudiness; bruising of injection site; arm pain; fatigue; This is a spontaneous report from non-contactable Pharmacist (patient). A 33-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) intramuscular at right arm on 19Dec2020 08:15 at single dose for Covid-19 immunization. The Covid-19 vaccine was administered in a hospital facility. Medical history included seasonal allergies, heartburn, and allergies to ethanol. The patient has no Covid prior vaccination. Concomitant medication included cetirizine, esomeprazole, melatonin; all from unspecified date for unspecified indication. The patient did not receive other vaccines in four weeks prior to the Covid vaccine. On 19Dec2020 at 15:00, the patient experienced bruising of injection site (x 1 week), arm pain, fatigue, mental cloudiness (approximately x 1 day). The patient was not tested post vaccination. The patient did not received treatment due to the events. The outcome of the events mental cloudiness, bruising of injection site, arm pain and fatigue was recovered in Dec2020. No follow-up attempts are possible. Information about lot/batch number cannot be obtained.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the event mental impairment cannot be excluded. The information available in this report is limited and this case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as

part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

30 minutes after receiving vaccine, patient reported heart racing, dizziness, flushing, burning pain in her chest, dizziness. tachycardia, nausea and throat tightness; 30 minutes after receiving vaccine, patient reported heart racing, dizziness, flushing, burning pain in her chest, dizziness. tachycardia, nausea and throat tightness; 30 minutes after receiving vaccine, patient reported heart racing, dizziness, flushing, burning pain in her chest, dizziness. tachycardia, nausea and throat tightness; 30 minutes after receiving vaccine, patient reported heart racing, dizziness, flushing, burning pain in her chest, dizziness. tachycardia, nausea and throat tightness; 30 minutes after receiving vaccine, patient reported heart racing, dizziness, flushing, burning pain in her chest, dizziness. tachycardia, nausea and throat tightness; 30 minutes after receiving vaccine, patient reported heart racing, dizziness, flushing, burning pain in her chest, dizziness. tachycardia, nausea and throat tightness; 30 minutes after receiving vaccine, patient reported heart racing, dizziness, flushing, burning pain in her chest, dizziness. tachycardia, nausea and throat tightness; This is a spontaneous report from a contactable pharmacist. A 58-year-old non-pregnant female patient received first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number= EH9899), intramuscular on 19Dec2020 07:00 at SINGLE DOSE at Left arm for covid-19 immunization. Medical history included breast cancer female and allergies to shell fish and Latex. The patient's concomitant medications were not reported. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. 30 minutes after receiving vaccine on 19Dec2020 07:30 am, patient reported 'heart racing, dizziness, flushing, burning pain in her chest, dizziness. tachycardia, nausea and throat tightness. Patient was taken to the ED where she received IV Benadryl and was observed for 4 hours. Patient was discharged home and symptoms subsided. The events resulted in emergency room/department or urgent care. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient was not been tested for COVID-19. Outcome of the events was recovered in Dec2020.; Sender's Comments: There is a plausible temporal relationship between immunization and onset of allergic reaction in a subject with a positive medical history for allergy to food (shellfish); causality cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

exacerbation of cryptogenic organizing pneumonia; fever; malaise; wheezing; This is a spontaneous report from a contactable physician reported for himself. A 60-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) via an unspecified route of administration from an unspecified date at single dose for Covid-19 immunization. Medical history included rheumatoid arthritis. The patient's concomitant medications were not reported. The patient experienced having fever and malaise after vaccination and then a few days later he has been wheezing. The patient believed it was an exacerbation of cryptogenic organizing pneumonia. The outcome of the events exacerbation of cryptogenic organizing pneumonia, fever, malaise and wheezing was unknown. Follow-up activities are possible, information on the batch number has been requested.; Sender's Comments:

The association between the event cryptogenic organizing pneumonia with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Sudden onset Acoustic Neuritis without Labyrinthitis, hyperacusis, loss of hearing, fullness in ears, dizziness and tinnitus.; Sudden onset Acoustic Neuritis without Labyrinthitis, hyperacusis, loss of hearing, fullness in ears, dizziness and tinnitus.; Sudden onset Acoustic Neuritis without Labyrinthitis, hyperacusis, loss of hearing, fullness in ears, dizziness and tinnitus.; Sudden onset Acoustic Neuritis without Labyrinthitis, hyperacusis, loss of hearing, fullness in ears, dizziness and tinnitus.; Sudden onset Acoustic Neuritis without Labyrinthitis, hyperacusis, loss of hearing, fullness in ears, dizziness and tinnitus.; sore arm; nerve related hearing loss; This is a spontaneous report from a contactable physician reporting for himself. A 69-years-old male patient received bnt162b2 (BNT162B2; Lot : EKS730) vaccine , intramuscular in the left deltoid on 21Dec2020 15:30 at single dose for covid-19 immunisation . Medical history included atrial fibrillation from 2009. There were no concomitant medications. The patient stated he experienced sore arm on the same day 21Dec2020 and this was not a big deal. On 26Dec2020 the patient experienced sudden onset of acoustic neuritis without labyrinthitis, hyperacusis, fullness in ears, dizziness and tinnitus . The patient also experienced nerve related hearing loss from Dec2020. Sore arm was considered non serious events, while the remaining were considered Important Medical Events. The outcome of nerve related hearing loss was recovered, the outcome of sore arm was unknown, while the outcome of the remaining events was recovering.; Sender's Comments: Based on the temporal association, it cannot be fully excluded that the vaccination with BNT162B2 might play a contributory role in the events onset. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

I have lost hearing in my right ear; the right side of my face was numb; This is a spontaneous report from a contactable consumer (patient). A 58-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Batch/lot number number EJ1685, expiration date Mar2021, on 25Dec2020 09:30 at single dose on left arm for Covid-19 vaccination. Medical history and concomitant medications were none. The patient had not received other vaccine in four weeks. The patient had no covid prior vaccination. The patient had no covid tested post vaccination. The patient received her first Covid-19 vaccination on Christmas morning. She worked at a medical center. Within an hour of when she got home, she lost hearing in one ear and also had some numbness on the same side of her face, She was wondering if that was something she should be concerned and she still didn't have hearing in her right ear. Treatment received for the events included Tylenol. The outcome of the events was not resolved.

She suspected that she had an undiagnosed autoimmune disease.; Spinal pain that elicits nausea; spinal pain that elicits nausea; Headache that is worse at night/Headache worse at night time, sometimes gets better during the day/bad head ache; Body aches; Feeling crappy; Low grade fever; Pressure in the head; Terrible pain; Neck pain; This is a spontaneous report from a contactable other health professional (patient). A 43-yearsold female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 19Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received Covid19 vaccine on 19Dec2020 and reported that at 36 hours she had body aches, feeling crappy, and low grade fever in Dec2020, she had since developed at headache that is worse at night, and spinal pain that elicits nausea. She suspected that she had an undiagnosed autoimmune disease. She was inquiring about duration of the reported AE's from clinical trials, and tried to decide how long she will feel this way. And going on 10 days and she's just struggling, bad headache and neck pain headache worse at night time, sometimes gets better during the day. Terrible pain and nausea. Any info on length of side effects: 36 hours- body aches feeling crappy. Low grade fever. Nausea with the spinal pain, pressure in the head. Difference in people with autoimmune issues- infertility - suspected autoimmune. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, there is no biological plausibility to implicate the suspect vaccine to the occurrence of the serious event autoimmune disease. More information such as medical history and concomitant medications and confirmative diagnostic workups are needed for full medial assessment. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Heart rate high; Blood pressure high; bruise at the site of the vaccination; This is a spontaneous report from a contactable other health professional reporting for herself. A female patient of an unspecified age received the 1st dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech), via an unspecified route of administration, on 22Dec2020, at single dose, for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. On 22Dec2020, 1-1.5 hours after vaccination, the patient experienced heart rate high with outcome of unknown , blood pressure high with outcome of unknown and bruise at the site of the vaccination with outcome of unknown. The patient underwent lab tests and procedures which included: blood pressure, high (22Dec2020); heart rate, high (22Dec2020). She returned to the emergency room (ER) of the hospital where she received the vaccine due to all the events. Therapeutic measures were taken as a result of heart rate high and blood pressure high and included treatment with a beta blocker. The patient was also prescribed with a blood pressure medicine from the ER physician. The events heart rate high and blood pressure high were considered medically significant. The information on the lot/batch number has been requested.; Sender's Comments: Based on the compatible temporal association, the Company considers the events heart rate high and blood pressure high are possibly related to vaccination with BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety

concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

tingling of the lips/Lips tingled; Throat got tight; This is a spontaneous report from a contactable other hcp(patient). The 49-year-old female patient received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK5730, Expiry Date: 31Mar2021), via an unspecified route of administration at left arm on 21Dec2020 at single dose for COVID-19 immunization. There were no concomitant medications nor medical history. Patient got first dose of the COVID vaccine and experienced her lips tingled/ tingling of the lips and her throat got tight, both on 21Dec2020, led to medically significant, lasted about 20 minutes. They observed her and she did not need any further treatment. Outcome of events was recovered in 21Dec2020.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of her lips tingled/ tingling of the lips and her throat got tight cannot be excluded, considering the plausible temporal relationship and the known adverse event (anaphylactic adverse reaction) profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate

"disoriented; hit her head and cut herself; hit her head and cut herself; Passed out at night; This is a spontaneous report from a contactable consumer (patient). A 67-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730), via an unspecified route of administration on 23Dec2020 at single dose at left arm for COVID-19 immunization. Medical history included Atrial fibrillation/heart problems diagnosed prior to the vaccine, got the COVID virus on 18Nov2020, disoriented in Nov2020. Concomitant medications included her heart medication every day and vitamins, nothing out of the normal. Caller stated she had heart problems. The heart problems were diagnosed prior to the vaccine. Caller also stated that she got the COVID virus this year before the vaccine as well and she was off, of work for like a month. On 23Dec2020 she got the vaccine. Then on Thursday 24Dec2020 and Friday 25Dec2020 she had a reaction. She had passed out in the night, hit her head and cut herself, she was then disoriented for 1 full day. Caller stated that the last time she was disoriented like this was when she had the COVID Virus, because she had heart problems. Caller stated that she was fine now. Caller stated that she had been off, of work so much. The heart problem she had was Atrial Fibrillation. Caller clarified that she had the COVID virus this year in Nov2020, it was before thanksgiving, on 18Nov2020 she had the virus, then on 19Nov2020 she got tested and it was positive. She got the vaccine on the 23Dec2020 Wednesday then on 24Dec2020 at night she passed out and on 25Dec2020 she was disoriented all day. Investigation Assessment: No. On 24Dec2020 she was going to bathroom, and found herself on the floor, then the following day 25Dec2020 was when she was disoriented. She knew this because when she had the actual COVID virus previous in Nov2020 this happened previously. When queried outcome of being disoriented she stated that she still felt a little weird but if getting better very, very slow. The Second dose was schedule for 13Jan2021. Caller confirmed that she did have a Positive Test for Covid Previously. Her treatment at the time was in the Emergency Room, they gave her an Antibody infusion, she had to schedule it because it was actually a

clinical trial. Caller was asked if she knew the name of covid test, she stated that she does not know, she only recalled that she opened her mouth and they test her that way. The outcome of the event ""disoriented"" was recovering, of the other events was unknown."

Bells Palsy; This is a spontaneous report from a contactable consumer. This consumer reported similar events for three patients. This is 1st of three reports. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (also reported as Comirnaty), via an unspecified route of administration on an unspecified in Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient experienced bells palsy on Dec2020. The action taken in response to the event for bnt162b2 was not applicable. The outcome of event was unknown. No follow-up attempts are possible; information about batch/lot number cannot be obtained.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2020519118 same reporter/drug/event, different patient;US-PFIZER INC-2020519119 same reporter/drug/event, different patient

Bell's Palsy; This is a spontaneous report from a contactable consumer or other non HCP. This consumer reported same events for three patients (nurses). This is 2nd of 3 reports. A patient of an unknown age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, also reported as COMIRNATY), via an unspecified route of administration on unknown date in Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were unknown. Healthcare worker reported that 3 nurses who work in her facility received Pfizer's COVID vaccine last week (Dec2020) came in with Bell's Palsy in Dec2020. Event took place after use of product. The outcome of event was unknown. No follow-up attempts are possible. Information about batch/Lot number cannot be obtained.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2020519105 same reporter, same drug, same event, different patients;US-PFIZER INC-2020519119 same reporter, same drug, same event, different patients

Bells Palsy; This is a spontaneous report from a contactable consumer or other non HCP. This consumer reported same events for three patients. This is a 3rd of 3 reports. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, also reported as Comirnaty), via an unspecified route of administration on an unspecified in Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. Healthcare worker reported that 3 nurses who work in her facility received Pfizer's COVID vaccine last week (Dec2020) came in with Bells Palsy. Event took place after use of product. The outcome of event was unknown. Gallbladder removed, septic, 11mm axillary lymph node.

she got the COVID 19 vaccine on the 16Dec2020 and got tested positive on the following day; she got the COVID 19 vaccine on the 16Dec2020 and got tested positive on the following day; This is a

spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A contactable nurse (patient) reported that a female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 16Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient reported that she got the COVID 19 vaccine on the 16Dec2020 and got tested positive on the following day (17Dec2020). She is scheduled to take her second dose on 20Jan2021. The patient wanted to know what Pfizer recommendations are. Outcome of the event was unknown. That information on the lot/batch number has been requested.; Sender's Comments: A causal role of BNT162B2 would seem unlikely based on the temporal gap between the vaccination and the event onset.

being tested positive; being tested positive; felt very sick; congestion; This is a spontaneous report from a contactable other healthcare professional (patient herself). A female patient of an unspecified age received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient felt very sick and that's not her normal. The patient felt great after getting the vaccine she hadn't felt that in a while. Today (23Dec2020) the patient had this congestion and 4 -5 people came back positive post covid-19 vaccination on unknown date. All of them sent home after being tested positive. The patient just someone to keep track, she just wanted Pfizer to know. She didn't have any problems, she was working COVID patients. They had a lot new cases. She just didn't feel 100%. The patient wanted to know if it's safe for her to get the second dose after being tested COVID positive post vaccination. The outcome of events was unknown.; Sender's Comments: The information available in this report is limited and does not allow a medically meaningful assessment of the case. The company cannot completely exclude a causal relationship between the reported events and vaccination with BNT162B2. Additional information regarding therapy vaccination date, lot number and investigation results will aid in comprehensive assessment of the case.

she reported on 18Dec2020 got vaccine later that day tested positive; she reported on 18Dec2020 got vaccine later that day tested positive; This is a spontaneous report from a contactable nurse. A female patient of an unspecified age received the 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration at single dose on 18Dec2020 for Covid-19 immunisation. The patient medical history and concomitant medications were not reported. She reported on 18Dec2020 got vaccine later that day tested positive with outcome of unknown. She asked can she still receive the 2nd dose of the vaccine or should she repeat the vaccination series. The patient underwent lab tests and procedures which included Sars-Cov-2 test: positive on 18Dec2020. Information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile

of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

received the (1st dose of) COVID-19 vaccine 5 days ago and tested positive; received the (1st dose of) COVID-19 vaccine 5 days ago and tested positive; This is a spontaneous report from a contactable pharmacist. A patient of unspecified age and gender received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Device Type: Vial), intramuscularly on 18Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the (1st dose of) COVID-19 vaccine 5 days ago and tested positive on 23Dec2020. PharmD asked if it's possible to administer Bamlanivimab to a patient who received the (1st dose of) COVID-19 vaccine 5 days ago and tested positive. Pharmacist mentioned that as Bamlanivimab was an EUA drug, they cannot go outside of the recommendations, and given that no information was available about its use after a dose of the COVID-19 vaccine, it is possible that Bamlanivimab may not be administered. Explained Pfizer MI is unable to provide a direct recommendation, was referred to the patient's Docton for guidance: Before receiving the next dose of the COVID-19 vaccine, and to clarify if Bamlanivimab should be administered. The outcome of events was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: The reported tested positive 5 days after COVID-19 vaccine is considered related to the administration of BNT162B2.

PCR test positive for COVID-19 but no signs of COVID-19; PCR test positive for COVID-19 but no signs of COVID-19; This is a spontaneous report from a contactable physician reporting for himself. A 70-year-old male patient received the 1st dose of bnt162b2 (BNT162B2), via an unspecified route of administration in arm left, on 17Dec2020 at 09:00 AM, at single dose, for Covid-19 immunisation. Medical history included hypertension, high cholesterol, benign prostatic hyperplasia, drug allergy and food allergy all from unknown date and unknown if ongoing. The patient had not been diagnosed with COVID-19 prior to vaccination. The patient received unknown medications within 2 weeks of vaccination. Historical vaccine included typhoid vaccine (unknown trade name) on unknown date and the patient experienced drug allergy. The day after vaccination with bnt162b2, on 18Dec2020 at 04:00 PM, the patient experienced PCR test positive for COVID-19 but no signs of COVID-19. The patient did not receive any treatment as a result of the event. The event resulted in doctor or other healthcare professional office/clinic visit. The patient underwent lab tests and procedures which included: COVID-19 PCR test positive (18Dec2020), nasal swab positive (18Dec2020). Outcome of the event was unknown. The information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of COVID-19 PCR test positive and suspected lack of efficacy due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for

adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

guillain barre syndrome; stroke; left thigh burning; Left b/l gluteal burning/bilateral gluteal burning; paresthesia; mid back burning; right side burning / right thigh burning; b/l hand numbness/bilateral hand numbness; left facial numbness; b/l foot numbness/bilateral foot numbness; This is a spontaneous report from a contactable physician (patient). A 39-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK5730), via an unspecified route of administration on 19Dec2020 at single dose for prevention. Medical history included none. There were no concomitant medications. Caller states, he received the covid vaccine 19Dec2020 and on 25Dec2020 he was experiencing left facial numbness, b/l foot numbness, b/l hand numbness on 26Dec2020, right side burning on 28Dec2020, Today (29Dec2020) he has had left thigh burning, and Left b/l gluteal burning and paresthesia. No motor issues and no tendon issues, all intact. Also had mid back burning on 28Dec2020 that comes and goes. He has heard that there is a described neuropathy with the virus and/or with the vaccine and wants more information on that. Curious if anyone has anything similar? and makes mention of possible Gillian Barre Syndrome. States that he has had a potential reaction. He had his dose on 19Dec2020. On 25Dec2020 he developed left facial numbness, then later that day he developed bilateral foot numbness. On 26Dec2020, he developed bilateral hand numbness, on 28Dec2020 he developed right thigh burning, and today (29Dec2020) he has developed left thigh burning, and bilateral gluteal burning and paresthesia. States that he has been kind of freaking out about it. He doesn't have any motor issues. States that he heard that there is a described neuropathy with the virus, but not with the vaccine, is that true? The left facial numbness resolved on either 26Dec2020 or 27Dec2020. States that the symptoms were concerning because it could have been a stroke. States his symptoms were moderate. States that due to the bilateral foot and hand numbness, he had a LP, brain and spine MRI, and blood work done on 26Dec2020. All came back completely normal. When asked about causality, caller states that it makes the most sense for his symptoms to be caused by the vaccine due to his age and the fact that all his testing was completely normal. Reporter seriousness for left facial numbness, bilateral foot numbness, bilateral hand numbness, right thigh burning, left thigh burning and bilateral gluteal burning and paresthesia: Medically significant. The outcome of the event left facial numbness was recovered in Dec2020. The outcome of the events guillain barre syndrome, stroke and mid back burning was unknown. The outcome of the other events was not recovered.; Sender's Comments: Based on the temporal relationship the association between the reported serious adverse events with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Approximately 4 days after vaccine I started experiencing sharp lower back and left hip pain. Also my left foot feels like pins and needles.

Complete loss of vision in the left eye 12 hours after receiving second dose (Moderna mRNA-1273) while having a fever of 102 F for 6 hours. Loss of vision lasted for 1 minute. Loss of vision occurred while standing. Referral to primary care and ophthalmology specialist found normal eye exam and MRI of orbits but presence of tachycardia especially while standing (fluctuations between 60 beats at rest/laying down to 130 beats per minute standing). Postural tachycardia syndrome (POTS) is suspected. Currently pursuing cardiac workup with cardiologist and Covid POTS specialist. POTS specialist believes autoantibody development after vaccination could be suspected as recovering covid patients similarly present to clinic with POTS like symptoms.

Patient with extreme nausea and vomiting that started soon after receiving the Moderna vaccine. Patient with loss of consciousness, diaphoresis and garbled speech during a foley catheter exchange thought to be from dehydration. Patient was admitted to Hospital for observation for 2 days

12/18 VACCINATION 12/19 WOKE UP, RINGING IN BOTH EARS. CALLED PCP, CONSULTED ENT ABNORMALITY - L INNER EAR; HIGH DOSE STEROIDS, 10 DAYS, 60 MG/DAY. WEEK 2; TINNITUS GOT WORSE. DR. PRIMARY CARE PHYSICIAN MEDICAL EXAM ON 1/6/2021 INJECTION OF STEROIDS.

Acute Pericarditis. Patient was admitted from 12/27-12/28/2020 at hospital by cardiology team who strongly felt the acute pericarditis was due to the Pfizer Vaccine (Dr. was senior cardiologist).

Fever, Malaise

After the 15 min monitoring, I went back to work 15 min later. the left side of my face started tingling which went to a numbing feeling down the left side of my body affecting my neck, shoulder, arm, elbow and up the upper left torso. My face and neck was numb for about 48 hrs and the rest came back to sensation within 24 hrs. D/T the numbness I was admitted into the hospital for a 24hr observation.

""""Pfizer-BioNTech COVID-19 Vaccine EUA."" Patient received first dose of vaccine on 12/21/2020. Patient called on 1/3/2021 to notify that she developed symptoms on 12/27/2020 and had an appendectomy on 12/28/2020 at another facility. Patient also reports that CDC V-Safe Application was used to report event as well. Patient reports that she is recovering well."

Patients adverse reactions started day of vaccination with right arm pain up to right ear as well as complete tongue numbness. On 1-1-21 patient had increased Bell's Palsy symptoms including; inability to raise left eyebrow, inability to close left eye in its entirety, teeth being numb on left side, and numbness and tingling in left foot and left hand (from palm to fingers). ER physician prescribed on 1-1 Prednisone, Keflex and Valtrex. Patient went to ER again on 1-2-21 with lower extremity numbness on left side that is moving proximally toward her hip. Patient went home on 1-3-21 with an RX for Prednisone as well as Valtrex. Symptoms have improved but have not fully resolved at this time.

She was hospitalized on 01/04 but exact situation unknown. COVID +. Hospitalized at Medical Center.

Employee received COVID 19 vaccination at 9:45am on 12/30/20. ~15 min. later she developed a rash down her left arm, then down her Rt. arm. about 4 hours later she decided to go to the emergency room

for Hearty Palpitations, Fever, Chest discomfort and feeling of generalized sunburn. Later developed severe headache..

Right arm swelling very bad right after shot, next day woke up to get ready to work I started to get light headed, dizzy, sweating, felt like I was going to pass out. My husband then called 911. They took me to Hospital ,I stayed there for a couple hours then released. They told me to stay home and the next day I felt fine. I did a televisit with my Nephrologist (Kidney doctor) the following week.

noticed twitching in L arm shortly after receiving vaccine, numbness , weakness and pain in arm and shoulder girdle, diagnosed with parsonage turner syndrome by neurologist, currently taking neurontin for pain as steroids not tolerated

Felt slight warmth throughout body about 5 minutes after vaccine. Disappeared 2 minutes later. Arm started to feel sore as the day went on and was very sore by nighttime. Next day, arm started to feel better and over the next 3 days was no longer sore. On the morning of the 30th, woke up feeling fine, took a 3.5 mile walk and felt fine. Around 12:30 pm, experienced sudden pain and a burning sensation in the chest and both upper arms. Thought it was possibly heartburn ; took a Prilosec. The discomfort (mild but steady) continued so checked blood pressure which was 141/91. Called cardiologist and went to emergency room per instruction, around 1:30. Admitted overnight with the diagnosis of a mild heart attack and performed a heart catheterization where they found no major blockage. One artery noted 30% blocked but that overall heart function looked good. Discharged on 12/31/2020. -reported by patient via email, on 1/3/2021 @ 4:49pm

Bell?s palsy, right side of face is numb, with difficulty closing eyes, smiling, raising eyebrows, eating, drinking, swallowing.

12/21 had covid vaccine (dose 1). On evening of 12/29 had sudden onset of mild neck pain and significant weakness and numbness of left arm, weak hand grip, clumsiness in hand . Did not improve after trying to shake arm/move around , and took prednisone 40mg oral. Went to ER and had CT Cspine which did not show evidence of cervical pathology. Continued with corticosteroids, sought consultation with PMR and neurology specialists, and steroid dose increased to 60mg/day. Some improvement in strength , but still have diminished sensation and strength in left hand/arm. Unable to perform full job tasks as I am left hand dominant. Likely brachial neuritis / parsonage turner syndrome per both specialists seen. Continuing with corticosteroids at this time, pending bloodwork and OT evaluation

Resident exhibited no adverse events during 30 minute monitoring following vaccine administration. Resident found without pulse at 1900.

thrombotic stroke -necessitating hospitalization; and craniotomy; required mechanical ventilator for 2 days. Patient now extubated, breathing on her own. Patient remains hospitalized with marked deficits (aphasic)

Pt experienced nausea, shortness of breath, chest tightness and anxiety and then lost consciousness. Vitals were obtained several times during the medical intervention. Respirations were within normal

limits throughout, BP was 135/89 initially, then rose to 210/110, then declined to 180s/? prior to EMS assuming care. Heart rate was 47 initially, then rose to normal limits. Treated with epinephrine, Benadryl and ammonia smelling salts and transported by ambulance to hospital.

Lightheadedness, throat tightness. Increasing chest tightness. History of atrial fibrillation and bilateral breast implants. Received two doses of epinephrine and one dose of diphenhydramine.

Patient developed a septic knee (history of arthroplasty) need for immediate surgery, hospitalization and months to years of antibiotics in his future now.

Presented to the ED after developing chest tightness, cough, lightheadedness, and throat closing sensation. She received the Moderna COVID-19 vaccine on the morning of presentation. Within 15 minutes of receiving the vaccine she developed pain and numbness, starting at the injection site traveling down the ulnar aspect of her arm, and nausea. Over the next several hours she continued to develop worsening nausea, chest tightness, cough, lightheadedness, and the sensation that her throat closing. She took PO Benadryl 25mg; however, her symptoms were not alleviated. She was subsequently evaluated in the ED. á Received PO Benadryl 25mg, IV Benadryl 25mg, Epinephrine 0.3mg x 2, IV Famotidine 20mg, IV Solumedrol 125mg & 60mg, DuoNebs x 3, Racepinephrine x 1.

Decompensation and temp 103.6.

Around 10 or 11 pm, arm pain, chills, fatigue, headache, nausea, swollen lymph nodes, lightheadedness, fainted in tub. Next day, fatigue all day, couldn't talk, or eat. Went back to bed again. The following day hot flashes, weakness. went to ER. Felt like blood pressure was dropping, tingling in legs, difficulty lifting her head.

20 minutes after receiving the vaccination the resident started to not feel well. She said she felt very far away and just kept repeating I don't feel well. She was diaphoretic and her chest was very red and she kept scratching and rubbing it at it. I asked if she wanted IM Benadryl or epipen and she at first denied. She also said she felt like she needed to focus on her breathing. At this time we decided it was best to administer Epipen x 1 dose. Immediately after she felt better. She was observed for another 30 minutes and then went home. at 7:17pm I called and spoke with her. She said her arm was sore and that her oxygen levels were about 88-89% which is low for her but she said she felt fine and is currently working right now.

Presented to the ED with cc of left sided facial and LUE numbness and weakness x 1 days. Patient received her COVID-19 vaccination on 12/30/2020 around 1PM. Immediately after the injection in her left shoulder, she began to feel warmth and numbness in her left shoulder, arm, neck, face, and chest. She reports later experiencing nausea, palpitations, and left arm weakness. Her symptoms persisted, and her family noted a left sided facial droop which prompted her ED visit. á In the ED, patient was noted to have some left sided facial droop and left arm and leg weakness. CT head and CTA showed no acute abnormalities. Tele-neurology was consulted who recommended admission to rule out acute stroke. Ultimately, work up was negative and symptoms resolved. Symptoms appear to be related to the vaccine.

Severe joint aches, fever-type symptoms, nausea

Cough began approx 5 min post vaccine, then pt experienced flushing of neck, chest tightness and SOB. Placed on O2 mask at 8L/min, given 1 dose of Epi and transferred to ED

On 12/24 at around 10 PM, circulation to my 4th left digit significantly decreased after being outside of my car for around 15 minutes during a temperature of about 50 degrees. I realized when sharp pain was felt at the digit. After about 5 minutes the digit felt numb. I got in my car, turned on the heater, and massaged my finger. Sharp pain was felt again as circulation returned to the digit. The event last approximately 10 minutes from the moment I realized the finger was pale until color returned. This occurred again on 12/27 at around 2 PM as I walked from my car into a store at a temperature of about 40 degrees. This time, discoloration occurred bilaterally on my left 3rd, 4th, and 5th digits and my right 2nd, 3rd, 4th, and 5th digits. The event lasted more than 15 minutes with constant massaging. This has occurred two more times since then, both times occurring bilaterally with minimal exposure to cold.

Fever to 103.4F for approximately 4 hours. Myalgias.

within 20 of the injection I strted to salivate and feeling nauseated. returned to clinic and was monitor there. my blood pressure was noted to be low at 115/41. HR 74. reepat BP was 121/48 which is much lower than my usal BP. i was observed for about 1 hrs. the sx's did not go away but the BP improved a little to 130/64 standing. I went home develop injection site pain, fatigue, headache and the pesistent salivation did not go away. after 1 wk it decreased in frequency but still present today. I can not do my normal activity as this worsen the symptom. and my blood pressure has not normalized. still run in 110's/60's. the headaches and fatigue are becoming a burden.

7 days post injection developed significant hives and edema at injection site

Left antecubital rash and pruritic lasting last 5 days, self treated with hydrocortisone 2.5% cream two times partially relieving the pruritic and redness, but still present at time of report.

At 17:00, the injection site started to itch and was warm to the touch. At 4:00 on 01/04/2021, I experienced extreme vertigo while washing my hands at a sink. I returned to bed to get the vertigo to pass, but then vomited at 4:30. I was extremely tired the remainder of the day, sleeping often and have been flushed all day as well.

after the injection I became lightheaded and my blood rose to 155/94. after a hour both my pressure and lightheadness went away. on 1/1 I felt fatigue at work and the injection site began to hurt. On 1/2 I stood home and was still fatigue and had some tension in my neck area. On 1/3 began to feel better no pain at the injection site, no longer fatique, and no tension on my neck.

"15 minutes after patient received her #1 Pfizer vaccine, she started to feel flushed with some throat irritation. She states she feels "" a bit shaky inside "". Given juice and crackers. BP 143/84. heart rate 89. O2 sat 99%. She was moved into another quieter observation area. She claims she felt better. Given H20 to drink. States she had a bit of chest discomfort but this was nothing new to her. She has been having chest discomfort for the past 1-2 weeks periodically. Upon observing patient for 40 minutes, patient

states, she felt better. BP 115/78, heart rate 80. Patient was then released. She states this is the first time this has happened while taking an IM injection."

One hour post shot, heart beat went up to 120 at rest. Slight dizziness. This passed. Later in the evening compared injection sites with others in the household. Mine is redder, more swollen and seems more tender than others.

Fever, nausea, body aches

Received covid vaccine 1/2 at 2pm. Around 7pm that night, left arm pain and slight itching of whole body. did not think much of it. woke up once in middle of night at 4am with racing heart but went back to sleep. Around 9 am next morning started getting chills, initially mild then severe and developed severe myalgias; could not get out of bed or lift arms or limbs. having chest tightness and shortness of breath. pressing on chest wall hurts, hard to take deep breath. Temps of 99.5 most of morning. started taking tylenol total of 1 gram. 1 hour after tylenol shaking and rigors with sweating. had temp of 101 after tylenol. HR 110 at this time (my baseline is around 60s). O2 sat remained normal. Went to ER for testing for covid in case this was covid--test negative. Felt a little better morning of 1/4--no fever. tried to work 1/2 day; called out sick. lots of brain fog, fatigue mental slowing. still having intermittent chest tightness and sob; feel like i cannot expand my lungs. deep breath makes me cough. had few small red bumps on left antecubital fossa that resolved. i'm a physician, i'm concerned this was a severe reaction and was advised to report this.

About 3 minutes after getting the injection, my heart rate elevated, I was dizzy and felt faint with some chest tightness. I told RN, the nurse who gave me the injection and I was told to lay down on my back and she lifted both of my legs perpendicular to the floor. My hands and feet were tingling. My blood pressure was taken and the first reading was elevated and hear rate was 102. I was given a can of apple juice and I felt better after drinking it. Since the blood pressure cuff was too large for me, I was able to go downstairs to urgent care and get a reading with a smaller cuff. The last BP reading was had lowered and I was able to leave. I did not feel well for a good 45 min. My left arm was very sore for the first 48 hours. It did not go away for at least 5 days.

Injection sight pain and swelling, headache, fatigue, omalaise.

I developed severe hives all over my body hours about 19 hours after the shot. Intense itching woke me up at 4:40am the day after receiving the vaccine. The reaction worsened for the next 3 days and began to settle/decrease at the end of the 3rd day. I also felt somewhat disoriented through the allergic reaction period, and on the day after the vaccine I felt slight pain on my chest. I did not experience shortness of breath or have trouble breathing at any point.

High grade fever with chills almost like rigors 103.8 F Happened after 9 pm Initially started with malaise Fever being monitored throughout the night

Numbness in right cheek of face almost immediately after injection.

tiredness, headache muscle pain, chills, nausea, feeling unwell

paleness, weakness, then a few hours later chills, fever, extreme pain at the injection site, body aches, malaise

Soreness of deltoid resolved 2 days after vaccine. Normal shoulder for 7 days. Day 8 post vaccination onset of itching, swelling and redness of left should, continuing now x2 days. No other systemic symptoms. No pain.

Began experiencing nausea and general stomach pains the morning after receiving the vaccine. After one day of pain and discomfort I woke the following morning (~44hrs after receiving the vaccine) to extreme acute abdominal pain in the lower right abdomen. Went to Urgent Care facility and was diagnosed by CT scan as having acute appendicitis. An emergency appendectomy was scheduled and performed for later that evening. I stayed at the Hospital overnight on 12/24/2020 post operatively on IV antibiotics to recover from the appendectomy. Was discharged from the hospital on 12/25/2020 and have been recovering for about 10 days now with limitted activity.

Fever 101.0

At time of injection and for about 30 minutes after, had light tingling to left arm to fingertips, face flushed and warm. Resolved without intervention. No other side effects except muscle soreness to this arm. (Wouldn't report but a coworker had a similar but more severe reaction and is still having effects 3 wks out)

Patient reported swelling on the injection site, itchiness, warmth and soreness.

12/31, 08:30pm: Immediate pain & welt developed at sight 12/31, 08:45pm: Slight numbness & tingling in left hand, persisted approximately 12 hours 12/31, 09:30pm (the following s/s persisted in varying degrees until 01/02): exhaustion/fatigue, headache, dizziness, nausea, chills 01/02, 08:30am: chills/cold sweat/fever (temp not confirmed, as my home thermometer had died, but I woke up later that night drenched in sweat as though a fever had broken, and since then my body temp has been normal (no cold chills or hot flashes) and other s/s have also decreased significantly) 01/03: minimal s/s - lingering fatigue, mild 01/04: 03:00a: woke up with cough - uncertain if related (seasonal allergies?)

Symptoms were chills, fatigue, body aches, headache, fever, tachycardia that started about 12 hours after receiving the vaccine and lasted for about 3 days.

Age at the time of vaccination was 16. Not identified until after the vaccine was administered.

light headed and nausea for 3 days

"10 minutes after receiving vaccination, patient reported rapid heart rate, fatigue, felt weak, hot, and palpitations. Patient reported tachycardia with heart rate 160-170's. Transient numbness to hands and perioral region. Presented to ED, was monitored with resolution of symptoms. On 1/4/21 patient presented to ED with tachycardia with HR up to 160s, Episode was severe, causing lightheadedness, ""throat squeezing"", with bilat UE paresthesias. Episode lasted 20 minutes. Patient evaluated in ED and discharged with outpatient follow up with cardiology and endocrinologist."

Tight throat.Drank 1 pill benadryl.After few hours the symptoms were gone

less than 24 hours after getting shot #1 i felt as if i was coming down with a cold, very congested, stuffy nose, slight sore throat probably from drainage. injection site pain which is normal, but i just felt under the weather. it cleared up within 48 hours of time of injection.

Cold legs, Fever, bodyache including fingers ache, chills, nausea, body weakness, headache. From Saturday to Tuesday. Tylenol

tested positive for COVID19 via antigen test; tested positive for COVID19 via antigen test; having no sense of taste and smell; having no sense of taste and smell; fever; scratchy throat; This is a spontaneous report from a contactable nurse. A 26-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EJ168J), via an unspecified route of administration on 21Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. After getting vaccinated, patient developed a fever on 22Dec2020. On 23Dec2020, the patient has no taste and smell and tested (used the Sofia test) positive for COVID. The patient was told to quarantine and take off work for 10 days. The patient has felt like she has had a scratchy throat. Patient has not taken her allegra. The outcome of events was unknown.; Sender's Comments: A causal role of BNT162B2 would seem unlikely based on the temporal gap between the vaccination and the event onset.

"patient received the PFIZER-BIONTECH COVID-19 MRNA VACCINE and then tested positive for COVID; patient received the PFIZER-BIONTECH COVID-19 MRNA VACCINE and then tested positive for COVID; This is a spontaneous report from a contactable pharmacist. A 40-year-old female patient received the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number and Expiration Date: Unknown), via an unspecified route of administration on 18Dec2020 at a single dose for COVID-19 immunization. The patient's medical history included high body mass index (BMI) from an unknown date and unknown if ongoing. Concomitant medications were not reported. On 22Dec2020, the patient received the PFIZER-BIONTECH COVID-19 MRNA VACCINE and then tested positive for COVID; and showed symptoms. The events were assessed as medically significant. The clinical course was reported as follows: The 40-year-old female patient, with comorbidities ""like high BMI"", received the Pfizer BioNTech COVID vaccine on 18Dec2020 and she had tested positive for COVID on 22Dec2020 and she was showing symptoms; however, they were not severe. The pharmacist did not describe the symptoms. In response to further probing, the pharmacist stated, ""can I do this tomorrow because I need to call patient and ask her about if they have an opinion regarding the monoclonal antibodies treatment."" The pharmacist wanted to know if there was information on consumers receiving antibodies after receiving the vaccine. The pharmacist stated the patient was eligible for antibody treatment. The patient underwent lab tests and procedures which included SARS-CoV-2 test: positive on 22Dec2020. The clinical outcome of the events was unknown. The batch/lot numbers for the vaccine, BNT162B2, were not provided and will be requested during follow up.; Sender's Comments: The reported tested positive for COVID after immunization with BNT162B2 is considered related to the administration of the suspect, BNT162B2."

tested positive for covid; tested positive for covid; coughing; congestion; could not sleep that night; her temperature is still low/temperature was lower around 96 or 97; fever; This is a spontaneous report from a contactable consumer (patient). A female patient of an unspecified age received first dose of BNT162B2 (Pfizer-BIONTECH Covid-19 Vaccine, lot number: EH9899), via an unspecified route of administration on 15Dec2020 at a single dose, for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the Covid-19 shot 8 days ago on 15Dec2020. She tested positive for COVID on 23Dec2020. She worked in the emergency room, clarified she was a certified Nurse Assistant (CNA). She was hesitant about taking the COVID-19 vaccine. She was curious since she has been around the virus 24/7 since the pandemic started since she works in the emergency room. When she took the COVID-19 shot, stated she felt great the next day and could not sleep at night in Dec2020 which is not normal for her. It's nothing like the flu shot. It was strange since she has been around the virus all this time, she felt like she had COVID in Feb2020, but she was not tested then. She does not ever get sick and she was down for two days with a fever in Dec2020. After those two days, she always had a low-grade fever of 98 or 99 which was constant. After she took the COVID vaccine her temperature was normal, her temperature was lower around 96 or 97 in Dec2020. She woke up on 23Dec2020 and she had congestion and her temperature was still low. She went to work, and she was told she looked like she had no sleep. She was coughing 23Dec2020 morning, but she did not have any symptoms as far as temperature. She realized that the COVID 19 shot is only 50% effective. She is asking if she should get the second dose. The outcome of events was unknown.

30 mins after vaccination caller was notified patient tested positive for covid; 30 mins after vaccination caller was notified patient tested positive for covid; This is a spontaneous report from a contactable pharmacist. A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for immunization. The patient's medical history and concomitant medications were not reported. 30 mins after vaccination caller was notified patient tested positive for covid on an unspecified date with outcome of unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available (30 mins after vaccination Covid test found positive), no effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the positive COVID represents the pre-existing infection prior to vaccine use. Further information like confirmative COVID 19 Nucleic acid/ PCR test together with any associated symptoms are needed for full medical assessment.

tested positive COVID; tested positive COVID; nasal congestion; loss of smell; This is a spontaneous report from a contactable physician (patient). A 46-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EK5730, Expiration Date Mar2021), via an unspecified route of administration in her right deltoid on 19Dec2020 at single dose for COVID-19 immunization. Medical history included ongoing Crohn's disease from 2007/ diagnosed at 33 years old. There were no other concomitant drugs. The doctor who received the COVID vaccine stated that she must had been exposed to the virus prior to receiving the vaccine because she became symptomatic 48 hours after getting the vaccine. She noted that on Pfizer website recommended that a person not get the vaccine until 6 weeks after active infection but she of course did not know she had been exposed and when her second dose

was due, she would not be 6 weeks after active infections. The vaccine was received on 19Dec2020 and she tested positive on 22Dec2020. The only symptoms she had experienced after testing positive are nasal congestion and loss of smell and they started on 21Dec2020 in the morning. She had had no worsening of her Crohn's disease. The only testing she had had done was the PCR testing for COVID. No treatments for the symptoms at this point. The outcome of the events tested positive COVID was not recovered, while for other events was unknown.; Sender's Comments: A causal role of BNT162B2 would seem unlikely based on the temporal gap between the vaccination therapy and the event onset.

Tested positive for covid; Tested positive for covid; This is a spontaneous report from a contactable nurse (patient). A 33-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899) intramuscularly at right arm on 18Dec2020 14:30 at single dose for COVID-19 immunization. Medical history included asthma. No allergies to medications, food, or other products. The patient's concomitant medications were not reported. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient developed severe nasal burning sensation the first two days of injection along with severe headache that lasted for 4 days. He lost his sense of taste and smell (23Dec2020) 5 days after vaccine was administered, tested positive for Covid (23Dec2020 16:30) with use of ABBOTT rapid test which was performed at his employment. Pending Covid nasal swab fulgent which was obtained on 23Dec2020 and sent out to reference lab. Patient was just wondering if any of these symptoms and/or testing positive after administration was a rare side effect. The adverse event resulted in doctor or other healthcare professional office/clinic visit. No treatment received for the adverse events. Prior to vaccination, the patient was not diagnosed with COVID-19. The outcome of the events was not recovered.; Sender's Comments: Vaccine BNT162B2 provides protection to COVID-19 after at least 7 days have elapsed from the second dose (21 days post first injection). These conditions are not met in the present report. The reported symptoms are compatible with COVID-19 illness.

positive for Covid with symptoms; positive for Covid with symptoms; positive for streph; positive for influenza; This is a spontaneous report from a contactable physician and nurse. A 68-year-old female patient received bnt162b2, via an unspecified route of administration on 17Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced positive for COVID with symptoms, positive for streph and positive for influenza in Dec2020. Additional Context: caller stated that she had a patient that got Covid vaccine on 17Dec2020 who was complaining of muscle aches, no fever, sudden loss of taste and smell in the last 24 hours, sore throat and a cough. Stated that she cannot attribute the cough to the vaccine. Stated that she was screened for COVID, streph and influenza. Stated that she was positive for covid and streph. Stated that she does not think that and wanted to know if the vaccine would cause a positive from a rapid test. Outcome of the events was unknown. The Lot/Batch and expiry date has been requested.; Sender's Comments: The reported positive for COVID with symptoms after immunization with BNT162B2 is considered related to the suspect, BNT162B2.

Chills, fever and a headache; Chills, fever and a headache; Chills, fever and a headache; tested positive; tested positive; This is a spontaneous report from a contactable nurse. This nurse reported similar events for two patients. This is 1st of two reports. An adult female patient of unspecified age (30-40 yrs

of age) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 17Dec2020 at single dose for COVID-19 immunization. The relevant medical history and concomitant medications were not reported. The nurse stated that they gave the vaccines to the patient the past week and the patient was COVID-19 positive at the time of the report. The nurse needed some guidance and needed to know if the patient could receive the second dose or what they were supposed to do. The patient tested positive for COVID-19 on 24Dec2020 after having chills, fever and a headache. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient might not be completely excluded. The case will be reassessed should additional information become available.,Linked Report(s) : US-PFIZER INC-2020513401 different patient, same drug and event

had another COVID test with positive results on 23Dec; had another COVID test with positive results on 23Dec; This is a spontaneous report from a contactable consumer. A 43-year-old female patient received bnt162b2 (BNT162B2, lot number and expiry date were not reported), via an unspecified route of administration on 18Dec2020 at a single dose for covid-19 vaccination. The vaccination was done in the hospital. The patient's medical history and concomitant medications were not reported. The patient was initially tested negative for covid-19 on 13Dec2020. The patient was not pregnant. The patient believed she may have been infected with COVID as early as 13Dec2020 based on symptoms but test results at that time came back negative. She had vaccine on 18Dec2020 and when symptoms hadn't resolved had another COVID test with positive results on 23Dec2020. The event resulted to a doctor or other healthcare professional office/clinic visit. There was not treatment for the event. The reporter considered the events as non-serious. The outcome of the event was recovering. Information about batch/lot number has been requested.

Received the vaccine and tested positive for Covid today; Received the vaccine and tested positive for Covid today; This is a spontaneous report from a contactable nurse. This nurse is reporting similar events for two patients. This is the first of two reports. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date were not reported), via an unspecified route of administration on 17Dec2020 at single dose for Covid Vaccine/ COVID-19 immunisation. The patient medical history and concomitant medications were not reported. It was reported that the patient received the vaccine and tested positive for COVID today (24Dec2020). She was having symptoms on Saturday (unspecified date in Dec2020), she received her vaccine on Thursday 17Dec2020. The reporter asked several questions, if do they get the second vaccination in 3 weeks and what will be the process, does it do anything to it, or if does it make it worse or better. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient might not be completely excluded.,Linked Report(s) : US-PFIZER INC-2020513377 same reporter, same drug, similar event, different patient.

Received the vaccine and tested positive for Covid today; Received the vaccine and tested positive for Covid today; This is a spontaneous report from a contactable nurse. This Nurse reported similar events for two different patients. This is second of two reports. A female patient of an unspecified age received

bnt162b2, via an unspecified route of administration on 21Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the vaccine and tested positive for covid today (24Dec2020).It was further reported that the patient showed up positive today (24Dec2020) and her symptoms have been on and off, she just got her vaccine 21Dec2020. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Preventive effect of BNT162b2 is documented after 7 days from the second dosing. This case does not match this requirement.,Linked Report(s) : US-PFIZER INC-2020513367 same reporter/drug. different patient and event.

Drug ineffective; tested positive; chills; fever; headache; This is a spontaneous report from a contactable nurse. This nurse reported similar events for two patients. This is 2nd of two reports. A female patient of an unspecified age (30-40 year-old)started to receive bnt162b2 (BNT162B2) , via an unspecified route of administration on 02Dec2020 at single dose for covid-19 immunisation . The patient medical history and concomitant medications were not reported. The patient was tested positive to COVID-19 on 24Dec2020 after having chills, fever and a headache. The outcome of the events was unknown. The reporter stated that these were worse than just side effects. The reporter is wondering if the patient can receive the second dose. Information on the lot/batch number has been requested.; Sender's Comments: Preventive effect of BNT162b2 is documented 7 days after the 2 dose. This case does not match this requirement,Linked Report(s) : US-PFIZER INC-2020512742 different patient, same drug and event

tested positive for covid; tested positive for covid; This is a spontaneous report from a Pfizer-sponsored program, Pfizer First Connect. A contactable consumer (patient) reported that a female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiration date were not reported), via an unspecified route of administration on 23Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the COVID vaccine on Wednesday this week (23Dec2020) and she tested positive for COVID yesterday (25Dec2020). She wanted to know if she should take the second dose of the vaccine. Outcome of the events was unknown. Information on the lot/batch number has been requested.

"I received the covid-19 vaccine and then afterwards contracted covid-19; I received the covid-19 vaccine and then afterwards contracted covid-19; This is a spontaneous report from a contactable nurse. A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 vaccine. The patient medical history and concomitant medications were not reported. The patient stated on an unspecified date, ""I received the covid-19 vaccine and then afterwards contracted covid-19. I was told by my hospital that because of this I needed to defer the second dose for 90 days. Is this best practice? Or should I take the second dose in 3 weeks as scheduled?"". The outcome of the events was unknown. Information on the batch/lot number has been requested.; Sender's Comments: BNT162b2 provides protection against COVID-19 seven days after the second dose is administered. This case does not match this condition"

"tested positive for Covid; tested positive for Covid; No symptoms at present time; This is a spontaneous report from a contactable nurse (patient). A 50-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EV1685) via an unspecified route of administration on 22Dec2020 at single dose for COVID-19 immunization. The patient's medical history included Covid-19 12 weeks before 25Dec2020. The concomitant drug was reported as levothyroxine sodium (SYNTHROID), hydrochlorothiazide and vitamins. The patient got the vaccine (Covid 19 Vaccine) on 22Dec2020 (Tuesday) and then on 25Dec2020 (today) had to be tested at work and was tested positive for Covid. So, she was wondering if that might have something to do with the vaccine or it was not for sure. Patient had already had Covid once and this is the first time she got tested since for 12 weeks. It just happened to be three days after the vaccine. So, the lady she work with told her a study was done and people were shown to test positive like two days after they got the vaccine. So, that's what she wanted to find out. If that could be."" She states the test on 25Dec2020 was a routine follow up Covid-19 test. No symptoms at present time. The outcome of the events was unknown.; Sender's Comments: BNT162b2 provides protection against COVID-19 after 7 days from the second dose. This case does not match this condition."

received the vaccine on Friday and tested positive; received the vaccine on Friday and tested positive; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect from a contactable other healthcare professional. A 27-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an unspecified route of administration in Dec2020 (reported as on Friday) at single dose for COVID-19 immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient received the vaccine on Friday and tested positive today 26Dec2020. The outcome of event was unknown. Information about batch/lot number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported event COVID-19 virus test positive based on the known safety profile.

Moderna COVID-19 Vaccine EUA Injection site redness, swelling, itching, discomfort the size of a fist 7 days after injection.

tested positive for COVID with symptoms such as nasal congestion, sore throat, weakness, and flu-like symptoms; tested positive for COVID with symptoms such as nasal congestion, sore throat, weakness, and flu-like symptoms; This is a spontaneous report from a contactable physician (patient). A 46-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EJ1685), via an unspecified route of administration on 20Dec2020 at single dose for covid-19 immunization. Vaccine location was left deltoid. The facility type vaccine was hospital. Medical history included polycystic ovarian diseases from an unknown date. Concomitant medication included metformin, omeprazole, apremilast (OTEZLA). Patient stated she got the vaccine on the 18th. She took the vaccine on 20Dec2020. Yesterday (25Dec2020) she started to feeling sick and today (26Dec2020) patient got tested and she have Covid. She reported to have tested positive for COVID today (26Dec2020) with symptoms such as nasal congestion, sore throat, weakness, and flu-like symptoms yesterday at around 4:00pm. This was the first time she has taken the Covid test. The physician stated she didn't know the causality between the event and vaccine. The action taken in response to the events for BNT162B2 was not

applicable. The outcome of events was unknown.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported event positive test for COVID based on the known safety profile. However the short duration of 5 days since the vaccine first dose is given it is unlikely patient would have fully developed immunity.

Got vaccinated and contracted COVID the following week; Got vaccinated and contracted COVID the following week; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number unknown as the reporter did not have any of that information at the moment of reporting), via an unspecified route of administration on 15Dec2020 at single dose for COVID-19 vaccination. The patient's medical history and concomitant medications were not reported. It was reported that the patient got vaccinated on December 15th and contracted COVID the following week (Dec2020). Treatment included regeneron infusion last night (24Dec2020). Patient was wondering if zinc supplements should be taken or how to handle own's immune system because the patient had the first immunization. The outcome of the event was unknown. Information on lot/batch number has been requested.

had a testing, came up positive; had a testing, came up positive/sporadic coughing and a little short of breath. Maybe a little sore throat; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EJ1685), via an unspecified route of administration on 20Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received Pfizer COVID Vaccine (further clarified) on 20Dec2020. And maybe two days after that, the patient kind of developed a little like very sporadic coughing, it was very mild and a little short of breath. Maybe a little sore throat so that's why the patient was concerned. The patient had a testing in Dec2020, they did swab the patient's throat, it came up positive. The outcome of events was unknown.

Very tired; Cold/head cold; upset stomach; she was not feeling well; it got her all congested and she got the head cold in Dec2020; little whooping cough; I had severe headaches and it was just too uncomfortable; my head was so congested; worst headache; it was just too uncomfortable; This is a spontaneous report from a contactable consumer(patient). A 59-year-old female patient received BNT162B2 via an unspecified route of administration on 22Dec2020 at the 59-year-old at single dose for Covid virus. The medical history included Congested, head cold and Covid virus. There was no concomitant medication. The patient work at a hospital and she went for a Covid shot (clarified as Covid 19 vaccine) on 22Dec2020 and she got a very bad reaction from it which bothered her, she had severe headaches in Dec2020 and it was just too uncomfortable and on 24th she was very tired, she didn't had too much of upset stomach in Dec2020 but it was not all that bad by 9 in the clock by morning she was at work and everything and she was told by if she was not feeling well she can walk by a day, but her question and her concern was back on November okay she had called in sick around, she had a funeral that she gone too and people that were at the funeral, unfortunately were smoking outside and smoke bothers me very much, she get congested and she get head cold from it you know and I was thinking it's nothing it's just a cold and somebody told her no (name) you better go get yourself to the employee health office and get checked out and she didn't bother doing that, she said no it's just the cold she will

be fine but then it just got worse down the road and she said to herself may be she better just to say she did it, so she called in sick on 24th because she had the cold still and she called and she went to employee health office on 25th she still had the headache and she still had the cold, however when she went to the health office they said to her well stay out of work and we will get back in touch with her and she said okay and she will do that so when they got back in touch with her they said they do have the Covid and she said ohhh she said okay so she stayed out of work and she went to work on the 07Dec so she was wondering whole time, so her confusion was this she was told if you already had the virus in her which at that time, she did not know what it was she just thought it was from cigarette smoke because it got her all congested and she got the head cold in Dec2020 and the whole thing that went along with it and the health employee officer know you had the virus and it's just the virus and she go oh great and that's when they told her to stay out of work and she said okay fine then she just have to that, so in the meantime everybody in the work said hi calling me checking up on her and she said it's so nice of you people, she appreciate it but then she went back to work she was still feeling you know much better than she was but she had little whooping cough in Dec2020 but that was not really that bad, so they said you going to get the shot or not, and she said she don't know she kind of debatable, she don't know if she should get it, because she work in the hospital or she should not get, she said she don't know she was kind of up and some people like she get it sometime your health was not that good but on the other hand everybody that is working here in the hospital working with patients because was work right in the ICU, all over the floor you know spreading right there so she said oh alright so she kicked myself and said go get the shot, get it just over with and get it out of here so that is when she took her shot that was on 22nd and on 24th she was very tired all day no she was tired all day but she was kind of dragging most of the day but she had on the 20th no that was fine on the 20th okay for some reason she guess it was after work that week on 19th, she came home and her head was so congested and she had the worst headache and she felt like a wand had hit her over the head, it was horrible and all she could smell was cigarette smoke, like is her neighbor smoking here so she went down the hall because in live in building that used to be hotel but now they turned that into Condominium and she walk up and down the hall and she was like was somebody smoking or why this or why smell this so strong and the all the lights off in a hallway and she don't want to offend anybody but they had to go to work and somebody elsewhere and she am like she can't stand this smell and they gave this shot and she went for this shot, and they told us to come back she think it was a week or something like that to get the second shot, and she am saying if this going to cost her going to feel this way again, she don't want to get the second shot, she told them that and they told her to call this number and talk to them.The only reason she got it because they encouraged to get it. Even though she had the Covid virus, people said if you already have the virus you don't need to get a shot but people were encouraging because that's she thought well she guess she will get it. But she was mad that she got because it made her sick in Dec2020. And because we already got it they want us to go back and get the second shot and what she was m trying to say to you is, without take and hour 3 hour of conversation here she just want to say she don't want to get back and get the second shot and if it is okay by you guys somehow send her a letter or whatever it is, whoever she have to talk to because she don't want to go back and get the second shot just because of getting sick. She took Excedrin because that works for my headache. She didn't understand why you need all this information history with all this when all she want to say was she didn't want to get a second shot. The outcome of events Head

cold and Headache was not recovered, the other events was unknown. Information on the lot/batch number has been requested.

Coworker who received the shot is positive too; Coworker who received the shot is positive too; This is a spontaneous report from a contactable consumer. This consumer reporter similar events for two patients. This is the second of two reports. A patient of unspecified age and gender received bnt162b2 (BNT162B2, lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date at a single dose for covid-19 vaccination. The patient's medical history concomitant medications were not reported. The reporter's coworker who received the shot was positive too. The outcome of the event was unknown. Information about lot/batch number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2020513735 same reporter/product, different patient, similar event

Caller stated that she received covid vaccine on Tuesday and was tested positive on Friday.; Caller stated that she received covid vaccine on Tuesday and was tested positive on Friday.; This is a spontaneous report from a contactable nurse reporting for herself. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE lot number and expiration date not reported), via an unspecified route of administration on Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient stated that she received the vaccine on Tuesday (Dec2020) and was tested positive on Friday (Dec2020). The patient stated she was told that vaccine was contraindicated in people who have COVID-19. The outcome of the events was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient might not be completely excluded.

hypersensitivity reaction to COVID-19 Vaccine; throat pain that progressed to a little bit of tightness; ear pain; wheals develop on her back bilaterally; This is a spontaneous report from a contactable pharmacist. A female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EJ1685 and Expiry date: 31Mar2021, strength: 0.3ml) (NDC number: 59267-1000-2) via Intramuscular on 21Dec2020 12:21PM at 0.3ml single dose for COVID-19 immunization. The patient's medical history and concomitant drug was reported as none. The patient experienced a hypersensitivity reaction to COVID-19 Vaccine late last night on 21Dec2020. Hypersensitivity reaction: Further described as patient developed throat pain that progressed to a little bit of tightness; some ear pain; and had wheals develop on her back bilaterally. She was transported to the emergency room on 21Dec2020 where she received treatment and was under observation. The outcome of events was unknown. Since whether outcome recovered completely, recovered with lasting effects or just improved is unknown. She was not admitted to the hospital; she was sent home from the emergency room after 2.5 hours. Caller reported seriousness criteria as medically significant because event required medical intervention. Causality was very likely. Patient at time of this report is scheduled to receive the second dose of vaccine; they have not determined if she will receive the second scheduled dose or change/stop dose in response to this event. First dose; scheduled to receive a second dose; have not determined if will be continuing with it.; Sender's Comments: Based on the compatible time association, the hypersensitivity reactions are reasonably related to suspect BNT162B2 administration.

positive COVID-19 test with symptoms; positive COVID-19 test with symptoms; This is a spontaneous report from a contactable nurse, who is also the patient. This 31-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration in Dec2020 at single dose for COVID-19 immunisation. Relevant medical history and concomitant medications were not reported. The reporting nurse stated that she received her first dose of the COVID-19 vaccine on Saturday (e.g. Dec2020). She had taken a PCR test on Thursday and received a negative result on Saturday, the same day she received her vaccination. She reported developing a fever on Monday night and testing positive for COVID-19 on Tuesday. At the time of the report, the outcome of the events was unknown. The information about lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspect vaccine BNT162B2 in this patient cannot be completely excluded. More information such as laboratory findings on viral nucleic acid /PCR test needed for meaningful medical assessment.

All of a sudden I did not have any taste or smell; All of a sudden I did not have any taste or smell; Tested positive; Tested positive; This is a spontaneous report from a contactable nurse reported for herself. A 29-year-old female patient received bnt162b2 ((PFIZER-BIONTECH COVID-19 VACCINE, batch/lot EH9899), via an unspecified route of administration on 22Dec2020 at single dose for covid-19 immunisation. Medical history included seasonal allergy. Concomitant medication included cetirizine hydrochloride (ZYRTEC [CETIRIZINE HYDROCHLORIDE]). The patient was taking a multivitamin a day. The patient experienced typical symptoms no taste, smell on 22Dec2020, Slight tingling, body aches, chills, all the other symptoms for Covid and now positive for Covid in Dec2020. Outcome of events was unknown.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported event positive for Covid based on the known safety profile.

"I am not feeling well; had a Covid PCR done swapped on yesterday and I am Covid positive; had a Covid PCR done swapped on yesterday and I am Covid positive; This is a spontaneous report from a contactable nurse. This nurse reported for herself that the 35-year-old female patient who received bnt162b2 (BNT162B2), via unknown route of administration on 23Dec2020 at single dose for covid-19 immunisation. Medical history was none. Concomitant medications were none. Nurse stated, ""I received the Pfizer Vaccine this Wednesday and right before getting the vaccine, I had a Covid test (captured as per verbatim) on before the vaccine on Tuesday (22Dec2020) was negative. I had a Covid PCR done swapped on yesterday (25Dec2020) and I am Covid positive. So I have the vaccine and I am Covid positive"" Nurse stated ""It's ""140"" ""130"" pounds (further bot clarified)."" The patient was not feeling well. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the limited available information, the company considers that a causal relationship between the SARS-CoV-2 test positive and vaccination with BNT162B2 cannot be excluded."

positive with Covid; having Covid symptoms; positive with Covid; having Covid symptoms; This is a spontaneous report from a contactable nurse. A 54-year-old female patient (mother) received BNT162B2 (Batch/lot number: EK5730), via an unspecified route of administration on 18Dec2020 at single dose for COVID-19 immunisation. Medical history included asthma. Concomitant medications

were not reported. Patient got the vaccine administered on 18Dec2020 and after that she was diagnosed positive with Covid on 24Dec2020, so now she was having Covid symptoms obviously after the vaccine but like not due to the vaccine. Reporter was just concerned what her next dose supposed to be scheduled for 08Jan2021, was she still supposed to get the second dose or what. No treatment received. Patient was just taking vitamins. Reporter also reported that typically it was not supposed to be but was trying to get the information on enhanced immune response. Outcome of the event was unknown.; Sender's Comments: The reported positive with Covid after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

sinus issues; positive COVID-19 test with symptoms; positive COVID-19 test with symptoms; right arm sore; This is a spontaneous report from a Pfizer Sponsored Program. A contactable consumer (patient) reported that a 58-year-old male patient received the first dose of BNT162B2 (lot number: EH9899; Expire Date: 31Mar2021), via an unspecified route of administration, in arm, right upper, on 16Dec2020 11:10 AM at single dose for COVID-19 immunization. The vaccination facility type was hospital. The vaccine was not administered at military facility. Patient's medical history (including any illness at time of vaccination) was none. The patient got ill from all pain medications- from prescription strength pain killers to OTC products such as tylenol, ibuprofen and aspirin. All of them make him sick- experienced hot flashes and nausea. No additional vaccines administered on same date of the Pfizer suspect vaccine. Prior vaccinations (within 4 weeks) was none. The concomitant medication included 2 different blood pressure pills, mentioning Lisinopril, but stated he did not think his blood pressure pills were relevant to what he was experiencing with the COVID-19 Vaccine. A MRI tech (clarified by caller as MRI technologist) at a hospital who received the COVID-19 Vaccine on 16Dec2020 (caller clarified he received the vaccine at 11:10 AM on 16Dec2020). Caller stated on 17Dec2020 he had signs of aches and pains allover, a sore arm (clarified as his right arm), no fever. He also experienced sinus issues and a loss of sense of smell. Clarified his right arm was sore for only a day, his sinus issues started on 20Dec2020, and his loss of the sense of smell gradually started on 22Dec2020. He stated on 23Dec2020 he had a COVID-19 test performed and the test result was positive for the COVID-19 virus. Caller asked since he had the first COVID-19 Vaccine dose, and has now tested positive for the COVID-19 virus, should he get the second COVID-19 Vaccine dose scheduled for 06Jan2021. Patient's Height: 5' 8'' as provided by caller, who stated he has shrunk 1''. No further details provided. Patient's Weight: 169 lbs. as provided by caller, who stated his weight was as of today. Reported he worked an overnight shift, clarifying he was injected with the COVID-19 Vaccine after his overnight shift was finished on the morning of 16Dec2020. He stated he came back to work later in the day on 16Dec2020 to work another overnight shift from 9:00 PM to 7:30AM. He said after he finished is overnight shift on the morning of 17Dec2020, he went home to bed, and woke up around 12:00 PM on 17Dec2020. He said when he woke up, he started to feel aches and pains allover, and after that noticed he was getting chills periodically. Clarified he experienced the aches and pains allover for a couple of days, and then the aches and pains went away. He said he then started to get the feeling a sinus infection was coming on, but he never got a sinus infection. He said the aches, pains, and chills came back. Reported his co-worker received the COVID-19 Vaccine on Saturday, 19Dec2020, clarifying his co-worker did well with the COVID-19 Vaccine. He clarified his employer was concerned that he may have exposed his co-worker to COVID-19 when the

two worked together on the overnight shift of 22Dec2020. He said both he and his coworker kept their PPE on the whole time they worked except when the two ate dinner. He said the two of them sat at a round table about 6 feet apart, and took off their masks to eat. He said his partner agreed that the two of them were right at 6 feet apart when the sat at the table to eat dinner, so their employer deemed his coworker as low risk. Reported on 22Dec2020 he had to go back to work, so he was asked for his temperature at the time, which was 98.8 degrees. He did have a flu shot previously. He was instructed as long as he doesn't have a fever over 100 degrees, he can work. The caller said he went to work on 22Dec2020, and read an email from his employer's wellness office. He said the wellness office email spoke about the COVID-19 Vaccine side effects, and instructed employees to contact the wellness office with any COVID-19 Vaccine side effects experienced. He said he left a voicemail with his employer's wellness office explaining exactly what his COVID-19 Vaccine side effects were. He said he instructed his employer's wellness office call him in the afternoon because he was going to go home, go to bed, and wake up at noon on 23Dec2020. He stated he spoke with his employer's wellness office at around 11:30 AM on 23Dec2020, and the wellness office asked for him to go to the hospital, and have a COVID19 test. Caller stated his employer performed a COVID-19 nasal swab test, and on 24Dec2020, he was told he was COVID-19 positive. He said his employer backed up his quarantine start date to 17Dec2020 (the first day he experienced symptoms), and had him follow a 10-day quarantine until 27Dec2020. He stated today, 28Dec2020, was the first day he has been off quarantine. Reported he was not saying he got COVID-19 from receiving the COVID-19 Vaccine, but should he have the second COVID-19 Vaccine injection. Clarified his symptoms were intermittent, and started coming back around 20Dec2020. Reported he was not experiencing any scratchiness in his throat, and his eyes were not watering. He said he has had no cough, no sneezing, and no trouble breathing. He said in general, it felt like something was coming on, saying it was building up, but not getting out. Clarified he had gone back to work on 23Dec2020 to have his COVID-19 nasal swab test performed, and was told by his employer on 24Dec2020 that the COVID-19 nasal swab test was positive. No AE required a visit to emergency room or physician office. The outcome of the event right arm sore was recovered on 18Dec2020 and the other events was unknown.

patient had COVID two days after vaccination; This is a spontaneous report from a non-contactable consumer. A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number/expiration date unknown) via an unspecified route of administration on 26Dec2020 at a single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. The patient had COVID two days after vaccination (28Dec2020). The outcome of the event was unknown. No follow-up attempts are possible, information about lot/batch number cannot be obtained.

four days after getting her first COVID vaccine injection, she had a COVID positive test result (antigen rapid response test); four days after getting her first COVID vaccine injection, she had a COVID positive test result (antigen rapid response test); This is a spontaneous report from a contactable consumer. A 29-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EK5730/expiration date unknown), dose number 1 via an unspecified route of administration on 23Dec2020 09:00 at a single dose on the left arm for COVID-19 immunization. Medical

history included vaccination of unspecified flu vaccine in Oct2020. No vaccines or new medications were received on the day of the vaccination. The patient stated that on 27Dec2020, four days after getting her first COVID vaccine injection, she had a COVID positive test result (antigen rapid response test). The patient stated that she had been mostly asymptomatic for COVID. The outcome of the events was unknown.

angioedema; swelling of the lips; This is a spontaneous report from a non-contactable nurse (patient). A 45-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at a single dose as COVID-19 vaccine. Medical history included angioedema 23 years ago. Concomitant medications were not reported. The caller wanted to report AE for the COVID-19 vaccine. AE reported that she took the COVID-19 vaccine and after 23 hours, she developed angioedemia on unspecified date. Additionally, she said that she woke up with swelling of the lips on an unspecified date. Given the AE from the first request, it was inquired if it was recommended to get a second dose. The outcome of the events was unknown. No follow-up attempts are possible. Information about lot/batch number cannot be obtained.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of angioedemia with lip swelling cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate

she had a rapid test performed which indicated a positive test result; she had a rapid test performed which indicated a positive test result; This is a spontaneous report from a contactable nurse (patient). A female patient of unspecified age received the first dose of BNT162B2, via an unspecified route of administration on 18Dec2020 at a single dose for immunization. The patient's medical history and concomitant medications were not reported. The patient indicated she received the first dose of the vaccine on the 18th and due to a family member testing positive, she had a SARS-CoV-2 rapid test performed in Dec2020 which indicated a positive test result. Her employment was questioning as to whether this is due to her receipt of vaccine. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The reported information is limited. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

resident (patient) tested positive for COVID, 10 days after the first dose of COVID vaccine; resident (patient) tested positive for COVID, 10 days after the first dose of COVID vaccine; This is a spontaneous report from a contactable physician via a Pfizer sponsored program Pfizer First Connect. A 29-year-old female patient received their first dose of BNT162B2 (lot number and expiry date not reported), via an unspecified route of administration on 17Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter wanted to know

how long they have to wait for the second dose of the COVID vaccine as her resident (patient) tested positive for COVID on 27Dec2020, 10 days after the first dose of COVID vaccine given to her on the 17Dec2020. The patient underwent lab tests and procedures which included SARS-CoV-2 test: positive on 27Dec2020. The outcome of the events was unknown. Information on the lot/ batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of subject vaccine cannot be excluded for the reported events of LOE and SARS-CoV-2 test positive, based on temporal relationship. There is very limited information provided in this report. This case will be reassessed upon receipt of follow-up information.

tested positive for COVID-19; was given the first COVID-19 dose. After some time, the employee got symptomatic and was tested positive for COVID-19; This is a spontaneous report from a contactable pharmacist. A patient of unspecified age and gender received the first dose of bnt162b2, via an unspecified route of administration on an unspecified date at a single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient who is employed in a hospital tested negative for COVID-19 then was given the first COVID-19 dose. After some time, the patient got symptomatic and was tested positive for COVID-19. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The reported information is limited. The case will be reassessed upon receipt of follow up information. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Angioedema of lips, throat, eyes, hands. Flushing of hands; Angioedema of lips, throat, eyes, hands. Flushing of hands; Dizziness; Fatigue; Legs became heavy; Joint stiffness of hands; This is a spontaneous report from a contactable healthcare professional (patient). A 36-year-old female patient received the first dose of BNT162B2 (Pfizer-BIONTECH Covid-19 Vaccine; Lot number: EJ 1685), intramuscular on the left arm on 23Dec2020 at 06:30 AM in a hospital at a single dose for COVID-19 immunization. Medical history included known allergies of seasonal allergies, cats, and metals; migraines, chronic idiopathic urticaria, and angioedema. The patient was not pregnant and did not have any other vaccine in four weeks. The patient did not have COVID prior to the vaccination and did not test positive to COVID post vaccination (also reported as not been tested for COVID-19 after the vaccination). Concomitant medication included propranolol, cetirizine hydrochloride (ZYRTEC), and sertraline (reported as other medications in two weeks). On 23Dec2020 at 06:45 AM, the patient experienced immediate symptoms of angioedema of lips, throat, eyes, hands; flushing of hands, dizziness, fatigue, legs became heavy, and joint stiffness of hands. She was monitored by colleagues for an hour, prescription for Epi pen refilled, and available angioedema and fatigue persisted for three days. It was reported that the patient was not treated for the adverse events but it was also reported that the AE treatment also included X-ray and antibiotic. Outcome of the events was recovered in Dec2020.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of immediate symptoms of angioedema of lips, throat, eyes, hands, flushing of hands, dizziness, fatigue, legs became heavy, and joint stiffness of hands cannot be excluded, considering the plausible temporal relationship and the known adverse event

profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate

Angioedema; This is a spontaneous report from a contactable Other Health Professional (patient). A 40-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) lot number: EL1284, intramuscular in the right arm (also reported as right shoulder), first dose on 22Dec2020 00:30 at a single dose for Covid-19 immunization. The patient's relevant medical history included severe reaction to some animal dander and pollen, severe reactions to poison oak, possible drug induced reactions (unspecified) post C-section, mild rash with influenza vaccine this year (2020) (with no other hx of adverse reaction to a vaccine); had allergies to pollen, mold, some animals. The patient previously took influenza vaccine (split virion, inactivated) and experienced rash. The patient had no covid prior vaccination nor was she tested post vaccination. Adverse event reported was angioedema on 24Dec2020 with outcome of recovering. Systems started appearing on 23Dec2020 evening with slight rash and fluid collection under right eye. Developed more rash on 24Dec2020. In the evening to early morning of 25Dec2020, symptoms worsened significantly. Rapid swelling to face occurred. Swelling was concentrated around eyes and cheeks the most. Both right and left side of the face and neck were affected. However, the right side face had a more pronounced reaction. MD ordered oral prednisone and Benadryl as treatment plan. Also, ordered episode-pen for a worst case scenario. Symptoms have been improving under treatment but still persist some. The events were reported as non-serious. The adverse event start date was 24Dec2020 (as reported). The event resulted in doctor or other healthcare professional office/clinic visit.; Sender's Comments: There is a reasonable possibility that the event angioedema was related to BNT162b2 based on known drug safety profile and temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

tested positive for the COVID virus/she was having a symptom, she lost her sense of smell; tested positive for the COVID virus/she was having a symptom, she lost her sense of smell; sinus infection; tested positive for the COVID virus/she was having a symptom, she lost her sense of smell; Her nose being stuffed; tension headache on the back of head; her deltoid was hurting for 24 hours; active infection after getting the first dose; This is a spontaneous report from a contactable pharmacist (patient). A 37-year-old female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on the right deltoid on 18Dec2020 at single dose for COVID-19 immunization. Medical history reported as none. There were no concomitant medications. The patient had active infection after getting the first dose, consult if it was still recommended to get the second dose next week or she should be delaying getting the second dose. The patient got the COVID vaccine on the 18Dec2020. Then on the 24Dec2020 she tested positive for the COVID virus. She was due to get the second vaccine on 08Jan2021. She was asking should she still get the 2nd dose of the

vaccine since came up positive. The patient was having a symptom, she lost her sense of smell of 22Dec2020. She lost her sense of smell on the evening on 22Dec2020, it still had not come back at all. She did have sense of taste on the tongue. She thought it was sinus infection, because her head didn't hurt and she was not stuffed anymore. She stated that after the vaccine, she had a tension headache on the back of head, and her deltoid was hurting for 24 hours. Her headache started the same day in the evening, went on till lunch time next day. Her nose being stuffed which she thought was a sinus infection started on Tuesday 22Dec2020, it was more located in the front middle of her forehead. Her nose being stuffed which she thought was a sinus infection started on Tuesday 22Dec2020, it was more located in the front middle of her forehead. She did not have her Card to provide Lot and Expiry, it was at work at the hospital. She was administered the vaccine on the right deltoid, since she didn't want to sleep on it. Prior to vaccine she has had no positive test for Covid. Caller stated that this was super unfortunately coincidental. She had had no antibody test. She had no reactions to vaccines in the past. Test: Respiratory Panel. Result: Negative on unknown date. The outcome of events drug ineffective, COVID-19 and sinus infection was not recovered. The outcome of event tension headache and muscle pain was recovered in Dec2020. The outcome of rest events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of subject vaccine cannot be excluded for the reported events of LOE, COVID 19 and other events, based on temporal relationship. There is very limited information provided in this report. This case will be reassessed upon receipt of follow-up information.

tested positive; tested positive; Symptoms experiencing include having no taste, smell and slight bodyache; Symptoms experiencing include having no taste, smell and slight bodyache; Symptoms experiencing include having no taste, smell and slight bodyache; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A contactable other-healthcare professional (patient) reported that a female patient of an unspecified age received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 17Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient was tested positive on 24Dec2020, and symptoms experiencing include having no taste, smell and slight body ache in Dec2020. The patient asked if she could get the second dose. The outcome of the events was unknown. Information about the Lot/batch number has been requested.; Sender's Comments: Based on the limited available information, the company considers that a causal relationship between the COVID-19, with symptoms of having no taste, smell and slight body ache, and vaccination with BNT162B2 cannot be excluded.

Positive rapid test and PCR test after 1st vaccination; Positive rapid test and PCR test after 1st vaccination; This is a spontaneous report from a contactable nurse reporting for her/himself. A patient of unspecified age and gender received the 1st dose of bnt162b2 (BNT162B2), via an unspecified route of administration, on 15Dec2020, at single dose, for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient tested positive on 27Dec2020 on a rapid test and on 28Dec2020 on a respiratory panel by PCR. Next dose was scheduled on 05Jan2021. The information on the lot/batch number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the

reported event Positive rapid test and PCR test based on the known safety profile. However the short duration of 12 days since the vaccine first dose is given it is unlikely patient would have fully developed immunity.

tested positive for coronavirus; tested positive for coronavirus; This is a spontaneous report from a contactable physician (patient). A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 22Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced tested positive for coronavirus on 24Dec2020. The patient worked in a hospital. She got the first dose of Pfizer coronavirus vaccine on Tuesday, 22Dec2020. She tested positive for coronavirus on Thursday 24Dec2020 after exposure to patients and staff. She had mild symptoms. Her 2nd dose was scheduled for 12Jan2021. The patient was inquiry whether she should receive it, or should she take an antibody test first, but it would be less than 3 weeks from the onset of illness. The outcome of event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported event tested positive for coronavirus based on the known safety profile. However the short duration of 2 days since the vaccine first dose is given it is unlikely patient would have fully developed immunity.

"tested positive for covid; tested positive for covid; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A contactable Pharmacist reported similar events for 2 patients. This is the first of two reports. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 14Dec2020 at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. Caller is a pharmacist asked if there is a contraindication for administering antibody therapy to a person after they have received the first dose of the covid vaccine. He reported that there are 2 patients that received the covid vaccine the week of 14Dec and subsequently tested positive for covid on the 23rd and 24th of December. He was trying to determine the safety of administering antibody therapy for those patients even though they already got the first vaccine dose. He reported this question has some urgency and needed the information within 48 hours. Attempted to warm transfer but caller reported that he does not have any patient specific information or identifiers at this time. Escalating Urgently for additional research. Outcome of event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the limited available information, the company considers that a causal relationship between the event ""tested positive for COVID"" and vaccination with BNT162B2 cannot be excluded.,Linked Report(s) : US-PFIZER INC-2020516661 same reporter/ drug/ AE, different patient"

meningitis; headache; fever; weakness; rash; This is a spontaneous report from a contactable consumer (patient). A male patient of an unspecified age received bnt162b2 (lot/batch number and expiration date not provided), via an unspecified route of administration, on 16Dec2020, at single dose, for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient received the Pfizer-BioNTech COVID-19 Vaccine on 16Dec2020, he experienced headache, fever, weakness and rash; went to the ER and after testing blood work and suspecting of meningitis. They did a spinal tap. Test came out negative for Flu and COVID; was told the rash could be due to a drug reaction

and they attributed side effects to a generic bactrim, so he stopped taking all medications. If he continues to have issues the primary concern is whether he should get the second dose of the COVID-19 vaccine or not. The outcome of the events were unknown. Information on the lot/batch number has been requested.

High fevers (103/104 degree F) with chills for five days followed by low fevers (upto 101) for another six days and still ongoing; High fevers (103/104 degree F) with chills for five days followed by low fevers (upto 101) for another six days and still ongoing; headaches; fatigue; This is a spontaneous report from a contactable physician, the patient. A 49-year-old non-pregnant female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: UNKNOWN), via an unspecified route of administration in the left arm on 18Dec2020 at 15:15 (at 49-years-old) as a single dose for COVID-19 immunization. Medical history included severe iron deficiency, hypothyroidism, osteoporosis, and low baseline IgM antibodies levels (unknown cause). The patient did not have any allergies to medications, food, or other products. Concomitant medications included gabapentin (MANUFACTURER UNKNOWN), iron (MANUFACTURER UNKNOWN), calcium (MANUFACTURER UNKNOWN), and biotin (MANUFACTURER UNKNOWN). The patient did not receive any other vaccines within four weeks prior to the vaccination. On 19Dec2020 at 18:00, the patient experienced high fevers (103/104 degrees Fahrenheit) with chills for five days followed by low fevers (up to 101 degrees Fahrenheit) for another six days, headaches, and fatigue; all reported as non-serious. On 24Dec2020, the patient had a post vaccination nasal swab rapid antigen test and SARS-CoV-2 PCR test with negative results. The patient took paracetamol (TYLENOL) and ibuprofen (ADVIL) for treatment for the events. The clinical outcomes of the fever, chills, headaches, and fatigue were recovering. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender's Comments: Based on the compatible temporal association and the drug's known safety profile, the vaccination with BNT162B2 might play a contributory role in triggering the onset of high fevers with chills. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"tested positive for Covid; tested positive for Covid; This is a spontaneous report from a contactable other healthcare provider. A 44-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration at single dose on 21Dec2020 for Covid-19 immunisation. The patient medical history and concomitant medications were not reported. The patient said that she received the Pfizer-BioNTech Covid-19 Vaccine last Tuesday, 21Dec2020, then tested positive for Covid on 26Dec2020. She said the symptoms started on 24Dec2020. Now, she wants to know if it is still okay to get the 2nd dose of the vaccine on the scheduled date. The outcome of events was unknown. Information about Lot/Batch number has been requested.; Sender's Comments: Based on the limited available information, the company considers that a causal relationship between the event ""tested positive for COVID"" and vaccination with BNT162B2 cannot be excluded."

difficulty thinking; brain fog; Injection site pain and swelling; Injection site pain and swelling; axillary lymph node swelling; wrist pain and swelling/joint pain; wrist pain and swelling; muscle and joint pain;

skin pain; kidney and liver pain; kidney and liver pain; dizziness; nausea; weakness; fatigue; chilling; This is a spontaneous report from a contactable nurse (patient). A 49-year-old female patient (not pregnant) received first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiry date were not provided), intramuscular in right arm on 22Dec2020 14:30 at single dose for COVID-19 immunisation. Facility where the most recent COVID-19 vaccine was administered was hospital. Medical history included asthma. Prior to vaccination, the patient was not diagnosed with COVID-19. No allergies to medications, food, or other products. Concomitant medication included fluticasone propionate, salmeterol xinafoate (ADVAIR). The patient experienced Injection site pain and swelling, axillary lymph node swelling, wrist pain and swelling, muscle and joint pain, skin pain, kidney and liver pain, dizziness, nausea, weakness, fatigue, chilling, difficulty thinking, brain fog on 23Dec2020 01:15. Symptoms lasting x 6 days. The patient not received any other vaccines within 4 weeks prior to the COVID vaccine. No treatment received for the adverse event. Since the vaccination, the patient has not been tested for COVID-19. The outcome of events was reported as recovering. Information about lot/batch number are requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the difficulty thinking, brain fog and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including head CT/MRI and chemistry panel, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Got first vaccine dose on the 18th and came out Covid test positive; Got first vaccine dose on the 18th and came out Covid test positive; This is a spontaneous report from a non-contactable consumer (patient). A female patient of an unspecified age received first dose of BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine; lot/batch number and expiry date were unknown) via an unspecified route of administration on 18Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient got the first dose on the 18th, and she came out Covid test positive yesterday (unspecified date in Dec2020). She wanted to know if she should get the second vaccine or what is the protocol into that. The outcome of the event was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained. No further information is expected.

Diagnosed with COVID after receiving first dose of COVID-19 Vaccine; Diagnosed with COVID after receiving first dose of COVID-19 Vaccine; This is a spontaneous report from a contactable nurse (patient). A 61-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE, lot number PAA156051, expiration date unknown), via an unspecified route of administration on 15Dec2020 16:00 at a single dose at the right arm for COVID-19 immunization. The patient has no medical history, no family medical history and no concomitant medications. The patient is a nurse in the Emergency Room. She had a first dose of COVID-19 vaccine on 15Dec2020. She was diagnosed with

COVID after receiving first dose of COVID-19 vaccine on 23Dec2020. Due for second dose of COVID-19 vaccine on 04Jan2021. She wanted to know if she should go through with second dose if her symptoms subside. The COVID swab was done in the Emergency Room and was not admitted to hospital. The outcome of the event was unknown.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient cannot be completely excluded.

tested positive for covid; tested positive for covid; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A contactable Pharmacist reported similar events for 2 patients. This is a 2nd of two reports. A patient of unspecified age and gender received BNT162B2, via an unspecified route of administration on 14Dec2020 at single dose for covid-19 immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. The reporter was a pharmacist asking if there was a contraindication for administering antibody therapy to a person after they had received the first dose of the covid vaccine. He reported that there was a patient that received the covid vaccine the week of 14Dec and subsequently tested positive for covid on the 23rd and 24th of December. The reporter was trying to determine the safety of administering antibody therapy for the patient even though the patient already got the first vaccine dose. The reporter reported this question had some urgency and needed the information within 48 hours. The patient underwent lab tests and procedures which included covid test: positive on 23Dec2020, positive on 24Dec2020. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the limited available information, the company considers that a causal relationship between the COVID test positive and vaccination with BNT162B2 cannot be excluded.,Linked Report(s) : US-PFIZER INC-2020516319 same reporter/ drug/ AE, different patient

tested positive; tested positive; This is a spontaneous report from a contactable nurse reported for herself. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection) via an unspecified route of administration on 22Dec2020 at single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient got the COVID vaccine on 22Dec2020 and tested positive (COVID) on 27Dec2020, she didn't expect to be immune. The outcome of the event tested positive was unknown. Follow-up activities are possible, information on the batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient cannot be completely excluded. Further information like specific SARS-CoV-2 test and any symptom associated with SARS-CoV-2 test positive needed for full medical assessment

Received the first dose of the vaccine; Have now tested positive; Received the first dose of the vaccine; Have now tested positive; This is a spontaneous report from a pharmacist. It was reported that a patient of unspecified age and gender received bnt162b2 (BNT162B2) vaccine , via an unspecified route of administration on an unspecified date at single dose for covid-19 immunisation . The patient medical history and concomitant medications were not reported. The patient received the first dose of the vaccine; and have now tested positive. The patient underwent lab tests and procedures which included sars-cov-2 test: positive No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Based on the limited available information, the company

considers that a causal relationship between the reported events and vaccination with BNT162B2 cannot be excluded.

had a positive COVID test; had a positive COVID test; O2 Saturation of 80% / Hypoxia; shortness of breath; He has a CT scan which showed extensive infiltration in the lungs; muscle pain; chills; body aches; low grade fever; cough; This is a spontaneous report from a contactable physician (pulmonary medicine). This physician reported similar events for 2 patients. This is 1st of 2 reports. A 35-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 18Dec2020 at single dose for covid-19 immunization. There were no medical history and concomitant medications. Caller stated that his close friend who was ER physician (front line worker) and within 24 hours after receiving the COVID vaccine, developed COVID or symptoms of COVID. Patient received the COVID vaccine on 18Dec2020 and the same night patient started with a low grade fever, body aches, chills, muscle pain, shortness of breath, cough, O2 saturation of 80% (hypoxia) and was in the intensive care unit now. Patient swore this was related to the vaccine. This patient tested positive for COVID. He had a CT (computerised tomogram) scan which showed extensive infiltration in the lungs in Dec2020. Patient was admitted to the hospital on 24Dec2020 and then was moved to the ICU 2 days later, on 26Dec2020. Caller thought patient had a positive COVID test at another hospital. Caller did know that tested positive at the current hospital on 26Dec2020 which was done to confirm the previous positive test. Caller thought patient had his first positive COVID test either the same day or the next day after receiving the vaccine. Event of O2 Saturation of 80% / hypoxia was reported as hospitalization from 24Dec2020 and life threatening; infiltration in the lungs and shortness of breath caused hospitalization from 24Dec2020, muscle pain, chills and positive COVID test was reported as medically significant; and other events were reported as non-serious. Outcome of O2 saturation of 80% / hypoxia and shortness of breath was not recovered, outcome of cough was recovering; and outcome of other events were unknown. Information about lot/batch number has been requested. ; Sender's Comments: Based on the information currently available, a lack of efficacy with suspected vaccine BNT162B2 in this patient cannot be completely excluded.,Linked Report(s) : US-PFIZER INC-2020519020 same reporter/drug , different patient/AE.

Anaphylactic reaction requiring two doses of Epinephren to control. Still having issues; other vaccine same date product received; This is a spontaneous report from a contactable nurse (patient). A 54-year-old female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscularly on right arm at 12:30 PM on 18Dec2020 at single dose for COVID-19 immunization, and first dose of other Pfizer vaccine same date product (other vaccine same date lot number: elt9899) on right deltoid on 18Dec2020 for unknown indication. Medical history reported as none. Concomitant medication included vitamin C and colecalciferol (VITAMIN D). The patient experienced anaphylactic reaction at 12:30 PM on 18Dec2020 requiring two doses of epinephren to control. still having issues, resulted in: Doctor or other healthcare professional office/clinic visit, Hospitalization in Dec2020. days hospitalization: 1. The patient received treatment: 2 doses of epinephrine, solumedrol, benadryl, IV and O2 for event anaphylactic reaction to vaccine. The outcome of anaphylactic reaction was not recovered. Lot/Batch and Expiration date has been requested.; Sender's Comments: The information available in this report is limited and anecdotal and does not allow a medically meaningful assessment of the case.

There is a plausible temporal association between vaccines administration and onset of the reported event. It is unclear what is the nature of the vaccine co-administered with BNT162b2. Currently no information is available on the co-administration of the Pfizer-BioNTech COVID-19 Vaccine with other vaccines.

patient received the first dose of COVID 19 vaccine on 16Dec2020. She got tested positive on 20Dec2020; patient received the first dose of COVID 19 vaccine on 16Dec2020. She got tested positive on 20Dec2020; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 16Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the first dose of COVID 19 vaccine on 16Dec2020. She got tested positive on 20Dec2020. The patient wanted to know if it's safe for her to get the second dose of covid-19 vaccine scheduled for 07Jan2021. Outcome of the event was unknown. Information on the Batch/Lot number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient might not be completely excluded.

anaphylactic shock/numb throat; high heart rate; light headed; anaphylactic shock/numb throat; This is a spontaneous report from a contactable consumer (patient himself). A male patient of an unspecified age (reported as 39: unknown unit) received bnt162b2 (BNT162B2 also reported as PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiry date were not reported), via an unspecified route of administration on 22Dec2020 at single dose, for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient experienced anaphylactic shock, numb throat, high heart rate and light headed on an on 22Dec2020. The outcome of events was unknown. Information on the lot/batch number has been requested.

tested positive for COVID-19; tested positive for COVID-19; feeling sick; This is a spontaneous report from a consumer or other non hcp. A male patient of an unspecified age received bnt162b2 (BNT162B2) vaccine, via an unspecified route of administration on 22Dec2020 at single dose for covid-19 immunisation . The patient medical history and concomitant medications were not reported. On 24Dec2020 the patient was sick and was tested positive for covid-19, the outcome of the event was unknown. Information about Lot/Batch number has been requested.

Rhonchi, frothy sputum, low grade temp, elevated HR, 12/30 MD assessed 1:00PM and increased prednisone and added Cefdinir. Sent to hospital 12/30 at approximately 6:30PM with worsening symptoms

Redness and warmth with edema to right side of neck and under chin. Resident was on Hospice services and expired on 1.1.21

12/30/2020 07:02 AM Resident noted to have some redness in face and respiration were fast. Resident vital signs were abnormal except blood pressure. Temp at the time was 102.0 F taken temporal. Resident respirations were 22 labored at times. Pulse is 105 and pulse ox 94% on room air. Resident is made comfortable in bed. Notified triage of change in condition also made triage aware of resident

receiving Covid vaccination yesterday morning. Resident appetite and fluid consumption has been poor for few days. 12/30/2020 07:32 AM Received order from agency to administer Acetaminophen 650mg suppos rectally due to resident not wanting to swallow anything including fluids, medications and food. This writer administered medication as NP ordered. Will monitor for effectiveness and adverse effects if any. 12/30/2020 08:41 AM Received new orders to obtain Flu swab, obtain CBC and BMP, and Chest Xray all to be obtained today. Notified family of resident having temperature and vital signs excluding b/p that was abnormal. Family was thankful for call and inierated to nurse that family does not want resident sent to hospital. Did educate family on benefits of Hospice services, but family persistant on continued daily care provided by nursing staff. Requests visits if decline continues. Family assured if resident continues to decline, facility will accomandate resident family to be able to be at bedside when time comes to do so. NP ordered IVF and IV Levaquin on 12/31/20. Family chose at that time to sign for Hospice services and not have resident provided with IVF or IV Antibiotics

Numbness from Neck to face to head on the left side. Lasted a few days. 12-30-2020 to January 3rd, 2021.

Patient received her Vaccine on 12/16/2020. Afterwards she developed symptoms of fever, chills, diarrhea, nausea, vomiting and headache that became worse over time and on day os presentation to our hospital on 1/2/2021 she was having photophobia. Current headache at time of admission had been persistent for over a week. Patient has no immunocompromising risk factors and was diagnosed with confirmed CMV meningitis. She was also admitted with transaminitis.

"The resident received is vaccine around 11:00 am and tolerated it without any difficulty or immediate adverse effects. He was at therapy from 12:36 pm until 1:22 pm when he stated he was too tired and could not do anymore. The therapist took him back to his room at that time and he got into bed himself but stated his legs felt heavy. At 1:50 pm the CNA answered his call light and found he had taken himself to the bathroom. She stated that when he went to get back into the bed it was ""abnormal"" how he was getting into it so she assisted him. At that time he quit breathing and she called a RN into the room immediately. He was found without a pulse, respirations, or blood pressure at 1:54 pm. He was a DNR."

6-7 hours after the vaccine she developed arm pain, fever and chills. About an hour later she started to have abdominal pain which worsened over the course of the day to excruciating. She went to the Emergency Room where a CT scan revealed a perforation of her sigmoid colon and had a resection of the area of the colon and a diverting colostomy surgery done the evening of 1/3/2021.

starting to feel lethargic and weak. Had menses with increased blessed. Called physician to have blood work done to see if I was experiencing anemia. Blood work complete on 12/31/2020. On 1/3/2021, I woke up with blood blisters all over the inside of my mouth and petechia on my trunk and bilateral upper and lower extremities. I called my primary physician to report the symptoms. He suggested to go to the ER if my symptoms worsened. Later that evening I started with a nose bleed and did go to the ER. Upon arrival to the ER, my platelet count was 9. I was admitted to the hospital and diagnosed with ITP.

12/31/20 around 11am Numbness in right hand and right cheek, 5 minutes later, slurred speech. Episode lasted approximately 10 minutes. Treated in ER. Labs, MRI, all normal 1/3/21 Swollen lymph node to left axilla 1/4/21 Rash to injection site

Tachycardia, resident was sent out to the hospital for evaluation on 12/30/2020 and came back to the facility on 12/31/2020.

Anaphylactic Reaction, facial swelling, facial Redness, Face felt like it was burning, face flushing, throat swelling, heart palpitations, trouble swallowing , feet swelling, light headed, anxiety. Hospitalized from the 12/23/20 to 12/26/2020 . Medications now on Epinephrine, diphenhydramine, cetirizine, famotidine, prednisone, lorazepam, cephalexin. on 1/1/2021 was taken to E.R. by ambulance around 11:00 am left hand was tingle started to go numb traveled up my arm into left side of my face ,ear, tongue, and then down to the left side of my leg and into left foot, could not move left side of body for a good 7 to 8 mins then went away transferred to ambulance enroute to ER blood pressure was high and and started having right ear pain and right side frontal severe headache, arrived to ER and was given diphenhydramine ,ketorolac, metoclopramide HCl, lorazepam. MRI was ordered and Neurologist found two small lesions on right side of frontal brain, following up now with neurologist. added more meds naproxen

2 minutes after vaccine was administered, noticed swelling back of tongue, progressed to posterior 2/3 of tongue, tachycardia, elevated BP. Progressive angioedema involving larynx, cough, shortness of breath. No wheezing. Physical exam did do show any obvious swelling. O2 sat decreased to 80, 1st epinephrine IM administered, 50mg benadryl IV and Famotidine administered. some improvement in symptoms. In 30mins, reoccurrence of angioedema and second epinephrine vaccine administered. Monitored for 2 hours without reoccurrence of symptoms and discharged from ER.

palpitations, chest tightness/heaviness, scratchy throat/frequent throat clearing, head heaviness, blurred vision, elevated blood pressure. Evaluated in ED received solumedrol, benadryl. Discharged home and returned to hospital as direct admit due to continued symptoms. Pertinent labs reveled AKI, elevated LFTs. AKI and LFTs improved with IVFs.

Found deceased in her home, unknown cause, 6 days after vaccine.

Vaccine 12/30/2020 Screening PCR done 12/31/2020 Symptoms 1/1/2021 COVID test result came back positive 1/2/2021 Deceased 1/4/2021

Abdominal pain that proceeded to get worse into the next day. Connected with PCP, had labs drawn and ultrasound ordered. Ended up going to ER. Determined to have Appendicitis, needed and had appendectomy on 12/29/2020.

felt like she had a stroke; fell down; Pain in leg; itchiness in her head; left leg not functioning normally; This is a spontaneous report from a contactable nurse (reporting for herself). A 51-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot number: EH9899), via an unspecified route of administration in the left deltoid on 21Dec2020 at 10:00 (at the age

of 51-years-old) as a single dose for COVID-19 immunization. Medical history was none. There were no concomitant medications. There were no prior vaccinations within 4 weeks prior to the first administration of the suspect vaccine. On 21Dec2020, the patient experienced left leg not functioning normally, which was reported with the seriousness criteria of disability. On 21Dec2020, the patient had itchiness in her head. The patient felt like she had a stroke, fell down and pain in leg on 22Dec2020, which were all reported with the seriousness criteria of disability. The patient called the doctor office and spoke with the doctor on call and was told to use diphenhydramine hydrochloride (BENADRYL). No further details provided. The patient was sent home for 10 days and she was sent back to work. The patient underwent lab tests and procedures which included COVID: negative in Dec2020. The outcome of the events was not recovered. The reported assessed the events related to the suspect product, BNT162B2.; Sender's Comments: The reported events leg dragging, leg pain and fall and suspected stroke were possibly related to the use of first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), due to temporal relationship. However, stroke was not diagnosed. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Had a rapid test for COVID, and it was positive; Had a rapid test for COVID, and it was positive; This is a spontaneous report from a contactable pharmacist. A male patient of an unspecified age started to receive BNT162B2 (lot number unknown), via an unspecified route of administration from an unspecified date to an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The pharmacist stated that they have vaccinated all their caregivers, and a physician (patient) who got the vaccine, called and reported to her that he had a rapid test for COVID, and it was positive. She is wondering if there was any data from the clinical trials where people tested positive after having the vaccine. The patient is now freaking out because he does not know if he needs to go to the hospital and get treatment for COVID. He works night shift and may have been exposed to COVID, but now she does not know how to guide him. The outcome of the events was unknown. The following information on the batch number has been requested.; Sender's Comments: The reported positive rapid test for COVID after COVID-19 immunization is considered related to the administration of BNT162B2.

"Systemic pruritis (itching) all over body; COVID test type: Nasal Swab and Rapid Antigen and were both positive; COVID test type: Nasal Swab and Rapid Antigen and were both positive; This is a spontaneous report from a contactable nurse (patient). A 26-year-old female patient started to receive BNT162B2 (lot number: EJ1685), intramuscular on 17Dec2020 16:30 at single dose in the left arm for COVID-19 immunization. Medical history included hypothyroidism from an unknown date. The patient was not pregnant at the time of vaccination. Concomitant medication included levothyroxine sodium (SYNTHROID) and spironolactone. The patient previously took cefprozil (CEFZIL) and tapazole and both experienced allergies. The patient experienced systemic pruritis (itching) all over body on 22Dec2020 10:00. The patient was not diagnosed with COVID-19 prior to vaccination and since the vaccination, the

patient has been tested for COVID-19. On 22Dec2020, the patient took COVID test type: Nasal Swab and Rapid Antigen and were both positive. No treatment received for the event ""Systemic pruritis (itching) all over body"". The outcome of the event ""Systemic pruritis (itching) all over body"" was not recovered. The outcome of the other events was unknown.; Sender's Comments: BNT162b2 provides protection against COVID-19 after 7 days from the second dose. This case does not match this codition"

result back w positive covid; positive COVID-19 test with symptoms; This is a spontaneous report from a contactable nurse reporting for herself. A 39-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 19Dec2020 11:00 (at age 39 years old) as a single dose (Dose 1) in the left arm for COVID-19 vaccination. The patient was not pregnant at the time of vaccination. The patient was not administered any other vaccine in the 4 weeks prior to COVID-19 vaccination. Medical history was none. There were no allergies to medication, food, or other products. The patient's concomitant medications were not reported; however the patient had not received any other medications in the last 2 weeks. The patient experienced a sore throat, voice loss on day 4, loss of smell on day 5, went to test, and the result came back with positive COVID. The events resulted in a Doctor's office visit. The patient was tested post vaccination on 22Dec2020 via NAAT-PCR (nasal swab), with a positive result. The patient had not been diagnosed with COVID-19 prior to vaccination. There was no treatment received for the event(s). The clinical outcome of the event positive COVID was unknown The event was reported as non-serious. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender's Comments: The association between the event drug ineffective (COVID-19 infection) with BNT162b2 can not be fully excluded.

tested positive for covid19/diagnosed with Covid; tested positive for covid19/diagnosed with Covid; she had SOB the day of her first vaccination; I am very sick; I feel bad; This is a spontaneous report from a contactable consumer (patient). A female patient of an unspecified age received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), via an unspecified route of administration on 21Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient got the first dose of COVID-19 vaccine on Monday, 21Dec2020 and then was diagnosed with COVID-19 on 23Dec2020. Added that she was very sick and wondering if he'll get her second dose or not. The patient feel bad and is due for her second dose on 11Jan2021. The patient also reported that she had shortness of breath (SOB) the day of her first vaccination on 21Dec2020 and then tested positive for COVID-19 later. She posits she may have received the vaccine when she had an active COVID-19 infection. She is wondering if she can still get her second vaccination. Outcome of the events was unknown.

"tested positive for COVID-19; headache; cough; voice being hoarse; Drug ineffective; This is a spontaneous report from a Pfizer Sponsored Program Pfizer First Connect from a Contactable nurse reporting for herself. A 58-years-old female patient received bnt162b2 (BNT162B2; Lot # EK5730) vaccine , via an unspecified route of administration on 18Dec2020 10:30 at single dose for covid-19 immunisation . Medical history included hypertension from an unknown date and blood cholesterol increased. Concomitant medication included losartan (LOSARTAN), hctz (HCTZ), ezetimibe (ZETIA), famotidine (PEPCID). The patient started having a headache and cough on 25Dec2020 and these

symptoms worsened on 26Dec2020 in addition to her voice being hoarse. On 26Dec2020 she went to get tested at an urgent center and tested positive for Covid-19. The outcome of the event was not recovered.; Sender's Comments: The association between the event ""tested positive for COVID-19, headache, cough, and dysphonia"" with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

It looks like one of the ingredients may have an animal cell lipid; Syncope; Dizziness; feeling faint; like going to pass out now and then; overall achiness, severe headaches, fever; overall achiness, severe headaches, fever; overall achiness, severe headaches, fever; This is a spontaneous report from a contactable nurse reporting for herself. This A 30-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot # EH9899), intramuscular at single dose in the left arm on 22Dec2020 09:00 for covid-19 immunisation. Medical history included reaction to pork, porsine and/or if she ever was exposed to exposed to heparin. There were no concomitant medications. On 23Dec2020, the patient experienced syncope (medically significant), dizziness (medically significant), feeling faint; like going to pass out now and then (medically significant), overall achiness, severe headaches, fever. The outcome of the events syncope, dizziness, feeling faint; like going to pass out now was recovering and outcome of overall achiness, severe headaches, fever was recovered on 24Dec2020. The patient ask: are there any animal products, pork gelatin or a lipid form of that contain in the vaccine? The events were described as follows: She experienced a significant amount of syncope and dizziness, for greater than 4 or 5 days post-receiving the vaccination. Also feeling faint like she is going to pass out every now and then. Has a more important question, wondering along with the doctors if one of the ingredients may have an animal product, like pork gelatin or a lipid form of that. It looks like one of the ingredients may have an animal cell lipid and was wondering if she was having a reaction to that. Declines to provide primary care provider details. States she received this first dose at occupational health in her workplace. Received the vaccine on the 22Dec2020 at 9am. 24 hours post vaccination, 1 day after, the syncope, dizziness, feeling faint started. Also the other symptoms, overall achiness, severe headaches, and fever were also experienced, but they stopped after that 24 hours. Those were expected since it was listed as side effects that popped up, so she expected those and they stopped after 24 hours. The syncope, dizziness, and faint feeling are not any worse and are very slowly improving, but she still has it and had to call out of work today because of it. That's consistent. Mentions it takes her a while to get down the stairs when getting product details for the COVID-19 vaccine. Unable to provide the vaccine NDC or expiry, or dose. Did not have any other vaccines at time of this one and none 4 weeks prior. Had to call a (company withheld) doctor and has to go to occupational health tomorrow to be seen. Declines having COVID virus. No further details provided.; Sender's Comments: Based on the compatible time association, the events syncope and dizziness are possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in

response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

positive COVID-19 antigen test with symptoms (ache, cough, fever); positive COVID-19 antigen test with symptoms (ache, cough, fever); This is a spontaneous report from a contactable physician (patient). A 51-year-old male patient received the first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EH9899), via an unspecified route of administration on 17Dec2020 at 10:30 at single dose in left arm for covid-19 immunization. Medical history included borderline diabetes, ongoing hypertension, ongoing hyperlipidemia, ongoing rhinitis allergic, and currently ill. Concomitant medication included ongoing fexofenadine hydrochloride (ALLEGRA, strength: 180 mg) at 180mg once daily by mouth for Rhinitis allergic taking for years, ongoing lisinopril (strength: 40 mg) at 40 mg once daily by mouth for hypertension taking for two or three years, ongoing atorvastatin (strength: 40 mg) at 40 mg once daily by mouth for hyperlipidemia taking for a year. The patient experienced positive covid-19 antigen test with symptoms (ache, cough, fever) from 19Dec2020. Event details: The patient received the COVID 19 Vaccine on 17Dec2020 10:30AM in the left arm. Tested for COVID 19 with the antigen test, on 20Dec2020 and his result was positive, he experienced ache and cough on 19Dec2020. Clarified he started having symptoms in the evening (19Dec2020) and then tested in the morning (20Dec2020). He experienced the low grade fever on 20Dec2020. His maximum temperature was 100.4 fahrenheit. He had only been treated with over the counter products. No further information provided for the over the counter products. He was not hospitalized. He will take the second dose of the COVID 19 vaccine on 07Jan2021. The patient didn't have SARS-CoV2 antibodies at diagnosis. The patient was not admitted to an Intensive Care Unit. The patient didn't display clinical signs at rest indicative of severe systemic illness. The patient didn't require supplemental oxygen (including high flow or ECMO) or receive mechanical ventilation. The patient didn't have any pre-existing diseases worsened during the SARS-CoV2 infection. The patient was not treated with immunomodulating or immunosuppressing medications or received any other vaccines around the time of COVID-19 vaccination. The outcome of all his symptoms was resolving.; Sender's Comments: The reported events drug ineffective and COVID-19 are likely intercurrent and are unrelated to suspect drug BNT162B2 based on short temporal relation between vaccination and onset of events.

positive COVID-19 rapid test with symptoms; positive COVID-19 rapid test with symptoms; headache; nasal congestion; This is a spontaneous report from a contactable physician. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced positive COVID-19 rapid test with symptoms, headache and nasal congestion on an unspecified date. The patient developed headache and nasal congestion by the third day after the vaccination. The patient underwent lab tests and procedures which included COVID-19 rapid test: positive on an unspecified date. The clinical outcome of positive COVID-19 rapid test with symptoms, headache and nasal congestion was unknown. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Sender's Comments: The reported positive COVID-19 rapid test with symptoms after

COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

positive COVID-19 test with symptoms; positive COVID-19 test with symptoms; This is a spontaneous report from a contactable nurse (patient). A 37-year-old female patient received their first dose of BNT162B2 (lot number: EL0140; expiry date unknown), intramuscular on 21Dec2020 at single dose for COVID-19 immunization. Medical history included congestion and dry cough (before vaccination), and not tasting anything from an unknown date. Concomitant medication included vitamins. The patient reported that they just have the concern about the vaccination last Monday that was 21Dec2020, on 25Dec2020, Christmas day they were diagnosed with Covid. They were thinking because the day before their vaccination they already had like some kind of congestion and also some kind of dry cough but they didn't really think that it was Covid but they were still able to get the vaccination on Monday. When they started to feel like they were not tasting anything, that's when they decided to get tested and it turns out to be positive. They were confirmed positive on the 25th but in their mind they were probably having Covid since the day before they got they vaccination. So their worry is, is there any effect where they got the vaccine where they already have the Covid in their body. So that is really their worry right now. The patient underwent lab tests and procedures which included SARS-CoV-2 test: positive on 25Dec2020. The outcome of the events was unknown.; Sender's Comments: The association between the event drug ineffective (COVID-19) with BNT162b2 can not be completely excluded.

developed rashes on the chest area, not spreading; This is a spontaneous report from a contactable nurse (patient). A 43-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot number EK5730), via an unspecified route of administration into the left deltoid on 18Dec2020 as the first single dose for covid-19 immunization. Medical history was reported as none. Concomitant medication included rosuvastatin calcium (CRESTOR). The patient developed rashes on the chest area, not spreading on 22Dec2020. The event as reported between not serious and medically significant by the reporter. Details were as follows: and patient was a nurse that had her vaccine through her workplace on 18Dec2020, so she was 10 days out, and noticed a rash on her chest on day 4, which was still present. It did not seem to be spreading, and she could not think of any reason for the reaction. She was scheduled to receive the second dose in three weeks. The outcome of developed rashes on the chest area, not spreading was not recovered. The relatedness of the event to the suspect drug was reported as unknown from the reporter.; Sender's Comments: Based on the information currently provided, the vaccination with BNT162B2 might play a contributory role in triggering the onset of rash. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

blurred vision; little spots on the inside of her eyelids; This is a spontaneous report from a contactable nurse (patient). A 53-year-old female patient received first dose of BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine; batch/lot number and expiry date were unknown), via an unspecified route of administration on 18Dec2020 at a single dose for COVID-19 immunization. Medical history included

eyeglasses wearer (reported as with her glasses). The patient's concomitant medications were not reported. The patient is experiencing symptoms from the COVID-19 vaccine received on 18Dec2020. She began to have blurred vision that night, and it worsened over the following weekend. She saw the eye doctor on 22Dec2020, and they stated her vision had changed even with her glasses. Now she has little spots on the inside of her eyelids that were also noticed on the eye examination in Dec2020. She has already reported these symptoms to the V-safe program. She mentioned that she is not the only nurse in the workplace that has experienced blurry vision. She asked if she should receive the second dose on 08Jan2021. It was still blurry, but it was better than it was a week ago. It still affected her reading and seeing at a distance. It scared her to get the second one because she doesn't want to go blind. She went to the eye doctor for visit on Tuesday. The outcome of the event blurred vision was recovering, while for the other event was unknown. The reporter considered blurred vision as serious due to being medically significant. Information about lot/batch number has been requested.; Sender's Comments: There is not a reasonable possibility that the reported event vision blurred and eyelid disorder related to the suspect product event most likely due to patient underlying contributory factors

positive COVID-19 test; positive COVID-19 test; This is a spontaneous report from a contactable pharmacist. A patient of unspecified age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced positive COVID-19 test on an unspecified date. The patient underwent lab tests and procedures which included COVID-19 test: positive on an unspecified date. The clinical outcome of positive COVID-19 test was unknown. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Sender's Comments: The reported positive COVID-19 test after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

having symptoms/She tested positive to COVID-19; having symptoms/She tested positive to COVID-19; This is a spontaneous report from a contactable nurse (patient). A 30-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 16Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient started having symptoms on Thursday. On Friday, her supervisor had her get tested for COVID. She tested positive to COVID-19 in Dec2020. Outcome of the events was unknown. The patient wanted to know if she is symptom free, should/can she still get the 2nd dose as planned. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the single dose and short duration

single hive on abdomen (itchy)/full body hives and itching; single hive on abdomen (itchy)/full body hives and itching; This is a spontaneous report from a contactable Physician. A 36-year-old female

patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EL0140, expiry date unknown) intramuscular at left arm on 24Dec2020 at single dose for Covid-19 immunization in a hospital facility. Medical history included Anxiety, Hypertension, and GERD (gastrooesophageal reflux disease). The patient was not diagnosed with Covid-19 prior to vaccination. Concomitant medications included diphtheria vaccine toxoid, pertussis vaccine acellular, tetanus vaccine toxoid (TDAP) on 08Dec2020 for immunization; bupropion hydrochloride (WELLBUTRIN), amlodipine, omeprazole; from unspecified date for unspecified indication. On 25Dec2020, the patient developed a single hive on abdomen (itchy), and on 26Dec2020 the patient developed full body hives and itching but spared the face and mucosal surfaces. The patient has no swelling, no respiratory symptoms. The patient has not been tested for Covid-19 since the vaccination. The patient received treatment of antihistamines (steroids if no improvement) on unspecified date. The hives responded to antihistamines temporarily. The outcome of the event single hive on abdomen (itchy)/full body hives and itching was not recovered. The reporter considered the events non-serious; did not results in death, was not life threatening, did not caused/prolonged hospitalization, was not disabling/incapacitating, not a congenital anomaly/birth defect.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event hives and itching due to temporal association.

ended up testing positive for COVID virus after receiving the first dose of Pfizer-BioNTech COVID-19 Vaccine/ She had symptoms; ended up testing positive for COVID virus after receiving the first dose of Pfizer-BioNTech COVID-19 Vaccine/ She had symptoms; This is a spontaneous report from a contactable nurse. This nurse reported similar events for two patients. This is 1st of two reports. A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899; expiry date unknown), via an unspecified route of administration, on an unspecified date, at 0.3 mL, single for COVID-19 vaccination. The patient's medical history and concomitant medications were not reported. The nurse reported on an unspecified date that the patient tested positive after the first dose. The reporter works in employee health at their hospital. The employee ended up testing positive for COVID virus after receiving the first dose of Pfizer-BioNTech COVID-19 Vaccine. She had symptoms the first 2-3 days after getting the vaccine and assumed it was a normal immune response, but after that she continued to have the symptoms. They went to see the provider and tested positive for COVID virus. They were asking how to handle their second doses. Outcome of the events was unknown.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the short duration of less than 5 days since the vaccine first dose is given.,Linked Report(s) : US-PFIZER INC-2020516628 same reporter, same drug, same event, different patient.

a patient received Pfizer COVID-19 vaccine, couple of days later the patient tested positive for COVID-19; a patient received Pfizer COVID-19 vaccine, couple of days later the patient tested positive for COVID-19; This is a spontaneous report from a contactable pharmacist. A patient of unspecified age and gender received the first dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine) via an unspecified route of

administration on an unspecified date at a single dose as Pfizer COVID-19 vaccine. Medical history and concomitant medications were not reported. It was reported that on an unspecified date, a patient received Pfizer COVID-19 vaccine, couple of days later the patient tested positive for COVID-19, patient subsequently received monoclonal antibody treatment: a combination of Casirivimab and Imdevimab. It was inquired if the patient could receive the second dose of COVID-19 vaccine. The outcome of the events was unknown. Information about Lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of BNT162B2 vaccine cannot be excluded for the reported events of LOE and COVID 19. There is very limited information provided in this report. This case will be reassessed upon receipt of follow-up information. Based on the information provided in the case, this individual report would not seem to modify the risk-benefit profile of the subject product.

I took the vaccine and two days after I tested positive/had lost my sense of smell and taste; I took the vaccine and two days after I tested positive/had lost my sense of smell and taste; Lost my sense of smell and taste; Lost my sense of smell and taste; This is a spontaneous report from a non-contactable consumer (patient). A patient of unspecified age and gender received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine; lot/batch number and expiry date were unknown), via an unspecified route of administration on 23Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The consumer stated that he/she just got the vaccine on Wednesday (23Dec2020), and he/she started experiencing some symptoms on 24Dec2020 where he/she had lost his/her sense of smell and taste. On 25Dec2020, he/she went 'health' to get tested, and he/she tested positive. The consumer is asking whether this has been reported that one of the side effects of getting the vaccine. The consumer said he/she hasn't read anything about loss of taste and smell after taking the vaccine. He/she was wondering if this has been reported or this is one of those small side effects that the vaccine has. The consumer further stated that he/she took the vaccine and two days after, he/she tested positive. Now, his/her whole family is also positive but only his/herself had the vaccine, because he/she is the only one that works in healthcare (further clarification was unknown, hence reporter was captured as consumer). The outcome of the events was unknown. No follow-up attempts are possible; Information about lot/batch number could not be obtained. No further information is expected.; Sender's Comments: The association between the event lack of effect (COVID19, lost of taste and smell) with BNT162b2 can not completely excluded.

ended up testing positive for COVID virus after receiving the first dose of Pfizer-BioNTech COVID-19 Vaccine/had symptoms; ended up testing positive for COVID virus after receiving the first dose of Pfizer-BioNTech COVID-19 Vaccine/had symptoms; This is a spontaneous report from a contactable nurse. This nurse reported similar events for two patients. This is the 2nd of two reports. A patient of an unspecified age and gender received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, strength: 0.3 mL, lot number: EH9899; expiry date was unknown), via an unspecified route of administration on an unspecified date at 0.3 mL, single for COVID-19 vaccination. The patient's medical history and concomitant medications were not reported. The patient ended up testing positive for COVID virus after receiving the first dose of Pfizer-BioNTech COVID-19 Vaccine. The patient had symptoms the first 2-3 days after getting the vaccine and assumed it was a normal immune response, but after that the patient continued to have the symptoms. The patient went to see the provider and tested positive for COVID

virus. The patient was asking how to handle his/her second dose. The outcome of the event was unknown.; Sender's Comments: Based on the information currently provided, the company considers that a causal relationship between the COVID-19 and vaccination with BNT162B2 cannot be excluded.,Linked Report(s) : US-PFIZER INC-2020516297 same reporter, same event, different patient.

tested positive after receiving Covid-19 vaccine; tested positive after receiving Covid-19 vaccine; This is a spontaneous report from a contactable nurse. A 38-years-old female patient started received her first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an unspecified route of administration on 18Dec2020 at a single dose for prevention of Covid 19. The patient medical history and concomitant medications were not reported. The nurse reported that a staff member received the first dose of Covid-19 vaccine on 18Dec2020. Approximately 9 days later, on 27Dec2020, the patient developed/experienced tested positive after receiving Covid-19 vaccine. The seriousness criteria for this event was none. The nurse asked if the patient will be able to receive the second dose and what is the advice for the patient. The outcome of the event was unknown. The reporter considered the relationship of the event to treatment with BNT162B2 as not applicable. Information about lot/batch number was requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported event tested positive Covid-19 based on the known safety profile. However the short duration of 9 days since the vaccine first dose is given it is unlikely patient would have fully developed immunity.

had loss of sense of smell and tested positive for the virus; had loss of sense of smell and tested positive for the virus; This is a spontaneous report from a contactable healthcare professional (patient). A 42-years-old female patient received her first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), intramuscular on 17Dec2020 at a single dose on the left arm, for Covid-19 immunization. The patient has no medical history and no concomitant medications (no other vaccines in four weeks and no other medications in two weeks prior to vaccination). The patient has no known allergies to medications, food, or other products. The patient had loss of sense of smell, no other symptoms on 25Dec2020 and tested positive for the virus yesterday, on 27Dec2020. The patient has no Covid-19 prior to vaccination. The patient underwent Covid test (Nasal Swab) and result was positive on 27Dec2020. The patient did not receive any treatment for the event. Outcome of the event was unknown. The events were assessed as non-serious by the reporter. No follow-up attempts are possible, information about lot/batch number cannot be obtained.; Sender's Comments: A possible contributory role of BNT162B2 vaccine cannot be excluded for event based on available information.

PATIENT VACCINATED AROUND 9AM. SHE REPORTS SHE FELT WARM/FLUSHING, FAINT AND STOMACH SPASMS WITHIN ABOUT 4-5 MINS. SHE FELT BETTER AND GOT UP TO WALK ABOUT 30 MINS LATER. SYMPTOMS WORSENED AFTER WALKING ~9:45AM: FAINT AGAIN, SEVERE RETCHING, BP196/140 TO 199/164, TROUBLE SWALLOWING, SOB, WHEEZING. AT 9:58AM, EPI PEN 0.3MG ADMINISTERED AND EMS ACTIVATED. SYMPTOMS REPORTED IMPROVED FOLLOWING EPI. EMS ARRIVED 10:05AM. PATIENT REPORTED RECEIVING 2 BAGS OF PEPCID, STEROIDS, AND ZOFRAN AT HOSPITAL. WAS RELEASED BETWEEN 11:30AM-12PM ON 1/4/21, BP 140/90 AND ACUTE SYMPTOMS RESOLVED. FOLLOW UP WITH PATIENT 1/5/21: NO PRIOR HX OF HTN, BP 120/60, NO SOB/ BREATHING DIFFICULTY. C/O SEVERE HEADACHE, LOW TEMP, FATIGUE, MUSCLE ACHES, SORE THROAT.

Droopy left cheek.; This is a spontaneous report from a contactable nurse. A 52-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number: EJ1685), intramuscularly in the left arm, on 17Dec2020 at 14:30 (at the age of 52-years-old) at a single dose for COVID-19 immunization. The patient had no medical history or concomitant medications. The patient had no other medications within two weeks of vaccination. The patient was not pregnant at the time of vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient previously took sulfamethoxazole, trimethoprim (SEPTRA) and experienced allergy. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient experienced droopy left cheek on 21Dec2020. No therapeutic measures were taken as a result of the event. The clinical outcome of droopy left cheek was recovered in Dec2020. It was also reported that since the vaccination, the patient had not been tested for COVID-19.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of droopy left cheek might not be excluded considering the plausible temporal relationship. The patient had previous allergy reaction to antibiotic (sulfamethoxazole, trimethoprim) use. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

patient tested positive for COVID; patient tested positive for COVID; This is a spontaneous report from a contactable physician from a Pfizer-sponsored program Pfizer First Connect. A 29-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: UNKNOWN), via an unspecified route of administration on 17Dec2020 as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. On 27Dec2020, the patient tested positive for COVID. The clinical outcome of patient tested positive for COVID was unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender's Comments: The efficacy of a drug varies from one patient to another and can be affected by different factors; however, a contributory role of the suspect drug BNT162B2 to the reported events Drug ineffective and COVID 19 cannot be ruled out.

"she was administered the first dose of Pfizer COVID-19 Vaccine and later got COVID-19; she was administered the first dose of Pfizer COVID-19 Vaccine and later got COVID-19; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A contactable female physician (patient) of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an unspecified route of administration from an unspecified date in 2020 at a single dose for Covid-19 immunization. The patient medical history and concomitant medications were not reported. On an unspecified date in 2020, the patient got the first shot of COVID vaccine and got COVID, she was wondering if she should still get the dose scheduled for 04Jan2021. The patient clarified that she is both a medical doctor/physician as well as the patient. She clarified that she was administered the first dose of Pfizer COVID-19 Vaccine and later got COVID-19. She called to ask if she should still get the second dose of COVID-19 Vaccine which is scheduled for 04Jan2021. She clarified that she does not think anything went wrong with the COVID-19 Vaccine. She does not think her

receiving the COVID-19 Vaccine and developing COVID-19 are related; there was no way she would have had time to develop any protection from the COVID-19 Vaccine at the time she was exposed to COVID-19 2 days later. She does not think she can provide any relevant medical information that would be helpful for this report and declined to continue report. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The reported ""developing COVID-19"" after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration."

"She tested positive for COVID-19; She tested positive for COVID-19; This is a spontaneous report from a contactable healthcare professional (patient) via Pfizer sales representative. A 55-years-old female patient received her first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an unspecified route of administration on 22Dec2020 at a single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient, who is a frontline medical worker, informed that she tested positive for COVID-19 today (28Dec2020). The patient stated that she was informed by her employee health division at (place) that she was exposed to a patient with COVID-19 prior to her vaccination. She asked to be contacted regarding the timing of her second dose in light of her current status. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: There is not a reasonable possibility that reported ""tested positive for COVID-19"" is related to BNT162B2 vaccine. The patient exposed to a patient with COVID-19 before vaccination."

Not feeling well; chills; muscle aches; headache; ears bothering; stuffy/runny nose; stuffy/runny nose; This is a spontaneous report from a non-contactable nurse (patient). A 43-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number: EL0140), intramuscularly in the right arm, on 18Dec2020 at 06:00 (at the age of 43-years-old) at a single dose for COVID-19 immunization. Medical history included hypothyroid, breast cancer, and penicillin allergy. The patient was not pregnant at the time of vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications, taken within two weeks of vaccination, included levothyroxine (MANUFACTURER UNKNOWN) and tamoxifen (MANUFACTURER UNKNOWN). Other concomitant medications included unspecified multivitamin. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient experienced not feeling well, chills, muscle aches, headache, ears bothering, and stuffy/runny nose on 25Dec2020 at 20:00. The events were reported as non-serious. No therapeutic measures were taken as a result of the events. The clinical outcome of not feeling well, chills, muscle aches, headache, ears bothering, and stuffy/runny nose was unknown. It was also reported that since the vaccination, the patient had not been tested for COVID-19. No follow-up attempts are possible. No further information is expected.

tested positive for COVID-19; tested positive for COVID-19; This is a spontaneous report from a contactable nurse (patient). A 39-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 17Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient is a nurse anesthetist that got Covid vaccine on 17Dec2020 and tested positive for

COVID-19 after the vaccine on 26Dec2020. The patient was wondering if have seen this. Stated that she was signed up for the booster scheduled for 05Jan2021 and wanted to know if they had any information about taking this. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The efficacy of a drug varies from one patient to another and can be affected by different factors; however, a contributory role of the suspect drug bnt162b2 to the reported events drug ineffective and COVID-19 cannot be ruled out.

nauseous; weak; no appetite; numbness on the skin of my arms and legs; I was post Ictal for 2+ hours; seizures/having 2 non epileptic seizures; dizzy and lightheaded; This is a spontaneous report from a contactable nurse (patient). A 21-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE. Batch/lot number: EK5730), intramuscularly on 28Dec2020 07:45 AM at right arm, at single dose for covid-19 immunization. Medical history was none. There were no concomitant medications. The patient was not pregnant at the time of vaccination. The patient received vaccine around 7:45 AM. Within 2 minutes she felt extremely dizzy and lightheaded on 28Dec2020. She sat down and drank some Gatorade and took deep breaths. The feelings persisted 5 minutes later. She then woke up after having 2 non epileptic seizures while still in 15m waiting period, (This included posturing and color change) a rapid response was called and she was taken to the ER. She was post Ictal for 2+ hours. Dizzy and nauseous, weak and no appetite for the rest of the day. She had no history of epilepsy. She also have numbness on the skin of my arms and legs within 24 hours of the vaccine. Onset date of all events (except dizzy and lightheaded) was reported as 28Dec2020 08:00AM. Treatment fluids, Zofran was received for all events. All event resulted in emergency room. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The outcome of the events was recovered with sequel.; Sender's Comments: A possible contributory effect of suspect BNT162BW on reported seizures cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

"Patient had SVT; flushing; hives; heart rate increased to 160's (had been 180's earlier in the day); This is a spontaneous report from a contactable pharmacist. A 46-year-old female patient received the first dose of BNT162B2 (lot number: EK5730), via intramuscular, on 28Dec2020 at single dose for COVID-19 immunization. Facility where the most recent COVID-19 vaccine was administered was hospital. The patient was not pregnant at the time of vaccination. The patient was not diagnosed with COVID-19 prior to vaccination. Since the vaccination, it's unknown if the patient was tested for COVID-19. No other vaccines were received within 4 weeks prior to the COVID vaccine. The patient's medical history and concomitant medications were not reported. The patient had SVT, flushing, hives 20 min after receiving vaccine on 28Dec2020. Patient was taken to ED and evaluated. SVT resolved. Patient sent home on heart monitor. Later that night while in bed, heart rate increased to 160's (had been 180's earlier in the day) and patient was admitted to hospital. Patient is a NP. Treatment received for the adverse event included cold water to face, vagal massage. The outcome of the event""Patient had SVT"" was

recovered on 28Dec2020 and of other events was recovering.; Sender's Comments: A causal association between BNT162B2 and the reported events supraventricular tachycardia, flushing, hives, heart rate increased cannot be excluded based on the compatible temporal relation. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate."

"Hypertensive crisis; Numbness to my left ear; progressively it went down to my mandible, my face and my left shoulder numbness; Radial blood pressure cough; This is a spontaneous report from a contactable nurse reporting for himself. A 48-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), via an unspecified route of administration on 28Dec2020 at single dose for covid-19 immunization. Medical history reported as none. There were no concomitant medications. During the administration the patient did experience some types of reaction where it wanted medical supervision. So, basically when he did got the injection he was waiting for his 15 minute prolapse. But within probably he would say 7 to 8 minutes he started to experiencing some numbness to his left ear and usually he thought it was secondary to the that he had (not clarified) but progressively it went down to his mandible, his face and his left shoulder numbness and he was experiencing some numbness that radiate towards his fingertips only to the left side. At that time he waived to the Nurse to supervise and at that time he wait again and a Physician came over. He checked his pulse and noted that he had normal rhythm during the pulse check and at that time and he had Emergency medical technician (EMT) come over. The EMT checked his blood pressure he thought multiple times through the left and to the right brachial. He was having what they would consider a hypertensive crisis where systolic were in 170's, 180's, diastolic numbers were between like 120's and 130's and his heart rate was in 70's. So, initially it was not anxiety induced. But he do not have no blood pressure. They wanted he to go to the hospital to treat the hypertensive crisis that was in. The patient opted not to. So he went home in a quieter environment he did have a radial blood pressure cough that he had been checking his blood pressure rigorously, tried different techniques and now he was back to normal state to 120-130 systolic and his diastolic was 70-80. This instance was weird that he did not see as a part of one of the side effects listed with Pfizer BioNTech Vaccine. No treatment received for the events, because he had no history of hypertension it was just more of decreasing the ambient around he. At that time he wanted to go to a quiet environment, took a shower and check his blood pressure. He did orthostatic while laying down sitting up, standing up and he was not hypertensive. For the causality, the nurse stated, ""I think it did. This is a fact I mean I was doing fine prior to administration and then this event is slowly subsiding."" The outcome of the events was recovering.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported hypertensive crisis cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

huge welt on her arm; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at a single dose for covid-19 immunization. Medical history included covid-19 from end of Oct2020 to an unknown date. The patient's concomitant medications were not reported. The patient reported that she is an nurse in the ICU. She had received the 1st dose of the vaccine after she had covid the end of Oct2020. Her reaction to the vaccine was, she felt exactly how she did when she had covid. It lasted 3 days. She had a huge welt on her arm. Her pulmonologist suggested that she contact Pfizer for advice on if or when she should receive the 2nd dose, which is currently due 08Jan2021. Outcome of the event huge welt was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported event of giant urticaria due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Appendicitis / colic pain to her right midsection; This is a spontaneous report from a contactable Other-HCP (Nurse Practitioner). A female patient of an unspecified age received bnt162b2 (BNT162B2) at single dose on 20Dec2020 for covid-19 immunisation. The patient medical history and concomitant medications were not reported. In Dec2020 3 days after vaccination she experienced colic pain to her right midsection. She was diagnosed with appendicitis. The outcome of events was unknown. Information about lot/batch number has been requested.; Sender's Comments: The event appendicitis is most likely an intercurrent medical condition and is assessed as unrelated to BNT162B2.

Fever; feels weak; tired; lightheaded; pain at the injection site; back and hip pain; back and hip pain; This is a spontaneous report from a contactable other healthcare professional (patient). A 47-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EK5730), via an unspecified route of administration on 29Dec2020 at a single dose for COVID-19 immunization. The patient's medical history included sick with coronavirus infection from 11Aug2020. There were no concomitant medications. The patient was experiencing the expected side effects fever, feels weak, tired, lightheaded, pain at the injection site in the right deltoid, hip and back joint pain on Dec2020. She does not know exactly when these events started but that she noticed them when she was trying to sleep last night. Outcome of the events was not recovered. The events were considered serious due to being medically significant.; Sender's Comments: Based on temporal association, the causal relationship between BNT162b2 and the events pyrexia, asthenia, fatigue, dizziness, vaccination site pain, back pain and arthralgia cannot be excluded.

a high fever; extreme fatigue; have allergies; This is spontaneous report from a non-contactable consumer. This consumer reported similar events for eight patients. This is the first of eight reports.

Only this report is serious. A patient of unspecified age and gender received bnt162b2 (BNT162B2 also reported as Pfizer version of the vaccine, lot/batch number and expiry date were not reported), via an unspecified route of administration on unknown date in Dec2020 at single dose, for Covid-19 immunisaton. The patient medical history and concomitant medications were not reported. The patient got the vaccine at a facility then had a high fever and extreme fatigue after getting the vaccine on Dec2020. The patient was admitted to the ICU. The patient had allergies, but it was unknown what the allergies are to. The outcome of events was unknown. No follow-up attempts are possible. Information on batch/Lot number can not be obtained. No further information is expected.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2020520700 same reporter/drug/AE, different patients;US-PFIZER INC-2020520703 same reporter/drug/AE, different patients;US-PFIZER INC-2020520699 same reporter/drug/AE, different patients;US-PFIZER INC-2020520704 same reporter/drug/AE, different patients;US-PFIZER INC-2020520705 same reporter/drug/AE, different patients;US-PFIZER INC-2020520701 same reporter/drug/AE, different patients;US-PFIZER INC-2020520702 same reporter/drug/AE, different patients;US-PFIZER INC-2020520700 same reporter, drug, events, and different patients;US-PFIZER INC-2020520701 same reporter, drug, events, and different patients

extremely lightheaded; This is a spontaneous report from a contactable physician (patient's husband). The physician reported same events for 2 patients. This is 2nd of 2 reports. A 74-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL0140), via an unspecified route of administration on 30Dec2020 at a single dose in deltoid left for Vaccination/COVID-19 vaccine. Medical history included COVID-19 in Jul2020, ongoing overweight. There were no concomitant medications. The patient experienced extremely lightheaded on 30Dec2020. Reporter seriousness for extremely lightheaded is medically significant. The reporter stated his wife (patient) was feeling about the same thing and believed his wife was feeling better. She got up and was walking around and is no longer beside him. No Emergency Room or Physician Office visited. The outcome of event was recovering.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the event dizziness cannot be excluded. ,Linked Report(s) : US-PFIZER INC-2020520760 same reporter/drug/event, different patient

Pt received COVID Vaccine at 1055, 1120 pt began coughing severely and could not stop, unable to speak. 1120 25mg Benadryl liquid given, Pepcid 20 mg given PO, cough worsening. 1122 second dose of Benadryl given, called for MD. Brought pt to Private room via wheelchair. Upon arrival, audible stridor noted. Epinephrine 0.3 mg IM given at 1126. IV started, placed patient on monitor and O2 via 1L NC. MD at bedside along with RT and pharmacy. 1134 Solumedrol 125 mg IV given, 1 puff of Ventolin given. Lungs clear. 1140 Coughing stopped, pt able to speak now. Vital signs: 1130 SPO2 99% Pulse 142 1135 99% pulse 106 BP 168/102 1140 sats 100% HR 93 BP 157/105 1145 sats 100% HR 97 BP 159/93 1200 sats 99% HR 103 155/97 114

Pt vaccinated on 12/23. PCP notified that SOB and fatigue getting worse on 1/4. Unable to keep pre-op Dental work planned prior to mitral valve surgery on 1/14/2021. PCP referred her to our ED where she was diagnosed with COVID-19 and transferred to facility, which is where her surgery was planned.

Pt received vaccination and left after 15 min. observation symptom free. He drove a short distance away from the clinical site when he felt profuse sweating and had syncope (seconds) crashing into curb. He was aroused from impact and was able to stop car. He then developed profuse nausea and sudden urge to defecate. He went to restroom. Given these events he returned to the clinical site in another vehicle. Upon arrival he denied chest pain, shortness of breath or ongoing nausea or abdominal pain. He reported his AM blood sugar was 72 and does not take insulin. No history of coronary disease or syncope. EMS was activated and assumed care.

The resident who was known to have seizures, and under control for many yeas with Keppra 1000 mg twice a day, on the second day after vaccination developed recurrent seizures requiring hospitalization to an intensive care unit, with intubation and mechanical ventilation until 1/5/21 (to be extubated today). She is still at the hospital.

RECEIVED VACCINE ON 12/22; ON 12/24, STARTED FEELING WEAK AND HAVING GI ISSUES WITH DIARRHEA. ON 12/27, STARTED HAVING SHORTNESS OF BREATH AND WHEEZING MORETHAN HER NORMAL WITH HER ASTHMA ILLNESS AND CAME TO ER. WAS TESTED AND FOUND TO BE COVID POSITIVE.

Resident received Covid Vaccine, noted after 30 mins with labored breathing BP 161/77, HR 116, R 38, T 101.4,

22 year old patient with no known allergies or medical history admitted 12/21 with TTP and currently being worked up. Currently unclear if related or unrelated to COVID vaccination, but received Pfizer vaccine Thursday 12/17.

Contracted Covid after receiving the first vaccine; Contracted Covid after receiving the first vaccine; This is a spontaneous report from a contactable consumer (patient). A 51-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 21Dec2020 at single dose for covid-19 immunisation. Medical history included asthma, dry cough due to inhalation from fires over the years. The patient's concomitant medications were not reported. Contracted Covid after receiving the first vaccine was reported. The patient received the first dose of the Covid vaccine, then contracted Covid. He now had the option to receive antibodies through plasma. Since he had the vaccine, was that still an option? Or was that a no-no? He received the vaccine at work on 21Dec2020. He got sick on 22Dec2020 and he was at home. He didn't feel like eating, and can't lay down because it made it worse to cough. He didn't know what vitamins they were giving him. The patient probably should be in a hospital, but was not. The outcome of events was not recovered. Information on Lot/Batch number has been requested.

patient receive the first dose of the vaccine and has now tested positive for Covid; patient receive the first dose of the vaccine and has now tested positive for Covid; This is a spontaneous report from a Pfizer-sponsored program. A contactable pharmacist reported a patient of unspecified age and gender received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The pharmacist reported that they had a

patient receive the first dose of the vaccine and has now tested positive for Covid. He stated the patient is a week out from receiving the second dose and asks what information Pfizer can provide on receiving the second dose for someone with Covid infection. Outcome of the event was unknown. Information on the Batch/Lot number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient might not be completely excluded.

"lost my sense of smell and tested positive for Covid; lost my sense of smell and tested positive for Covid; This is a spontaneous report from a non-contactable consumer (patient) received via a Pfizer-sponsored program. A patient of unspecified age and gender received BNT162B2 via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. The content of a post was noted that on Dec2020, ""Got mine! And in a stroke of weird ironic awfulness, lost my sense of smell and tested positive for Covid later that day....If only a month sooner! Thank you for creating this vaccine. I know it had nothing to do with my diagnosis!"". The outcome of the events was unknown. No follow-up attempts are possible. Information about lot/batch number cannot be obtained. Sender's Comments: The events drug ineffective and COVID 19 are likely intercurrent and are unrelated to suspect drug BNT162B2 based on the short temporal relation between vaccination and onset of events."

"she is positive that she is positive"" and is having symptoms, although not yet been tested; she is positive that she is positive"" and is having symptoms, although not yet been tested; This is a spontaneous report from a contactable pharmacist (patient). A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an unspecified route of administration on Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient reportedly asking if she should keep her appointment for the second dose of the vaccine as scheduled if she thinks she was positive for COVID and having symptoms. The patient had vaccine on Tuesday (Dec2020), and husband tested positive yesterday, ""she was positive that she was positive"" and was having symptoms, although not yet been tested. The 2nd dose was in 2 weeks. The outcome of the events was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: Based on the information currently provided, the company considers that a causal relationship between the suspected COVID-19 and vaccination with BNT162B2 cannot be excluded."

Tested positive for COVID-19; Tested positive for COVID-19; Sick; He got the chills and later came down with muscle aches and fatigue; He got the chills and later came down with muscle aches and fatigue; He got the chills and later came down with muscle aches and fatigue; His arm was sore for a day; This is a spontaneous report from a Pfizer-sponsored program Corporate (Pfizer) Social Media Platforms. A non-contactable consumer reported for a 45-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 18Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced his arm was sore for a day on 18Dec2020 but he suffered no other side effects. Six days later on Christmas Eve (24Dec2020), after working a shift in the COVID-19 unit, the patient became sick. He got the chills and later came down with muscle aches and fatigue. The day after Christmas (26Dec2020), he went to a drive-up hospital testing site and tested positive for COVID-19. The patient

was feeling better since his symptoms peaked on Christmas Day but still felt fatigued. The outcome of event fatigue was not recovered, the outcome of the events sick, chills, muscle aches was recovering, the outcome of other events was unknown. No follow-up attempts are possible. Information about lot/batch number cannot be obtained.; Sender's Comments: The efficacy of a drug varies from one patient to another and can be affected by different factors; however, a contributory role of the suspect drug BNT162B2 to the reported events drug ineffective and COVID-19 cannot be ruled out.

"Severe allergic reaction; BP of 170/104; felt like his whole body was on fire; chest tightness; HR elevated at 110bpm; Severe allergic reaction with symptoms that include/ rash all over his body including his throat, chest, and inner legs.; Right side of neck was swollen and sore; Right side of neck was swollen and sore; his neck was stiff to turn; he feels ""really weak and tired""; he feels ""really weak and tired""; This is a spontaneous report from a contactable other healthcare professional. A 46-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date unknown) via an unspecified route of administration, on 29Dec2020, at a single dose, for COVID-19. The patient's medical history and concomitant medications were not reported. Patient is a 46y/o male certified nursing assistant (CNA). He received his first dose of Pfizer-Biontech Covid19 vaccine, yesterday 29Dec2020. On an unspecified date in Dec2020, patient experienced severe allergic reaction with symptoms that include: felt like his whole body was on fire, chest tightness, BP of 170/104, HR elevated at 110 bpm, rash all over his body including his throat, chest, and inner legs. Right side of neck was swollen and sore. Both sides are swollen, today, and his neck was stiff to turn, he feels ""really weak and tired"". Patient was taken by ambulance to the emergency room. Patient then asked if he should get the second dose of the vaccine. Outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of severe allergic reaction with multiple symptoms cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

potential person infected with Sars-Cov-2 following the administration of the first dose of vaccine and was isolated during the timing of the second dose; potential person infected with Sars-Cov-2 following the administration of the first dose of vaccine and was isolated during the timing of the second dose; This is a spontaneous report from a contactable Pharmacist. A female patient of unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The relevant medical history and concomitant medications were not reported. The pharmacist was questioning as to guidelines to the potential person infected with Sars-Cov-2 following the administration of the first dose of vaccine and was isolated during the timing of the second dose. The outcome of the event was unknown. Information on the Batch/Lot number has been requested.; Sender's Comments: The reported potential person infected with Sars-Cov-2 following the administration of the first dose of

vaccine is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

Migraines for several days, nausea on day three; nausea; This is a spontaneous report from a contactable other healthcare professional, the patient. A 51-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, Lot number: EL0140), via intramuscular route of administration in the left arm on 18Dec2020 at 09:00 (at the age of 51-years-old) as a single dose for COVID-19 vaccination. Medical history included fibromyalgia and history of migraines. The patient did not have any known allergies to medications, food, or other products. The patient was not pregnant at the time of vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient's concomitant medications were not reported; however, there were other medications the patient received within 2 weeks of the vaccination. The patient had not received any other vaccine within 4 weeks prior to the vaccine. On 21Dec2020 at 13:00 the patient experienced migraines for several days, nausea on day three. The patient did not receive any treatment for the events. The clinical outcome of the migraines for several days, nausea on day three was recovering. It was also reported that since the vaccination, the patient had not been tested for COVID-19.

Felt sore throat and tachycardia; Felt sore throat and tachycardia; COVID test came back positive; COVID test came back positive; This is a spontaneous report from a contactable physician, the patient. A male patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration on 18Dec2020, as a single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. It was unknown whether the patient received any other vaccine within 4 weeks prior to the vaccine. On 28Dec2020, the patient felt sore throat and tachycardia. The patient also reported that on an unspecified date, in Dec2020, the COVID test came back positive (the Sepheid test, not the rapid test). The events were reported as non-serious. The patient underwent lab tests, which included COVID-19 test: positive on an unspecified date in Dec2020. It was unknown if the patient received treatment for the COVID test came back positive, felt sore throat and tachycardia. The clinical outcome of the events the COVID test came back positive, felt sore throat and tachycardia was unknown. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender's Comments: Based on available information, a possible contributory role of subject vaccine cannot be excluded for the reported events of LOE, COVID 19, Oropharyngeal pain and tachycardia, based on temporal relationship. There is very limited information provided in this report. This case will be reassessed upon receipt of follow-up information.

positive for covid; positive for covid; positive for covid; This is a spontaneous report from a contactable nurse (patient). A 43-year-old female patient received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 18Dec2020 at a single dose for COVID-19 immunization. completely excluded. More information such as laboratory findings on nucleic acid /PCR test needed for meaningful medical assessment.The patient's medical history and concomitant medications were not reported. The patient tested positive for COVID on 20Dec2020. Outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments:

Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. More information such as virus genome /nucleic acid detection needed for meaningful medical assessment

Swelling arm/ swelling down to their biceps after receiving the COVID-19 Vaccine; arm soreness/ soreness in their arms after receiving the COVID-19 Vaccine; light redness around the vaccine injection site; body felt cold; felt real tired right after; fell asleep quickly; This is a spontaneous report from a contactable consumer. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 28Dec2020 13:00 at SINGLE DOSE for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. It was reported the patient got the COVID-19 Vaccine at the same time as her husband did, and she had some symptoms afterwards, but her symptoms went right away. It was reported both she and her husband had soreness in their arms after receiving the COVID-19 Vaccine. She said a micro needle was used when the COVID-19 Vaccine was administered to both her and her husband's left upper arms. It was also reported both her and her husband had swelling down to their biceps after receiving the COVID-19 Vaccine. She said the swelling went away on both of their left arms after 12-14 hours. It was also reported the husband and his wife continuously monitored each others vaccine injection sites. She said the husband used a LED light to look at her left upper arm, and saw a light redness around her vaccine injection site. The husband said the light redness around the vaccine injection site went away in 2 hours after receiving the COVID-19 Vaccine. It was reported her body felt cold after receiving the COVID-19 Vaccine on 28Dec2020, and that she felt real tired right after she noticed her body felt cold. The husband said his wife fell asleep quickly on 28Dec2020, which is not normal for her, and slept for awhile. The husband said after she woke up she was fine. It was reported their arm swelling and soreness didn't really effect either one of them right away. He said the vaccine injection site redness for his wife started about 45minutes to an hour after she received the COVID-19 Vaccine. He said they both started to feel the soreness in their left arms later. He said he could feel the soreness at the vaccine injection site when he moved his left arm. He said it was the same for his wife when she moved her left arm, clarifying it was a very subtle feeling of soreness. The outcome of the events was recovered. Lot/Batch has been requested.

51-year-old female with history of intermittent asthma presented to the ED with 1 week of intermittent fevers, myalgias, arthralgias and headache. Patient reports receiving first dose of moderna vaccine last week. She initially developed arm soreness followed by chills and body aches. Subsequently developed frontal headache, photophobia, back pain, nausea and vomiting. She was seen in the ER on 1/1/21, when her work-up including labs, CT spine, chest x-ray were negative therefore she was discharged home. She continued to have symptoms and also developed bilateral intermittent ear pain. She also developed rash in her extremities and torso. Rash is pruritic but not painful. reports ongoing history of neck pain for which she sees PT. Denies sore throat, cough, chest pain or shortness of breath.

Vaccine given on 12/29/20 by Pharmacy. On 1/1/21, resident became lethargic and sluggish and developed a rash on forearms. He was a Hospice recipient and doctor and Hospice ordered no treatment, just to continue to monitor. When no improvement of codition reported, doctor and Hospice ordered comfort meds (Morphine, Ativan, Levsin). Resident expired on 1/4/2021

DEATH ON 1/4/2021, RESIDENT RECIEVED VACCINE ON 1/2/20

Began experiencing increased temp of 101.4 on 1/4/2021 at 0701. Temp did not resolve with the use of Tylenol. HR increased to >100 and BP was decreasing below baseline. Increased weakness also noted. Temp increased to 102.9 on 1/4/2021 at 2220. Transferred from SNF to ER for evaluation.

Resident had body aches, a low O2 sat and had chills starting on 12/30/20. He had stated that they had slightly improved. On 1/1/21 he sustained a fall with a diagnosis of a displaced hip fracture. On 1/2/21 during the NOC shift his O2 sat dropped again. He later went unresponsive and passed away.

Administered first dose of COVID19 vaccine at 1:29pm on 1/4/21. At approximately 11:00pm resident exhibited acute respiratory decompensation with very limited air entry and hypoxemia. Patient received Benadryl, steroids, epinephrine, and Duoneb without improvement. Resident was referred to the emergency room and found to be COVID positive. No fever or rash were reported.

LTCF Pfizer Vaccine clinic conducted 12/29/2020 Vaccine lead received a call indicating that a staff member deceased somewhere between 1/3/2021 and 1/4/2021. Cause of death is unknown, and an autopsy is being performed.

Vaccine received at about 0900 on 01/04/2021 at her place of work, Medical Center, where she was employed as a housekeeper. About one hour after receiving the vaccine she experienced a hot flash, nausea, and feeling like she was going to pass out after she had bent down. Later at about 1500 hours she appeared tired and lethargic, then a short time later, at about 1600 hours, upon arrival to a friends home she complained of feeling hot and having difficulty breathing. She then collapsed, then when medics arrived, she was still breathing slowly then went into cardiac arrest and was unable to be revived.

tremors resident sent hospital facility.

Started out vague. Started with headache at the base of her head and then it felt like a web that covered her entire head. By 10:00 she did not feel good. Went to sleep instantly. Slept for about an hour. Began to have nausea. Sunday headache got worse. Started ringing , buzzing sound in her head. Took Zofran because of nausea. Sunday night chest discomfort. Monday had horrible chest pain, headache was horrible, then vomiting. went to ER, doctor felt it was a reaction to the vaccine. was give medicine for nausea and Decadron for the reaction. Gave fluids for dehydration. Got medicine for headache. Keep taking Zofran for nausea. Still has headache. Has appointment with pcp in the morning.

"Received COVID-19 Moderna vaccine on 12/28. Developed nausea, vomiting, diarrhea, fever, and hypoxia at facility the day follow vaccine administration (12/29). He was sent to the hospital on 12/29 and admitted for post vaccine fever where he had a chest x-ray that showed infiltrates but WBC count was normal and fever resolved upon admission to hospital. Provider documented ""expected reaction to vaccination in a patient with previous COVID exposure"". He returned to the facility on 12/30."

The resident was found deceased a little less than 12 hours following COVID vaccination, and he had had some changes over the last 2 days. He was 96 and had been on hospice care for a little while. Noone noticed any side effects from vaccine after it was given

Within 10 minutes of receiving the vaccine patient began to look sleepy and started to gasp for breath. She called for help and slouched over in a chair and was moved to lay on the floor. Her feet were elevated and 911 was called. Epinephrine was given, patient responded by being able to gasp for breath and her face returned to a more natural state. Within 5 min she began to struggle to breath and epi was given again. Some improvement did occur. EMS arrived and she was taken to the hospital.

Bell?s palsy

Anaphylactic reaction (swelling and redness of face and torso, shortness of breath, constriction of airway and dizziness)

Pt describes falling with onset of weakness below the hip level about 6 inches above the patella with missing clonus reflex. The pt cannot squat down with associated observable loss of strength, pt is not able to stand up. The pt has fallen 7 times since symptom onset around lunchtime between 1200 and 1300. Pt denies LOC.

After three days, couldn't sleep the whole night. The next day, went to work, came home felt jittery. Close to midnight bp 200/90. Took Clonidine 0.1 and went to ER, bp 180/90. waited for almost two hours bp came down to 141/80. Today, bp is back to normal. Took sleeping medication Zzzquil to go to sleep.

Aseptic meningitis, prolonged fever for more than a week, headache, elevated transaminase (ALT is 124). Lumbar tap showed elevated WBC of 23, 76% polys and 24% mononuclear, 25 RBC. Glucose and protein are normal. CSF PCR viral panel is negative. Patient was initially given Acyclovir and was stopped when HSV and VZV PCR were negative. He was given vancomycin IV for Gram positive bacteremia which was later stopped because it was deemed a contaminant.

Arm weakness increased each day by post vaccine day 4 arm weak and unable to raise arm, conduct ADLs, painful interrupting sleep. Unable to initiate movement in arm. Use other arm to help move arm. Went to ED on post vaccine day 4. Wbc 12. Crp 4. CT no abscess. Mri on 1/4 shows bursitis. DX SIRVA. Bursa aspirated. Pending cultures. PO MEDROL DOSEPAK.

3 Days after the covid vaccine. I Started to have these symptoms around 1am: fever, chills, body aches, cold sweats. I took ibuprofen fell asleep. Around 330am. Woke up with dizziness, headache, chills. Took tylenol. Fell asleep body was extremely cold esp hands and feet. Woke up around 7am. Still had severe body aches and was extremely dizzy, headache worsening. Took ibuprofen. Woke up around noon. Extremely dizzy with chills and body aches headache still severe. Took tylenol. I was not getting better. went to hospital . It was found I had extremely high wbc and had extremely low blood pressure. Diagnosed as septic shock.

Immediate warm rush to my head and body. Heart was beating out of my chest and difficultly breathing. Heart rate spiked to 150 (normal around 55). Hand, legs, and mouth started to go numb. Eventually settled down after about 1 hr. Have not felt normal since which has been 3 days.

Patient presented to receive COVID-19 vaccine, received vaccine at approximately 10 am. Patient waited 15 minutes for observation and left observation area without complaining of any sx. Patient returned a few minutes after reporting tongue tingling which eventually got to her lips. . No difficulty breathing or any other sx. No history of allergies. NP/RN administered PO Benadryl 25 mg. As of report of this iReport no additional symptoms or intervention needed. Last vitals: 131/83 75spo2. BP higher than usual per patient, sp02 normal.

red dotted rash only on my chest. the rash starts at my jaw line and goes behind my ears, around the front on my neck, then my entire chest in between each best down to bra strap line and stops.

Itching, pain, swelling, and redness at injection site; fevers, myalgia, fatigue, malaise.

Painful, swollen lymph node in arm of injection

Left side, neck near collar bone. Swollen bulge in neck (lymph nodes?) severely painful and swollen. No treatment.

Arm pain, extreme fatigue, body/muscle aches, fever, shortness of breath, sensitivity to light, unable to go to work or preform daily activities Onset 5 hours after vaccination

Itchy, red, swollen lump at injection site, 2-3 inches in diameter. Painful, swollen axillary lymph nodes on the same side (right).

I suffered a miscarriage on 12/31/2020. I was at 5 weeks gestation. This was my first pregnancy. I had uterine bleeding and abdominal cramps on 12/31/2020 and underwent evaluation by my Obstetrician and was diagnosed with a miscarriage after ultrasound.

Fever of 101 for the first 48 hrs, ibuprofen, fever went down Pain in the arm for first 24 hrs, ice, ibuprofen, pain went away

Ipsilateral axillary swelling and tenderness beginning 2 days after vaccine with notably increasing swelling and tenderness at 5 days post vaccine. Continuing to monitor at home.

Patient went to get in her car after completing time of wait after vaccination, felt cloudy, compared it to how she feels after having a glass of wine, denied vision changes but states perception of environment felt foggy. EMT assessed patient, HR normal at 71, O2 100%, Bp elevated at 182/100, patient did report anxiety, monitored for another 15-20min until patient felt better, cloudiness improved, Bp improved. Advised to consult with PCP re: Bp.

Significantly sore left shoulder (injection arm) with pain now radiating up into neck & downward around shoulder blade, severe headaches, nausea (no vomiting), sore throat, FATIGUE, chills/cold sweat, general body aches.

Pt states that she developed a rash on her chest along with chest and back pain around 1012pm on 4Jan2021

"19th received Covid Vaccine at noon 21st negative Covid surveillance test completed due to ED Cluster 22nd Bedtime approx. 2100 A very strange feeling of overwhelming fatigue ""spacey feeling""""" 23rd nausea dizzy general malaise 24th nausea dizzy general malaise 25th nausea dizzy general malaise Contacted Health Service 26th still nauseous dizzy general malaise and then chills Health Service Ordered Covid Test 26th negative Covid. 26th video appointment with PCP states no need for labs feels it's Vaccine related 27th minimal nausea no chills episodes of feeling ?spacey? and tired 28th Minimal nausea 29th Morning nausea and fatigue 30th Morning nausea and fatigue 31st increased nausea and fatigue all day easing as day progresses ""spacey"" with fatigue"

Approximately 10 minutes after injection tingling in right hand, red splotchy skin on palm of hands and forearms. Approximately 15-20 minutes after injection. Tingling in feet and lower extremities. Thirty minutes after injection slight itching at injection site. Approximately 1 1/2 hours after injection splotchy red skin inside both thighs and mild generalized itching. At 2:00 pm that day of injection tingling began in face with slight swelling in cheeks. Itching lasted 3 days. Currently intermittent itching since Monday 01/03/2021.

Shortness of breath Dizziness Nausea Soreness in arm of injection

Nausea vomiting chills headache fever

I was instructed to stay for 30min as i have been anaphylatic to cipro in past. at 30min was told i could leave. while driving home on rt 91 my cheekbones became numb. then slowly a few min later my cheeks became numb. a few min later my lips became numb. as i was driving off exit to rt 5 in longmeadow i developed a lump in my throat. i turned around at top of exit and went back to highway to go to ER. this was approx 1645-1650. i went to ER arrived approx 1655. i was shaking. my bp and pulse were elevated. no tingling or swelling in my face. nurse checked my pupils and my smile and were wnl. no history of bells palsy. i received iv fluids, solucortef 125mg ivp, pepcid 20mg ivp, and benedryl 25mg ivp approx 1840pm. approx 45 min after solucortef numbness better but not gone. it started to come back a little more before discharge, which i let md know. she discharged me with scripts for epi-pen, prednisone, and OTC pepcid and benedryl. follow up with my pcp's office in am 12/24 at 10am with his NP. total time with facial numbness/lip numbness 29 hours.

EE starting with migraine about 5 minutes after receiving vaccine. That night had rash to trunk and back with the chills. Took benadryl that night. Next am, had swollen eyes and hands. Within 24 hours,those sx resolved- but then had 48 hours of sx similar to past covid infection.

Severe chills and weakness. Ran 6 miles day of getting vaccinated (21st) unable to even reach the end of the street on the 22nd.

the top of her stomach felt swollen and gassy; Diarrhea/had diarrhea that was like liquid-y water; top of her stomach had a bad burning sensation; Vomiting; she got choked on some saline and sweat ran down

her face, and she had to concentrate on breathing; sore throat with a mild cough, like she needed to be clearing her throat; sore throat with a mild cough, like she needed to be clearing her throat; got a chill; food was not tasting right; arm was sore; could not raise her arm; her weight on 21Dec2020 when she got the vaccine, was 200.6, but her weight today, was 196.0 pounds; This is a spontaneous report from a contactable consumer (patient). A 52-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: unknown) via an unspecified route of administration on 21Dec2020 on left upper arm at a single dose for COVID-19 prevention. Current medical history included a lung disease called asthma and allergies, diagnosed in her late 20's; Diabetes Type 2, diagnosed about 10 years ago and High Blood pressure, diagnosed when she was in her 30's. Caller also wanted to include that she did have COVID before, she had COVID in Jul2020. Current concomitant medications included salbutamol (ALBUTEROL) at 2 Puffs via inhalation, twice daily for asthma; Unspecified Blood Pressure Medication One pill, once daily by mouth in the morning; Unspecified Nasal Spray 1 spray in each nare, once daily via nasal inhalation; montelukast sodium (SINGULAIR) at 1 pill via oral, once a day for allergies; metformin at 1 pill, daily, by mouth for Diabetes Type 2. The patient stated that her place of employment did not give her the card that has the lot number on it, they said they would give it to her with her second injection. The patient did not know the dose received, just that it was the first in the series. The patient had no other vaccines on the same day as the COVID vaccine. The patient reported that her weight on 21Dec2020 when she got the vaccine, was 200.6, but her weight today, was 196.0 pounds. The patient received the vaccine on 21Dec2020, and as soon as she got the shot, her arm was sore like a flu shot. When she got the shot, she could not raise her arm past her shoulder without pain, but now she can raise her arm again. On Thursday, 24Dec2020, patient got a chill, and later that same night, food was not tasting right. On 25Dec2020, the chill continued, and she had a little bit of a sore throat with a mild cough, like she needed to be clearing her throat. On 26Dec2020 morning, the patient experienced vomiting when she woke up, and the top of her stomach had a bad burning sensation, and she had diarrhea. The patient stated that while she was vomiting, she got choked on some saline and sweat ran down her face, and she had to concentrate on breathing. But the patient stated that she vomited, had diarrhea, and the burning sensation, the whole day on Saturday. The patient stated that on 27Dec2020, it calmed down, and she did not vomit at all. The patient stated that she felt like she needed to vomit, but she did not. The patient states that on Sunday, she still had the chills a little, and the top part of her stomach was still burning. The patient took some Pepto-Bismol and that helped calm down the caller's stomach. The patient stated that she could feel the Pepto-Bismol cooling her stomach off, like it had been hot, and patient stated that the top of her stomach felt swollen and gassy. The patient stated that later Sunday night, things calmed down, but she still has the burning sensation and she did not feel like she needed to vomit anymore. This morning, patient reported that she still has some burning sensation, but now, it is coming and going like labor pains. The patient stated that she did go to the bathroom once this morning and had diarrhea that was like liquid-y water. The patient stated that during all this over the last few days, each and every time that she tried to eat, she couldn't eat much because her stomach would burn more with eating. But yesterday, the patient had some fried fish and stated that the fried fish did not burn as much as the rest of the food she tried eating. The outcome of the events vomiting and the top of her stomach felt swollen and gassy was recovered on 27Dec2020, arm was sore and could not raise her arm was recovered on 26Dec2020, chills, top of her stomach had a bad burning sensation was recovering,

Diarrhea/had diarrhea that was like liquid-y water was not recovered and other events was unknown. Information about batch/lot number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Vomiting and Foreign body aspiration cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

I woke up with tingling in my right hand and arm, my right side, and down my right leg. I went to the ER at Hospital, and was confirmed to have had a stroke in my left thalmus.

Patient woke on 1/3/2021 weak having uncontroled bowels and off and on confusion.

12/22 Vaccination 12/24 sore throat, sniffles, diarrhea, malaise. Contacted PCP; Covid test; negative. Had symptoms to following Tues. Following week, felt better; 1/1/2021

Fever, RespDepression & COVID positive REMDESIVIR (EUA) 200 mg x1 then 100 mg daily

The patient received the vaccine indicated above. Immediately following vaccination the patient states that they began feeling lightheaded and dizzy.

Severe right lower quadrant pain, anorexia over 12 hours. Went to the emergency department. Lab results showed elevated WBC and CT scan showed acute appendicitis. Admitted for urgent surgery: laparoscopic appendectomy. Was hospitalized from 12/26/20-12/28/20.

Rapid heart rate, shakiness, headache, rash, scratchy throat, raspy voice, dizziness, extreme weakness

tested positive for the Covid 19; tested positive for the Covid 19; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect from a contactable consumer. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration on 18Dec2020 as the first single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient tested positive for the COVID 19 on 27Dec2020. The patient underwent lab tests and procedures which included a test for Covid 19 virus, which was positive on 27Dec2020. The outcome of tested positive for the COVID 19 was unknown. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available.

"drooping on one side of the face/ eye hurts to open and hurts to close it; Her eyes are droopy; ""my eye is hurting so bad"", it hurts to open and hurts to close it/pain in the eyes; Face is tender to the touch and hurts on that one side; Swelling of her left side of her face that hasn't gone down/swelling and drooping on one side of the face; This is a spontaneous report from a contactable nurse (patient). A 20-

year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiry date were not provided), via an unspecified route of administration on 23Dec2020 at single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. Caller asking if pain in the eyes and swelling and drooping on one side of the face a side effect of the vaccine. Patient received the Covid vaccine on 23Dec2020 and noticed the next day (24Dec2020) swelling of her left side of her face that hasn't gone down. Her face is tender to the touch and hurts on that one side. Her eyes are droopy, ""my eye is hurting so bad"", it hurts to open and hurts to close it. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset eye hurts to open and hurts to close/ eyes droopy cannot be excluded, considering the plausible temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

received the COVID-19 vaccine on 19Dec2020 and then contracted COVID-19/positive COVID-19 test after receiving COVID-19 vaccine; received the COVID-19 vaccine on 19Dec2020 and then contracted COVID-19/positive COVID-19 test after receiving COVID-19 vaccine; This is a spontaneous report from a Pfizer sponsored program Pfizer First Connect via a contactable consumer. A 22-year-old female patient receive bnt162b2 (BNT162B2, also reported as PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiry date were not reported), via an unspecified route of administration in left arm/deltoid on 19Dec2020 at 0.3 mL, single for Covid-19 immunisation (as protection). Medical history included ulcerative colitis. The patient's concomitant medications were not reported. On 28Dec2020, the patient was positive for COVID-19 test after receiving COVID-19 vaccine. She informed she contracted COVID-19 due to an exposure from a co-worker. The outcome of events was not recovered. Information about lot/batch number has been requested.

"received his first dose of the vaccine and tested positive for Covid yesterday; received his first dose of the vaccine and tested positive for Covid yesterday; This is a spontaneous report from a contactable healthcare professional. A male patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date were not reported), via an unspecified route of administration on 17Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. It was reported that the patient received his first dose of the vaccine on 17Dec2020 and tested positive for Covid yesterday (28Dec2020). He is scheduled to have his second dose in January. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role BNT162B2 vaccine cannot be completely excluded for event ""tested positive for COVID""."

tested positive for COVID after the first dose; tested positive for COVID after the first dose; This is a spontaneous report from a contactable Pharmacist reported for herself. A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for

injection, lot number and expiry date unknown) via an unspecified route of administration on 22Dec2020 at single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient informed that she had the COVID-19 vaccine exactly a week ago (22Dec2020). However, she was tested positive for COVID (Dec2020) after the first dose. The outcome of the events tested positive for COVID after the first dose was unknown. The patient asked if she can take the second dose. Follow-up activities are possible, information on the batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further information like confirmative virus genome /nucleic acid detection needed for meaningful medical assessment.

We have a patient that received the 1st vaccine, then 7days later they tested positive for COVID-19.; We have a patient that received the 1st vaccine, then 7days later they tested positive for COVID-19.; This is a spontaneous report from a contactable pharmacist (Pharmacy Intern) via Pizer-sponsored program: A patient of unspecified age and gender received first single dose of BNT162B2 (lot number, and exp date not reported), via an unspecified route of administration on an unspecified date for immunization. The patient's medical history and concomitant medications were not reported. The patient received the 1st vaccine, then 7days later tested positive for COVID-19 (date unspecified). It was asked if patient needed to wait 90 days to receive the 2nd Vaccine dose. The outcome of the event was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

tested positive for Covid; tested positive for Covid; This is a spontaneous report from a contactable consumer (patient). A female patient of an unspecified age received first single dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine, lot number and exp date not reported), via an unspecified route of administration on 17Dec2020 for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. Patient received first Covid vaccine and on 26Dec2020, tested positive for Covid. Patient asked when if it was safe for her to get second dose. Asked if she get it on 21 days or if she had to wait. The outcome of the event was unknown. Information about Lot/Batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further information like confirmative virus genome /nucleic acid detection is needed for meaningful medical assessment.

had covid and also received the Pfizer covid 19 vaccine.; had covid and also received the Pfizer covid 19 vaccine.; This is a spontaneous report from a contactable nurse. A patient of unspecified age and gender started received single dose of BNT162B2 (Solution for injection, batch/lot number and exp date not reported), via an unspecified route of administration on an unspecified date for immunization. The patient's medical history and concomitant medications were not reported. They have a patient that meets the criteria to receive product bamlanivimab. The patient had Covid and received the Pfizer covid 19 vaccine. The nurse asked if patient can still get the bamlanivimab after receiving vaccine. The outcome of the events was unknown. No follow-up attempts are possible; information about batch number cannot be obtained.; Sender's Comments: Based on the information currently available, it is unclear if Covid developed after BNT162B2 Pfizer covid 19 vaccine, pending further clarification, at this

moment, the Company would handle the reported COVID related to the suspect, BNT162B2, for reporting purpose.

flare of existing autoimmune disease (undifferentiated connective tissue disease (UCTD) with predominant features of systemic sclerosis); flare of existing autoimmune disease (undifferentiated connective tissue disease (UCTD) with predominant features of systemic sclerosis); flare of existing autoimmune disease (undifferentiated connective tissue disease (UCTD) with predominant features of systemic sclerosis); This is a spontaneous report from a contactable physician. A 35-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot EH9899) intramuscular on 22Dec2020 16:15 (04:15 PM) at a single dose on the left arm as COVID-19 vaccine. Medical history included autoimmune disease (undifferentiated connective tissue disease (UCTD) with predominant features of systemic sclerosis); secondary Raynaud's phenomenon with calcinosis; known allergies to sulfa drugs, pine nuts. Concomitant medications included mycophenolate mofetil (MMF) 1000mg bid (twice a day), hydroxychloroquine sulfate (PLAQUENIL) 300mg qd (once a day), and prednisone 15mg daily (received within 2 weeks of vaccination). The patient had an adverse event (AE) of flare of existing autoimmune disease (undifferentiated connective tissue disease (UCTD) with predominant features of systemic sclerosis) on 23Dec2020 09:00 PM (also reported as flare began about 36-48 hours after vaccine) which required increased daily dose of prednisone (higher dose) up to 80mg total daily dose (80mg daily x3d, then tapered down) (treatment received for AE) and lasted about 4-5 days. The patient was not pregnant at the time of vaccination. She had no other vaccine in four weeks (did not receive other vaccine within four weeks prior to the COVID vaccine). She was not diagnosed with COVID-19 prior to vaccination and did not have Covid tested post vaccination (had not been tested for COVID-19 since the vaccination). The patient was vaccinated in a hospital (facility where the most recent COVID-19 vaccine was administered). The outcome of the events was recovered on Dec2020.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported flare of existing autoimmune disease (undifferentiated connective tissue disease (UCTD) with predominant features of systemic sclerosis) and the administration of BNT162B2, based on the plausible temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to agencys, as appropriate.

developed symptoms/mild/thought the symptoms were from the vaccine but turned out she did test positive for Covid; developed symptoms/mild/thought the symptoms were from the vaccine but turned out she did test positive for Covid; This is a spontaneous report from a contactable other healthcare professional (HCP) (patient). A 33-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 19Dec2020 at a single dose as vaccine. Medical history and concomitant medications were not reported. The patient received the vaccine on 19Dec2020 and 2 days later on 21Dec2020, she developed symptoms. Her symptoms had been mild. She thought the symptoms were from the vaccine but turned out she did test positive for Covid on Dec2020. She inquired what would happen if you get the vaccine and you test positive. She also inquired if her symptoms would be worse. The outcome of the events was unknown. Information on the

lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further information like confirmative virus genome /nucleic acid detection is needed for meaningful medical assessment.

positive for Covid/ symptoms of Covid; positive for Covid/ symptoms of Covid; This is a spontaneous report from a contactable nurse (reported for himself). A 33-year-old male patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiration date not provided), via an unspecified route of administration on 17Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Patient got the first dose of the vaccine on 17Dec2020 and then around Christmas he developed symptoms of Covid (Dec2020). On 27Dec2020, he came back positive for Covid and wanted to know if he skip the second dose. Patient questioned what percentage of persons obtained immunity after the first product dose. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further information like confirmative virus genome /nucleic acid detection is needed for meaningful medical assessment.

tested positive for COVID-19 by PCR the following day and developed covid symptoms; tested positive for COVID-19 by PCR the following day and developed covid symptoms; This is a spontaneous report from a contactable physician (patient). A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the first dose of the Pfizer-biontech covid-19 vaccine and tested positive for COVID-19 by PCR the following day and developed COVID symptoms. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The reported tested positive for COVID-19 by PCR after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

they suspect that I have rheumatoid arthritis; this is like abnormal I mean anybody with arthritis should not be a part of these trials; Never felt this kind of joint pain in my life/these are hitting my every joint in my hand, I can barely move; I have never been in as much pain in my life; I am really bad nauseous; soreness in your arm; This is a spontaneous report from a contactable consumer (patient) (Food service worker in the hospital). A 48-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: Unknown), via an unspecified route of administration on 28Dec2020 at single dose for COVID-19 immunisation. Medical history included Meniere's disease (reported 'Meniere's disease in my left ear'). The patient's concomitant medications were not reported. Consumer stated, ''I just took the COVID 19 vaccine I work at (institute name), (city name), I took it yesterday around 1 and all through the night; they suspect that I have rheumatoid arthritis I got an injection in one of my hips, my right hip and both my shoulders I can inject in cortisone injection and I have never felt this kind of joint pain in my life, I can barely move, I had been calling and I let my director know and anybody that has any kind of arthritis on these trials, I have never been in as much pain in my life and I

am really bad nauseous.'' When offered for the website consumer stated, ''I just wanted to report the side effects, I am really nauseous and I can barely move; this is like abnormal I mean anybody with arthritis should not be a part of these trials.'' When probed if vaccine was prescribed by Physician, Consumer stated, ''No it was voluntary, it was not mandatory it was given my hospital administration.'' Product details for vaccine (LOT#, Expiration date, NDC#, UPC#): Consumer stated, ''EH9894, I think for the last number.'' Treatment for adverse events: Consumer stated, ''I don't have anything for nausea, I did take, they told to me take Ibuprofen my doctor said that it would help with the soreness in your arm, I take my Ibuprofen every six hours because it is prescribed to me, but I could barely move my, I can barely move; these are hitting my every joint in my hand.'' Expiry Date of Ibuprofen: 16Jul2021. The outcome of the events was unknown. Information on the Batch/Lot number has been requested.

"Tested positive for COVID after receiving the vaccine/runny nose and felt achy/coughing/ dizzy and weak. It was affecting her legs and she had no taste; Tested positive for COVID after receiving the vaccine/runny nose and felt achy/coughing/ dizzy and weak. It was affecting her legs and she had no taste; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A contactable consumer (patient) reported a 53-year-old female received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: Unknown, did not see this information on the vaccination card), via an unspecified route of administration in the left arm on 20Dec2020 at single dose for covid-19 immunization (certified nurse assistant in healthcare). Other products, patient history and investigation assessment was No. There were no concomitant medications. The patient was vaccinated with the COVID Vaccine on 20Dec2020 but tested positive afterwards on 27Dec2020. The patent thought she had COVID in the vaccine and COVID in her body. She was scheduled for next dose on 10Jan2021 and would like to know if she should get the scheduled dose or if she needs to wait longer and re-schedule it. She was now a COVID patient and sick. She was waiting to get better. Before the vaccine she tested negative and felt great. Then she got the vaccine. She had a runny nose and felt achy. She asked her coworker, and her coworker felt the same. She thought if it continued that maybe it was a side effect. Caller confirmed her symptoms were runny nose, feeling achy, and coughing. She took Tylenol and the aches went away. They then came back, and she had more aching and she was wondering why. Caller clarified that these symptoms did not start the next day after receiving the vaccine. Achiness/body aches was started on 23Dec2020 when she was at work. It would wake her up at night. She did have aches right now, but her fever had lowered down. She was also dizzy and weak. It was affecting her legs and she had no taste. She was not eating but needs to eat. If she did, she eat something sweet. Runny nose was started on 24Dec2020. She went back to work on 26Dec2020 but told them she could not work because she had symptoms of COVID. She went to her second job where they do COVID testing and asked her boss for a test. She tested positive on 27Dec2020. Dose was unknown. She said she thought she got 1 vial. The whole thing. The outcome of events ""tested positive for COVID after receiving the vaccine"" was not recovered. Information on lot/batch number has been requested."

testing positive for COVID after getting the vaccine; testing positive for COVID after getting the vaccine; This is a spontaneous report from a contactable Other Health Professional reported for herself. A female patient of an unspecified age (reported as 42) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for COVID-19

immunization. The patient's medical history and concomitant medications were not reported. The patient experienced testing positive for COVID after getting the vaccine in Dec2020 with outcome of unknown. The patient underwent lab tests and procedures which included COVID test in Dec2020: negative; positive. The reporter would like an explanation as to the rapidness of her testing positive for COVID after getting the vaccine. Can the vaccine cause false positive test results? Information on interpretation of SARS-CoV-2 test results. The patient tested negative on Monday, got the vaccine on Monday. However tested positive today, asymptomatic. Information about batch/lot number has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Had the vaccine eventually then I ended up getting the virus; I ended up going through a rapid test that turned positive; This is a spontaneous report from a contactable consumer reporting for himself. A 53-years-old male patient started to receive bnt162b2 (BNT162B2; Lot # EK5730) vaccine , intramuscular in the left arm on an unspecified date at single dose for Covid-19 immunisation . Medical history included hypothyroidism from an unknown date. Concomitant medication included levothyroxine sodium (SYNTHROID). The patient stated that he does get test for the virus twice weekly. He did end up getting the Pfizer, the first round of Pfizer vaccine a week ago. The patient had a test, a virus test before, a swab test afterwards, both were negative but by Christmas eve the patient started getting, what he thought was side effect of the vaccine and he ended up going through a rapid test and it turned out he was positive for the virus.

Tested positive for COVID /she received the first dose of the vaccine last 16Dec2020 but tested positive via Nasal Swab test on 24Dec2020; Tested positive for COVID/positive via Nasal Swab test/fever/body aches/headaches/She was very very weak, almost lethargic/felt really bad/fatigued; gas; bloated; the weight last week she was 167 and this week she was 180; This is a spontaneous report from a contactable nurse reporting for herself. A 48-year-old female patient received her first dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine) Lot #EH9899, via an unspecified route of administration on 16Dec2020 at single dose by injection in the right deltoid for COVID-19 immunisation. Medical history included borderline hypertension from 2018 and ongoing. Concomitant medication included olmesartan medoxomil (BENICAR) from 2018 and ongoing for borderline hypertension. The nurse reported that she received the first dose of the vaccine last 16Dec2020 but tested positive via Nasal Swab test on 24Dec2020. She said this kinda weird. She received the COVID vaccine on 16Dec2020. She tested positive for COVID on 24Dec2020. Obviously she was exposed to COVID prior to the vaccine. She was scheduled to have the 2nd dose on 05Jan2021 but her hospital deferred it to 23Mar2021. She was asking if this was what's recommended.She said this was another weird thing, regarding the weight last week she was 167 and this week she was 180 (in Dec2020). She was very bloated in Dec2020, it was bizarre. He husband did not receive the vaccine and had symptoms on 24Dec2020. She had normal seasonal allergy symptoms. She did not think much of it. She took her Xyzal and her normal things.She

took her husband to get tested and he tested positive, so she got tested, and was positive. She worked at (address withheld), and all of her patients were immunocompromised. She was shocked. She did not think this had anything to do with the vaccine. If anything, it has helped her fight the virus.By Christmas day 25Dec2020 her fever was 102, she had body aches, she went into overdrive. She had headaches and lots of gas in Dec2020.She went into overdrive from partial recognition from the vaccine.She was very very weak, almost lethargic. Her O2 saturation have stayed good around 98% in Dec2020. She has done really well. Yesterday or the day before she felt really bad again. She did a virtual visit with (name withheld), and the doctor started her on steroids and gave her an inhaler just in case she needed it. She felt better on 30De2020. On 29De2020 she was so bad and bloated, she only had one dose of the steroids, but had unusual weight gain. Then 2 pounds were gone this morning on 30De2020.She had no pitting edema or edema period. She was very fatigued, but had more energy this morning, probably because of the steroids. She had the vaccine, even though day 7 post-injection, instead of day 10, which was about 50%, her body reacted more so than her husbands because her body recognized it. The outcome of the events was unknown. She was unsure of the outcome. It was up and down. She has felt worse and she has felt better. The reporter considered the event Tested positive for COVID was Not serious and unrelated to the BNT162B2.; Sender's Comments: While reporter causality is noted, a possible contributory effect of suspect BNT162B2 on reported events cannot be excluded.

Bell's palsy on the left side of his face; Headaches; Overall was not feeling well; This is a spontaneous report from contactable consumers (including the patient). A 64-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EH9899), via an unspecified route of administration in right arm on 18Dec2020 04:00 at a single dose for covid-19 vaccination. There were no relevant medical history and concomitant medications. On, 19Dec2020, the patient had headaches and overall was not feeling well. On 28Dec2020, the patient experienced bell's palsy on the left side of his face. He said it was a little hard to talk as his mouth was not working at the moment. The provider he saw gave him steroids- Prednisone, and Valaciclovir. He was also told to get some eyedrops as one eye does not close very well. He laughed and said it was a little hard to drink his coffee. The outcome of the events headache and not feeling well was recovered on 21Dec2020 while the outcome of bell's palsy was not recovered. The information on the batch/lot number and expiration date has been requested.

positive COVID-19 test with symptoms; positive COVID-19 test with symptoms; This is a spontaneous report from a contactable physician reporting for a nurse (patient) from a Pfizer-sponsored program Pfizer First Connect. A 43-year-old female patient received first dose of BNT162B2 (Pfizer Covid-19 vaccine), via an unspecified route of administration on 22Dec2020 at single dose for covid-19 immunisation. There were no medical history and concomitant medications. The physician was reporting that a nurse received the vaccine and had a headache after receiving it. She also tested positive for Covid 6 days after getting the vaccine (on 28Dec2020). He was asking if there was any connection with getting the first shot and testing positive. She was very keen with social distancing and wearing a mask. The physician is a medical oncologist. He was reporting on one of the nurses that worked at the hospital. She also developed nasopharyngeal congestion 4-5 days later. The nurse was at work today. She was disappointed because she had to go home. The patient underwent lab tests and procedures which included SARS-CoV-2 test: positive on 28Dec2020. The outcome of the events was

unknown. Information on Lot/Batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available.

has tested positive shortly after; has tested positive shortly after; This is a spontaneous report from a contactable pharmacist. A patient of unknown age and gender received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on unknown date at single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. The pharmacist asked for recommendation for the 2nd dose of the patient who had received the 1st dose but had tested positive shortly after. The outcome of the events was unknown. information on the LOT/Batch number has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported event cannot be excluded.

"fatigue; arm soreness; chills; muscle pain/muscle aches; fever; vomiting; he was positive for COVID-19; he was positive for COVID-19; This is a spontaneous report from a contactable consumer and a nurse. A 45-year-old male patient started to receive BNT162B2, via an unspecified route of administration on 18Dec2020 at single dose for COVID-19 immunization. Medical history included bronchiolitis obliterans, and ulcerative colitis. Concomitant medications were not reported. Patient experienced arm soreness. Six days later, after working a shift in the COVID-19 unit, patient had chills, muscle pain and fatigue. A drive-up hospital test confirmed he was positive for COVID-19. Patient was tested positive after receiving vaccination on 18Dec2020. Patient experienced muscle aches, fever, chills, and vomiting. On 30Dec2020, patient was tested positive for Covid-19 after receiving Pfizer vaccination. Outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported event ""he was positive for Covid-19"" cannot be excluded."

palpitations; Shortness of breath; Heart rate was 160s; This is a spontaneous report from a contactable Physician. This 29-Year-old female physician reported that she received 1st dose of BNT162B2 on 30Dec2020 08:30 AM at right arm for COVID-19 immunisation. Medical history included allergies: Citrus and cinnamon- perioral contact dermatitis. Concomitant therapy included birth control- Mylan. The patient reported within 5 mins of vaccine administration, she experienced palpitations and shortness of breath. Heart rate was 160s on 30Dec2020. No rash or fever. Event onset time was reported as 30Dec2020 8:30. She needed to be taken to the emergency room. Treatment was received as Steroids epinephrine Benadryl. The outcome of the event was recovering. The events were reported as non-serious. Lot/Batch and Expiration date has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

tested positive; tested positive; This is a spontaneous report from a contactable Nurse. A female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 27Dec2020 (reported as about 3 days ago, as of 30Dec2020) at single dose for covid-19 immunisation. Medical history, concomitant medications or past drug history were not provided. She received the vaccine about 3 days ago and later tested positive in Dec2020 and asked if the patient needs to restart the 2 doses series. Outcome of the events were unknown. Lot/Batch and Expiration date has been requested.; Sender's Comments: The reported events drug ineffective and COVID-19 are likely intercurrent conditions and are unrelated to BNT162B2 based on the short temporal relation between vaccination and onset of event.

Caller stated that a patient tested positive for covid 19 after the first dose of the vaccine; Caller stated that a patient tested positive for covid 19 after the first dose of the vaccine; This is a spontaneous report from a contactable Pharmacist. A female patient of an unspecified age (age: 74; unit- unknown) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient tested positive for COVID 19 after the first dose of the vaccine. Reporter wants to know if the patient can be treated with monoclonal antibodies after having received the vaccine. Reporter also wanted to know if the storage in the thermal shipper can be extended past the 30 days. Event outcome was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events drug ineffective and COVID-19 are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available.

Patient who got the vaccine a week ago tested positive now for COVID; Patient who got the vaccine a week ago tested positive now for COVID; This is a spontaneous report from a contactable pharmacist. A patient of unspecified age and gender received first dose bnt162b2 (BNT162B2), via an unspecified route of administration on Dec2020 at single dose for covid-19 immunisation. The patient medical history was not reported. The patient's concomitant medications were not reported. The pharmacist reported the patient who got the vaccine a week ago tested positive now for covid on Dec2020 with outcome of unknown. The patient underwent lab tests and procedures which included covid: positive on Dec2020. the doctor is thinking of giving antibody. The event was reported at non-serious. Information on lot/batch number has been requested.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available.

Moderate to severe Chills; body and head aches; head aches; Fever (99.6 F); This is a spontaneous report from a non-contactable other hcp. A 32-year-old male patient received BNT162b2 (COVID 19, Lot number: EK9231, dose number was 1), intramuscular at right arm on 28Dec2020 08:00 AM at single dose for COVID-19 immunization in hospital. Medical history was none. There was no known allergies to medications, food, or other products. The patient's concomitant medications were not reported. There was no other vaccine in four weeks. The patient experienced Moderate to severe Chills, body and head aches, and Fever (99.6 F) on 28Dec2020 20:30(08:30 P.M). There was no treatment. There was no COVID prior vaccination nor COVID tested post vaccination. Outcome was recovering. Events were assessed as

non-serious by the reporter. No follow-up attempts are possible. No further information is expected.; Sender's Comments: A causal association between BNT162B2 and the reported event chills cannot be excluded based on known safety profile of suspect drug and compatible temporal relation.

bell's palsy; This is a spontaneous report from a contactable physician. A female patient of an unspecified age (age: 37 unit: unknown), received BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date were not reported), via an unspecified route of administration on 29Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient experienced bell's palsy on 30Dec2020. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of bell's palsy might not be excluded, considering the plausible temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"heart rate (HR) was 180; tongue and lips tingled; walking for a short distance and felt ""off; This is a spontaneous report from a contactable Nurse reported for herself. This 34-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number: EK9231), via an unspecified route of administration on 29Dec2020 15:15 at single dose on left arm for Covid-19 immunisation. Medical history included allergies to hepatitis B vaccine rhbsag (HEY B VACCINE) booster and poison ivy. Concomitant medication included biotin / calcium pantothenate / cyanocobalamin / folic acid / nicotinamide / pyridoxine hydrochloride / riboflavin / thiamine mononitrate (B COMPLEX), fexofenadine, ascorbic acid (VIT C) and Multivitamin. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. Immediately after shot (29Dec2020 15:15), her tongue and lips tingled but it went away quickly. She was walking for a short distance and felt ""off."" The patient checked her pulse and pulse ox and her heart rate (HR) was 180. Her HR had bounced around from 150-180 with minimal exertion and was in the 90s at rest. No treatment received for the events. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The outcome of not recovered. The events were non-serious.; Sender's Comments: A causal association between BNT162B2 and the event heart rate increased cannot be excluded based on a compatible temporal relation. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate."

dizzy; fever; elevated blood pressure; flushed feeling day of vaccine. The next day she continued to feel flushed; This is a spontaneous report from a contactable pharmacist. This pharmacist reported for a 60-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via intramuscular route on 29Dec2020 15:00 at single dose for COVID-19 immunization. Medical history included COVID-19, hypertension and depression. Concomitant medications included vitamins received

within 2 weeks of vaccination. The patient previously took duloxetine and experienced allergies. Facility that the most recent COVID-19 vaccine was administered in Workplace clinic. Prior to vaccination, the patient was diagnosed with COVID-19. Since the vaccination, the patient hasn't been tested for COVID-19. On 29Dec2020, the patient was dizzy, had fever, elevated blood pressure, and flushed feeling day of vaccine. The next day she continued to feel flushed that moved through her face and down her neck. It felt like she was on fire. The adverse events resulted in the following: Emergency room/department or urgent care. Outcome of the event feel flushed was recovered on 30Dec2020, outcome of other events was recovered in Dec2020. Treatment received for the adverse events included IV fluids, prednisone, diphenhydramine hydrochloride (BENADRYL). Events were reported as non-serious. Information on the lot/batch number has been requested.; Sender's Comments: A causal association between BNT162B2 and the events dizzy, fever, elevated blood pressure and flushed feeing cannot be excluded based on a compatible temporal relation. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

"swelling/cellulitis in her left arm/redness, inflammation, swelling that looked like cellulitis to the arm/deltoid area; redness; to the arm/deltoid area; inflammation; to the arm/deltoid area; swelling/cellulitis in her left arm/swelling; to the arm/deltoid area; This is a spontaneous report from a contactable nurse reported for herself. A 28-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EK5730, expiry date unknown) intramuscular at left deltoid on 16Dec2020 16:45 at single dose for Covid-19 immunization at a hospital facility and not in a military facility. Medical history included ongoing acne. Concomitant medications included ongoing spironolactone for acne. The patient did not receive any other vaccines the day or 4 weeks prior Covid-19 vaccine. The patient informed that after 8 days of getting Covid vaccine she has swelling/cellulitis in her left arm. The patient got the COVID-19 vaccine and had kind of a delayed reaction. She got the vaccine on 16Dec2020 16:45 pm at her workplace. The patient informed that she had no reaction right after the vaccine. On 24Dec2020, the patient experienced redness, inflammation, swelling that looked like cellulitis to the arm/deltoid area. The patient got antibiotics and it has improved. The reporter informed that the events required visit to physician office. The outcome of the events swelling/cellulitis in her left arm/redness, inflammation, swelling that looked like cellulitis to the arm/deltoid area was recovering. The patient was queried regarding seriousness of the events and the patient stated ""it could have potentially dangerous."" The patient wanted to know if she should get second dose of the vaccine.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events vaccination site cellulitis, vaccination site erythema, vaccination site inflammation and vaccination site swelling cannot be excluded."

she had developed symptoms and tested positive to COVID-19; she had developed symptoms and tested positive to COVID-19; This is a spontaneous report from a contactable physician (patient). A female patient of unspecified age received BNT162B2 first dose on 20Dec2020 at single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. She tested negative on

18Dec2020. She received the first dose of the COVID 19 vaccine on 20Dec2020. On the following Friday (25Dec2020), she had developed symptoms and tested positive to COVID-19. The outcome of the events was unknown. Information on the batch/lot number has been requested.; Sender's Comments: The causal relationship between BNT162B2 and the events drug ineffective and SARS-CoV-2 test positive cannot be excluded as the information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available.

received the 1st dose of the COVID-19 vaccine on 21Dec2020, however, on 28Dec2020 she tested positive to COVID-19; received the 1st dose of the COVID-19 vaccine on 21Dec2020, however, on 28Dec2020 she tested positive to COVID-19; This is a spontaneous report from a contactable other healthcare professional (HCP) (patient) from a Pfizer-sponsored Program Pfizer First Connect. A 26-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EJ1685), intramuscularly on left deltoid on 21Dec2020 (between 2:15PM and 2:30PM) at single dose (reported as 225mcg/.45ml intramuscular suspension) for COVID-19 immunization. The relevant medical history included birth control. Concomitant medications included ongoing ethinylestradiol, ferrous fumarate, norethisterone acetate (TAYTULLA) for birth control. The patient received the 1st dose of the COVID-19 vaccine on 21Dec2020, however, on 28Dec2020 she tested positive to COVID-19. She wanted to know if the vaccine could have caused a positive test result, if the test assesses IgM or IgG (to the viral spike proteins), could a false positive result be caused by the vaccine. She hadn't been able to get up with her primary care on the phone. This was her first dose. The window to get the second vaccine is 07Jan2021 through 11Jan2021. The patient did not require a visit to emergency room or physician office. The outcome of the events was unknown.; Sender's Comments: The causal relationship between BNT162B2 and the events drug ineffective and SARS-CoV-2 test positive cannot be excluded as the information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available.

acute pericarditis; This is a spontaneous report from a contactable physician. A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot/batch number not reported), via an unspecified route of administration on 23Dec2020 at a single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. It was unknown if other vaccines were given in four weeks and unknown if patient had Covid prior vaccination. The patient experienced acute pericarditis on 24Dec2020. Clinical course as follows: Doctor colleagues at the institution admitted (at Emergency room/department or urgent care) and treated a patient with acute pericarditis who received his first dose of Pfizer SARS-CoV-2 EUA vaccine on 23Dec2020. The physician (reporter) considered the event as non-serious. The outcome of the event was recovering. Information about batch/lot number has been requested.; Sender's Comments: The causal relationship between BNT162B2 and the event acute pericarditis cannot be excluded as the information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as

well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

received the vaccine last week and tested positive for covid this week; received the vaccine last week and tested positive for covid this week; This is a spontaneous report from a contactable other Healthcare Professional (patient). A 30-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: Unknown), via an unspecified route of administration on 23Dec2020 at single dose by injection in the right arm for COVID-19 immunization (to be protected and to protect her family with other conditions like diabetes). The patient's medical history and concomitant medications were none. The patient got the first dose of the COVID vaccine last week on 23Dec2020 and then she tested positive for COVID on Monday on 28Dec2020. She was asking if it was safe to get the second dose. Patient was a pharmacy technician. The outcome of the events was not recovered. Information on the Lot/Batch number has been requested.; Sender's Comments: The causal relationship between BNT162B2 and the events drug ineffective and SARS-CoV-2 test positive cannot be excluded as the information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available.

Headache; blurred vision; unable to read at time; Difficulty focusing; right hand numbness; This is a spontaneous report from a contactable Nurse (patient). A 35-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 28Dec2020 04:15 PM, Intramuscularly at single dose (Vaccine location: Left arm) for COVID-19 immunization. Medical history was reported none. Concomitant medications were not reported. Patient did not have any allergies. Patient did not receive other vaccine in four weeks. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. Patient experienced Headache, blurred vision and unable to read at time, Difficulty focusing and right hand numbness on 30Dec2020 12:00 AM. Patient did not receive any treatment. The outcome of the events was not recovered. This case was assessed non-serious by reporter. The events did not result in death, Life threatening, Caused/prolonged hospitalization, Disabling/Incapacitating, Congenital anomaly/birth defect. Information on the lot/ batch number has been requested.; Sender's Comments: The causal relationship between BNT162B2 and the events headache, vision blurred, cognitive disorder, disturbance in attention and hypoaesthesia cannot be excluded as the information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

"mild supraglottic swelling of my aryepiglottic folds; feel difficulty swallowing (globus); allergic response; This is a spontaneous report from a contactable physician. A 41-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730), intramuscular on 23Dec2020 12:30 at single dose for COVID-19 immunisation. Medical history included allergies to medications, food, or other products: Penicillin. There were no concomitant medications. The patient previously took benzoyl peroxide and experienced allergies. The patient experienced stated that on

23Dec2020 12:31, ""I am an ENT surgeon. I received the first dose of the vaccine at 12:30pm. Within 1-2 minutes I started to feel difficulty swallowing (globus). I reported this to the nurse and she offered me ginger ale. My symptoms worsened and then stabilized after 10 minutes. I went upstairs and got the residents to perform a fiberoptic nasoendoscopy and this demonstrated mild supraglottic swelling of my aryepiglottic folds. I choose not to receive treatment as I did not want to dampen my allergic response and as an ENT surgeon manage airways on a daily basis. I stayed at the hospital for a further 6 hours and continued to work. My symptoms resolved after 9 hours"". The outcome of the events was recovered on 23Dec2020.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the event laryngeal oedema cannot be excluded. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate."

chronic auto immune response; angioedema/tongue is swollen; urticaria/hives; This is a spontaneous report from a contactable other healthcare professional. A 35-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiration date were not reported), intramuscular in the right arm on 28Dec2020 10:15 at a single dose for COVID-19 immunization. The patient's medical history was not reported. The patient was not pregnant. Concomitant medications included cetirizine hydrochloride (ZYRTEC), omeprazole (PROTONIX), naproxen sodium (ALEVE), and birth control. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination and had not been tested for COVID-19 since the vaccination. On 30Dec2020 16:00, the patient have a chronic auto immune response in the form of urticaria and angioedema. The symptoms of hives as well as swollen tongue was maintained with antihistamines. Outcome of the events was not recovered. The events were considered non-serious. The following information on the batch number has been requested.; Sender's Comments: Based on the temporal relationship, the association between the events chronic autoimmune response in the form of urticaria and angioedema with BNT162b2 can not be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Tachycardia/her heart rate at 11:00PM last night was at around 100/ she checked her pulse it was 115; she was not feeling right, so she took the day off from work today; Lightheadedness; wobbly; she felt weak; This is a spontaneous report from a contactable nurse (patient). A 50-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot Number: EL1284, expiration date: Apr2021), via an unspecified route of administration at right deltoid on 29Dec2020 17:45 at a single dose for Covid-19 immunization. Medical history included asthma from 2003 and ongoing, tachycardia and major surgery. Concomitant medication included maintenance inhaler (unspecified) for asthma.

Patient was officially diagnosed with asthma in 2003. She said her asthma was controlled, and she takes a maintenance inhaler every day. She said she has been taking the same maintenance inhaler since she was first diagnosed with the asthma. She said she rarely uses a rescue inhaler. Reported she was prescribed the Metoprolol Tartrate 25mg for her tachycardia that she had after her major surgery, but she did not take the full 25mg dose during that time. She said she hasn't had taken the Metoprolol Tartrate 25mg in almost a year, clarifying it was last Jan2020 that she used the Metoprolol Tartrate. The patient previously received a flu shot in Oct2020, and felt rundown for a day afterwards, but that she always does after she receives a flu shot. She said she had no heart issues after receiving the flu shot in Oct2020. The patient who is a registered nurse reported she received the COVID-19 vaccine last night at work, on 29Dec2020, at 5:45PM, and had experienced some tachycardia after receiving the vaccine. Reported the COVID-19 Vaccine was offered through her employer. She said the COVID-19 vaccine was optional and offered to all employees if they work at the hospital. She experienced the tachycardia at 11:00 PM last night, 29Dec2020. She said her normal resting heart rate is between the high 60s to low 70s. She said her heart rate at 11:00PM last night was at around 100, clarifying she was not running a fever at that time. She stated after she received the COVID-19 vaccine, she was not feeling right, so she took the day off from work today, and slept in. She said when she woke up this morning (in Dec2020), she still didn't feel right, saying she felt weak and wobbly, and when she checked her pulse it was 115. She said she does have a past history of tachycardia. She said a year ago she had major surgery, and she had tachycardia after the major surgery. She said the tachycardia eventually went away, but she did have to see a cardiologist and take a beta blocker. She said she took a tiny dose of the beta blocker this morning, and called the cardiologist to let him know what was going on. She said she has not heard back from the cardiologist yet. She said the tachycardia went away once she took the beta blocker this morning. She said she took the beta blocker because her heart rate was going higher, and higher. She said she didn't want to end up like last year after her major surgery with a heart rate in the 170s. She said the tachycardia she was experiencing after receiving the COVID-19 Vaccine was not normal for her. She said once she got over the major surgery last year, her heart rate was fine. Reported her employer was making employees wait around for 15 minutes after the employees received the COVID-19 Vaccine to make sure no one had a major reaction to the COVID-19 Vaccine. She said after she received the COVID-19 Vaccine, she waited around longer than the 15 minutes. She said she felt weird after she received the COVID-19 Vaccine and thought maybe she was experiencing anxiety. She said she was lightheaded on 29Dec2020 after she received the COVID-19 Vaccine and completed a report right then on the website. She said the website is for reporting adverse events, and she was sent a website link to complete the adverse event reporting. She said she signed into the website link while she was still at the hospital. She said one of the website's first questions asked was how she was feeling. She said the question made her wonder if her lightheadedness was due to her heart rate being up because she becomes lightheaded when that happens. She clarified she reported only the lightheadedness on the website, and not the tachycardia. She said her lightheadedness got better and she was fine, and then at 11:00PM the tachycardia hit her like a switch. Reported this morning she felt fine, and then all of sudden she wasn't fine. Tachycardia Treatment: Reported she took a 8.5mg dose, or one quarter of a 25mg tablet (as provided by the reporter) of the beta blocker Metoprolol Tartrate 25mg tablet this morning and called her cardiologist to let him know. She said she split the Metoprolol Tartrate 25mg tablet this morning, and only took a quarter of the 25mg tablet (reported as a 8.5mg dose by the reporter).

Reported she believes 100% that her tachycardia was caused by the COVID-19 Vaccine, saying she has been fine up until receiving the COVID-19 Vaccine. She said she got the COVID-19 Vaccine because she was afraid of getting the COVID-19 Virus with her asthma. She said she has no other preexisting conditions besides the asthma. Reported she is not going to get the second COVID-19 Vaccine dose. She said it was scary when her heart rate shot up out of nowhere. She said the COVID-19 Vaccine is the only thing different she has done. She said before the COVID-19 Vaccine, she was completely fine. Patient asked if the Pfizer DSU agent had heard of anyone else who has experienced tachycardia after receiving the COVID-19 Vaccine. The outcome of the event tachycardia was recovered in Dec2020, event lightheadedness was recovering and unknown for the other events. The reporter assessed the event 'tachycardia' as Serious (Medically Significant).; Sender's Comments: Based on the close temporal relationship, the association between the event tachycardia with BNT162b2 can not be fully excluded. The medical history of tachycardia and asthma medication may be contributory as well. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

swelling and joint pain in the little finger on left arm; swelling and joint pain in the little finger on left arm; She got a bruise at the injection site; It bled a little bit when she put it in; This is a spontaneous report from a contactable nurse (patient). A 62-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EK9231), via an unspecified route of administration on the left arm, on 28Dec2020 at 14:15 at a single dose for Covid-19 immunization. Medical history included environmental allergies, she has allergies and can have an asthmatic attack from cat dander and perfume, blood pressure (abnormal) and sleep (disorder). Concomitant medications included ongoing lisinopril for blood pressure, colecalciferol (VITAMIN D), acetylsalicylic acid (BABY ASPIRIN), paracetamol (TYLENOL). The patient previously took novocaine but was allergic. She got all this information when she got the vaccine on Monday at (place name) in (state name). It tells all the side effects from the first injection. She wanted to report that it is the same arm that she got the vaccine in. She has swelling and joint pain in the little finger on left arm. It says you can have joint pain, but nothing about swelling. She thought she better report it. This was her first shot. She is supposed to get the second one on 18Jan2021. She wanted to make sure she can take it. She received the vaccine on 28Dec2020. She laid around that day. Today is the first day she doesn't have arm pain and swelling at the injection site. It was the first time she has had arm pain. She has never had that with flu shot. The arm pain started within the 15 minutes she was observed. It hurt like hell until that day. She got a bruise at the injection site. It bled a little bit when she put it in. Swelling and joint pain in the little finger on left arm: she doesn't know if it was later that day. She can't remember. She really noticed it yesterday. She has never had joint pain or swelling. She doesn't have any problems with arthritis. Now her little finger is bigger than the rest of her fingers. It hurts because of the swelling. She doesn't want to take anything. It might be fluid. She has a high pain tolerance. She keeps bending it thinking it will get better. It isn't as bad, but its still swelled up. At first she thought it was better, but it is still pretty swollen. To her this is a reaction. She was thinking if she took paracetamol before, it wouldn't hurt as bad, but she can't remember if she took it that morning. She takes 500mg before bed for the heck of it at night. It helps

her sleep better. She has allergies and can have an asthmatic attack from cat dander and perfume. They think she was allergic to the preservative in the flu shot, but she has never had any trouble with the flu shot since. She has environmental allergies. They thought she was allergic to Novocaine once at the dentist office. Who knows, it only happened once. She's been to the dentist many times and who knows what they injected and why she reacted that way. She felt like she was going to pass out. They don't give it to her anymore. She doesn't know what was in it. She is worried since this vaccine is emergency authorization. She doesn't want to get the next one and have a worse reaction. She is not sure if she should be worried. The events of swelling and joint pain in the little finger on left arm were assessed as medically significant. Outcome of the event of 'swelling of fingers' was not recovered, the other events were unknown.; Sender's Comments: There is a reasonable possibility that the event joint pain was related to BNT162b2 based on known drug safety profile. Based on the temporal relationship, the association between the event swelling with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Covid 19 test: Nasal Swab Result: Positive; Covid 19 test: Nasal Swab Result: Positive; Severe joint swelling oral viral sores left lung fluid exhaustion; Severe joint swelling oral viral sores left lung fluid exhaustion; Severe joint swelling oral viral sores left lung fluid exhaustion; This is a spontaneous report from a contactable Other HCP (patient). A 56-year-old non-pregnant female patient received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular in the left arm on 24Dec2020 12:00 at a single dose for COVID-19 immunization at the hospital. Medical history included juvenile idiopathic arthritis (JRA). The patient was not diagnosed with COVID-19 prior vaccination. Concomitant medications included imipramine, nebivolol hydrochloride (BYSTOLIC), and topiramate (TOPAMAX). The patient received other vaccine within 4 weeks prior to the COVID vaccine which is J&J cv trial. The patient experienced severe joint swelling, oral viral sores, and left lung fluid exhaustion on 25Dec2020 06:00; it was reported that no treatment was given for these. The patient tested for COVID-19 post vaccination. The COVID-19 test post vaccination was a Nasal Swab (Abbott Binax) on 27Dec2020. The COVID-19 test result was positive. Outcome of the events severe joint swelling, oral viral sores, and left lung fluid exhaustion was recovering; for the other events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The association between the event lack of effect (COVID-19 test positive) with BNT162b2 can not be fully excluded. Based on the close temporal relationship, the association between the event left lung fluid exhaustion with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

"blood pressure went up to 150/101; feeling like fainting; feeling really tired; Weakness; irregular heart beat; sob; feeling like flushing in the body; chills; This is a spontaneous report from a contactable

healthcare professional. A 39-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL1284), intramuscular on the left arm on 30Dec2020 07:15 at single dose for COVID-19 immunisation. Medical history included hypothyroidism, depression, cardiac murmur and pvc. The patient hadno known drug allergies and had not tested for COVID-19 prior and after vaccination. Concomitant medication included levothyroxine sodium (SYNTHROID), ergocalciferol (VITAMIN D), tocopherol (VITAMIN E) and sertraline hydrochloride (ZOLOFT). The patient experienced weakness, irregular heart beat, feeling like fainting, sob, blood pressure went up to 150/101, feeling like flushing in the body, chills, feeling really tired, all on 30Dec2020 07:15. The patient received treatment. The outcome of the events was recovering.; Sender's Comments: Based on the close temporal relationship, the association between the event ""blood pressure went up to 150/101"" with BNT162b2 can not fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

Got the first Pfizer COVID Vaccine and today I tested positive for COVID; Got the first Pfizer COVID Vaccine and today I tested positive for COVID; Congestion; Sore throat; This is a spontaneous report from a contactable consumer reporting for herself. A 26-years-old female patient received bnt162b2 (BNT162B2; Lot # EL0140) vaccine , via an unspecified route of administration on an unknown date in Dec2020 at single dose for Covid-19 immunisation . The patient medical history was not reported. There were no concomitant medications. The patient stated she got the first Pfizer Covid vaccine and on an unknown date in Dec2020 she tested positive for Covid 19, she also experienced nasal congestion and sore throat. The outcome of the events is unknown.

anaphylaxis; throat swelling; This is a spontaneous report from a contactable physician. A 50-year-old female patient (non-pregnant) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 29Dec2020 at single dose for COVID-19 immunization. Medical history included hypertension, lipids (as reported) and asthma. The patient was known allergies: codeine, iodine, shellfish, latex, and cefatrizine propyleneglycolate (CEFTIN). Prior to vaccination, the patient was diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The most recent COVID-19 vaccine was administered in hospital. The patient experienced anaphylaxis and throat swelling on 22Dec2020 with outcome of recovered in Dec2020. The events were reported as non-serious. The events resulted in Emergency room/department or urgent care. Treatment of epinephrine, steroids, antihistamines, observation was received for the events. Information on lot/batch number has been requested.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of anaphylaxis and throat swelling cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The underlying predisposing condition of allergies to multiple materials may put the patient at high risk of anaphylactic reactions. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of

aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

she got tunnel vision; almost passed out; Blood pressure dropped to 70/50; heart rate went up to 140; whole body got cold and tingly; whole body got cold and tingly; This is a spontaneous report from a contactable pharmacist (patient) reported for herself. A 25-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; brand: Pfizer Biotech; lot number: EL0142) via an unspecified route of administration at left arm on 30Dec2020 at 12:45 PM at a single dose (dose number: 1) for COVID-19 immunization. Facility where the most recent COVID-19 vaccine was administered was workplace clinic. Medical history included premature ventricular contractions (PVCs). No known allergies (no allergies to medications, food, or other products). The patient was not pregnant. No other vaccine in four weeks and no other medications in two weeks. The patient experienced adverse events included blood pressure dropped to 70/50, heart rate went up to 140, whole body got cold and tingly and she got tunnel vision and almost passed out. The events all started on 30Dec2020 at 12:45 PM. The events were reported as non-serious. No treatment received for events. The outcome of events was resolving. Prior to vaccination, the patient was not diagnosed with COVID-19, and since the vaccination, the patient had not been tested for COVID-19. No follow-up attempts are possible. No further information is expected.; Sender's Comments: Based on the close temporal relationship, the association between the event tunnel vision with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

"The body aches started in his shoulder and now are all over his neck, back and whole body aches; The body aches started in his shoulder and now are all over his neck, back and whole body aches/ feeling like he has 1,000 pounds on his back; The body aches started in his shoulder and now are all over his neck, back and whole body aches; Body aches/The body aches started in his shoulder and now are all over his neck, back and whole body aches; Headache; Chills; Feel like crap; Low grade temperature; This is a spontaneous report from a contactable Nurse (patient). A 49-year-old male patient received BNT162B2 (Pfizer-BioNTech Covid-19 vaccine, lot number EL0142) intramuscularly at right shoulder approximately at 17:30 on 29Dec2020 for Covid-19 immunization. The patient's medical history included diagnosed allergies, compromised immune status, respiratory illness, genetic / chromosomal abnormalities, endocrine abnormalities (including diabetes) and obesity (a little over weight but he is fit). The patient had COVID in the end of Apr2020. The patient had no family medical history and had no prior vaccinations within four weeks. The patient had no concomitant medication. The second day of the vaccination, the patient called to report body aches, headache, chills, low grade temperature. As he reported, he just woke up and was walking around feeling like he had 1000 pounds on his back and felt like crap. The body aches started in his shoulder and currently all over his neck, back and whole body aches. Chills started last night (vaccination night). He was just trying to get to sleep and had to put an extra sweatshirt on last night. He did not check his temperature until he got up and it was 99.2 degrees

Fahrenheit. He was not able to provide a start date for the temperature. ""Body aches, headache between, chills between, low grade temperature (unspecified start date), feels like crap"" were considered developing between 24:00-01:00. He stated that they were all medically significant and he needs a day to recover hopefully. He just felt like he was hit by a truck. The patient had not visited physician or went to ER yet. The outcome of low grade temperature was unknown, chills was resolving and all other events did not resolve at the time of reporting.; Sender's Comments: There is a reasonable possibility that the events vaccination site pain, headache, chills, and pyrexia were related to BNT162b2 based on known drug safety profile. The association between the other reported events with BNT162b2 can not be completely excluded based on temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

"A nurse got Bell's Palsy after the vaccine; heart attack; This is a spontaneous report from a contactable consumer. A female patient (nurse) of an unspecified age received single dose of BNT162B2 (batch/lot number and exp date not reported), via an unspecified route of administration on an unspecified date for immunization. The patient's medical history and concomitant medications were not reported. The consumer asked if Pfizer have more information if so then what's the ingredients. States that ""injury lawyers know how many deaths because of the vaccine. Bell's palsy, a nurse got Bell Palsy after the vaccine, she is all distorted, and 30 days later, that's the 2nd one to have a heart attack."" The outcome of the events was unknown. Information on the Lot/Batch number has been requested."

2nd one to have a heart attack; This is a spontaneous report from a contactable consumer. A female patient of an unspecified age received BNT162B2 via an unspecified route of administration on an unspecified date at a single dose as Covid vaccine. Medical history and concomitant medications were not reported. After stating Pfizer has submitted a request for Emergency Use Authorization for potential COVID-19 vaccine and it was now in the FDA's hands, the reporter inquired if Pfizer had more information if so then what's the ingredients. It was then reported that the patient's the 2nd one to have a heart attack on an unspecified date. The outcome of the event was unknown. Information on the Batch/Lot number has been requested.; Sender's Comments: The association between the event heart attack with BNT162b2 can not be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

"right mouth drop; right face numbness from eyebrow to below chin with right mouth drop; pins and needles feeling at injection site; then ears itching; This is a spontaneous report from a contactable nurse, the patient. A 63-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE Lot number: EK9231), via an unspecified route of administration, on 30Dec2020 at 03:45 AM (at the age of 63-years-old) as a single dose for COVID-19 vaccination. The facility where COVID-19 vaccine was administered was at a workplace clinic and anatomically located on

the right arm. Medical history included: History of Guillain Barre in 1970's with Swine Flu Vaccine. Concomitant medications included: clonidine (MANUFACTURER UNKNOWN), hydralazine ((MANUFACTURER UNKNOWN), spironolactone (MANUFACTURER UNKNOWN), pantoprazole (MANUFACTURER UNKNOWN); all for unknown indications from unknown dates and unknown if ongoing. The patient was not pregnant at the time of vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient previously took unspecified medications (MANUFACTURER UNKNOWN), from unknown dates to unknown dates for unknown indications and experienced sensitivity to some medications, and unknown if ongoing. On 31Dec2020 04:15 PM, the patient reported ""'Within 30 minutes of vaccine, I had pins & needle feeling at injection site. Then ears itching followed by right face numbness from eyebrow to below chin with right mouth drop.'"" The patient did not receive any treatment for the events. The clinical outcome of the events pins & needle feeling at injection site, ears itching followed by right face numbness from eyebrow to below chin with right mouth drop, was not recovered. It was also reported that since the vaccination, the patient had not been tested for COVID-19.; Sender's Comments: A possible contributory role of the suspect products cannot be excluded for the reported events based on the temporal association."

Bell's Palsy; This is a spontaneous report from a contactable physician. A 37-year-old female patient (nurse) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot EK9231) via an unspecified route of administration on 29Dec2020 17:50 (5:50 pm) at a single dose as Covid vaccine. Medical history included hypertension and depression. Concomitant medications included venlafaxine hydrochloride (EFFEXOR); olmesartan medoxomil (BENICAR); and unspecified medications for depression and blood pressure medication (hypertension). It was reported that the reporter's nurse got her vaccine last night, about 6'o clock at night, and woke up with Bell's Palsy on Dec2020. She woke up in midnight to go to the bathroom and when she looked in the mirror, she noticed that there was discrepancy. The physician examined her this morning, so it was in several hours getting the vaccine that she noticed it. She got the vaccination last night at 5:50 pm. When she went to bed it wasn't a problem. She woke up at midnight and noticed it. The patient was started on Medrol dose pack but she hasn't taken it yet because she's at work so she would start it today (unknown if the treatment was already received); it's steroid, Methylprednisolone, at 24 mg on day one and then decreases 4 mg a day over the next five days until it's done. The doctor inquired what should the patient do about her second dose and also asked if she should not get her second dose. The outcome of the event was unknown.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the event facial paralysis cannot be excluded. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

edema started in her feet and ankles and then moved 3 quarter way to her shin; 4+ pitting edema; This is a spontaneous report from a contactable nurse (patient). A 47-year-old female patient received the

first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 17Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient reported she received the Covid vaccine on 17Dec2020 and on 25Dec2020 she noticed her shoes were snug and on 26Dec2020 she noticed 4+ pitting edema lasting 3 days. She went and brought some compression stockings and this has helped the edema improve but was still mild. The edema started in her feet and ankles and then moved 3 quarter way to her shin. She would like to know if she should receive second dose of Pfizer vaccine. Outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The reported information is limited. Based on the close temporal relationship and the description of the events, there is a reasonable possibility that the events are related to BNT162 vaccine. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Having trouble clearing my throat, felt like it was closing up; Having trouble clearing my throat, felt like it was closing up; Uncontrollable rigors; High heart rate; Numb lips and hands; Numb lips and hands; Nausea; Shortness of breath, difficulty catching my breath; This is a spontaneous report from a contactable healthcare professional (reporting for herself). A 38-year-old female received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number EJ1685, expiry date 30Dec2020) intramuscular (Arm Left), on 30Dec2020 09:15, single dose, for COVID-19 immunization. Relevant medical history included bariatric surgery, had anterior vaginal repair and bladder sling, had gall bladder removed, and had tonsils removed. It was reported that the patient cannot take NSAIDS, patient was not allergic to them. No allergies to food or other products. Concomitant medications included rizatriptan and paracetamol (TYLENOL). On 30Dec2020, within about 10 minutes of the injection of the vaccine, the patient had trouble clearing her throat, felt like it was closing up, had uncontrollable rigors, high heart rate, numb lips and hands, and nausea. The patient was discharged from the ED, went home and took a nap. Later that evening, the patient began to have a rapid heart rate again, began to had shortness of breath, difficulty catching her breath, and was admitted to the ED again and given more IV medications. Therapeutic measures given in response to the event included administration of IV medications, epinephrine injection and breathing treatment. Prior to the COVID vaccine, the patient did not receive any other vaccines within 4 weeks, was not tested or diagnosed with COVID-19. Facility where the most recent COVID-19 vaccine was administered was in the workplace clinic. Outcome of the events was recovering at the time of the report.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events oropharyngeal discomfort, throat tightness, chills, heart rate increased, hypoaesthesia oral, hypoaesthesia, nausea and dyspnoea cannot be excluded. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

patient was noted to be flushed by residential home staff on 12/30/2020, approximately 2.5hrs after vaccination, fever present at that time. Prior to COVID19 vaccine administration, this patient did have exposure and was close contact with a known case of COVID19 in a residential care employee. Patient was taken to hospital for evaluation of febrile status, had positive COVID19 test at that time, and reported hypotension per residential care staff.

PATIENT SPOUSE REPORTS THAT PATIENT RECEIVED VACCINE ON 1/4/2021 AND ON 1/5/2021 PATIENT'S ARM BEGAN TO TURN RED AND SWELL AT THE INJECTION SITE. THE SWELLING AND REDNESS BEGAN TO GO DOWN HIS ARM AND HE BROKE OUT INTO A RASH. PATIENT THEN BECAME SHORT OF BREATH. EMS WAS CALLED AND PATIENT WAS TRANSPORTED TO HOSPITAL, WHERE HE WAS TREATED FOR ANAPHYLACTIC SHOCK TO THE COVID MODERNA VACCINE.

Anaphylaxis Narrative: 12/22 received COVID-19 vaccine at 1209 and developed SOB at 12:15. Took her own albuterol inhaler without relief. Transported to ED. PE: red hands with swelling, throat and lip swelling with difficulty swallowing. Later developed headache and dizziness then tachypnea and stridor. Meds given - See section 5 PLUS epinephrine IM and infusion @ 0.05 mcg/kg/min, Alb and ipratropium negs, racemic epi nebs. Admitted to the hospital on 12/22 and still hospitalized at the time of this report on 12/23. She remains on an epinephrine drip and was given methylprednisolone 125 mg IV x 2. No previous history of anaphylaxis. History of Reye's syndrome as a child when given aspirin.

Agitation, Sedation, Anaphylaxis, Rash & HYPOtension

"covid; covid; This is a spontaneous report from a contactable physician. A male patient of an unspecified age received single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, batch/lot number and exp date not reported), via an unspecified route of administration on an unspecified date for immunization. The patient's medical history and concomitant medications were not reported. The physician inquired whether a person with previous history of COVID would experience more significant reaction to the COVID vaccine than a person without a previous diagnosis due to having already produced antibodies. Reporter's colleague (physician) had the vaccine 2 weeks ago, had a severe reaction (unspecified) wherein he got a shot of epi. Patient recovered and was okay. At the time of reporting, patient now had Covid or maybe he had Covid before, reporter was not sure. The outcome of the events was unknown. Information on the Batch/Lot number has been requested.; Sender's Comments: Based on available information, a possible contributory role of suspect BNT162B2 vaccine cannot be completely excluded for event ""Covid""."

positive COVID-19 test with symptoms; positive COVID-19 test with symptoms, tested for COVID (PCR); night sweats; Soreness at injection site; slight temp 99.5 degrees/her temperature was 101 degrees Fahrenheit/it was 102.5 degrees Fahrenheit/99 degrees Fahrenheit and then 98 degrees Fahrenheit; Tiredness she related to giving blood; This is a spontaneous report from a contactable nurse (patient). A 54-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL0140) via intramuscular on 19Dec2020 15:45 on left deltoid at a single dose for prevention as frontline health worker at hospital (COVID-19 immunisation). The patient donated blood on 18th and no antibodies were present then. The patient was a former smoker and quit 2 or 3 years

ago. Patient diagnosed Osteoporosis in 2015, benign heart arrhythmia in 2005. The patient took 70 mg alendronate sodium (FOSAMAX) once weekly and just a regular OTC daily multivitamin. Caller reported she was having the covid vaccine on 19Dec2020 and began having fever, night sweats, loss of taste and smell and then tested positive for covid. The patient received the Pfizer COVID 19 vaccine through work on 19Dec2020. She received it at 3:45 pm and should have taken temperature before, but she was afebrile the day before because she donated blood. At 7pm, she had slight temp 99.5 degrees Fahrenheit and by 10:30, her temperature was 101 degrees Fahrenheit and she still felt fine. She was surprised that it was that. She woke up at 2:30 am on 20Dec2020 and took her temperature and it was 102.5 degrees Fahrenheit. She took 2 Tylenol and went back to bed and felt fine. By morning it was 99 degrees Fahrenheit and then 98 degrees Fahrenheit a little later. She has been afebrile since then. She was a little tired because she gave blood and though it was related. She does not know if it was a side effect or not. It was not significant tiredness and was just not having energy in the evening of 19Dec2020. She also had soreness at injection site that night after 22:00 and the next day. It did not bother her until she woke up in the middle of night, and she noticed her left arm was sore. She received the vaccine at 3:45pm and started with low grade fever at 6:30 pm, earlier stated at 7:00 pm. There was no prescriber. She tested for COVID (PCR) on Saturday, 26Dec2020 at 14:50and it came back positive 28Dec2020 18:45. At 10pm on 19Dec2020, her temperature was 101 degrees Fahrenheit. If she had not been monitoring her temperature, she would not have known. She has been Afebrile since morning of 20Dec2020. Tiredness she related to giving blood and the holidays. She was a little stressed about the holidays and running around. It was very mild. Soreness at injection site was during the night after 10pm when she went to bed. On Wednesday, 23Dec2020, she woke up congested, sniffly, sneezy, with a runny nose. This persisted through Wednesday night. Her sense of taste was off. She had no problem with that on Tuesday. She had some horrible smell at work she recalled, so she knew her sense of smell was fine. On Thursday, 24Dec2020, she had no sense of taste or smell. She could not smell a pine candle. She was congested on Thursday and called employee health on 24Dec2020. This both improved and persisted. She is still congested but it has improved. She has never had a complete loss of sense of taste or smell before. Mild cough started yesterday morning. On the night of 20Dec2020, and 21Dec2020, she developed night sweats. She had not had any night sweats before this since menopause and she woke up really wet. The patient was not hospitalized and not admitted to an Intensive Care Unit. NO ER or physician's office required. She did not know if she was exposed on the day of the vaccine or if a couple of days later if the fever is from the vaccine. She stated what are the chances she goes 10 months and is super careful and then gets the vaccine and test positive. The patient did not display clinical signs at rest indicative of sever systemic illness. The patient did not require supplemental oxygen nor receive mechanical ventilation. No Multiorgan failure. The patient did not receive any additional therapies for COVID- 19. No initiation of new medication or other treatment or procedure. Not any preexisting diseases worsen during the SARS-CoV2 infection. She would like to know if there is a chance of false positive for this. It would just be her luck to be 10 months and not getting it. She has not gone anywhere without her N95 and then gets the vaccine and gets COVD. She wears mask and face shield at work always. She also wanted to know if she should get the second dose. The outcome of the event slight temperature was recovered on 20Dec2020 and the other event was recovering.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded.

tested positive for Covid two days after getting vaccine; tested positive for Covid two days after getting vaccine/nasal swab/ NP PCR and result was positive; This is a spontaneous report from a contactable physician. A 39-years-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiration date not reported), intramuscular on the left arm on 24Dec2020 at 08:30 at a single dose for Covid-19 immunization. There were no medical history and no concomitant medications. The patient has no known allergies to medications, food, or other products. On 25Dec2020 at 09:00 am, also reported as 26Dec2020, the patient was tested positive for Covid two days after getting vaccine. He was wondering if he should get the booster dose in 3 weeks or not since he will have natural immunity. The patient did not receive any treatment for the events. The patient had a nasal swab/ NP PCR and result was positive on 26Dec2020. The outcome of the events was not recovering. The events were assessed as non-serious. Information on the lot/batch number has been requested.; Sender's Comments: No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the COVID-19 PCR test positive represents the pre-existing infection prior to vaccine use. Further information like confirmative COVID 19 nucleic acid/ PCR test together with any associated symptoms are needed for full medical assessment.

positive COVID-19 test with symptoms; positive COVID-19 test with symptoms; This is a spontaneous report from a contactable unspecified HCP reporting for herself. This 61-year-old female patient received on 22Dec2020 BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) at single dose for COVID-19 vaccination. Medical history and concomitant medications were not reported. On 24Dec2020, the patient had a bad reaction, coughing, headache, no taste, tiredness and body aches. The patient thought originally, she was having a reaction to the vaccine, and took some ibuprofen (ADVIL). The patient was still congested and was sent for testing. She was tested positive on 28Dec2020. The test was a nasal swab. Outcome was unknown. The patient was wondering if this was part of the side of effect of the vaccine. Information on the batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available.

got the COVID-19 vaccine last week and six days later tested positive for COVID-19; got the COVID-19 vaccine last week and six days later tested positive for COVID-19; This is a spontaneous report from a contactable pharmacist. A patient of unspecified age and gender received bnt162b2 (BNT162B2 also reported as PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiry date were not reported), via an unspecified route of administration on unspecified date in Dec2020 at single dose, for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient got the covid-19 vaccine last week and six days later (Dec2020) tested positive for Covid-19. The outcome of event was unknown. Information about Lot/Batch number has been requested.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available.

anaphylaxis; ALOC/decreased level of consciousness; This is a spontaneous report from a contactable Pharmacist (patient). a 40-year-old female patient (no pregnant) received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EL0140) via intramuscular at Left arm on 23Dec2020 at single dose for COVID-19 immunization. The patient's medical history included known allergies to egg, seafood, azithromycin, orange and seasonal allergies. The concomitant was reported as cetirizine hydrochloride (ALLERTEC) and PRN 1371. The patient with no known past medical history brought in by CODE Team to RUH ED with concern for ALOC after getting the COVID vaccination 30-40 minutes PTA. Patient was a nurse and experienced decreased level of consciousness following her COVID vaccination. Patient reports h/o anaphylaxis. She was given epinephrine PTA. Denies SOB, oral swelling, CP. Blood glucose (BGL) within normal limits. Patient denies any other complaints or symptoms at this time. Adverse event start date: 23Dec2020. Treatment was unknown for decreased level of consciousness. The outcome of the events was recovered in Dec2020.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of anaphylaxis /decreased level of consciousness cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The underlying predisposing condition of allergies to multiple materials may put the patient at high risk of anaphylactic reactions. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"caller couldn't hear properly; got the Covid vaccine last 18Dec2020/her second dose of COVID-19 Vaccine was scheduled on 06Jan2021; Caller got the Covid vaccine last 18Dec2020 and was tested positive, 29Dec2020; Caller got the Covid vaccine last 18Dec2020 and was tested positive, 29Dec2020; Nausea; Headache; Body aches; fatigue; Cold sweat; This is a spontaneous report from a contactable other health professional. A 51-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number reported as either EK5730, ER5730, or EX5730), via an unspecified route of administration on 18Dec2020 16:00 at single dose at left deltoid for COVID-19 immunisation. Medical history and concomitant medications were none. The patient previously had shingles shot in Sep2020, previous shingles shot either three months or six months prior to the one in Sep2020 (2020), both for immunization, and severe myalgia and fever that lasted for two days after the second shingles shot (adverse events followed prior vaccinations). It was reported that did a callback as caller couldn't hear properly. Caller got the Covid vaccine last 18Dec2020 and was tested positive, 29Dec2020. Want to know if it's safe for her to get the second dose. The patient received Pfizer COVID-19 Vaccine on 18Dec2020 at 16:00. Patient had a couple days worth of symptoms. Now patient had COVID. Patient believed most likely got COVID from her son who was home from college. She was in between dosages of COVID-19 Vaccine. Looked like from research her quarantine would be done on 05Jan2021 and her second dose of COVID-19 Vaccine was scheduled on 06Jan2021. Everything she had read stated if her symptoms were gone to go ahead and get the second COVID-19 Vaccine. Patient wanted to know if Pfizer was doing any studies regarding people who test positive for COVID after receiving the COVID-19 Vaccine. Not sure if Pfizer would be interested in doing antibody studies. Declined obtained COVID-19 Vaccine through work Clarified caller's days worth of symptoms as: Headache the same evening as

vaccination. Body Aches: began overnight on 18Dec2020. Fatigue that lasted all week, began overnight on 18Dec2020. Cold sweats: Lasted two days and began overnight on 18Dec2020. Nausea: began on 21Dec2020, not sure if it was related to COVID-19 Vaccine or not. The reporter considered the events weren't serious, but felt like she was having an immunological response. Diagnosed with COVID Seriousness: As of now, not serious. Is having a recurrence of all of those same symptoms as the COVID-19 Vaccine and then some. Lot number provided from patient card. Stated she was unable read it accurately. would take picture in case Pfizer wanted it. Stated lot number was either EK5730, ER5730, or EX5730. A sample of the product was not available to be returned. Vaccination facility type was Hospital, not administered at military site. No additional vaccines administered on same date of Pfizer suspect. No adverse events required a visit to. No prior vaccinations received within 4 weeks. The outcome of the event ""Cold sweat"" was recovered on 20Dec2020. The outcome of the other events was unknown. The reported considered the events Headache, Body aches, fatigue, Cold sweat, Nausea were related to the suspect drugs. Information on the lot/batch number has been requested.; Sender's Comments: The reported COVID test positive after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration."

had her shot of Covid vaccine last (22Dec2020) 7 days and was tested positive on Dec2020; had her shot of Covid vaccine last (22Dec2020) 7 days and was tested positive on Dec2020; This is a spontaneous report from a contactable consumer (patient). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 22Dec2020 at a single dose as Covid vaccine. Medical history and concomitant medications were not reported. It was reported that the patient had her shot of Covid vaccine last (22Dec2020) 7 days and was tested positive on Dec2020. She wanted to know if this was normal to get false positive results after getting the vaccine. The outcome of the events was unknown. Information on the lot/batch number has been requested.

Positive for Covid after receiving the vaccine; Positive for Covid after receiving the vaccine; This is a spontaneous report from a Pfizer Sponsored Program. This consumer reported similar event for two patients. This is the 2nd of 2 reports. A female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiration date not reported), via an unspecified route of administration on 22Dec2020 at a single dose for Covid-19 immunization. The patient medical history and concomitant medications were not reported. On an unspecified date, the patient was positive for Covid after receiving the vaccine. It was reported that patient was positive and they were all in the breakroom without a mask. The patient (person that is positive) got the vaccine and got worse, so co-workers are thinking that she (patient) had the virus before getting the vaccine and just didn't have any symptoms. Outcome of the events was unknown. Information on the batch/lot number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2020518090 same reporter/drug, similar event, different patient

Asymptotic positive rapid COVID test 12 days post vaccination. Close contact testing/Nasal Swab positive; Asymptotic positive rapid COVID test 12 days post vaccination. Close contact testing/Nasal Swab positive; This is a spontaneous report from a contactable Other HCP (patient). A 52-year-old

female (not pregnant) patient received first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK5730), intramuscular in arm left on 17Dec2020 13:15 at single dose for COVID-19 immunisation. Medical history included seasonal allergies, depression and Allergies: Sulfa. Prior to vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included sertraline hydrochloride (ZOLOFT), cefixime (FLEXERIL), fluticasone propionate, salmeterol xinafoate (ADVAIR), montelukast sodium (SINGULAIR), omeprazole (PRILOSEC). The patient previously took pethidine hydrochloride (DEMEROL) and experienced 'allergies: Demerol', codeine and experienced 'allergies: codeine'. The patient experienced asymptotic positive rapid COVID test 12 days post vaccination. Close contact testing on 29Dec2020. The patient underwent lab tests and procedures which included [{covid test type post vaccination= Nasal Swab, covid test date=29Dec2020, covid test result= Positive}]. Facility type vaccine was workplace clinic. No treatment received for the adverse event. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The outcome of the events was unknown.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded.

"I got the Pfizer vaccine, the first shot; I tested positive for Covid; I got the Pfizer vaccine, the first shot; I tested positive for Covid; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899), via an unspecified route of administration on 18Dec2020 at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. Consumer stated, ""I had a question, I got the Pfizer vaccine, the first shot on the 18Dec but I tested positive for Covid on the 27Dec, so, my question is this and I asked my healthcare institution and they still haven't got back to me, so I just wanted to call you guys, what do I do about the second dose because I am scheduled to get the second dose net week?"" The outcome of event was unknown."

she received the COVID Vaccine on the evening of Christmas, and then she tested positive for COVID on Sunday; she received the COVID Vaccine on the evening of Christmas, and then she tested positive for COVID on Sunday; This is a spontaneous report from a contactable consumer, the patient. A 48-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE); in the left arm on 25Dec2020 as a single dose, for COVID-19 immunization. The patient had no known medical history. There were no concomitant medications. Caller confirmed the product was not specifically prescribed to her, but she received it via an options at her company and had received no other vaccines on the same day as the COVID vaccine. The patient received the COVID Vaccine on the evening of Christmas 25Dec2020, and then she tested positive for COVID on Sunday, 27Dec2020. The patient had a positive SARS-CoV-2 test on 27Dec2020. The clinical outcome of the event Drug ineffective and COVID-19 was unknown. Information regarding lot number has been requested.

tested positive for COVID; tested positive for COVID; This is a spontaneous report from a contactable consumer (patient). The consumer reported for self and husband. This is the first of two reports, and concerns the reporter (patient). A patient of an unspecified age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) (lot number EJ1685/expiration date: 31Mar2021), via an unspecified route of administration, on 19Dec2020, as a single dose for COVID-19 immunization. Relevant medical history and concomitant medication were not provided. On an

unspecified date in Dec2020, the patient tested positive for COVID. The outcome of the event tested positive for COVID was unknown.

tested positive for COVID; tested positive for COVID; Flu; This is a spontaneous report from a contactable consumer. The consumer reported for self and husband. This is the second of two reports and concerns the reporter's husband. A male patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) (lot number EH9899/expiration date: not provided), via an unspecified route of administration, on 18Dec2020, as a single dose for COVID-19 immunization. Relevant medical history and concomitant medication were not provided. On an unspecified date in Dec2020, the patient experienced the flu after receiving the vaccine. On an unspecified date in Dec2020, the flu symptoms went away and the patient tested positive for COVID. The outcome of the event flu was recovered in Dec2020 and the outcome of tested positive for COVID was unknown.

Caller received COVID vaccine on the 18th then tested positive on the 24th; Caller received COVID vaccine on the 18th then tested positive on the 24th; This is a spontaneous report from a contactable healthcare professional. A female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date not reported), via an unspecified route of administration on 18Dec2020 at single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. It was reported that the patient received COVID 'vaccine on the 18th then tested positive on the 24th'. The reporter mentioned that a friend who works for Pfizer told her to call and report. Clinical outcome of the events was unknown. Information on batch/lot number was requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the short duration of 6 days since the vaccine first dose is given.

Was diagnosed with the COVID-19 virus after receiving the COVID-19 Vaccine on 18Dec2020; Was diagnosed with the COVID-19 virus after receiving the COVID-19 Vaccine on 18Dec2020; This is a spontaneous report from a contactable Other Health Professional (patient) from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A 38 years old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 18Dec2020 at single dose in Deltoid Right for COVID-19 immunization. Medical history and concomitant medications were none. After receiving the COVID-19 Vaccine, the patient was diagnosed with the COVID-19 virus on 28Dec2020. she saw Dr. at the clinic where she works to seek treatment. She stated she is supposed to receive the 2nd dose of the COVID-19 Vaccine on 08Jan2021. She asked now that she is COVID-19 positive, should she get the 2nd COVID-19 Vaccine dose. Reported she had a rapid nasal swab COVID-19 test performed. Reported she is taking Hydroxychloroquine and a bunch of vitamins for treating COVID-19. Caller stated she did not have the COVID-19 Vaccine card with her to provide the Lot Number. The patient underwent lab tests and procedures, which included COVID-19 rapid POC test with positive result. Outcome of event was unknown. Information on the Batch/Lot number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect

BNT162B2 cannot be excluded for the reported COVID-19 based on the known safety profile. However the short duration of 10 days since the vaccine first dose is given it is unlikely patient would have fully developed immunity.

"Lost sense of taste; Lost sense of smell; Whole body is sore; Rapid test came back positive for COVID; Rapid test came back positive for COVID; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs) via a contactable consumer (patient). A 21-year-old male patient received his first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number: EK5730, expiration date: 31Mar2021), via intramuscular on 29Dec2020 07:40 at 0.3 mL, single dose on his left deltoid for covid-19 immunization. Medical history included allergic to wasp stings. There were no concomitant medications. The patient had no additional vaccines administrated on the same date and no prior vaccinations were received within 4 weeks. Caller on the line calling about the COVID Vaccine he received on 29Dec2020. The day after receiving it he woke up and had a loss of sense of smell on 30Dec2020 12:00. That afternoon he went to get tested and the rapid test came back positive for COIVD on 30Dec2020. He was now waiting on the other one, clarified to be the PCR test, the lab test. The next day he also lost his sense of taste on 31Dec2020 11:00 and his whole body feels sore on 30Dec2020 around noon. Transfer agent stated the caller needs to be transferred to Medical Information as he was scheduled to get the next shot on 19Jan2021 and he was calling to ask if he should proceed with that. It was reported that the patient works in a hospital (not an HCP). No emergency room was visited and no physician office was visited. The outcome of the event ""rapid test came back positive for covid"" was unknown, the outcome of the other events ""lost sense of smell"", ""lost sense of taste"", ""whole body is sore"" were not recovered."

Went to the ER on the 31st, my face swelled and chest was covered in hives. Lips swelled. I would get nauseated and I felt like there was acid in my stomach. I also had a headache. I have been taking Zyrtec, Benadryl as needed.

The day after the vaccine I had fatigue and body aches. Then on 12-23 fevers of 101.4, chills, body aches, diarrhea, vomiting, productive cough, and profuse sweating. Jan 1st I was in the shower and was dizzy with a headache. Loss of consciousness almost happened and that is when i got out of the shower and laid down. Went to the ED and was diagnosed with bilateral pneumonia

I did let the nurse know right after I got the vaccine It did feel like a huge water balloon was sitting on my arm and very heavy at the site. I went to the waiting area and the last 5 minutes and I started feeling weird, kind of getting dizzy and my heart started racing really fast. Am I can tell I was getting really hot and my face was flushed and my heart was racing and my hands started shaking, trembling almost like I couldn't control it. I've never experienced something like this. The part that really scared me was my heart racing like it was going to come out of my chest. They called a code, put me in a wheel chair and took me to the ER (where I work). They took my blood pressure which was really high, they did EKG, blood work and urine test. They kept me there for about five hours, while watching me. And the last weird thing that happened at one point I felt like liquid was running thru my body and my feet were really cold for several hours, It felt like someone was pouring liquid over me. I kept asking the nurse if this is normal and no one knew what to tell me. After everything started slowing back down and it had

been a couple hours and the next day i felt like I had a slight head ache and felt out of it, kind of like I had a hangover and of course my arm was really sore. The Doctor in the ER did advise me not to get the second dose as it will be worse than the first one.

LEFT SIDED CHEST PAIN, SHORTNESS OF BREATH, FELT WARM AND FLUSHED

I got my shot on the 19th and that evening it was like a light switch and I was so tired I went to sleep at 730pm I had severe chills and fever and had to go to bed. The next day I still wasn't feeling well and I was called in to get covid tested and I went to the ER on the 21st and took a rapid covid test that was positive. I was stable and had good oxygenation and was discharged. I have fever nausea vomiting I also had problems with O2 stat i was in the 80s and realized I was having respiratory failure so I was admitted on the 27th and I've been here ever since. I had kinetic storm and infusions my O2 stats were bad and I was sent to the covid unit and put on high flow oxygen and negative for a PE, I'm still on the covid unit but I feel much better today

Patient was vaccinated Dec 30, 2020. Prime dose of Moderna vaccine. Observed for full 15 minutes post-injection. No complaints when asked during observation. Released. Subsequently, vaccine clinic staff learned from the patient's supervisor that on Jan 4, 2021 that the patient had expired on Jan 2, 2021. By report from the supervisor, the patient was found dead at his home. The patient's primary care provider was unaware of his death when contacted by this reporter today (Jan 6, 2021). Electronic Medical Record without any information since the vaccination.

5 MIN POST ADMINISTRATION: SOB, DIZZINESS, CHANGE IN VISION - GAVE BENADRYL 25 MG AND 1 VIAL ALBUTEROL VIA NEB 1 HOUR POST ADMINISTRATION: SWOLLEN LIPS, RASH ON CHEST AND ARMS - GAVE 1 DOSE OF EPI PEN AND IM SOLU-MEDROL, CALLED EMS, LEFT TO GO TO ER BP, HR, OXYGEN STABLE THROUGHOUT

after 20-30 minutes my throat started to get tight, I could not swallow properly, I felt dizzy & my heart was beating fast.

anaphylaxis, dyspnea

"Client received vaccine at approximately 3:50pm, waited in observational area x30min. Left with husband, stated that she got a few miles down the road and starting experiencing tightness in her chest and flushing. She took 50 mg of Benadryl, 30mg of prednisone and two puffs on her inhaler. She returned to the clinic, upon assessment from nursing she looked extremely flushed and anxious, she stated that she still felt tightness and that she had a history of anaphylaxis once before and had used an epi pen in the past. She had an epi pen with her and questioned whether or not she should give it to herself. BP was 190/68, pulse was normal, respirations normal, she continued to experience tightness and ""not able to catch my breath"", encouraged to use epi pen. She administered epi pen to right thigh at approximately 4:45PM, 911 called. Within a few minutes, she stated she was feeling better, less tightness in the chest, flushing was subsiding. BP at 190/70 at 4:52. EMS on scene at 5:03pm. Vitals normal , EKG normal. Client decided not to transport with EMS."

resident expired 1/1/2021

I started having intermittent chest pain moderate in intensity and palpitations.

Resident expired 1/3/21

Migraines, right side of face swollen, nausea, tingling

Patient tolerated the vaccine well with no apparent side effects. Ten days later awoke 12:30 AM with severe chest and upper back pain, presented to Med Center where he was found to have an Acute Coronary Syndrome. Transferred to Medical Center where he underwent successful PCI with two drug eluting stents for a 99% mid-LAD stenosis

Shortness of breath, fever, fatigue

At around 11:40am resident was observed to be unresponsive. resident noted with pulse and respiration. Not in any distress. lung sounds clear. Vital Signs BP162/82 P86 R18 T97.1 O2 Sat 96%, fingerstick is 133mg/dl .Resident received COVID 19 vaccine at 11:25am. O2 via 2l NC initiated. Nurse Stat call, 911 initiated, MD at Bedside. Resident awake and responsive. EMT responded and resident left with EMT to be transferred to hospital, remains awake and not in any respiratory distress.

Adult failure to thrive; Chronic hypoxemic respiratory failure; Generalized weakness

Patient did not display any obvious signs or symptoms; the vaccination was administered at approximately 10:00 AM and the patient continued throughout her day without any complaints or signs of adverse reaction. Patient was helped to bed by the nursing assistant estimated at around 9:00 PM. The facility received notification from the lab around 11:00 PM that the patient's COVID-19 specimen collection from Sunday, 1/3/21, detected COVID-19. When the nursing staff went to the room to check on the resident and prepare her to move to a COVID-19 care area the patient was found unresponsive, no movement, no chest rises, noted regurgitated small amount of food to mouth left side, lying on left side. Pupils non reactive.

coughing up blood, significant hemoptysis -- > cardiac arrest. started day after vaccine but likely related to ongoing progression of lung cancer

PATIENT REPORTING ITCHING AT 30 MINUTES POST INJECTION. AT 1.5 HOURS POST INJECTION PATIENT REPORTED ITCHY THROAT AND NUMBESS OF LEFT SIDE OF FACE. AT THAT TIME ADVISED TO GO TO EMERGENCY ROOM. NEXT DAY WHEN I FOLLOWED UP WITH PATIENT, SHE REPORTED HER AIRWAY STARTED TO CLOSE AND SHE RECEIVED EPINEPHRINE, AFTER 5 HOURS HER STARTED TO CLOSE AGAIN AND RECEIVED ANOTHER DOSE OF EPINEPHERINE, WAS RELEASED FROM HOSPITAL ROUGHLY 15-16 HOURS AFTER GOING TO ER.

At 10:12 am, Client c/o of sore throat, tightness in throat that relieve quickly, nausea, dry heaves, flushed, light headed and dizziness. Called for EMT. They arrive at 10:25 am and transported her to the

local hospital for observation. 01/06/21-Treatment in hospital blood draw, medications given Zofran, Decadron, Benadryl, and Pepcid, and IV fluids. Discharged home at 1244.

5 minutes after injection, my feet and palms itched and I was lightheaded but I tried to shake it off and it faded over the next 10 minutes. I did report it and stayed longer and was ok. Then i went straight home and layed down because i did not sleep well night before (was on call) i awoke 1 hour post injection dry heaving, very nauseated, mild headache, achy, itchy over different parts of my body and weak. Sat up and my face was getting itchier, lips started to swell, tongue started to swell and itch, throat felt like someone was strangling me, had trouble swallowing and trouble breathing. took 2 benadryls immediately and went out into cold air, thought about calling 911 but got better in 10-15 minutes. never have had a reaction like this in my life. have had hives though in the past. If I would have had an epi pen I would have used it (never have had an epi pen) I was frightened but the benadryl worked and I slept due to the benadryl for 5 hours, when I woke up the benadryl wore off and it started again. took more benadryl, and it improved. before bedtime, the benadryl wore off and I had a hard time swallowing my night time meds like my throat was swollen. Took 2 more benadryls, today I am weak and nauseated and ate very little and feel like my face is still red and itchy. I told my sister and she said she is allergic to PEG which i later noted was in the vaccine. i am very disappointed that I had this reaction- I have desparately wanted this vaccine as a medical worker with a lot of covid patients- I onlu hopr this one shot will protect me enough because it is clear to me that i cannot take this vaccine again.

Severe Hypotension, Redness, Warmth and sensitivity all over skin surfaces, lack of responsiveness, low oxygen saturation.

At approximately, 1855, I was alerted by caregiver, resident was not responding. Per caregiver, she was doing her rounds and found resident in bed, unresponsive, mouth open, observed gurgling noises and tongue hanging out of mouth. This primary caregiver observed resident at baseline and ambulating after dinner at approximately, 1800 less than an hour prior to incident. This PCG called 911 for EMS and gave report of incident. Resident was taken to Medical Center Emergency Department. At ER, CT scan and X-ray was performed. Per report from ER RN, CT scan and x-ray revealed an intracranial aneurysm and fluid in the lungs. Per RN, resident was still unresponsive and was admitted to Medical Center for observation and comfort measures. This primary caregiver reported to RN, resident recently received the first dose of COVID-19 vaccine on 1/2/21. Primary caregiver received a call from Castle RN at 0700, resident expired at 0615.

Three to four hours after vaccine had bruising, major loss of range of motion, severe sharp pain, elevated temp and chills due to reaction of injection site Treatment given 24 hrs later- strong antibiotics, anti inflammatory, exercise, and three days out of work Due to loss of function of left arm due to inflammation

Severe shortness of breath, administered inhaler, hydralazine with no improvement. Dr. notified. Sent to ER

COUGH, RIGORS, NAUSEA, VOMITING, URINARY URGENCY/FREQUENCY, DYSURIA - FOUND TO HAVE LLL PNEUMONIA, CONCERNING FOR POSSIBLE CYRPTOGENIC ORGANIZING PNEUMONIA

PATIENT DEVELOPED PROGRESSIVE NEW DYSPNEA, DIFFERENT FROM HER BASELINE. SHE HAS BEEN HOSPITALIZED TWICE FOR PERSISTENT DYSPNEA AND CENTRALIZED CHEST PAIN, WHICH HAS OTHERWISE HAD NEGATIVE WORK UP.

103.5 Fever that wouldn?t come down with Tylenol, chills, sharp headache, tachycardia, site pain, dizziness, body aches, nausea All symptoms started 11 hours after first dose of vaccine (3AM), went to hospital 15 hours after symptoms started and was treated for 9 hours until all symptoms abruptly stopped

positive COVID test; positive COVID test; fever; chills; sore throat; cough; nasal congestion; runny nose; little diarrhea; tiny bit of shortness of breath; Caller received the COVID-19 vaccine on 17Dec2020 and is scheduled to take the second dose on 5Jan2021.; Caller received the COVID-19 vaccine on 17Dec2020 and is scheduled to take the second dose on 5Jan2021.; sore arm; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect via a contactable physician (patient himself). A 56-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number: EH9899), via intramuscular route on 17Dec2020 at single dose (dose 1, left deltoid) for COVID-19 immunization. The patient medical history included non-smoker. Concomitant medications were reported as none. The patient was scheduled to take the second dose on 05Jan2021, also reported as 08Jan2021. The patient experienced sore arm for 24 hours afterwards on Dec2020. Patient experienced mild COVID symptoms such as fever, chills, sore throat, cough, nasal congestion, runny nose, little diarrhea, and tiny bit of shortness of breath on 24Dec2020, but stated he was better now. The patient was positive in the COVID test on 28Dec2020. He wanted to know if it was normal to get COVID after getting the vaccine and if he should get the booster shot if he gets better. He commented that testing positive for COVID was medically concerning. The patient did not require supplemental oxygen (including high flow ECMO) or receive a mechanical ventilation. Treatment included over the counter medication. No additional testing was done. The patient was not hospitalized. Outcome of the event sore arm was unknown; cough was not recovered; fever, chills, sore throat, nasal congestion, runny nose, little diarrhea, tiny bit of shortness of breath was recovering. No follow-up attempts are needed. Information about lot/batch number was already obtained. No further information is expected.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 virus test positive cannot be totally excluded. The case will be reassessed if additional information becomes available.

2days after my 1st Covid vaccine I broke out into a rash with hives requiring me to go to the ER; 2days after my 1st Covid vaccine I broke out into a rash with hives requiring me to go to the ER; This is a spontaneous report from a contactable nurse (patient). A 58-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number: EH9899, expiry date was not provided) solution for injection, via an unspecified route of administration on left arm on 17Dec2020 08:00 at a single dose for Covid-19 immunization. Medical history included eczema, chronic kidney disease, thyroid disease. Patient had known allergies. The patient was not pregnant. Concomitant medications included apixaban (ELIQUIS), allopurinol (ALLOPURINOL), levothyroxine (LEVOTHYROXINE), iron (IRON), magnesium (MAGNESIUM). The patient reported that 2 days after her 1st Covid vaccine,

she broke out into a rash with hives requiring her to go to the ER on 19Dec2020 12:00. She also visited a physician. She was treated with steroids, Atarax, and Epi shot. The events were reported as non-serious. Outcome of the events was not recovered. No follow-up activities are needed. No further information is expected.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of urticaria and rash due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

tested positive within 2-4 days of the vaccine; tested positive within 2-4 days of the vaccine; This is a spontaneous report from a contactable nurse. This nurse reported similar events for two patients. This is the first of 2 reports. A patient of unspecified age and gender received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The nurse had questions about patients that received the first dose of the COVID 19 vaccine. One patient tested positive within 2-4 days of the vaccine and this patient had a known exposure to a COVID positive person. The nurse wanted to know if this patient should receive the second dose. The outcome of the events was unknown. Information about batch/lot number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of SARS-CoV-2 test positive and LOE due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2020520414 Same reporter, drug, and events; different patients

Tested positive for COVID; Tested positive for COVID; This is a spontaneous report from a contactable healthcare professional (patient). A 40-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), via an unspecified route of administration on 18Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the first dose of the vaccine on 18Dec2020, and was tested positive for COVID yesterday, 29Dec2020. States that she knows she only has had the first dose and states her exposure level was high, states that she cannot believe she made it this far before testing positive. Second dose scheduled for 08Jan2021, wanting to know if she should get the second

dose since she was now positive. The outcome of the events was unknown.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 virus test positive cannot be totally excluded. The case will be reassessed if additional information becomes available.

positive Covid results with symptoms; positive Covid results with symptoms; This is a spontaneous report from a contactable nurse (patient). A 56-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an unspecified route of administration on 20Dec2020 at single dose for COVID-19 immunization. Medical history included hypertension (diagnosed 3-4 years ago), hyperlipemia (diagnosed 3-4 years ago), supraventricular tachycardia since 2017, and asthma; all ongoing. Family history included hypertension. She has no history of adverse reactions or allergies to any vaccines received previously. The patient's concomitant medications were not reported. The patient explains that she got the COVID-19 vaccine on 20Dec2020. Afterward she had some coughing, so she went for a rapid test and found she tested positive after the vaccine. The patient was wondering if this has been reported previously, where someone tested positive after getting the vaccine. She has never tested positive before. She got the results on 28Dec2020 that she was positive. She was now in a hotel quarantining. She was looking trying to find information on this occurring. Since she was in the hotel, she would prefer to use email as communication for follow-up. The patient noticed the cough on 25Dec2020. She works nights so she stayed home on the 26Dec2020. Then on 27Dec2020 she had the test done and on 28Dec2020 the results were given to her and she was positive. Her second dose was due on 10Jan2020 and it was before the 14 days of quarantine will be up. She was checking to see is there anywhere else she can get the second dose. The patient explains that she has been researching and she wanted to get it because she was with elderly family members. She wanted to know how she was tested positive, what test was used as she had the rapid test. There were no treatments for the events. The caller patient was also experiencing a cough, sore throat, and nasal congestion. There was no shortness or anything else going on at this point. The outcome of the events was not recovered. Information on the lot/batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 virus test positive cannot be totally excluded. The case will be reassessed if additional information becomes available.

positive person for Covid after receiving the Covid vaccine; positive person for Covid after receiving the Covid vaccine; This is a spontaneous report from a contactable nurse. A patient of unspecified age and gender received bnt162b2 (BNT162B2 also reported as Pfizer-BioNTech COVID-19 Vaccine, lot/batch number and expiry date were unknown), via an unspecified route of administration on unknown date at single dose, for Covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient was a positive person for Covid after receiving the Covid vaccine on an unspecified date. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the

development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available.

"Her measured blood pressure at 7:35 am was 180/80 but came down to 146/62 at 9:37 am; arms had some pain; chills; headache; a stiff neck pain at the back of her neck; a stiff neck pain at the back of her neck; a trembling pain; This is a spontaneous report from a contactable consumer. This is the 1st of two reports. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 29Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient stated on Dec2020, ""she reported that she herself felt fine but her arms had some pain. She was having chills, a headache, a stiff neck pain at the back of her neck, and a trembling pain. Her measured blood pressure at 7:35 am was 180/80 but came down to 146/62 at 9:37 am. Her pulse was at 62 bpm, Caller is asking for recommendations"". The outcome of ""her measured blood pressure at 7:35 am was 180/80 but came down to 146/62 at 9:37 am"" was recovering and other events was unknown. Information about Lot/batch no has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2020520380 same reporter/drug, different patient/event"

"extremely lightheaded; like he was about to fall down; This is a spontaneous report from a contactable physician. This physician reported similar events for 2 patients. This is the 1st of 2 reports. An 89-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number; EL0140), intramuscular on the right arm on 30Dec2020 10:10 at single dose for vaccination. Medical history included covid-19 on Jul2020 and had it fairly severe and almost died and he mentions he was overweight. There were no concomitant medications. The patient previously took flu shot (INFLUENZA VACCINE), a couple of months ago. He mentions he was in the military so he had a lots of shots in his life but he has never had a reaction like this. The patient stated that on 30Dec2020 10:30, ""he became extremely lightheaded, like he was about to fall down. He sat down and is currently sitting down. This lightheadedness started about 20 minutes after the injection. When probed for the outcome, the caller explains it might be improving a little. The lightheadedness is not still not gone, but it has not worsened. When probed for seriousness criteria, the caller explains he is just resting and sitting. He would say its not serious but it could be medically significant. He states he isn't sure if this is something that happens to just people who have had COVID before. He states none of his friends or relatives have this type of reaction. He lives in a retirement home and everybody is getting the injection. This is the second day of injections. He doesn't know if anybody had a reaction to the COVID-19 vaccine here"". The outcome of the events were recovering.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of lightheadedness and pre-syncope due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics

Committees and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2020520862 same reporter/drug, similar event, different patient."

Vomiting/threw up; Headache; muscles got rigid and tight in her neck; muscles got rigid and tight in her neck; sick; She doesn't know if she had the flu bug or not; She also had very high blood pressure. It was through the roof/Blood pressure was high and she was concerned she would have a stroke; Muscle soreness; Arm soreness; This is a spontaneous report from a contactable healthcare professional (physical therapist). A 57-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date not reported), intramuscular on the left arm on 21Dec2020 08:15 at a single dose for COVID-19 immunisation; and sumatriptan from 25Dec2020 to an unspecified date at unknown dose and frequency (standard unknown dose/ She only gets 9 pills a month) for migraine. Medical history included ongoing migraine, obesity (She would say she was kind of obese), coeliac disease (She had Celiac disease and cannot eat gluten which was diagnosed since she was 4), chronic back pain (this was diagnosed a couple of years before she took the COVID vaccine), spinal stenosis (this was diagnosed a couple of years before she took the COVID vaccine), and pain (she took hydrocodone for pain but did not take any that day). Concomitant medication included hydrocodone for pain. Prior Vaccinations (within 4 weeks) and events following prior vaccinations were none. The patient had the vaccine on 21Dec2020, and she got sick on Christmas day. She was vomiting at 14:00 and did not know if it was a side effect or not. She did have arm soreness muscle soreness at 15:00, that evening and the next day too. She normally gets a migraine once a month. She does not normally throw up with a headache though. The vomiting started when she threw up twice on 25Dec2020, then once on morning of 26Dec2020. She also had very high blood pressure. It was through the roof. She did not know if that was related to drug for migraine or vaccine. She also had the headache at 14:00 the whole time. She believed she threw up before she took Sumatriptan. The muscles got rigid and tight in her neck and she doesn't think she took it. She threw up and then she took it. She did not have a lot or expiration. There was no ER nor physician's office required. She would have it if her car was not buried in snow. Her blood pressure was high and she was concerned she would have a stroke. It was usually around 110/70 and was always very low usually. She did not know if it was accurate, but it was 165/124 at one point and she did know her pulse was accurate. She did not provide her pulse rate. She did not know if she was throwing up because her blood pressure was high and did not know if blood pressure was high because of Sumatriptan. She only gets 9 pills a month. She did not know if high blood pressure was one of the side effects. It was not a real safe medication to take once a day. She only took it once a month and only once that day. She had never thrown up with migraines before and was just concerned. She doesn't usually take her blood pressure and doesn't know if the Sumatriptan always makes it go up or not. She doesn't know if she had the flu bug or not. The action taken in response to the events for bnt162b2 was not applicable, while for sumatriptan was unknown. Clinical outcome of sickness and influenza was unknown, for headache was recovered on 27Dec2020, while for the other events was recovering. Information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the elevated BP and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case

will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

allergic reaction; This is a spontaneous report from a contactable other healthcare professional reported for herself. A 45-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EK 5730, expiry date unknown) via unspecified route of administration at left arm on 30Dec2020 08:30 at single dose for Covid-19 immunization in a hospital facility. The patient was not diagnosed with Covid-19 prior vaccination. Medical history was none. Concomitant medications was not reported. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 30Dec2020 at 08:45, the patient experienced allergic reaction which resulted to patient visiting doctor or other healthcare professional office/clinic and emergency room/department or urgent care visit. The patient received treatment of epinephrine, decadron and Benadryl due to the event. The patient was not Covid tested post vaccination. The outcome of the event allergic reaction was recovering at this time of the report. The reporter considered the event non-serious; did not results in death, was not life threatening, did not cause/prolong hospitalization, was not disabling/incapacitating, and no congenital anomaly/birth defect.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of event Allergic reaction cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

peripheral neuropathy type symptoms; tingling of the feet, legs, hands, arms; This is a spontaneous report from a contactable Other Health Professional (patient). A 34-year-old non-pregnant female patient received first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration at Left arm on 22Dec2020 10:00 at single dose for covid-19 immunization. The COVID-19 vaccine was administered at Hospital. Medical history included hypothyroidism. The patient had no known allergies. Concomitant medication included levothyroxine and multivitamin. No other vaccine in four weeks. The patient was not sure if this was related to the vaccine or not. The patient didn't know if anyone else was having peripheral neuropathy type symptoms such as tingling of the feet, legs, hands, arms. The symptoms started a few days ago. The patient did not even sure if it related to the vaccine. Adverse event start date was 27Dec2020. Covid was not tested post vaccination. The outcome of the events was not recovered. No treatment received for the events. Information on the lot/batch number has been requested.; Sender's Comments: The temporal relationship between the onset of the event and administration of the vaccine does not support a causal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern

identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

tested positive for covid; tested positive for covid; fever; headache; runny nose; nasal congestion; This is a spontaneous report from a contactable consumer (patient). A 34-year-old female patient received the first single dose of BNT162B2 (Solution for injection, lot number: EK5730, exp date: Mar2021), intramuscular (injected in left upper arm) on 20Dec2020 12:30 to 20Dec2020 12:30 at 0.3 mL for immunisation. The vaccine was administered in a hospital and not in a military facility. Medical history included birth control. The patient had no other history. NO ER or physician's office required Prior Vaccinations (within 4 weeks). Patient had no relevant family history. Concomitant medication include unspecified birth control.There was no previous immunization. Patient, who was a Respiratory therapist, got the covid vaccine on 20Dec2020 (Sunday). She first stated she doesn't have any side effects and just had a question. Patient had COVID Symptoms on 26Dec2020 21:00 which was minimal like a runny nose. She further reports that on 26Dec2020 she started to have nasal congestion. On 27Dec2020 the nasal congestion worsened, and she started having a headache. She then experienced a 102.6 fever on 28Dec2020 (Monday). She has since tested positive for Covid on 28Dec2020 11:30. Patient asked if it was ok that she received the 2nd dose after testing positive for covid. Investigation assessment was not performed. There was no prescriber. She received at work because she was a front line healthcare worker. The patient does not have SARS-CoV2 antibodies at diagnosis but never tested for antibodies. The patient was not in the hospital, nor was admitted in ICU. The patient did not display clinical signs at rest indicative of severe systemic illness. The patient did not require supplemental oxygen (including high flow or ECMO) or receive mechanical ventilation. No Multiorgan failure. The patient did not receive any additional therapies for COVID-19. The patient did not require the initiation of new medication or other treatment or procedure. PCR on 28Dec2020 (Saturday) Results: just detected. No units available. No reference ranges provided. Standard range was not detected. It was just detected or not detected ranges. No other test or diagnostic imaging performed. The patient had not been treated with immune modulating or immunosuppressing medications or received any other vaccines around the time of COVID-19 vaccination. No pre-existing diseases worsened during the SARS-CoV2 infection. The patient was recovering from event positive for covid and runny nose; nasal congestion was not recovered and outcome of the other events was unknown.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given.

"had side effects of ""tongue feels swollen and globus sensation in my throat.""; had side effects of ""tongue feels swollen and globus sensation in my throat.""; she did not have a lot of injection site pain, it very minimal.; bruise or ecchymosis at the injection site; bruise or ecchymosis at the injection site; This is a spontaneous report from a contactable physician (patient) via a Pfizer sponsored program Pfizer First Connect. A 37-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot EH9899) via intramuscular on 19Dec2020 09:00 on left deltoid at a single dose for COVID-19 prophylaxis. The patient medical history, family history and relevant tests were reported

as none. Current concomitant medications included multivitamin took 2 chewable gummies sporadically for years as supplementation therapy. The patient previously took Flu shots she got a sore arm. It was not bad. Tetanus gives her a sore arm, but that was all. Caller wanted to know what she should do for preparation to safely get second dose of Covid vaccine and how to fix what she was feeling right now, making sure it doesn't get worse, considering she is still having symptoms. Caller stated that she had side effects of tongue felt swollen and globus sensation in her throat. The transferring agent stated that he has a caller on the line that was calling about the Covid-19 Vaccine and reported that the patient got the shot on the 19Dec2020 and was inquiring about to proceed with her weird side effects. Caller had not told her physician about her symptoms yet. Caller clarified that she said a half an hour after the dose on 19Dec2020 09:30 she said that she had a Globus sensation or like a lump in her throat. Caller also reported that the back of her tongue felt swollen. Caller said that the Globus sensation was intermittent and it was not as prominent now as it was. Caller said that it was medically significant, but she has not sought medical treatment yet. Caller said that she still had a bruise or ecchymosis at the injection site. She said that the injection was high but reported that she did not have a lot of injection site pain, it very minimal. No emergency room or physician office required. The outcome of the event tongue felt swollen and globus sensation in her throat was recovering and the outcome of the event a bruise or ecchymosis at the injection site was not recovered and the outcome of the event minimal injection site pain was unknown.; Sender's Comments: There is a plausible chronological association between vaccine administration and onset of the events. Causality cannot be completely excluded."

"had a reaction of bells palsy with mild symptoms 5 minutes of receiving covid vaccine; facial numbness right sided ear discomfort, difficulty closing right eye, only right side numbness and weakness of her face. It has gotten a lot better; facial numbness right sided ear discomfort, difficulty closing right eye, only right side numbness and weakness of her face. It has gotten a lot better; facial numbness right sided ear discomfort, difficulty closing right eye, only right side numbness and weakness of her face. It has gotten a lot better; This is a spontaneous report from a contactable Other Health Professional reported that a 35-year-old female patient receives first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot/Batch Number and Expiration Date unknown) via an unspecified route of administration on 21Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications was not reported. The patient experienced a reaction of bells palsy with mild symptoms 5 minutes of receiving Covid vaccine. ""facial numbness right sided ear discomfort, difficulty closing right eye, only right side numbness and weakness of her face. It has gotten a lot better, patient was vaccinated 10 days ago on 21Dec2020. Patient was treated with 60mg of Prednisone for 5 days which was started today."" Question is regarding the 2nd dose of Covid vaccine, whether or not she should have it. The outcome of events was recovering. No follow-up attempts are possible; information about lot/batch number cannot be obtained. .; Sender's Comments: There is a positive chronological association between vaccine administration and onset of the events. Causality cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

now have a positive cov-19 test results; now have a positive cov-19 test results; This is a spontaneous report from a contactable nurse reporting for herself. A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date not reported) via an unspecified route of administration, on an unspecified date, single dose for COVID-19 immunization. Relevant medical history and concomitant medications were not reported. The patient took first round of cov-19 shot and due to take 2nd one Saturday but now have a positive cov-19 test result. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given.

Contracted covid 19 virus after receiving first dose of vaccine; Contracted covid 19 virus after receiving first dose of vaccine; This is a spontaneous report from a contactable nurse. A 46-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number Eh9899), intramuscular in left arm on 17Dec2020 18:00 at a single dose for covid-19 vaccination. Vaccine was administered in the hospital. There were no relevant medical history. The patient had no known allergies. Concomitant medication included levothyroxine sodium (SYNTHROID). On 27Dec2020 20:00, the patient contracted covid 19 virus after receiving first dose of vaccine. The outcome of the event was recovering. The patient did not received any treatment. The event resulted in a doctor or other healthcare professional office/clinic visit. The patient did not have COVID prior to vaccination. The patient was tested for COVID post vaccination. The patient had nasal swab on 31Dec2020 and had a positive result.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given.

tested positive following the first dose of vaccine; tested positive following the first dose of vaccine; This is a spontaneous report from a contactable healthcare professional. A female patient of an unspecified age received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine; lot/batch number and expiry date were unknown), via an unspecified route of administration on unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter stated that she has a patient who tested positive following the first dose of vaccine and inquiring as to second dose recommendations. The outcome of the event was unknown. Information about lot/batch number has been requested.; Sender's Comments: There is scant information at this point. Case will be reevaluated based on additional information during the follow-up

"sore arm; aches and pains for a couple of days; a little headache; I received results yesterday and I am positive; I received results yesterday and I am positive; This is a spontaneous report from a non-contactable physician (patient). A male patient of an unspecified age started to receive bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), lot number and expiry date was unknown, via an unspecified route of administration on 19Dec2020 at single dose for COVID-19 immunization. The patient's medical

history and concomitant medications were not reported. The patient received his first covid vaccine dose on 19Dec2020, and due to get his second dose on 09Jan2021. The problem is he tested for the covid virus on Wednesday 26Dec2020 (was negative). He was tested again on the 30Dec2020, because his wife and son had tested positive on the 26Dec2020, he received the results yesterday and he is positive. He asked if he should proceed with the 2nd dose, another test on the 30th and tested positive. He reports that, other than initial side effects from the vaccine administration, sore arm, aches and pains for a couple of days, never had fever, a little headache for a day or two, he feels fine. The outcome of the events ""a little headache"" was recovered on an unspecified date while outcome of the other events was unknown. No follow-up attempts are possible. Information about lot/batch number cannot be obtained. No further information is expected.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given."

tested positive with COVID; tested positive with COVID; This is a spontaneous report from a contactable nurse. A male patient (Age:22 Units: unspecified) received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were not reported), via an unspecified route of administration on 15Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient had the 1st dose last 15Dec2020 and tested positive with COVID on 25Dec2020. The outcome of the event was unknown. He will have the COVID result 04Jan2021 to check if he was still positive. Information on the Lot/Batch number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

developing a left facial droop; Bell's palsy; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A contactable physician reported that a female patient of an unspecified age received the first dose of bnt162b2 (COVID-19 Vaccine) via an unspecified route of administration on an unspecified date in Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The physician reported that the patient received the COVID-19 vaccine roughly two weeks ago (Dec2020) and is developing a left facial droop, they are concerned if that is a sign of facial Bell's palsy. It's left side and it's a facial droop. The physician was concerned if patient is developing Bell's palsy and they are wondering if she should get the second dose or not. The physician further stated that her patient got the vaccine like about 2 weeks ago and developed Bell's palsy three days after the administration of the vaccine (Dec2020) and of course she won't be able to get to see because we are all booked up until yesterday and that is like about a week ago, after the onset of Bell's palsy. Outcome of the event was unknown. Information about lot and batch has been requested.; Sender's Comments: The event is considered possibly related to the suspect product based on the assumed positive temporal association. The information available in

this report is limited and does not allow a medically meaningful assessment of the case. In particular the following relevant information is not available: patient's medical history and concomitant medications, exact vaccination date, event outcome. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

nurse got Covid after getting the vaccine; nurse got Covid after getting the vaccine; This is a spontaneous report from a contactable nurse. A patient of unspecified age and gender received BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine; lot/batch number and expiry date were unknown), via an unspecified route of administration on unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that a nurse got Covid after getting the vaccine. The reporter wanted to know if the chills were common. She wanted to know if it is okay to feel chills every now and then. She wanted to know how people would know if they are positive when getting the vaccine. The outcome of the event was unknown. Information about the lot/batch number has been requested.; Sender's Comments: Based on the limited information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

a strong, whole body heat, and flushing; a strong, whole body heat; tachycardic; Palpitations; This is a spontaneous report from a contactable Nurse(patient). This Nurse reported for similar events for 6 patients. This is 1st of 6 reports. A 49-year-old female patient received BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 28Dec2020 at the 49 years old at single dose for COVID-19 immunization. The medical history and concomitant medications were not reported. The registered nurse and 5 other registered nurses she worked with, had a serious reaction right after receiving the COVID-19 Vaccine. The patient had a weird reaction right after she was injected with the COVID-19 Vaccine. She had a strong, whole body heat, and flushing. She said she became tachycardic and had palpitations that lasted a few minutes. She said the tachycardia and palpitations then slowly resolved in less than 5 minutes. The patient said she had no other symptoms after receiving the COVID-19 Vaccine. The reporter said there were 5 other registered nurses that received the COVID-19 Vaccine at the same time and had the same exact symptoms she experienced. The reporter said stated the registered nurse who was monitoring the people who received the COVID-19 Vaccine indicated that the same feeling had occurred in many other workers who had received the COVID-19 vaccine. The reporter stated she did not know if the patient had received any other vaccines at the same time as the COVID-19 Vaccine, and if the patient had received any other vaccines within the last 4 weeks. The patient works at a hospital but didn't received any medical treatment. The patient just waited her symptoms out, and within 5 minutes her symptoms had gone away. The outcome of the events was recovered on 28Dec2020. Information on the lot/batch number has been requested.;

Sender's Comments: A possible contributory role of the suspect products cannot be excluded for the reported events based on the known safety profile and temporal association. Case will be reevaluated based on follow-up information ,Linked Report(s) : US-PFIZER INC-2021001363 same reporter/drug/event, different patient.;US-PFIZER INC-2021001364 same reporter/drug/event, different patient.;US-PFIZER INC-2021001195 same reporter/drug/event, different patient.;US-PFIZER INC-2021001204 same reporter/drug/event, different patient.;US-PFIZER INC-2021001329 same reporter/drug/event, different patient.

anaphylaxis; This is a spontaneous report from a contactable other healthcare professional (patient). A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for immunization. The patient's medical history and concomitant medications were not reported. Pfizer covid vaccine caused anaphylaxis on 30Dec2020 and landed patient in hospital. Patient was an anesthesiologist and had high IgG to thyroid with hashimotos. Patient thought he/she had IgG/neutrophil mediated anaphylaxis (not the typical IgE) as absolute neutrophil count elevated but everything else normal in labs. Had tachycardia into 140-150s and mild facial and throat edema. Still having sudden bouts of elevated heart rate in the morning of 31Dec2020. Heart tests all normal. Outcome of event elevated heart rate was not recovered, and outcome of other events was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: A possible contributory role of the suspect products cannot be excluded for the reported events based on the known safety profile and temporal association. Case will be reevaluated based on follow-up information

12/29/2020 2 hr after vaccination patient became hypotensive, decreased oxygen levels was transferred to Hospital currently inpatient at hospital - admitted for cardiac arrest

Deceased

Woke up Thursday am with hives on right lower abdomen and leg getting progressively worse throughout the day. By that afternoon had back pain in right back and continuing hives. Woke up Friday with numbness to right leg, hives, and back pain all on right side of body. Had numbness to foot, face but especially thigh, back and across upper buttocks. Saturday hives subsiding, numbness receding to face, upper thigh and foot only on right side of body. Sunday, back pain some improved, no hives or hives minimal, numbness persists upper thigh face and foot on right side of body. Monday, Tuesday and Wednesday the same. Woke up Thursday with shingles rash to upper thigh back, numbness to foot face and upper thigh persist only on right side of body. Darn!!!

I woke the next morning with flu like symptoms my arm was hurting, I was feelin tired and really couldn't get out of bed. As the day progressed I got chills, started running a fever, It went up to 104 and my heart rate went up and down from 120-165 so I went to the ER. They gave me fluids and ran a whole bunch of test, tested me for Covid and Sepsis and everything came back normal and negative for Covid. They monitored my heart rate and once it started getting back to normal, they ended up letting me go home, I was there from 8pm to about 3am. After that I felt tired and felt like when I had Covid back in

November. I started feeling better about Sunday, still a little tired but felt more back to normal. My heart rate is still getting back to normal so my Dr is following me on that.

PT was found deceased in his home on 1/5/2021

Expired 1/05/2021

"worry; frustration; regrets/wishing she would have never taken it; phlegm; can't talk; taking her voice, she felt like she was losing her voice; scary/""scaring"" her; coughing/cough; difficult for her to catch her breath/lost her breath, couldn't catch her breath/couldn't breath; allergic reaction to the vaccine; This is a spontaneous report from a contactable consumer (patient). A 61-year-old female patient received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EL1284, expiry date 30Apr2021) intramuscular on 29Dec2020 09:16 at 0.3 mL, single for Covid-19 immunization in a hospital. Medical history included diabetic, allergy reactions, blood pressure (abnormal), cholesterol (abnormal); all ongoing, and reaction to dust. Concomitant medications included ongoing amlodipine;hydrochlorothiazide;valsartan for blood pressure, ongoing potassium for unspecified indication, BP pills (unspecified) and has cholesterol medications. The patient informed that yesterday (29Dec2020), she got the COVID vaccine shot at work, received it at 9:16 am and was monitored for 30 minutes post administration. The patient went to work and was holding the babies. The patient worked in transport in the NICU at a hospital. Few hours after the injection, while working in the NICU, she experienced coughing to the point where it was difficult for her to catch her breath. The patient started coughing so bad, she had no control. She mentioned trying to drink water and continued coughing more. The patient lost her breath, couldn't catch her breath, she had to call for the charge nurse (manager), as she couldn't breath and they took her to the ER and consulted at the ER of her facility. The patient informed that she kept coughing and couldn't catch her breath. They made her drink water. The patient has allergies, so she always has an epi pen with her. The patient felt like she had an allergic reaction to the vaccine. The doctor there explained that her symptoms were not related the Covid-19 vaccine she received earlier. The patient specified that the last time she had a similar reaction was at work and was due to dust. The patient explained that she was perfectly fine before receiving the vaccine, laughing, and so what can her symptoms be related to, if it was not the vaccine. The patient was coughing all night, can't get rid of the cough. She has called her doctor. The nurse said just to watch herself for now. The patient informed that she was supposed to go back to work tomorrow and she was afraid to go around the babies. The patient informed that today (30Dec2020), she gargled apple cider vinegar and salt water, and phlegm came out. The patient continued saying that she has still been coughing, can't talk and that it was scary. The patient informed that she was taking her voice, she felt like she was losing her voice. It was ""scaring"" her. She was unsure if it was the Pfizer vaccine. The patient attempted to reach her HCP and that she cannot be seeing at her clinic due to her cough. The patient mentioned that she won't have access to a respiratory clinic until Tuesday. The patient expressed her concerned about returning to work with babies and asked if she should return to work tomorrow. The patient pursued verbalizing her worry and frustration. The patient asked if she can decide not to get the second dose. The patient voiced her regrets on receiving the first dose of the COVID-19 vaccine. She stated wishing she would have never taken it and that all who have an EpiPen should not receive it. The outcome of the event cough was not recovered, Dyspnoea, Allergy to vaccine,

Productive cough, Speech disorder, Aphonia, Nervousness, Anxiety, Frustration tolerance, Depressed mood was unknown."

her face started to go numb/felt like a dental block you would get with Lidocaine; She got on her left side, a cold spike feeling up her shoulder and neck and up to her face; upper esophageal sphincter got tight and felt funny like she was going to throw up; her whole body was shaking- her head, hands, and legs; feeling giddy; blood pressure was up; being stressed; was going to throw up/transient nausea; felt a little funny; This is a spontaneous report from a contactable Nurse(patient). A 54-year-old female patient received BNT162B2 (lot number EL0140), via an unspecified route of administration at left deltoid on 30Dec2020 14:28 at the 54 years old at 0.3 mL single for where she works she was exposed to patients who need rehab that were exposed and getting COVID. The patient medical history included Primary Essential Tremors and ongoing (had these for about 10-11 years. Her mother and grandmother also had them. Normally they were very fine, small tremors that people didn't notice. She can hold and turn her head and hide it) and Sulfa drug allergy (would get shortness of breath). The concomitant product was none. The patient previously took flu vaccine and experienced preservative made neck twitch and joint sores. Yesterday the patient got the COVID Vaccine and had a pretty significant adverse event. She was calling to report it and to see if she should get the second dose of the vaccine. The patient was also a licensed speech pathologist. She received the vaccine yesterday at 2:28 PM. She was allergic to Sulfa drugs and would get shortness of breath, so they wanted her to wait 30 minutes for monitoring. She was feeling giddy on 30Dec2020, but she ran into a friend that she had not seen before quarantine, so they were talking. It was exciting. After her 30 minutes she went to her car and felt a little funny. She thought she was hungry so she ate half a banana and had some water. She had an appointment to get to so she started to drive off, and by the time she got to the interstate she was feeling funny. She got on her left side, a cold spike feeling up her shoulder and neck and up to her face on 30Dec2020. This was like the precursor. Then on 30Dec2020 her face started to go numb. It felt like a dental block you would get with Lidocaine. It went from her temple area, below her eye all the way to her lips. It was midline on the left side. She was breathing fine. She was trying to figure out if she should pull over or call(Number), but her airway did not close up. Her upper esophageal sphincter got tight and felt funny like she was going to throw up. She drove to the hospital close to her house which is affiliated with where she got the vaccine. She normally had primary tremors, small to where people do not notice. But her whole body was shaking- her head, hands, and legs on 30Dec2020. She looked like a bobble head. But she could still breath. They took her right in and they did an EKG to make sure it was not her heart. Her blood pressure was up on 30Dec2020, she assumes for being stressed. They monitored her. They gave her Pepcid and Benadryl. She did not want any nausea medications. She stayed for about 2 hours and slept some from the Benadryl. Her face slowly became less numb. The numbness went away started from her lips and outward to her check and temple area. Then it just felt funny. When she touched it, which she never lost sensation, it was like, whose face is this? It was strange. She is not numb anymore. It took a while for it to go away, and it still felt weird. When she woke up this morning it was completely gone. She had recovered completely from all of these things. The only thing she has now was some transient nausea. It was very mild. It comes and goes. It had improved. She had not taken anything for it. The events Feeling funny, her face started to go numb, upper esophageal sphincter got tight, a cold spike feeling up her shoulder and neck and up to her face, Her whole body was shaking- her

head, hands, and legs, were all assessed as Medically significant. The outcome of the event Nausea was recovering, the events Felt giddy, blood pressure was up, Stress was recovered on 31Dec2020, the other events were recovered on 30Dec2020. The reporter considered there was a reasonable possibility that the events Feeling funny, a cold spike feeling up her shoulder and neck and up to her face, Face started to go numb from her temple area, below her eye all the way to her lips, upper esophageal sphincter got tight , whole body was shaking- her head, hands, and legs, Nausea, were related to the product BNT162B2.; Sender's Comments: Based on the compatible temporal association, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the events. The impacts of this report on the benefit/risk profile of the product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"DVT; This is a spontaneous report from a contactable nurse. A patient of unspecified age and gender received BNT162B2, via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The nurse asked if there is any DVT cases reported following the administration of Pfizer-BioNTech COVID-19 Vaccine. E-transmitting duplicate AE caller already reported a DVT case post vaccination. Caller also asked ""Why is there's a statement indicating that individuals with a history of bleeding disorder or taking anti-coagulant should contact their vaccination provider? How did they prove 95 % efficacy? Why aren't antibodies produced after the 1st dose of Covid-19 vaccine?"" The outcome of the event DVT was unknown. Information on Lot/batch number has been requested.; Sender's Comments: Very limited information was provided for this individual patient, such as pre-existing medical history, suspect administration details, clinical course and relevant supportive lab data for the reported Deep vein thrombosis (DVT). Pending further details, the Company would handle this reported DVT related to the administration of BNT162B2, COVID-19 immunization, for reporting purpose. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate."

throat swelling; Initially had headache; dizziness; irritability; Throat tingling; difficulty swallowing; This is a spontaneous report from a contactable other healthcare professional (HCP) (patient). A 49-year-old female patient received a single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot#: EJ1685) as the first dose via an unspecified route of administration in the left arm on 29Dec2020 06:00 for COVID-19 immunization. Medical history included fibromyalgia, asthma, prediabetes, and carpal tunnel syndrome. There were no concomitant medications. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. There were not any other medications the patient received within 2 weeks of vaccination. The patient was not diagnosed with COVID-19 prior to vaccination. The patient had not been tested for COVID-19 since the vaccination. The patient had no previous allergies to vaccines. The patient allergies to medications which included: doxycycline, medroxyprogesterone acetate (DEPO-PROVERA), metoclopramide (REGLAN), gluten. The patient initially

had headache, dizziness and irritability, throat tingling, throat swelling, and difficulty swallowing started around 12 hours after injection, event onset date reported as 29Dec2020 18:00. The events resulted in emergency room/ department or urgent care. The events were reported as non-serious by HCP. Treatment received for the events included diphenhydramine and hydroxyzine embonate (HYDROXYZINE PAMOATE). The outcome of the events was recovering.; Sender's Comments: The reported pharyngeal swelling together with other symptoms was likely related to the single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) due to temporal relationship. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics committees and Investigators, as appropriate.

Moderate to severe headache 24-48 hours post injection. Complete sensorineural hearing loss in left ear 1 week after injection; Moderate to severe headache 24-48 hours post injection. Complete sensorineural hearing loss in left ear 1 week after injection; This is a spontaneous report from a contactable physician (patient). A 37-year-old female non-pregnant patient received her first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 22Dec2020 17:15 at single dose on her left arm for covid-19 immunization. Medical history included known allergies to penicillin. The patient had no other medical history. There were no concomitant medications. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine and the patient was not received list of any other medications within 2 weeks of vaccination. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The patient experienced moderate to severe headache 24-48 hours post injection. Complete sensorineural hearing loss in left ear 1 week after injection on 23Dec2020. These events resulted in doctor or other healthcare professional office/clinic visit, disability or permanent damage. The patient had received prednisone to treat the events. The outcome of the events was not recovered.; Sender's Comments: A possible contribution role of first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) to the onset of sensorineural hearing loss in left ear and headache cannot be excluded due to temporal relationship. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics committees and Investigators, as appropriate.

jaw tightening; muscle spasms; entire face and around her mouth went numb; entire face and around her mouth went numb; heart palpitations; I had hives on my chest; a wave of heat rush up her back; This is a spontaneous report from a contactable nurse (patient). A 46-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), via an unspecified route of administration in left arm on 22Dec2020 10:30 at first single dose for COVID-19 immunization. Medical history included ectopic pregnancy, hay fever. Concomitant medication received within 2 weeks

included: loratadine, colecalciferol (vitamin D), olly womens multivitamin. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No known allergies. About 15 minutes after the vaccine the patient experienced jaw tightening and muscle spasms. The patient was given oral Benadryl 50 mg. About 5 minutes after taking the Benadryl, her entire face and around her mouth went numb. The patient began having heart palpitations and felt a wave of heat rush up her back. She had hives on her chest. The patient received 1 dose of epinephrine from an Epi-Pen and transported to the emergency room for further treatment. Adverse event start date: 22Dec2020 11:00 AM. Events were considered as non-serious. Events resulted in: Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. Treatment received for the adverse event included: Benadryl, Epinephrine, Solumedrol, Pepcid. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had been tested for COVID-19. Test Name: SARS-CoV-2 by PCR (Nasal Swab) on 30Dec2020: Negative. Outcome of the events was not recovered.; Sender's Comments: The temporal relationship is suggestive of an acute anaphylactic reaction. Based on the temporal relationship and the known pattern of response, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the reported events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"Joint pain; loss of balance; increased drowsiness; Headaches induced by allergies; Limited neck mobility/lessened neck pain but still limited mobility; Scalp tenderness and sensitivity; Significant migraines/debilitating migraines (light & noise sensitivity, covers whole head, pulsating, sharp pain, loss of balance, increased drowsiness); Sharp pains in neck/Neck pain; Sharp pains in neck, ear, head pain (similar to an ear infection pain); head pain/sharp pains in lower head/covers whole head, pulsating, sharp pain/Increase in headaches but no longer centralized to back of head/ headaches induced by allergies; Nausea; Neck stiffness; This is a spontaneous report from a contactable Other Health Professional (patient). A 29-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Solution for injection, lot number was unknown, via an unspecified route of administration in the right arm on 22Dec2020 07:30 at a single dose for COVID-19 immunization. Medical history was none. There were no concomitant medications. The patient was not pregnant. The patient had not receive any other vaccines within 4 weeks prior to the COVID vaccine. It was reported that the patient received vaccine in Tuesday (22Dec2020). The following Sunday (27Dec2020) at 12:00, she had nausea and neck stiffness. On Monday (28Dec2020), she had sharp pains in neck, ear, head pain (similar to an ear infection pain), and nausea. She used teledmed appt and got antibiotics (unspecified). On Tuesday (29Dec2020), she had significant migraines, limited neck mobility, sharp pains in neck and lower head, scalp tenderness and sensitivity which felt like whiplash when she moved her head w/ her head feeling ""swimmy"". She tried to see urgent care but was to go to ER. On Wednesday (30Dec2020), there was lessened neck pain but still limited mobility, increased in headaches but no longer centralized to back of head. She went to ER and they said that she had headaches induced by allergies. She mentioned that she never had migraines or allergies in her life. They also reported no ear infection. She did complete CT Scan with no concerning results on 30Dec2020. On Thursday (31Dec2020) & Friday, she

no longer has neck pain but with continued nausea, joint pain, debilitating migraines (light & noise sensitivity, covers whole head, pulsating, sharp pain, loss of balance, increased drowsiness). The events were reported as non-serious. The treatment received for the adverse events included fluids, pain & nausea meds. The patient was not diagnosed with Covid prior to vaccination. She was tested for covid post vaccination on 30Dec2020 through a nasal swab with negative result. The outcome of the events neck stiffness, ear pain, scalp tenderness and sensitivity, and 'Headaches induced by allergies' was unknown; while neck pain was recovered on 31Dec2020. The outcome of the events 'significant migraines/debilitating migraines', nausea, limited neck mobility, head pain/Headache, joint pain, loss of balance, and increased drowsiness was not recovered. Information on the lot/batch number has been requested.; Sender's Comments: A causal association between BNT162B2 and the event migraine cannot be excluded based on a compatible temporal relation between vaccination and onset of event. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate."

Miscarriage; patient was pregnant while taking BNT162B2; patient was pregnant while taking BNT162B2; This is a spontaneous report from a contactable Other Health Professional. A 34-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL0140), intramuscularly on 22Dec2020 06:00 AM at single dose at Arm Right at Hospital for COVID. Medical history included ongoing sleep apnoea. There were no concomitant medications. There were no allergies to medications, food, or other products. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient did not receive any other medications the patient received within 2 weeks of vaccination. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient experienced miscarriage on 29Dec2020 13:00. The patient was pregnant while taking BNT162B2. The patient was 4 Weeks pregnant at the onset of the event. Patient last menstrual period date was 24Nov2020. The Pregnancy due to deliver was on 07Sep2021. The pregnancy resulted in spontaneous abortion. Since the vaccination, the patient has been tested for COVID-19 on an unknown date with unknown results. Nasal Swab on 28Dec2020 was Negative. There was no treatment received for the adverse event. The outcome of event was recovering.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to agency, Ethics Committees, and Investigators, as appropriate.

DVT left calf; This is a spontaneous report from a contactable Physician (patient). A 60-year-old male patient started to receive the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Intramuscular on 20Dec2020 08:00 at single dose on right arm for COVID-19 immunization. Medical history included Gastric reflux. The patient had no known allergies. The patient had no covid prior vaccination. The patient had no covid tested post vaccination. Concomitant medications included

omeprazole (PRILOSEC) and ergocalciferol (VIT D). The patient had not received other vaccine in four weeks. The patient experienced deep vein thrombosis (DVT) left calf on 27Dec2020 09:00 which resulted emergency room visit. Treatment received for the event included Xarelto. The outcome of the event was not resolved. Information on the lot/batch number has been requested.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

"reaction to excipient; kidneys tried to shut down; This is a spontaneous report from a contactable consumer from a Pfizer Sponsored Program. A female patient of an unspecified age received the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), and potassium (MANUFACTURER UNKNOWN); both via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunisation. The patient's medical history included ongoing kidney issues from an unknown date, allergic to antibiotics and pain pills from an unknown date and unknown if ongoing. Concomitant medications were not reported. On an unspecified date, the patient experienced: kidneys tried to shut down and reaction to excipient; which were assessed as medically significant. The consumer stated, ""I looked at the ingredient list: potassium is listed. I have kidney issues and potassium is really bad, my kidneys tried to shut down on me. I'm allergic to ""antibiotics and pain pills."" The clinical outcome of the events, renal failure and reaction to excipient, was unknown. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 MRNA VACCINE, were not provided and will be requested during follow up."

Mild difficulty with thought/speech/concentration; strong wave of burning sensation growing inside the body; Lightheadedness; Blood pressure went up; Heart rate went up; Hands freezing; Mild difficulty with thought/speech/concentration; Mild difficulty with thought/speech/concentration; Weakness; Mildly shaky; Anxiety; Feeling that may pass out; This is a spontaneous report from a contactable other healthcare professional (HCP) (patient). A 61-year-old female patient received 1 dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EJ1686) via unspecified route on left arm single dose for COVID-19 immunization on 02Jan2021, 02:30 PM, at 61-year-old. Medical history: allergies to sulfa, paclitaxel (TAXOL); breast cancer in 2003 and 2007. Prior to vaccination, the patient did not be diagnosed with COVID-19. Concomitant medication in two weeks included: escitalopram oxalate (LEXAPRO, strength: 10m); omeprazole; multivitamin; ibuprofen. About 5 minutes after the vaccine (02Jan2021, 02:35 PM), the patient had a strong wave of burning sensation growing inside the body, lightheadedness, blood pressure went up, heart rate went up, hands freezing, mild difficulty with thought/speech/concentration, weakness, mildly shaky, anxiety, feeling that may pass out. Emergency room/department or urgent care visited. Treatment received for the adverse event included: heart rate H20 and BP monitor, water, observation. Since the vaccination, the patient did not have been tested for COVID-19. Action taken for BNT162B2 was not applicable. Outcome of the events was resolving. It was reported as non-serious per the reporter.; Sender's Comments: Based on the current available

information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of event Mental impairment cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"reported increased hand stiffness after vaccination; This is a spontaneous report from a contactable pharmacist via Pfizer sales representative. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for Covid-19 immunisation. Medical history included psoriasis and psoriatic arthritis. The patient's concomitant medications were not reported. The patient previously took adalimumab (HUMIRA) and non compliant with Humira. The patient had psoriasis and psoriatic arthritis, reported increased hand stiffness after vaccination on an unspecified date with outcome of unknown. Information on the lot/batch number has been requested.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported ""psoriasis and psoriatic arthritis with increased hand stiffness after vaccination"" and the administration of BNT162B2, based on the reasonable temporal association. The patient's pre-existing medical condition of psoriasis and psoriatic arthritis might have provided alternative explanations. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate."

"Confirmed DVT in the left leg; COVID test (PCR swab): positive on 26Dec2020; COVID test (PCR swab): positive on 26Dec2020; This is a spontaneous report from a contactable other healthcare professional. An 85-year-old female patient received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# ELO140, expiration date: Mar2021), via an unspecified route of administration in arm (deltoid; unknown side) on 23Dec2020 at single dose for Covid-19 immunisation. Medical history included type 2 diabetes mellitus from 2017 and ongoing, high blood pressure from 2017 and ongoing, atrial fibrillation (A-Fib) from 2019 and ongoing. The patient's concomitant medications were not reported. The patient was administered first dose of the COVID vaccine on 23Dec2020 and then was swabbed for COVID on 26Dec2020, and then on 28Dec2020 her PCR swab was positive for COVID. She was asymptomatic until she started complaining of leg pain. She ordered an ultrasound for the patient on 30Dec2020, and it confirmed a deep vein thrombosis (DVT) in left leg. The patient was being treated with anticoagulant apixaban (ELIQUIS) currently. Caller stated that this could be that it (DVT) is from COVID, but her real question was, could it be from the vaccine? In Pfizer's information packet for patients, there is section on what to tell your provider prior to getting vaccinated. One of the things on there is if you have a bleeding disorder or are on an anticoagulant. There is no explanation as to why it was in the packet of information. Caller has looked everywhere and can not figure out why that is on the FAQ/packet information. The patient was due for the second dose on 13Jan2020, but she was worried and hesitant

to approve it. The patient underwent lab tests and procedures which included COVID test (PCR swab): positive on 26Dec2020, ultrasound of the left leg: confirmed DVT on 30Dec2020. The outcome of events was not recovered.; Sender's Comments: There is not a reasonable possibility that event ""COVID test (PCR swab): positive"" is related to BNT162B2 vaccine. The event occurred 3 days after vaccination, when vaccine was not expected to achieve the effect. The event DVT of legs is not considered related to BNT162B2 vaccine. The patient had underlying diabetes and cardiovascular disorders, which are considered as risk factors for DVT. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

Patient was poorly responsive to her inhalers that she used for asthma; Persistent shortness of breath and chest tightness starting within a few days after vaccine; Persistent shortness of breath and chest tightness starting within a few days after vaccine; This is a spontaneous report from a contactable physician (patient). A 40-year-old male patient received the first single dose of BNT162B2 (Solution for injection, lot number: EK5730, exp date not reported), via an unspecified route of administration (vaccine location: left arm) on 18Dec2020 04:15 for COVID-19 immunization. Medical history included allergy induced asthma, allergies to cats and dust, and occasional seasonal allergies. Concomitant medication included other vaccine/s received within 4 weeks prior to the COVID vaccine: first dose of diphtheria vaccine toxoid, pertussis vaccine acellular 3-component, tetanus vaccine toxoid (BOOSTRIX, GlaxoSmithKline) administered as single dose via unspecified route of administration (vaccine location: left arm) on 08Dec2020. There were no other medications the patient received within 2 weeks of vaccination. The patient experienced persistent shortness of breath and chest tightness starting within a few days after vaccine (24Dec2020). Patient was poorly responsive to her inhalers that she used for asthma (onset date not reported). She rarely needed the, used about once or twice a year). It was constant, but with periods of improvement followed regression. Will likely seek medical evaluation as it's been over a week now and rather concerning. The patient did not consider the events shortness of breath and chest tightness as serious. Treatment for the adverse events shortness of breath and chest tightness included fluticasone propionate, almeterol (ADVAIR), albuterol, and unspecified anti-allergy medications. Patient did not have covid prior vaccination. Patient was tested for COVID post vaccination wherein patient tested negative for COVID via Covid test rapid on 30Dec2020. The adverse event resulted in doctor or other healthcare professional office/clinic visit and emergency room/department or urgent care. The outcome of shortness of breath and chest tightness was not recovered and unknown for the other event.; Sender's Comments: Based on the time association, the possible contribution of BNT162B2 to the events shortness of breath , chest tightness and asthma aggravated cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"diabetes was high; seeing double vision; Headache on the right side; This is a spontaneous report from a contactable nurse. A patient of an unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number/expiration date unknown) dose number 1, via an unspecified route of administration on 18Dec2020 at a single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. The patient had the vaccine in a hospital on a Friday (18Dec2020). No side effect was noted over the weekend. On 21Dec2020, when the patient woke up, s/he was seeing double vision, so s/he went to the doctor; they ran some test (unknown result). Because the patient was having headache on the right side in Dec2020, s/he went back to the doctor on 23Dec2020; the patient was sent to the eye doctor and they ran all kind of test. On 24Dec2020, the only thing they could find was that the patient's diabetes was high, so they kind of felt that what that could have been was kind of coincidental. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The mentioned ""diabetes was high"" is likely an intercurrent disease, unlikely related to the administration of BNT162B2, the COVID-19 immunization. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate."

joint pain; it doesn't seem to be feeling well; sweating; Fever; chills; night sweats, that he will randomly start sweating; headache; muscle pain/mild muscle aches; gastric upset; Fatigue; he had mild arm soreness right after he got the vaccine; This is a spontaneous report from a contactable Other-HCP (patient). This 45-year-old male Other-HCP received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EJ1685, NDC number: 59267-1000-1) on 22Dec2020 at single dose in his right arm for COVID-19 immunization. Medical history and concomitant drug were not reported. It was reported that patient experienced Fever on 27Dec2020 with outcome was recovered on 29Dec2020, chills and night sweats on 27Dec2020 with outcome was not recovered, Headache on 27Dec2020 with outcome was not recovered, muscle pain 27Dec2020 with outcome was not recovered, gastric upset on 27Dec2020 with outcome was Recovering, Fatigue on 27Dec2020 with outcome was unknown, arm soreness on 22Dec2020 with outcome was not recovered, joint pain with outcome was unknown, it doesn't seem to be feeling well with outcome was unknown, sweating with outcome was unknown. All events were serious (medical significant). Caller stated that he thought having a reaction to the vaccination, spoken with Occupational Health at his job and with a doctor, stated everyone is a bit stumped. Caller stated he has had for over a week now, fever, chills, night sweats, that he will randomly start sweating, headache, joint pain, gastric upset, and it doesn't seem to be feeling well. Stated the joint pain is actually more muscle pain. Stated he got the vaccination on Tuesday 22Dec2020, stated he has been having these symptoms for over 5 days now. Stated he does not think this is something infectious, that no one in his family is getting sick, his wife or child are not catching it from him. Stated he tried to do research online for data about delayed side effects, would like to know if we have any information on delayed side effects. Stated he considers these events medically significant because he cannot be cleared to go back to work. Stated he had mild arm soreness right after he got the vaccine, states he had mild muscle aches Wednesday and Thursday, then they went away and came back all on Saturday night and Sunday. Stated he is worried about getting a second vaccine. Stated he tested

negative for the COVID on 29Dec2020. Stated he has a CBC and other blood work scheduled for today, results unknown at this time. No follow-up attempts are possible. No further information is expected.; Sender's Comments: Based on the compatible temporal association and the drug's known safety profile, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Tachycardia; Palpitations; had a strong, whole body heat, and flushing; had a strong, whole body heat, and flushing; This is a spontaneous report from a contactable nurse. This nurse reported similar events for 6 patients. This is the 4th of 6 reports. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch unknown) via an unspecified route of administration on 28Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter said her friend is a registered nurse, and received the COVID-19 Vaccine on Monday, 28Dec2020. She said her friend stated she, and 5 other registered nurses she works with, had a serious reaction right after receiving the COVID-19 Vaccine. The patient had a strong, whole body heat, and flushing. The patient said she became tachycardic and had palpitations that lasted a few minutes. She said the tachycardia and palpitations then slowly resolved in less than 5 minutes. She had no other symptoms after receiving the COVID-19 Vaccine. There is unknown whether the patient received the treatment or not. The outcome of the events was recovered on 28Dec2020. Information on lot/batch number has been requested.; Sender's Comments: Based on the compatible temporal association, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the events flushing, feeling hot, tachycardia and palpitations. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2021001345 same reporter/drug/event, different patient.

It sounds like to be an allergic reaction; She passed out; Tachycardia; Nausea; Lightheadedness; This is a spontaneous report from a non-contactable physician. A 32-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) in Dec2020 at single dose to be vaccinated for her protection. Medical history was none. The patient's concomitant medications were not reported. Patient took the Pfizer COVID-19 vaccine and next day she had a very serious reaction. She did not know that if it was due to the vaccine. But she had tachycardia requiring her to go to the emergency room and she passed out and she had nausea and lightheadedness as well. It sounds like to be an allergic reaction. Given the seriousness of tachycardia and passing out as well as the lightheadedness and nausea it sounds too severe just to be a mild immune response. So, it was sort of rare immune response or it was unrelated it was unknown at this time. Outcome of event was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Based on the compatible time association, the contribution of suspect BNT162B2 to the events cannot be excluded. The impact of

this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

strong, whole body heat, and flushing; strong, whole body heat, and flushing; Tachycardia; Palpitations; This is a spontaneous report from a contactable Nurse. This Nurse reported for similar events for 6 patients. This is 2nd of 6 reports. A 49-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch unknown), via an unspecified route of administration on 28Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter said her friend was a registered nurse, and received the COVID-19 Vaccine on Monday, 28Dec2020. She said her friend stated she, and 5 other registered nurses she works with, had a serious reaction right after receiving the COVID-19 Vaccine. The patient had a strong, whole body heat, and flushing. The patient said she became tachycardia and had palpitations that lasted a few minutes. She said the tachycardia and palpitations then slowly resolved in less than 5 minutes. She had no other symptoms after receiving the COVID-19 Vaccine. It was unknown whether the patient received the treatment or not. The outcome of the events was recovered on 28Dec2020. Information on lot/batch number has been requested.; Sender's Comments: The reported transient events of whole body heat, flushing, tachycardia and palpitations were likely related to BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) due to temporal relationship and clinic course. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics committees and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2021001345 same reporter/drug/event, different patients.

Serious, weird reaction/had a strong, whole body heat, and flushing; Serious, weird reaction/had a strong, whole body heat, and flushing; Serious, weird reaction/tachycardic; Serious, weird reaction/had palpitations; This is a spontaneous report from a contactable nurse. This nurse reported similar events for 6 patients. This is 5th of 6 reports. A patient of unspecified gender and age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 28Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter did not know if the patient had received any other vaccines at the same time as the COVID-19 Vaccine, and if the patient had received any other vaccines within the last 4 weeks. It was reporter that the reporter's friend texted her last night, on 30Dec2020, at around midnight. The reporter, and 5 other registered nurses she works with in a hospital, received the COVID-19 vaccine at the same time and had the same exact symptoms she experienced. They had a serious reaction right after receiving the COVID-19 Vaccine. The patient had a weird reaction right after being injected with the COVID-19 Vaccine. The patient had a strong, whole body heat, and flushing. The patient became tachycardic and had palpitations that lasted a few minutes. The tachycardia and palpitations then slowly resolved in less than 5 minutes. The patient had no other symptoms after

receiving the COVID-19 Vaccine. The registered nurse who was monitoring the people who received the COVID-19 Vaccine indicated that the same feeling had occurred in many other workers who had received the COVID-19 vaccine. For treatment information, the reporter didn't believe the patient received any medical attention. Reporter believed that the patient just waited symptoms out, and within 5 minutes the symptoms had gone away. The outcome of the events was recovered on 28Dec2020. Information on the lot/batch number has been requested.; Sender's Comments: Based on the compatible temporal association, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the events flushing, feeling hot, tachycardia and palpitations. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2021001345 same reporter/drug/event, different patient.

"Back of my right leg has a quarter size oblong shape lump it's little bit red but not warm to the touch; Back of my right leg has a quarter size oblong shape lump it's little bit red but not warm to the touch; Back of my right leg has a quarter size oblong shape lump it's little bit red but not warm to the touch, it may be a blood clot; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received single dose of BNT162B2 (Solution for injection, batch/lot number and exp date not reported), via an unspecified route of administration on 30Dec2020 18:30 SE for immunization. The patient's medical history and concomitant medications were not reported. Patient received the Pfizer Vaccine the day of reporting: 30Dec2020 at about 06:30 (tonight). Patient felt fine and still felt fine but when was going to rub some lotion on the back of right leg, has a quarter size oblong shaped lump (onset date not reported) which was little bit red but not warm to the touch. Patient didn't do anything to make it happen. Patient doesn't know if it may be a blood clot which was patient's question. ""The blood clot something may be concerned about."" Patient asked ""Is this a blood clot, it could go to my heart and I could die tomorrow? So I am going to call my family doctor but thank you."" The outcome of the events was unknown. Information about lot/batch number has been requested."

Fatigue and overall lethargic feeling/Sore throat; Dark colored urine despite pushing fluids; Frequent urination; Migraine; Swollen joints and could not move arm that received vaccine in; Swollen joints and could not move arm that received vaccine in; Stomach pains, nausea, diarrhea, swollen lymph nodes; Stomach pains, nausea, diarrhea, swollen lymph nodes; Stomach pains, nausea, diarrhea, swollen lymph nodes; Stomach pains, nausea, diarrhea, swollen lymph nodes; Chills, body aches, spiked fever of 102.; Chills, body aches, spiked fever of 102.; Chills, body aches, spiked fever of 102.; Fatigue and overall lethargic feeling; Fatigue and overall lethargic feeling; Sore throat; The initial case was missing the following minimum criteria: Invalid for no adverse effect. Upon receipt of follow-up information on (31Dec2020), this case now contains all required information to be considered valid. This is a spontaneous report from a contactable Nurse. A female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot number EH9899, Expiry Date: Mar2021), intramuscular at Deltoid Left on 29Dec2020 07:20 at single dose for COVID-19 immunization. Medical

history included covid-19 from Nov2020 to an unknown date (had covid in the middle of November), surgeries from an unknown date and unknown if ongoing (She also had previous surgeries and has foreign objects in her body. Those areas were super hot. Those antibodies were like rejecting those foreign bodies because they were super hot.) There were no concomitant medications. Received call from RN calling about the Pfizer COVID vaccine. She got the vaccine on Tuesday and had a terrible reaction to it and she called a couple of different hotlines and spoke with the people who administered it. She confirmed that she did not report to Pfizer though. The people at her work that she spoke with told her to go to an Urgent care. They told her she should not get it within 90 days of having COVID. She had COVID in the middle of Nov2020. She went ahead and got it on Tuesday and had this terrible reaction. She would like to know if she should get the second dose or wait until 90 days after she had COVID and start again. There was no prescriber. She received it as part of the (hospital name withheld) front line health worker precaution. She thought that this was a normal reaction, but was told it was not. Fatigue and overall lethargic feeling happened exactly 12 hours after receiving. She works night shift and that is her base line. Pretty much everything hit after that within an hour. She was told low grade fever was normal, but not 102. She never spikes fevers, so it is medically significant. It persisted for 24 hours and is better today. She is on the 48 hour mark now. Stomach pains, nausea, diarrhea, lymph node swelling all over, including swelled armpits and groin area, Migraine, Frequent urination, were also listed as side effects. She was trying to push more fluids but her urine was dark color more than normal, despite pushing fluids. Swollen lymph nodes in her groin and armpits were concerning. Her head is lumpy. Meaning, she can feel swollen lymph nodes in back of neck area. Migraine was consistent through 24 hours and now has improved. Urine color remains dark and she will keep an eye on color. She had swollen joints, but really terrible swollen joints, and she could not move the arm that she got the vaccine in. She could not lift to above shoulder height. AE Details and time of onset: Sore Throat 12:00 on 29 Fatigue and overall lethargic feeling 20:00 Chills, body aches, spiked fever of 102: 21:00 Stomach pains, nausea, diarrhea, swollen lymph nodes- 21:00 Migraine- 21:00 Frequent Urination 23:00 Dark colored urine despite pushing fluids 23:00 Swollen joints and could not move arm that received vaccine in: 21:00. ER or physician's office required: Went to urgent care 36 hours after administration. No treatment given. She just wanted to make sure no additional infection was causing anything weird. All test were negative. Prior Vaccinations (within 4 weeks): none. Events Swollen joints and could not move arm that received vaccine in, Stomach pains, nausea, diarrhea, swollen lymph nodes, Chills, body aches, spiked fever of 102 were serious with criteria of medically significant, while the other events were non-serious. The outcome of the event Fatigue and overall lethargic feeling/Sore throat (Condition worsened) was unknown, the outcome of the events Swollen joints and could not move arm that received vaccine in, Chills, body aches, spiked fever of 102., Migraine, Dark colored urine despite pushing fluids, Frequent urination was recovering, while the outcome of the other events was not resolved.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported events due to temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators as appropriate.

anaphylactic reaction; neuropathy in fingers, toes, roof of mouth/lips; This is a spontaneous report from a contactable nurse (patient). This 48-year-old female patient (not pregnant at the time of vaccination) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot#: EL0140) at single dose on left arm on 30Dec2020 at 09:00 for COVID-19 immunization. Medical history included asthma (controlled); hypertension diagnosis 1 year ago; allergies to medications, food and environmental. Concomitant medications in two weeks included antihypertensives - amlodipine and losartan. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. On 30Dec2020 at 9:15 AM, the patient experienced anaphylactic reaction within 10 minutes of administration, neuropathy in fingers, toes, roof of mouth/lips. Neuropathy continued to date. The adverse events resulted in emergency room/department or urgent care. The patient received treatment Epinephrine IM (intramuscular) and IV (intravenous) steroids. The outcome of events was recovering.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of anaphylactic reaction and neuropathy peripheral due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including serum tryptase and nerve conduction studies, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"brain felt swollen; glands were also swollen; bad headache; minimal arm pain; fatigue; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an unspecified route of administration on 30Dec2020 at single dose for COVID-19 immunization. Medical history included lupus-like history and chronic Lyme disease. The patient's concomitant medications were not reported. The patient stated she received the first vaccine dose on 30Dec2020 and had minimal arm pain, fatigue that went to a very bad headache on Thursday (31Dec2020). By Friday headache and fatigue were terrible until this morning. Her brain felt swollen and her glands were also swollen on 03Jan2021. The patient stated that she called healthcare professional (HCP) and was told that her body was ""having an auto immune response"", ""due to a lupus like history and a history of chronic Lyme disease and to hydrate well"". It was so hard to talk, she was so fatigued. Her doctor compared it to like an encephalopathy. The patient was feeling better today but was concerned about taking the second dose. She works in a facility with a lot of Covid-19 patients. The outcome of the events was recovering. Information on the lot/batch number has been requested.; Sender's Comments: Based on the current available information, a possible contributory role of the suspect product to the development of event brain felt swollen cannot be totally excluded. Medical history of lupus-like history and chronic Lyme disease may provide plausible alternative explanations for the event. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part

of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

numbness and weakness in left arm; numbness and weakness in left arm; had a brachial plexus pathology; her grip and fine motor are affected in her left arm/she could not do her job; This is a spontaneous report from a contactable physician (patient). A 35-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EH9899), via an unspecified route of administration in right arm on 21Dec2020 at single dose for Covid-19 immunisation. Medical history included ongoing birth control. No other medical history. Concomitant drug included other medication she took for birth control. On 29Dec2020, the patient experienced numbness and weakness in left arm, had a brachial plexus pathology, went to the emergency department on 30Dec2020 and was seen by one of the facility doctors and stated this doctor had her on steroids for treatment. She got the vaccine in her right arm, stated her grip and fine motor are affected in her left arm. States this was disabling since she could not do her job. She was following up with neurology on Monday (unspecified), that she had a CT scan of her neck and it was normal. Only other medication she was taking was for birth control, but she did not feel like it was relevant. The outcome of events numbness and weakness in left arm was recovering, while outcome of other events was unknown. This case was reported as serious, seriousness criteria was disabling.; Sender's Comments: Based on the information currently provided, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the reported events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

it hits a nerve; perceived it along the face still and the arm; Bell's Palsy; numbness in a small area of her tongue; right eye was irritated a little dry; right eye was irritated a little dry; right sided ear pain; fluid in the ear but no infection; This is a spontaneous report from a contactable health care professional (nurse practitioner). A 35-year-old female patient received her 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) at single dose via an unknown route on the right side on 21Dec2020 for Covid-19 immunization. Medical history included intermittent hives. Concomitant drug included ongoing cetirizine hydrochloride (ZYRTEC) 5 mg for intermittent hives. The reporting nurse practitioner saw a patient on 31Dec2020 who was vaccinated on 21Dec2020 and had a Bell's Palsy reaction (reported as not serious). She did some research and saw no more incidents in the general population but she wanted to report this. She also wanted to get more information on if the patient should proceed with dose number 2 of the vaccine. The patient developed the Bell's Palsy within 5 minutes after getting the vaccine. She thought it was because she was anxious to get the vaccine, so she brushed it off. The Bell's Palsy was still occurring but per the patient it had improved. On exam she did not have any weakness, facial droop or dumbness with sharp or dull testing. The patient perceived it along the face still and the arm. The reporting nurse practitioner said that the arm was probably not Bell's Palsy, but more related to getting the vaccine in the arm and it hits a nerve. Patient stated that her smile was also unequal and it

was difficult for her to close her right eye, although now (as of 31Dec2020) she can. Her right eye was irritated a little dry. Regarding treatment, the patient was started on steroids on 31Dec2020. She did not start her on an anti-viral as she did not want it to impact her immunity to the vaccine. The patient also complained of right sided ear pain. She was unsure if that was related to the Bell's Palsy, but it was also on the right side. There was fluid in the ear but no infection. The pain was still ongoing. The patient also mentioned numbness in a small area of her tongue when she first got the vaccine. This was still ongoing. Outcome of Bell's Palsy was resolving. Outcome of the event numbness in a small area of her tongue, right sided ear pain was not resolved. Outcome of the other events was unknown. The reporting nurse practitioner stated that this was not serious as this was a mild case and was thankfully resolving. The reporting nurse practitioner comment that nothing of history was relevant besides for the last several months (as of 31Dec2020) the patient had been taking 5mg of cetirizine hydrochloride for intermittent hives. She wondered if she had not been taking it how she would have reacted or if the reaction would have been more severe. Information on the lot/Batch number has been requested.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of Bell's Palsy cannot be excluded, considering the plausible temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Pitting edema/Edema: It was her feet, ankles, and 3/4 way up her shins.; This is a spontaneous report from a contactable nurse (patient). A 47-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EK5730, expiry date: Mar2021), intramuscular in the left deltoid on 17Dec2020 at 07:15 at single dose for COVID-19 immunization. Medical history included ongoing neuralgia since 2003 (has nerve pain in her face and neck. It has never caused swelling and that she has had it for a long time. Symptoms started 17 years ago, became apparent in 2009), ongoing hypothyroidism since 2003 (Diagnosed about 17 years ago. Nothing has changed medication wise). The patient's concomitant medications were not reported. The patient reported that she got the vaccine on 17Dec2020. On 25Dec2020, her shoes felt snug and by the next day she had 4 plus pitting edema. She could not fit in the shoes. She had the pitting edema for several days. She said that she went and bought compression stockings to help with the edema. It was her feet, ankles, and 3/4 way up her shins. It was more of the pedal area that was pitting. The patient further reported that she never had pitting edema before and the only thing new she had was the vaccine. Therapeutic measures were taken as a result of the event which included compression stockings. The patient was recovering from the event.; Sender's Comments: Based on temporal association, a possible contributory role of BNT162B2 cannot be excluded for reported event pitting edema. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

a strong, whole body heat, and flushing; a strong, whole body heat, and flushing; Tachycardia; Palpitations; This is a spontaneous report from a contactable Nurse. This Nurse reported similar event for 6 patients. This is 3rd of 6 reports. A 24-Year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 28Dec2020 at single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. Pfizer employee reporting on behalf of a friend, reported her friend texted her last night, 30Dec2020, at around midnight. The nurse and 5 other registered nurses she works with, had a serious reaction right after receiving the COVID-19 Vaccine. Caller said she had a strong, whole body heat, and flushing. She said she became tachycardic and had palpitations that lasted a few minutes. Caller said there were 5 other registered nurses that received the COVID-19 Vaccine at the same time and had the same exact symptoms she experienced. Outcome of events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on temporal association, a possible contributory role of BNT162B2 vaccine cannot be excluded for events flushing, feeling hot, tachycardia and palpitations. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate. ,Linked Report(s) : US-PFIZER INC-2021001345 same reporter/drug/event, different patient.

she had a strong, whole body heat, and flushing; she had a strong, whole body heat, and flushing; Tachycardia; Palpitations; This is a spontaneous report from a contactable nurse. This nurse reported similar events for 6 patients. This is the 6th of 6 reports. A 49-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch unknown) via an unspecified route of administration on 28Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter said her friend is a registered nurse, and received the COVID-19 Vaccine on Monday, 28Dec2020. She said her friend stated she, and 5 other registered nurses she works with, had a serious reaction right after receiving the COVID-19 Vaccine. The patient had a strong, whole body heat, and flushing. The patient said she became tachycardic and had palpitations that lasted a few minutes. She said the tachycardia and palpitations then slowly resolved in less than 5 minutes. She had no other symptoms after receiving the COVID-19 Vaccine. The registered nurse who was monitoring the people who received the COVID-19 Vaccine indicated that the same feeling had occurred in many other workers who had received the COVID-19 vaccine. The reporter did not know if the patient received any other vaccines at the same time as the COVID-19 Vaccine, and if had received any other vaccines within the last 4 weeks. The patient works at a hospital but doesn't believe that she received any medical attention. she believed just waited her symptoms out, and within 5 minutes her symptoms had gone away. The outcome of the events was recovered on 28Dec2020. Information on lot/batch number has been requested.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported whole body heat, flushing, tachycardia and palpitations, and the administration of BNT162B2, based on the reasonable temporal association and lacking alternative explanations. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any

appropriate action in response, will be promptly notified to RA, IEC, as appropriate.,Linked Report(s) : US-PFIZER INC-2021001345 same reporter/drug/event, different patient.

Rash; Welts; she had a very sore arm; This is a spontaneous report from a contactable nurse (patient herself). A 65-year-old female patient received her first dose of bnt162b2 (BNT162B2 also reported as Pfizer Covid Vaccine, lot EH9099 or EH9899), via an unspecified route of administration in her left deltoid on 22Dec2020 09:32 at single dose for Covid-19 immunisation. Medical history included broken toe for 3 weeks. This was from her taekwondo and doesn't complain. No history of all previous immunization with the Pfizer vaccine considered as suspect drug. There were no additional vaccines administered on same date with Covid-19 vaccine. There were no concomitant medications. On 24Dec2020, she broke out in a rash on different parts of her body. She said the rash would come and go. She said she then had welts appear on different parts of her body and the welts would come and go. She said on the 3rd day, she had rash and welts together only on her trunk. She said on days 4, 5, and 6, she would have either a rash or welts come and go on different parts of her body. She clarified she had the rash and welts on her hands, wrists, ankles, and body. She reported that the rash and welts were serious-medically significant. On 22Dec2020, she had arm soreness and was just inconvenient and uncomfortable. She said she was not saying that what she was experiencing was related to receiving the COVID-19 Vaccine, but she doesn't know what else can be causing the rash and welts. She said she hasn't changed anything she has been eating or doing. She said she was worried about taking the 2nd COVID-19 Vaccine dose. She used Hydrocortisone 1% cream, Equate brand (reported to be expired) and took an oatmeal bath. She also took Benadryl and brand of Zyrtec called Wal-Zyr. Her height was 175cm, weight was 63kg. The rash and welts recovered on 30Dec2020; arm soreness recovered on 23Dec2020. Information about lot/batch number has been requested.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events rash and urticaria cannot be excluded. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

Saturation down to 84%; Temperature of 101.3; Rapid pulse having some difficulty; This is a spontaneous report from a contactable consumer. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date not reported) via an unspecified route of administration, on 30Dec2020, single dose for COVID-19 immunization. Relevant medical history and concomitant medications were not reported. The reporter is working in long term in Nursing care facility. It was reported that they have a resident who recovered from COVID. They are having some questions following the guidelines stuff, just kind of asking some more questions. Just one of their resident had temperature of 101.3, saturation down to 84%, 'frustration' at 24% and rapid pulse having some difficulty. The patient was put in her bed. The reporter contacted the doctor in house. 'The reporter wanted to see if any of the recommendation were for (incomplete sentence). The long term care facilities recovered COVID, the reporter wanted to know any of the lasting short term and any guideline for treating. They were all recovered COVID, all of two of the resident two weeks or more out

and we (Further clarification was unknown) just had the vaccine yesterday' (as reported, pending clarification). Outcome of the events was unknown. Information on the batch number has been requested.

Fainting; Red Palms; blotching; sweating profusely; heart palpitations; Chest pain; Elevated BP; This is a spontaneous report from a contactable consumer (patient). A 46-years-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 28Dec2020 09:15 at single dose on left arm (Lot number: ek9231) for COVID-19 immunisation. Medical history included asthma, bronchitis, mitral valve regurgitation, herpes, depression, ADHD. COVID prior vaccination: Yes. Known allergies: tramadol, milk products. No other vaccine in four weeks. Concomitant medication included amfetamine aspartate, amfetamine sulfate, dexamfetamine saccharate, dexamfetamine sulfate (ADDERALL), bupropion, and, losartan/hydrochlorothiazide. The patient experienced red palms/blotching, sweating profusely, heart palpitations, chest pain and fainting, elevated BP, all on 28Dec2020 09:15. All these events required Emergency room visit. Therapeutic measures were taken as a result of the events included 50 mg of Benadryl, 60 mg of Prednisone, omepresol. No COVID tested post vaccination. Outcome of events was recovered with sequelae.

I have a sleep problem almost eight hours; I was so tired; Headache; My arm was sore for 24 hours; so stiff; This is a spontaneous report from a contactable physician. A 69-year-old patient of an unspecified gender received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date at a single dose for COVD-19 immunization. The patient's medical history and concomitant medications were not reported. The patient had the first dose of the vaccine and had a pretty significant reaction, one say serious to moderate reaction. The patient's question was do they know yet if you take a second shot was your reaction get even worse because the patient had a sleep problem almost eight hours. The patient was so tired, had headache and so stiff, arm was sore for 24 hours. The patient was a little afraid to take a second shot. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to agencys, Ethics Committees, and Investigators, as appropriate.

feeling close to loss of consciousness; intense chest pressure/tightness; shortness of breath; chills while driving home; This is a spontaneous report from a contactable healthcare professional (patient). A 50-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number: EL0142), via an unspecified route of administration in the left arm, on 02Jan2021 at 11:30 (at the age of 50-years-old) as a single dose for COVID-19 immunization. The patient's medical history was not reported. The patient was not pregnant at the time of vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications, taken within two weeks of vaccination, included ibuprofen (MANUFACTURER UNKNOWN). The patient previously took amoxicillin (MANUFACTURER UNKNOWN) and experienced allergy. The patient did not receive any other vaccines

within four weeks prior to the vaccination. The patient experienced feeling close to loss of consciousness, intense chest pressure/tightness, shortness of breath, and chills while driving home on 02Jan2021 at 12:00. The patient did not receive any treatment for the events. The clinical outcome of feeling close to loss of consciousness, intense chest pressure/tightness, shortness of breath, and chills while driving home was recovering. It was also reported that since the vaccination, the patient had not been tested for COVID-19.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of feeling close to loss of consciousness, intense chest pressure/tightness, shortness of breath cannot be excluded, considering the plausible temporal relationship. The underlying predisposing condition of penicillin allergy may put the patient at high risk of anaphylactic reactions. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Right sided facial & top lip Numbness & recurring pain; Right sided facial & top lip Numbness & recurring pain; Right sided facial & top lip Numbness & recurring pain; This is a spontaneous report from a contactable consumer reporting for herself. A 66-year-old female patient (not pregnant at the time of vaccination) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EK9231), via unspecified route of administration on 29Dec2020 13:30 on left arm at single dose for COVID-19 immunization. Facility where the most recent COVID-19 vaccine was administered in Hospital. Medical history included Hypertension, Reflux and low back pain. Concomitant medications included ibuprofen, dicycloverine hydrochloride (BENTYL), Valsartan and omeprazole. The patient previously took codeine, Bactrim, Zyrtec and experienced allergies. The patient experienced Right sided facial and top lip Numbness, recurring pain on 31Dec2020 16:00. All events resulted in emergency room visit and Hospitalization on 31Dec2020 for 1 day. The patient underwent lab tests and procedures, which included Cat scan, MRI, ultrasound of heart and labs on unspecified dates, Nasal Swab/Covid 19 test on 01Jan2021 with negative result. The outcome of the events were not resolved.

hives on her legs; a slight rash on abdomen (started morning on the next day when she woke up) and it spread to her legs (leg rash started 2 days later in the morning); This is a spontaneous report from a contactable nurse (patient). A 58-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) intramuscularly at left arm on 29Dec2020 10:30 at single dose for COVID-19 Immunization. No medical history. No family medical history. There were no concomitant medications. Patient received first dose last Tuesday, 29Dec2020, at the hospital. The next day, she had a slight rash on abdomen (started morning on the next day when she woke up) and it spread to her legs (leg rash started 2 days later in the morning). It was a pretty severe case of hives on her legs now (31Dec2020). Spread to legs and now has hives on legs was reported as worsened. Physician's office visit involved. She had a question. Her doctor prescribed a dosing pack of prednisone to get rid of the hives and her question was, will it affect the effectiveness of the vaccine if she takes it, also, is it ok to get 2nd dose in 2 weeks. She confirmed she had not taken the prednisone yet. There was no prescriber. She received it because she is a healthcare worker. Patient asked if there is any recommendation on getting pre medicated with ex: Benadryl before getting the vaccine. No previous history of all previous

immunization with the Pfizer vaccine considered as suspect. No additional vaccines administered on same date of the Pfizer suspect product. No medications prior vaccinations (within 4 weeks). No test done. This is a serious report. The slight rash on abdomen, spread to legs and now has hives on legs was considered medically significant per reporter. The outcome of the events was not recovered. Information about lot/batch number has been requested.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events rash and urticaria cannot be excluded. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

experienced eye puffiness; light headed ness; scratchy throat; This is a spontaneous report from a non-contactable consumer via Pfizer Sales Representative. A male patient (Health care worker) of an unspecified age and gender received BNT162B2(Pfizer BioNTech COVID-19 vaccine) via an unspecified route of administration in Dec2020 at single dose for COVID-19 immunization. The medical history and concomitant medications were not reported. The patient experienced eye puffiness, light headed ness and scratchy throat 10 minutes after vaccination in Dec2020. Reaction was not considered anaphylaxis. Patient received epinephrine, Pepcid and Benadryl in the ED, felt completely back to normal within an hour and was released. Event took place after use of product. The outcome of events was recovered in Dec2020. No follow-up attempts are possible; information about batch number cannot be obtained.

Felt sharp pain under jaw, then facial numbness. Then quickly developed facial swelling, left eye swelling and tongue swelling. Then felt like throat closing up within 7 minutes of receiving vaccine. Received vaccine in the clinic, was transported to Emergency Room. In ER received Epinephrine, steroids, Benadryl and Pepcid.

1 day after the vaccine he had a low grade fever... 1 week later he had a seizure and then multiple ones in the ER...

Developed shortness of breath, swelling of tongue, persistent cough within 5 minutes of vaccination. Was treated with EpiPen and kept in ER for observation overnight. Symptoms resolved.

Patient contacted provider 12/26 with following symptoms: Dry cough, diarrhea, fatigue for 7 days. Covid test ordered and positive. presented to ED on 12/31 and admitted into hospital. Still inpatient as of 1/7/2021.

Patient experienced an episode of SVT and then sinus tachycardia for approximately 6 hours after injection

"Pt last seen at 1200 by nurse for ID band check. No visible signs of distress noted. Pt states ""I just want to be left alone"". 1230 nurse was called to pt room. Pt was noted unresponsive, no pulse and respiration noted. CPR started immediately, at 1239 first shock given. 1245 EMT took over, at 1319 EMT called time of death"

Hemmoragic Stroke. Began with vision difficulty in the morning. Then I noticed she had left sided neglect. Went to ER. Treated with Andresxa (to counteract Elaquis). In SICU for 2 nights then telemetry unit for 3 nights. CUrrently in Rehab.

"Following vaccination the patient had progressively worsening abdominal pain over the next 24 hours. Presented to the ER and was initially thought to have appendicitis. However, it was then discovered during surgery that the appendix was surgically absent. The surgeon did not that the patient did have a ""Round, infarcted ligamentous tissue was wrapped around ascending colon. """

Patient developed hypoxia on 1/4/2021 and did not respond to maximal treatment and passed way on 1/5/2021

When vaccine was administered, seemed high on my arm. I had immediate soreness and shoulder discomfort, I was told this was normal. It continued to progress and I eventually had decreased ROM, weakness and sharp shooting pain in my shoulder. Working at OI, I consulted provider, xrays were obtained and I was evaluated. He strongly suggested an MRI be obtained as well. That was completed the same day as my evaluation on 12/31/2020 (1 week and 2 days after the vaccine was administered). The provider informed me that they have had patients with similar situations that were evaluated for frozen shoulder after having a vaccine d/t administration site and vaccine going into subacromial space. He does report that this was my case/situation, upon my exam, I had severe inflammation with this as well-he is now having me follow up for a surgical consultation for my shoulder to be repaired. Today's date is 1/7/2021, I have these same ongoing symptoms that have continued since day of administration, without diminishing in severity. He is unable to provide an injection d/t my upcoming second dose of the COVID vaccine this next week, 1/12/2021. He strongly suggests that my 2nd vaccine be administered elsewhere-advised NOT be administered in the same shoulder OR in opposite to cause these symptoms to flare. He advised in gluteus if possible to avoid any further issues if at all possible.

patient declined 12/30/2020 and was transferred to hospital where he did not respond to treatment and passed away 1/4/2020

Patient did not report any signs or symptoms of adverse reaction to vaccine. Patient suffered from several comorbidities (diabetes and renal insufficiency). Patient reported not feeling well 01/06/2021 and passed away that day.

Guillain Barre syndrome/AIDP event. Paresthesia and nerve pain developed in bilateral legs 4 hours after shot and progressed slowly for 4 days in intensity and area involved. Symptoms progressed distally to superior. On the 5th day symptoms progressed rapidly and involved bilateral legs up to the groin, left arm up to lateral shoulder, and right hand. I went to the hospital and was admitted to start IVIG treatment for Guillain Barre Syndrome/AIDP.

Vaccine Candidate received vaccine approxat 2:30pm, was monitored for 15 min no complications at the time, went home. Around 5:30pm while walking into her home she became unresponsive, was assisted in a siting position, became incoherent, mumbling and started to convulse to the right side of her r upper extremity. Foaming at the mouth and stopped breathing, CPR was initiated for 1-2 min, EMS

arrived was transported to Medical Center. She was admitted and is currently hospitalized. MD reports this event is highly unlikely related to the vaccine given her medical history but suggested to report being its a new vaccine. Current status: stable.

Person had a fever of 102.4, pulse rate of 118, he was non-responsive with edema of the right calf & ankle this morning when he was assessed.

Resident had the COVID vaccine 12/30/2020. 12/31/20, resident has been in bed all shift. Staff became concerned when resident was not easily aroused. Resident displayed signs of tremors, twitching, confusion, in and out of consciousness, low O2 sats, elevated pulse and fever, fatigue and weakness. Writer called NP. NP stated this is most likely a reaction d/t the COVID vaccine. She gave orders for Benadryl 25mg IM x1 now and Tylenol 1000 mg now. NP also stated resident will not be getting the second dose of vaccine. Will continue to monitor and update NP if worsening symptoms. After receiving Benadryl and Tylenol at 145pm, resident began to appear as though she was feeling better and was talking to talk, fever had gone down. Tonight resident is not easily aroused, lethargic, continues to have tremors and twitches, almost appearing as convulsions. When asked if she knows where she is or what day it is, resident can properly answer. Resident denies SOB but staff has noted loud squeals while breathing. NP was updated and gave new orders to give Benadryl 25 mg IM x1 if needed and Ok to send resident to ED. Resident currently refuses to go to the hospital. Will continue to monitor. BP 152/112, P 116, T 99.1, O2 87-91. Resident's O2 at 1205am was 80% on 3LPM. Resident unable to be aroused from sleep by writer. NAR called to assist. NAR could not arouse resident. Writer and NAR attempted to reposition resident and resident's breathing became more labored. Resident turned back to previous position and writer called on call MD at approx. 1220am. MD returned call approx. 1235am with orders to send resident to ED. 911 called and ambulance arrived about 1245am. History of present condition given to EMTs and they stated resident would be going to Hospital. Writer has attempted to contact Hospital ED x3 but have been unable to get through. An EMT did just call to clarify when vaccine was given, what symptoms have been present and when they started. She said she has everything she should need and she will let Hospital ED staff know to call if they need anything else. Writer will again attempt to contact them though. Resident's temp was 97.5 and BG 128. When EMTs arrived they got an O2 reading of 60%. Resident did open her eyes a couple times during transfer from bed to stretcher and while stretcher was going outside but no responses from resident were made.

had a vaccination on 12/31/2020 late morning passed away early morning 01/01/2020. This is a 93 year old with significant heart issues. EF of 20% among other comorbidities. He died suddenly approximately 0430, it is unlikely it was related to receiving the vaccine.

Immediate pain and loss of range of movement of left shoulder. Physical examination today demonstrates a healing injection site which is fairly superior on the left shoulder, and abduction of the left shoulder which is limited secondary to pain. Patient's physician's impression is that he has a subdeltoid bursitis which was temporally associated to the COVID-19 vaccination. (SIRVA)

RED CIRCULAR RASH AND LUMP UNDER SKIN. SKIN IS VERY ITCHY

Diffuse polyarthropathy starting the day after vaccination and continuing for 7+ days. Currently treating with abx for concern of possible cellulitis, and prednisone 60mg for polyarthropathy. Currently admitted.

woke up with fever and sore throat on 22nd; went to job and got tested and tested positive; on the 23rd developed right upper lobe pneumonia; on 27th was hospitalized with three lobe pneumonia; On 22nd received got zpack - azithromycin and sudafed; received at hospital doxicycleln IV ; ivermectin and went home with them, as well. Hospital

Day 2 (12/29/20): Fever (<100 degrees), Mild muscle aches, Fatigue Day 3 (12/30/20): Fatigue, Muscle aches Day 4 (12/31/20): Alternating chills and profuse sweating starting at 8am, Full body flushing, Grand Mal Seizure at 4:30pm

Patient was vaccinated at 11am and was found at the facility in his room deceased at approximately 3:00pm. Nurse did not have cause of death

Nausea, hives, anaphylactic shock, throat swelling, hypotension, headache, dizziness, weakness . The symptoms returned at 1:25pm the best day as well. I?ve now had two anaphylactic reactions

No adverse effects noted after vaccination. Patient with cardiac history was found unresponsive at 16:45 on 1/6/21. Abnormal breathing patterns, eyes partially closed SPO2 was 41%, pulseless with no cardiac sounds upon auscultation. CPR and pulse was regained and patient was breathing. Patient sent to Hospital ER were she remained in an unstable condition had multiple cardiac arrest and severe bradycardia and in the end the hospital was unable to bring her back.

Hives-like appearance on both arms within 10 minutes of administering vaccine. Resolved by itself in 30-40 minutes.

45 min later after receiving the vaccine I felt a lump in my throat. No other symptoms of an allergic reaction. Took benadryl with improvement of symptoms. Had intermittent difficulties swallowing seven hours afterwards. Went to the ED and was prescribed prednisone/ pepcid/benadryl. Symptoms improved but next day felt intermittent difficulty swallowing again. Returned to the ED and was given IV solumedrol and, IV pepdcid, IV benadryl.

Patient alerted pharmacist to feeling light headed at 12:10pm. Patient was instructed to sit down on the floor. She stated she felt hot and hadn't eaten all day. She was given a few bites of apple sauce and some Dr. Pepper to drink in case of low blood sugar. She was also given 25mg of diphenhydramine in case of an allergic reaction after the vaccine adminstration at 12:15pm. A few minutes later, she began shaking and stated she thought she was having an anxiety attack. At this time, the patient requested we call 911 because that would make her feel better and so we did.

Symptoms started during bedtime and woke me up. Began with severe full body chills and full body muscle shaking and weakness during the night of 1/5 and early morning of 1/6, around 1000 to 0200. Slight headache began during that time as well. Upon waking at 0900 on 1/6, chills and shaking decreased to mild severity, muscles still felt moderately weak and shaky, headache had increased in

severity to a severe throbbing pain that worsened upon standing and walking, and moderate visual photosensitivity began. The headache persisted until I took 2 tablets of ibuprofen 200 mg, which is when the severity decreased to moderate after a few hours and then mild by bedtime. The photosensitivity persisted through the day and did not decrease much by bedtime. Upon waking 1/7, there was only a mild headache and mild photosensitivity that faded completely within a few hours, no medication required. No more symptoms in the afternoon.

Moderna covid 19 vaccine EAU

2 hrs after vaccine felt sweating, clammy. Gas pains and cramps began. Loose stool once. 7 pm arm was sore and throbbing 6 of 10, injection site flushed and warm to the touch 9pm pain worsened to 8of 10. Unable to grab toothbrush with left arm sharp pain 10 of 10. Unable to sleep on left side due to pain and pressure . 6:00 am Thursday pain worse and unable to lift arm above the shoulder. Was unable to drive with left hand. All day today bad gas and abdominal cramps.by the end of the work day I was unable to hold anything in my left hand, body aches started, legs tight and achy. Frontal headache. Took Tylenol extra strength q 6 hrs, nsaid 800mg bid. And aleve, no relief

Had chills fever and body ache starting 01/07/21 Temperature went as high as 102.0 took ibuprofen and came down 97.9

On day 7, a red rash appeared just below the injection site and is indurated, hot, and tender. It spread in size within the next day.

Morning 8 days after injection, emergence of rash above injection site and redness and swelling at injection site. Morning 9 days after injection rash became a larger hive and doubled regular Zyrtec dosage. Morning 10 days after injection symptoms gone.

"Tire on day one-slept for 18 hours. Day 2: Woke up and was mildly achy, not wanting to do anything and red large swelling in my right deltoid. Very tender. Also, edema starting in my right axilla extending down my lateral chest about 7"". Day 3 to 7: Achiness is gone. Edema and swelling continue. Eventually the red swollen area became itchy. The edema under my arm (not a lymph node) was tender when my arm was close to my body. Woke me up during the night frequently. Very hard to sleep."

4 days later after the vaccine my left eye turned really red with crust and mucus coming out. I went to walk in clinic and was being treated for pink eye. I was started on an antibiotic eye drop. A day later my right eye started to have the same problem. I scheduled an appt with a eye specialist where he examined both eyes and said I had a major infection. I was started on steroid eye drops which I am still taking but seems my eyes are not getting better. I have a follow up with another specialist next week for further testing. I have been out of work due to this matter.

"Severe allergic reaction; anaphylactic reaction; A spontaneous report was received from a physician, who was also a male patient who received Moderna's COVID-19 Vaccine and developed a severe/anaphylactic allergic reaction. The patient's medical history, as provided by the reporter, included a shellfish allergy and elevated Immunoglobulin E. He reported no history of adverse events

following other immunizations, that all his immunizations were up to date, and that he gets the flu shot annually. Products known to have been used by the patient, within two weeks prior to the event, included pantoprazole, vitamin D, and vitamin B12. On 24 Dec 2020, minutes prior to the onset of the event, the patient received the first of two planned doses of mRNA-1273 intramuscularly for COVID-19 infection prophylaxis. Within minutes, the patient felt dizzy and his heart was racing. His throat felt swollen and he experienced shortness of breath (""heavy breathing"") with no wheezing or stridor, but with chest tightness that he felt was possibly related to anxiety about receiving the vaccine and the potential for allergic reaction. No supplemental oxygen was required. Vital signs showed a heart rate of 145, with normal blood pressure (BP) and oxygen saturation. After a few more minutes, he started to feel numbness and tingling in his mouth and tongue. He experienced diaphoresis (""drenched in a cold sweat""), skin pallor (""skin was severely pale""), felt faint, and reported that his blood pressure was undetectable by a monitor. He did not lose consciousness and denied any skin rash. The patient felt he was developing an allergic reaction and self-administered his personal epinephrine auto-injector. He felt better within five to six minutes after self-administration of epinephrine and was taken by stretcher to the Emergency Department for further evaluation and treatment of shortness of breath, dizziness, palpitations, and numbness. The patient was evaluated, treated, observed, and discharged four hours later. Treatment provided for the events while in the Emergency Department included diphenhydramine hydrochloride, intravenous (IV) fluids, IV steroids, and famotidine. On 25 Dec 2020, the patient felt fully recovered. On 26 Dec 2020, the patient felt dizzy and reported experiencing a ""rapid heart rate"" of 70-120 with a systolic BP that was abnormal for him at 150 mmHg. He also reported that he felt premature atrial contractions, for which he took his wife's propranolol. His heart rate came down, but he still felt flushing and dizziness for a few more hours. Action taken with mRNA-1273 in response to the event was not reported. The outcome of the event, severe/anaphylactic allergic reaction, was considered resolved on 26 Dec 2020. The reporter assessed the event of severe/anaphylactic allergic reaction as related to Moderna's COVID-19 Vaccine due to the temporal association and the similarity of symptoms previously experienced with severe/anaphylactic allergic reactions to shellfish.; Reporter's Comments: Company Comment: This case concerns a male patient with medical history of shellfish allergy , who experienced an unexpected events of severe allergic reaction; anaphylactic reaction, dizzy, faint, heart racing, tongue prickled and went numb, cold sweat, blood pressure plummeted, shortness of breath, numbness and skin was pale..The onset of event occurred 15 hrs the first dose of vaccine administration . The events are assessed as possibly related to vaccine."

throwing up; fever; body aches; her whole intestines hurt; it was horrible; thought she had contracted COVID-19; thought she had contracted COVID-19; tired; This is a spontaneous report from a contactable consumer. A 54-years-old female patient received her first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EL0140), via an unspecified route of administration on left arm on 17Dec2020 at 19:15, at a single dose for vaccination. Medical history included ongoing ulcerative colitis, onset date was unknown, but when she was about 25 years of age. Concomitant medication included ongoing azathioprine for ulcerative colitis, started probably 5-10 years ago and taken daily since. In the past, she took different products for ulcerative colitis off and on when she had an episode. This patient reported she was administered her first Pfizer COVID-19 Vaccine injection on 17Dec2020 and was just kind of tired on 17Dec2020; but she had onset of serious reactions to the

COVID-19 Vaccine starting 18Dec2020 for 2 days straight and then as suddenly as the events started they suddenly stopped after 2 days with no lasting effects. She called to ask if there is any data about if the second dose of the COVID-19 Vaccine will be just like the first shot or if the events are just hit or miss; she is really hoping not to be that sick again with the second dose. Serious reactions to the COVID-19 Vaccine further described as sick for like 2 days straight. Afternoon of 18Dec2020 she was throwing up; had fever; body aches; thought she had contracted COVID-19 in between injection and onset of symptoms; she had no lung issues; her whole body hurt; she could not stop throwing up; her whole intestines hurt; it was horrible; she could not hold anything down for like 2 straight days and then just left on 20Dec2020. Scheduled date for second dose was on 06Jan2021, she has no plan to change dose schedule. The outcome of the event of tired recovered in Dec2020, while other events recovered on 20Dec2020.

positive COVID-19 test with symptoms; positive COVID-19 test; gastritis; diarrhea; This is a spontaneous report from a contactable other hcp (patient). A 50-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EJ1685; expiry date was not reported), via an unspecified route of administration on the upper right arm on 21Dec2020 at single dose for COVID-19 immunization. Medical history included blood pressure high, attention deficit hyperactivity disorder (ADHD), hypertension all from an unknown date and unknown if ongoing, and was a former smoker. Concomitant medication included lisinopril and methylphenidate. The patient reported that after he received the vaccine, he tested positive for Covid on 30Dec2020. The patient further reported that he ended up getting significant gastritis on Christmas Eve, which he didn't think about acquiring COVID, he had had the vaccine, he ate a bunch of holiday fare, so he thought he had got a stomach bug or something like that. He says he had considerable diarrhea on Christmas morning, but no fever or chills, then those symptoms resolved by Saturday, and he didn't think about it, he didn't have any issues. He says that he went to get tested, which they do frequently, and his temperature was checked frequently at the places he goes and he had no fever, and is still not febrile now. He says that he gets a weekly COVID test which allows for him to enter different facilities, and this was the first time in 9 months that he tested positive since this all came out. He says he has worked in some heavy duty places, but he wears his PPE, his respirator, his shield, and still did this stuff after he got the vaccine, he didn't let his guard down since it might take a while for immunity to kick in, but he still didn't think that it could be possible to have COVID on Christmas Eve, he was rather surprised he was positive. The patient confirms that he hasn't had the second dose of the vaccine yet. He says that his diarrhea improved on day or two starting after he had been having bloating on Christmas Eve and Christmas morning. He says his diarrhea resolved, he took no medication for it, and had no change in his heart rate or breathing, no problems anywhere else, he didn't feel that bad, except for the going to the bathroom. The patient underwent lab tests and procedures which included sars-cov-2 test: positive on 30Dec2020. The outcome of the events was unknown.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this subject cannot be completely excluded. Further information like confirmative virus genome /nucleic acid detection needed for meaningful medical assessment.

Reported to get the vaccine, and within a couple of hours or days, test positive for COVID; Reported to get the vaccine, and within a couple of hours or days, test positive for COVID; This is a spontaneous

report from a contactable other HCP received from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A patient of unspecified age and gender received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date at a single dose for covid-19 vaccination. The patient's medical history and concomitant medications were not reported. The patient reported to get the vaccine, and within a couple of hours or days, test positive for covid. The outcome of the event was unknown Information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of SARS-CoV-2 test positive and LOE due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2020520145 different patients, same drug and event

Cough; Fever; body aches; Tested positive for COVID after the first dose of the vaccine/tested positive for COVID-19; Tested positive for COVID after the first dose of the vaccine/tested positive for COVID-19; This is a spontaneous report from a contactable physician reporting for himself from a Pfizer sponsored program, IBCC (Inbound Call Center for HCPs). A 31-year-old male received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number EK5730) intramuscular Deltoid Left, on 17Dec2020 9:00, single dose for COVID-19 immunisation. Relevant medical history included seasonal allergies and asthma. Concomitant medications were reported as none. The patient took the first dose of the COVID-19 Vaccine and he is schedule on 07Jan2021 for his second dose. After the first dose he tested positive for COVID on 30Dec2020. The patient got tested for COVID-19 around 10:30 a.m. The patient hasn't seen a physician and he doesn't don't plan on it. The patient had a cough on an unspecified. Early on he had a fever and body aches but that passed after the first day. Caller clarifies the fever and body aches started Sunday and were gone by Tuesday morning. The cough started on Monday and is still ongoing and persisting. The patient was not hospitalized in response to the events. Outcome of the event cough was not recovered, the events fever and body aches recovered on an unspecified date, while it was unknown for tested positive for COVID after the first dose of the vaccine.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the SARS-CoV-2 test positive, LOE and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Test positive for COVID after the first vaccine dose; Test positive for COVID after the first vaccine dose; This is a spontaneous report from a contactable Physician. This Physician reported similar events for 2 patients. This is the 2nd of 2 reports. A female patient of unspecified age received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 vaccination. The patient's relevant medical history and concomitant medications was not reported. The patient was tested positive after the first dose of the vaccine. The outcome of the event was unknown. Information on the lot/batch number has been requested; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of COVID-19 virus test positive and LOE due to temporal relationship. There is limited information provided in this report. positive for COVID-19 after 1st dose; positive for COVID-19 after 1st dose; This is a spontaneous report from a contactable nurse. A female patient of an unspecified age received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The nurse was inquiring about receiving the second dose of vaccine

after testing positive for COVID-19 after 1st dose. Outcome of the event was unknown. Information on Lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further information like confirmative virus genome /nucleic acid detection needed for meaningful medical assessment.

came out positive for Covid-19; came out positive for Covid-19; This is a spontaneous report from a contactable pharmacist. A male patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in 29Dec2020 at a single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient came out positive for covid-19 on 30Dec2020 and inquired if he should still get the 2nd dose. Information on the lot/batch number has been requested.

"testing positive for covid/ they have had a patient have a positive COVID test after vaccine was given; testing positive for covid/ they have had a patient have a positive COVID test after vaccine was given; This is a spontaneous report from a contactable pharmacist via medical information team and a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A 43-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EK5730, expiration date 31Mar2021), via an unspecified route of administration on 18Dec2020 at single dose for COVID-19 immunization. The patient's medical history included ongoing asthma. The reporter was not aware of any allergies, adverse reactions to previous vaccines, significant medical history or any relevant family medical history of the patients. Concomitant medications were reported as none. It was reported that that they had a patient who had a positive COVID test after vaccine was given. The patient who received the vaccine on 18Dec2020 now testing positive for COVID. The patient received the first vaccine dose on 18Dec2020. She tested positive 30Dec2020. They wanted to give her monoclonal antibodies (Bamlanivimab) but they don't know how that would interact with the vaccine. Also, they didn't know how the product and the positive test would play into her already having the first dose and getting the second dose. The second shot would be due on 08Jan2020. The patient was not at the facility at the point of reporting, they had been talking to her by phone. The type of test done was unknown. No treatments known. The outcome of the event ""positive COVID test after vaccine was given"" was not recovered. The event was assessed as medically significant, and unrelated to vaccine by reporter. The seriousness assessment option was made due to her history of asthma.; Sender's Comments: Based on available information, a possible contributory role of suspect BNT162B2 cannot be completely excluded for reported ""positive COVID test after vaccine was given""."

Contracted Covid; Contracted Covid; This is a spontaneous report from a contactable Other Health Professional (patient). A 59-year-old female patient received the first dose of BNT162b2 (Lot/batch number and Expiration date were not provided), via an unspecified route of administration at left arm on 21Dec2020 18:00 at single dose for COVID-19 immunization. Medical history included chronic obstructive pulmonary disease (COPD). The patient received the unspecified concomitant medications within 2 weeks of vaccination; patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was contracted COVID on 29Dec2020 20:00. The event resulted in Doctor or other healthcare professional office/clinic visit. Patient received the treatment Monochrome antibiotic

for event. The patient received the COVID test post vaccination on 29Dec2020. The COVID test type post vaccination was Nasal Swab, COVID test name post vaccination was RNA, COVID test result was Positive. The patient was not COVID prior vaccination. The patient was not pregnant at the time of vaccination. The outcome of the events was not recovered. Information on the Lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the vaccination with BNT162B2 in this patient cannot be completely excluded.

He lost the sense of smell on 28Dec2020 and later tested positive; He lost the sense of smell on 28Dec2020 and later tested positive; He lost the sense of smell on 28Dec2020 and later tested positive; This is a spontaneous report from a contactable other healthcare professional (HCP). A male patient (respiratory therapist) of an unspecified age received a single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) as the first dose via an unspecified route of administration on 16Dec2020 for COVID-19 immunization. The patient medical history and concomitant medications were not reported. He lost the sense of smell on 28Dec2020 and later tested positive in Dec2020. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further information like confirmative virus genome /nucleic acid detection is needed for meaningful medical assessment.

"I came down with a COVID infection; I came down with a COVID infection; This is a spontaneous report from a contactable healthcare professional (HCP) reporting for herself. A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number not reported) via an unspecified route of administration on 18Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient came down with a COVID infection on 23Dec2020 with outcome of unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported event ""came down with a COVID infection"" based on the known safety profile. However the short duration of 5 days since the vaccine first dose is given it is unlikely patient would have fully developed immunity."

Anaphylactic reaction; hives in the first 10 minutes of the vaccine; This is a spontaneous report from a contactable Other Health Professional (Physician Assistant). A 29-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 29Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter stated that she is treating a patient in ICU that got the COVID-19 vaccine on 29Dec2020. The patient developed hives in the first 10 minutes of the vaccine and had an anaphylactic reaction 1 hour later. Seriousness of events was reported to be hospitalization. Outcome of the events was unknown. The reporter also mentioned that it was not a mild reaction and patient was still in the ICU, 48 hours later. Information about lot/batch number has been requested.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of anaphylactic reaction and hives cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation,

including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"She tested positive PCR; She tested positive PCR; This is a spontaneous report from a contactable Nurse. A female patient of unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 17Dec2020 at single dose for COVID-19 immunization. The relevant medical history and concomitant medications were not reported. Resident inoculated on 17Dec. She tested positive PCR on 29Dec2020. Currently in quarantine and asymptomatic. She was scheduled for dose 2 on 06Jan2021. This still fell in quarantine period. The nurse wanted to know if the patient could get the second dose on 06Jan, if not when should she get second dose. The outcome of the events was unknown. Information about lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of suspect BNT162B2 vaccine cannot be completely excluded for reported event ""test positive PCR""."

I tested positive for COVID 9 days after receiving the vaccine; I tested positive for COVID 9 days after receiving the vaccine; Rhinorrhea; aches; fatigue; cough; This is a spontaneous report from a contactable physician. This physician reported similar events for two patients. This is the first of the two reports. A 68-years-old female patient (not pregnant) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date not reported), via an unspecified route of administration on the left arm on 21Dec2020 at 09:30 at a single dose for COVID-19 immunization. Medical history included hypertension. The patient had no known allergies. Concomitant medications included losartan (LOSARTAN), amlodipine (AMLODIPINE), and atorvastatin (ATORVASTATIN). On 28Dec2020, the patient had rhinorrhea, aches, fatigue, and cough. The patient had no COVID prior vaccination, and when tested post vaccination showed a positive result. It was reported that the patient was tested via nasal swab (PCR SARS) and showed positive for COVID on 30Dec2020, 9 days after receiving the vaccine. The patient had no other vaccines in four weeks. No treatment was administered for the events. The events had not resolved. Information on the lot/ batch number has been requested.; Sender's Comments: A causal association between BNT162B2 and the events drug ineffective and SARS-COV-2 test positive cannot be excluded based on a compatible temporal relation. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2021001246 Same reporter, same drug, similar events, different patients.

She also complained of all the COVID signs and symptoms; She also complained of all the COVID signs and symptoms; left cervical, axillary, clavicular and periscapular lymphadenopathy; left arm and shoulder pain; left arm and shoulder pain; This is a spontaneous report from a contactable physician. An adult female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Solution for injection, lot number was unknown, intramuscular in the left arm on 28Dec2020 at a single dose for COVID-19 immunization. Medical history included covid-19 from an unknown date and unknown if ongoing. The patient's concomitant medications were not reported. The patient is not pregnant. It was

unknown if the patient received any other vaccines within 4 weeks prior to the COVID vaccine. It was reported that after receiving the Pfizer COVID-19 vaccine in the left deltoid, the patient experienced left cervical, axillary, clavicular and periscapular lymphadenopathy in Dec2020 with outcome of not recovered. She also complained of left arm and shoulder pain and all the COVID signs and symptoms in Dec2020 with outcome of not recovered. The onset was within a day of immunization. She has a history of COVID-19, she had Covid prior vaccination. It was unknown if the patient tested for Covid post vaccination. The onset date of the events was reported as Dec2020. The events was reported as non-serious and it was unknown if the patient received treatment for the events. Information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the suspected LOE, COVID 19 and other reported events due to temporal relationship. Of note, it is reported that the patient had a history of COVID-19, and she was diagnosed with COVID 19 infection prior to the vaccination. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics , counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

tested positive for Covid test; tested positive for Covid test; difficulty breathing; chills; fluctuating fever; nausea; weakness; weakness/extreme fatigue; loss of taste and smell; loss of taste and smell; muscle pain; cough; sore throat; nasal drip; dizziness; fast heartbeat; injection site pain; anxiety; crying; This is a spontaneous report from a contactable healthcare professional. This 21-year-old female patient reported for herself that she received BNT162B2 1st dose on 31Dec2020 10:00 AM intramuscular at left arm for COVID-19 immunisation. Medical history included known allergies: Penicillin and Covid-19. Concomitant therapy included BC as reported. The patient experienced difficulty breathing, chills, fluctuating fever, nausea, dizziness, weakness, fast heartbeat, tiredness, loss of taste and smell, muscle pain, injection site pain, anxiety, cough, sore throat, nasal drip, crying, extreme fatigue, Etc on 31Dec2020 at 06:00 PM. The events resulted in doctor or other healthcare professional office/clinic visit, emergency. The patient was hospitalized for 1 day and received treatment included blood thinner rivaroxaban (XARELTO) and had 2 weeks quarantine. The patient had Covid prior to vaccination and tested positive for Covid test post vaccination on 01Jan2021. The outcome of the events was not resolved. Information on Lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the suspected LOE, SARS-CoV-2 test positive and the other reported events due to temporal relationship. Of note, it is reported that the patient had history of COVID 19 infection prior to the vaccination. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part

of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

polyneuropathy; facet joint diagnosis/new left forefoot paresthesia; This is a spontaneous report from a contactable physician (patient). A 45-years-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot EJ1685) at the first dose in left arm on 17Dec2020 12:45 at single dose for COVID-19 immunisation. Facility where the most recent COVID-19 vaccine was administered at Doctor's office/urgent care. Medical history included ongoing back pain (thinking it was due to running/physical therapy overuse injury). No allergies to medications, food, or other products. There were no concomitant medications. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No any other medications the patient received within 2 weeks of vaccination. It was reported that 20Dec2020 morning: new left forefoot paresthesia. no weakness. Patient thought this might be due to the back pain he had been watching for 3 months, thinking it was due to running/physical therapy overuse injury. On 21Dec2020 sports medicine physician evaluation. numbness was gone, facet joint diagnosis, MRI lumbar ordered (still pending). On 24Dec2020 9 pm, paresthesia both hands and feet, no weakness nor other symptoms those continued and were slightly worse on 27Dec2020 morning, including face/teeth. no other symptoms; 27Dec2020 afternoon: internal medicine physician evaluation, working diagnosis polyneuropathy. Neurologist appointment will be 07Jan2021, 2 hours before 2nd shot was scheduled. The patient had been tested for COVID-19 test type post vaccination: negative on 22Dec2020. No treatment for event. Prior to vaccination, the patient was not diagnosed with COVID-19. Outcome of events was not resolved.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of polyneuropathy and facet joint diagnosis/new left forefoot paresthesia due to temporal relationship. However, the reported events may possibly represent intercurrent medical conditions in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including nerve conduction tests, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

got COVID-19 from his son and tested positive; got COVID-19 from his son and tested positive; This is a spontaneous report from a contactable physician. A 51-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 18Dec2020 at single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient got COVID-19 from his son and he tested positive 31Dec2020. The patient's son got the COVID-19 virus on 20Dec202020. The patient is due to have 2nd vaccine on 07Jan2021. Outcome of the events was unknown. Information on batch number has been requested.;

Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 virus test positive cannot be totally excluded. The case will be reassessed if additional information becomes available.

was diagnosis with COVID-19 through nasopharyngeal swab today, 02Jan2021; was diagnosis with COVID-19 through nasopharyngeal swab today, 02Jan2021; This is a spontaneous report from a contactable pharmacist (patient himself). A 34-year-old male patient received his first dose of bnt162b2 (BNT162B2 also reported as COVID 19 brand Pfizer, lot EJ1685, expiry date not reported), via an unspecified route of administration in his right arm on 23Dec2020 15:30 at single dose, for Covid-19 vaccination. The patient's medical history was not reported. Prior to vaccination the patient was not diagnosed with COVID-19. He did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Concomitant medication included bupropion. The patient informed that he was diagnosed with Covid-19 through nasopharyngeal swab (COVID-19 Nucleic Acid Amplification test) on 02Jan2021 01:00 and Influenza virus test was unknown results (02Jan2021). It was unknown if there was a treatment used. The outcome of event was not recovered.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

she received the Pfizer vaccine on 29Dec2020. She tested positive for coronavirus on 01Jan2021. Is the efficacy of the vaccine after the second dose?; tested positive for coronavirus; This is a spontaneous report from a contactable nurse reported for herself. A female patient of an unspecified age received first dose of BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine; lot/batch number and expiry date were unknown), via an unspecified route of administration on 29Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. VA nurse calling stating that she received the Pfizer vaccine on 29Dec2020. She tested positive for coronavirus on 01Jan2021. She wanted to know how to proceed with getting her second vaccine, and if the efficacy of the vaccine is after the second dose. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and Coronavirus test positive cannot be totally excluded. The case will be reassessed if additional information becomes available.

received vaccine on 17Dec2020, then tested positive for coronavirus on 25Dec2020; received vaccine on 17Dec2020, then tested positive for coronavirus on 25Dec2020; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 17Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received vaccine on 17Dec2020, then tested positive for coronavirus on 25Dec2020. The patient was calling to inquire if she can get second vaccine. Outcome of the event was

unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available.

became positive for covid 19; became positive for covid 19; This is a spontaneous report from a contactable other healthcare professional (patient). A female patient of an unspecified age received the first dose of bnt162b2 (Pfizer-Biontech Covid-19 Vaccine) via an unspecified route of administration on 22Dec2020 at a single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient she received covid vaccine on 22Dec2020 and on 30Dec2020 became positive for covid 19. The patient wanted to know when she can schedule her 2nd dose. Outcome of the event was unknown. Information about Batch/Lot number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available.

slight cough; diarrhea; shortness of breath; no sense of smell; positive for covid 19 virus; positive for covid 19 virus; feel tired; sore arm; This is a spontaneous report from a non-contactable consumer (patient). A 44-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) first dose on 20Dec2020 at single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. Patient was Diagnosed with covid 19 virus on the 31Dec2020, she was set to have the second vaccine on the 10Jan2021. She wanted to know if she can get the second dose and if so, when. Also asked if she should get tested before taking the 2nd dose of the covid 19 vaccine. Her Adverse effects are sore arm on vaccination day (20Dec2020), and she began to feel tired on 27Dec2020 and thought that was normal. She went to a Christmas eve party 24Dec2020 and no one was masked, friend had several people from work tested positive. was tested and was positive for covid 19 virus on 31Dec2020. She also was experiencing slight cough, diarrhea (which is normal for her), shortness of breath is improving and she had no sense of smell but she was able to taste. The outcome of event shortness of breath is recovering. The outcome of other events was unknown. No follow-up attempts are possible. information about lot/batch number cannot be obtained.

Tested Positive for COVID-19/nausea, occasional dry cough, neck and lower back soreness, and sore throat; Tested Positive for COVID-19/nausea, occasional dry cough, neck and lower back soreness, and sore throat; Weakness/generalized weakness; This is a spontaneous report from a contactable nurse (patient). A 62-year-old female patient received first dose of BNT162b2 (Pfizer, Lot number: 5730), via an unspecified route of administration at right arm at 22Dec2020 21:00 at single dose for covid-19 immunization. Medical history included Mayonaise allergies. The patient's concomitant medications were not reported. The patient previously took codeine and experienced allergies. At 31Dec2020 06:00, the patient experienced Weakness, nausea, occasional dry cough, generalized weakness, neck and lower back soreness, and sore throat which has now dissipated. Tested Positive for COVID-19 on 02Jan2021 (also reported as 01Jan2021, pending clarification). The covid test type post vaccination was Nasal Swab, Covid test name post vaccination was COVID-19 PCR ROCHE c6800(NTX), RNA SARS CoV2 TGT1, PAN

SARS RNA TGT2. No treatment received for events. The events result in Emergency room/department or urgent care. The patient was not pregnant. The outcome of the events were nor recovered.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available.

Took the COVID vaccine; Rapid Antigen Test turned out positive, PCR test came out negative; Took the COVID vaccine; Rapid Antigen Test turned out positive, PCR test came out negative; This is a spontaneous report from a non-contactable consumer. A patient of unspecified age and gender received BNT162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. The patient took the COVID vaccine, and a few days later they took the Rapid Antigen Test, the COVID test. And it turned out positive. The person took other tests as well, PCR test which came out negative. The reporter didn't know if there was any research or data if that was done maybe during clinical trials of whether it is possible to come out positive on an antigen test which tests for bio-protein. The reporter believe that was what in the vaccine. The reporter guess the vaccine causes the reaction in the body to make that protein in the body. The reporter wonder if it was possible it could be false positive on one of those tests because of the vaccine, because of the way that rapid test works. The outcome of the events was unknown. No follow-up attempts are possible. Information about lot/batch number cannot be obtained. No further information is expected.

"Got tested positive; Got tested positive; This is a spontaneous report from a contactable nurse from a Pfizer-sponsored program Pfizer First Connect. A male patient of an unspecified age received first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EJ1685, Expiry Date: 31Mar2021), via an unspecified route of administration on 17Dec2020 at single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. Transferring agent stated, ""I have a nurse (reporter) on the other line. She is currently on hold. She is reporting an adverse event about COVID Vaccine because she is saying that their doctor (Incomplete sentence). I mean, the nurse on the other line is working at the vaccine clinic. One of their doctors in the clinic had COVID Vaccine on 17Dec2020. I mean, the Doctor got positive or tested positive on 23Dec2020. Should that mean that the COVID Vaccine or the first dose of COVID Vaccine did not take effect for the Doctor itself because the Doctor got positive? They would like to know if they should still need to take second dose of COVID Vaccine."" When paraphrased the concern, reporter stated, ""Correct. And the question is would he need to get his second dose. It is said that it's two doses."" The outcome of the events was unknown.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported event test positive based on the known safety profile. However the short duration of 6 days since the vaccine first dose is given it is unlikely patient would have fully developed immunity."

Anaphylactic reaction; This is a spontaneous report from a contactable nurse. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), via an unspecified route of administration on deltoid (unknown which) on 31Dec2020 at 0.3 mL, single for

COVID-19 immunization. There were no medical history and concomitant medications. The patient experienced anaphylactic reaction on 31Dec2020. The event required emergency room visit for observation and treatment.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of anaphylactic reaction cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"Tested positive for COVID after having received the vaccine; Tested positive for COVID after having received the vaccine; This is a spontaneous report from a contactable nurse. This nurse reported similar events for 2 patients. This is second of 2 reports. A 7-decade-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EJ1685, expiration date Mar2021), via an unspecified route of administration on 19Dec2020 at 0.3 mL, single in the left deltoid for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. It was reported that on 30Dec2020, the patient tested positive for COVID after having received the vaccine. The reporter said that they had been vaccinating people at their work. The reporter had vaccinated two people now who within about a week after, they tested positive for COVID. The patient was exposed to COVID outside of work. This patient was a healthcare worker (Doctor) in his 60's, weight within normal limits. He seemed healthy. He was fit. He showed up for work everyday. He was vaccinated on 19Dec2020, then tested positive for COVID yesterday, on 30Dec2020. The reporter was wondering if the patient should still get the second dose in 3 weeks, or wait 90 days after tested positive. The reporter needed to know whether to stick with the 21 day time period for the second dose, or wait 90 days. They had been telling people who were already positive, or who had COVID in the past, to wait 90 days to get the vaccine. The reporter had read all of the literature and looked online and could not find any information on this. The outcome of the event ""tested positive for COVID after having received the vaccine"" was not recovered. The event was assessed as non-serious, and unrelated to vaccine by reporter. She did not think, with either of these patients that them getting COVID had anything to do with the vaccine. She thought it was a coincidence and they were obviously exposed prior to receiving the vaccine.; Sender's Comments: Based on the information currently available, the reported event ""tested positive for COVID"" which was further reported as getting COVID by the nurse, was likely related to patient's exposure to SARS-CoV-2 virus prior to vaccination, and unlikely causally related to BNT162B2 vaccine. Further information like confirmative virus genome /nucleic acid detection needed for more meaningful medical assessment.,Linked Report(s) : US-PFIZER INC-2021001215 Same drug and events, different patient"

"Got the vaccine and developed COVID; Got the vaccine and developed COVID; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs) from a contactable physician. This pharmacist reported similar events for two patients. This is the second of two reports for Infection Control Nurse's daughter. A female patient of an unspecified age received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an

unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient got the vaccine and 10 days later, got COVID, so, she got swabbed on unknown date. The patient was wondering if she needed to start over or if she was okay to get the second dose. The outcome of events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported ""got COVID"", based on the known safety profile. However the short duration of 10 days since the vaccine first dose is given it is unlikely patient would have fully developed immunity.,Linked Report(s) : US-PFIZER INC-2021001217 same reporter/product, similar events, different patients."

"Tested positive for COVID after having received the vaccine; Tested positive for COVID after having received the vaccine; This is a spontaneous report from a contactable nurse. This nurse reported similar events for 2 patients. This is 1st of 2 reports. A 7-decade-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot number: EJ1685, expiration date: Mar2021), via an unspecified route of administration on 18Dec2020 at left deltoid, at 0.3 mL, single for covid-19 immunization. Medical history included ongoing diabetic. Concomitant medication included insulin for diabetic; pioglitazone hydrochloride (ACTOS) for diabetic and all ongoing. The patient received the vaccine on 18Dec2020 and then less than a week later, on 23Dec2020 was positive for COVID. The reporter said that they had been vaccinating people at their work. The reporter had vaccinated two people now who within about a week after, they tested positive for COVID. The patient was exposed to COVID outside of work. This patient was a healthcare worker (Doctor) in his 60's, weight within normal limits. The reported stated that obviously this person was exposed prior to getting the vaccine and was not symptomatic. But she needed to know, should she stick with the 21 day time period for the second dose or wait 90 days. The patient described COVID as the flu with an attitude. He was staying home and resting. The reporter did not think, with either of these patients that them getting COVID had anything to do with the vaccine. She thought it was a coincidence and they were obviously exposed prior to receiving the vaccine. The event was assessed as non-serious, and unrelated to vaccine by reporter. The outcome of the events was not recovered.; Sender's Comments: There is not a reasonable possibility that event ""tested positive for COVID"" is related to BNT162B2 vaccine. Patient most likely was exposed to SARS-CoV-2 virus prior vaccination.,Linked Report(s) : US-PFIZER INC-2021001199 Same drug and events, different patient"

Patient got the vaccine and 10 days later got Covid; Patient got the vaccine and 10 days later got Covid; Sinus drainage; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs) from a contactable physician. This pharmacist reported similar events for two patients. This is the first of two reports for Infection Control Nurse. A female patient of an unspecified age received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient got the vaccine and 10 days later, got COVID. So, the patient got swabbed because of the sinus draining but she was not ill. The patient was not sick she got some sinus drainage. The outcome of event was unknown. The patients were wondering if they need to start over or if they were okay to get the

second dose. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. However, the duration of 10 days since the vaccine first dose is short, and it is unlikely patient would have fully developed immunity. Further information like confirmative virus genome /nucleic acid detection needed for meaningful medical assessment.,Linked Report(s) : US-PFIZER INC-2021001212 same reporter/product, similar events, different patients.

patient tested positive for COVID 1 week after vaccination; patient tested positive for COVID 1 week after vaccination; This is a spontaneous report from a contactable physician (patient's wife). This physician reported similar events for two patients. This is the second of two reports. A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date not reported) via an unspecified route of administration, on 21Dec2020, single dose, for COVID-19 immunization. Relevant medical history and concomitant medications were not reported. The patient tested positive for COVID on 28Dec2020 (1 week after vaccination). Outcome of the events was unknown. Information about lot/batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 virus test positive cannot be totally excluded. The case will be reassessed if additional information becomes available.

chills and not feeling very good; chills and not feeling very good; rapid COVID test positive; rapid COVID test positive; This is a spontaneous report from a contactable consumer. This consumer reported similar events for two patients. This is the first of two reports. This case is serious, the other one is non-serious. A 22-year-old female patient received first dose of BNT162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/Lot Number: EH9899) intramuscular at left deltoid on 22Dec2020 19:00 at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. No other vaccines given at the same time. The patient received a flu shot back between 27th or 28th Nov2020 in her left deltoid. Caller reported getting the COVID vaccine on the 22Dec2020 and feeling fine before that. On the 28Dec2020 she started feeling chills and not feeling very good and that hasn't gone away. The patient went and got a rapid COVID test and it came back positive, not sure if it was because of the vaccine having antigens in it or she came into contact with it or if she just weakened immune system from the shot. The patient wanted to know if that was true. Then stated she and her mom got the COVID vaccine and her mom received it on the 23Dec. On the 29Dec her whole family started to get sick and experiencing the same things she experienced. The patient was not feeling well at the time of the call. The outcome of the events was not recovered.; Sender's Comments: Linked Report(s) : 2021001266 same reporter/ drug, different patient/event

PCR was positive last night; PCR was positive last night; This is a spontaneous report from a contactable Other Health Professional (Patient) reported that a 39-year-old female patient receives first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot/Batch Number: EH9899 and Expiration Date unknown) via an unspecified route of administration on 18Dec2020 at single dose for covid-19 immunization. The patient's medical history was unknown. The concomitant medications were reported as none. The patient experienced received the Pfizer's COVID Vaccine on 18Dec2020 (later clarified) at

work, at (Institution name) and she just wanted to report that on 23Dec2020, her husband developed symptoms, he was positive on the 26Dec2020 and then she was just converted and her PCR was positive last night on 30Dec2020 (later clarified). Patient think her husband exposed then she was exposed. Treatment included Advair is twice a day and albuterol is three times a day. The outcome of events was unknown.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported COVID-19 PCR test positive based on the known safety profile. However the short duration of 12 days since the vaccine first dose is given it is unlikely patient would have fully developed immunity. Of note, the patient was exposure to COVID-19 (her husband developed COVID-19).

tested positive for the Covid antigen with no signs or symptoms; tested positive for the Covid antigen with no signs or symptoms; This is a spontaneous report from a contactable consumer(an administrator of skilled nursing facility). A patient of unspecified age and gender received BNT162B2 (Covid vaccine) , via an unspecified route of administration on an unspecified date at single dose for covid-19 immunisation. The patient medical history and concomitant medications were not reported. The reporter stated the pharmacy did a Pfizer vaccine clinic at his facility, stated that after looking at the FAQs he would like to know if they should not expect a positive antigen test after the vaccine, states the reason he was asking was because the patient they tested today(31Dec2020) that got the vaccine tested positive for the Covid antigen with no signs or symptoms. Outcome of event was unknown. Information on the lot/batch number has been requested.

given the Covid 19 vaccine and subsequently tested positive for SARS CoV2 a day or so later; given the Covid 19 vaccine and subsequently tested positive for SARS CoV2 a day or so later; This is a spontaneous report from a non-contactable healthcare professional via Pfizer sales representative. A patient of an unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date not reported) via an unspecified route of administration, from an unspecified date, single dose for COVID-19 immunization. Relevant medical history and concomitant medications were not reported. The patient was given the COVID 19 vaccine and subsequently tested + for SARS CoV2 a day or so later on an unspecified date. Outcome of the events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

Allergic reaction; Hives on back; Flushed; Chills; Swollen tongue; Burning tongue; This is a spontaneous report from a contactable consumer (patient). This 47-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 29Dec2020 07:00 at single dose on left arm for COVID-19 vaccination. There were no medical history and concomitant medications. The patient previously took flu shot. Vaccination Facility Type was hospital. Patient did not receive any other vaccines at time COVID-19 vaccine given and no vaccines given 4 weeks prior. Patient got the Pfizer COVID-19 vaccine on 29Dec2020 and had an allergic reaction

to it. Had hives on her back, was flushed, had chills, and swollen tongue on 29Dec2020. There was swelling on either side of tongue not in the center. Swelling seemed to bounce around sides of tongue. Patient mentioned she also had burning sensation of tongue first on 29Dec2020 and then the swelling was after that. Adverse events hives, flushed, chills, burning sensation of tongue and swelling of tongue required a visit to emergency room. Patient was seen in the emergency room and given diphenhydramine hydrochloride (BENADRYL) and an Epi-pen to take home. This all happened after receiving the vaccine on 29Dec2020. Patient wasn't getting any better/feeling better and went back to the emergency room on 30Dec2020. Patient was treated with dexamethasone and told her to take diphenhydramine hydrochloride every 4 hours, her last dose was at 2pm 31Dec2020. Patient said all events still persisting, but there maybe a little more swelling of the tongue, but not much. Patient had had a flu shot before, but never had anything to happen like this. Outcome of allergic reaction, hives, flushed, chills and burning tongue was not recovered, outcome of swollen tongue was unknown. Information on the lot/batch number has been requested.

tested positive for Covid; tested positive for Covid; This is a spontaneous report from a contactable Nurse reported for self. This 42-year-old patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on an 22Dec2020 08:00 on Left arm at single dose (Lot # EH9899) for covid-19 immunisation. Medical history, concomitant medications were none. The patient tested positive for Covid in 25Dec2020. The patient was scheduled to receive the second dose in 08Jan2021 so should the patient get it. (Further clarified the dates and years). Outcome of the events were unknown.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported event cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

"Left axillary, supraclavicual, and cervical chain lymphadenopathy > 1-week post-injection.; since the vaccination, has the patient been tested for COVID-19?: Yes; since the vaccination, has the patient been tested for COVID-19?: Yes; This is a spontaneous report from a contactable healthcare professional. A 26-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), intramuscular on the left arm on 21Dec2020 20:00 at single dose for COVID-19 immunisation. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient experienced left axillary, supraclavicual, and cervical chain lymphadenopathy > 1-week post-injection on 22Dec2020 16:00. in which the patient received no treatment. It was also reported on Dec2020, ""since the vaccination, has the patient been tested for COVID-19?: Yes"". The patient has other pending test. The outcome of left axillary, supraclavicual, and cervical chain lymphadenopathy > 1-week post-injection was not recovered and other events was unknown.; Sender's Comments: Based on the information provided, the COVID-19 test positive are possibly related to drug ineffective of BNT162B2 vaccine."

One of my partners was the same way, tested positive after getting the vaccine; One of my partners was the same way, tested positive after getting the vaccine; This is a spontaneous report from a contactable nurse. This nurse reported similar events for 2 patient. This is the second of 2 reports. A patient of

unspecified age and gender received bnt162b2 (BNT162B2, Pfizer biontech Covid-19 Vaccine, solution for injection, lot number and expiation date unknown), via an unspecified route of administration on an unspecified date at a single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. On an unknown date, the patient was tested positive after getting the vaccine. The outcome of the event was unknown. Information on Lot/batch number has been requested.; Sender's Comments: The association between the event lack of effect (SARS CoV2 test positive) with BNT162b2 can not be fully excluded.,Linked Report(s) : US-PFIZER INC-2020510419 same reporter/ drug/similar events, different patient

positive COVID-19 test with symptoms; her arm ached; positive COVID-19 test with symptoms; This is a spontaneous report from a non-contactable nurse (patient) and two consumers. A 45-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date not reported), via an unspecified route of administration on Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient who is a nurse got the disease after getting coronavirus vaccine. This nurse reported that her arm ached after the vaccination and that she did not experience any other side effects. This nurse who worked in the coronavirus unit after the vaccine, fell ill 6 days after the vaccine. Stating that she was cold, the nurse later reported that she was experiencing muscle pain and feeling weak. The nurse, who applied to the hospital after becoming increasingly sluggish, performed a coronavirus test. The nurse's corona test was positive on an unspecified date in Dec2020. The patient underwent lab tests and procedures which included sars-cov-2 test: positive on Dec2020. The outcome of the events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained. No further information is expected.; Sender's Comments: The association between lack of effect (SARS CoV test positive) with BNT162b2 can not be fully excluded based on the temporal relationship. Occupational exposure may have played a contributory role as well.

she woke up sick and was having the same symptoms as her husband so she was positive; she woke up sick and was having the same symptoms as her husband so she was positive; This is a spontaneous report from a contactable pharmacist reported for herself. A 31-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in Dec2020 at single dose for COVID-19 immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. Caller stated that she was a pharmacist and on Tuesday last week that she received the Pfizer BioNTech Vaccine. Stated that her husband tested positive yesterday (on 29Dec2020). Stated that she was positive that she was positive because that was her husband. Stated that she woke up sick and was having the same symptoms as her husband so she was positive. Stated that she was due for second dose in 2 weeks. Stated that she received the vaccine last week and was negative. The patient underwent lab tests and procedures which included covid test: negative in Dec2020. The outcome of the events was unknown. Information about Batch/Lot number has been requested.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available.

symptomatic of Covid; symptomatic of Covid; inoculated on 15Dec2020; patient was scheduled on 04Jan2021 for 2nd dose; inoculated on 15Dec2020; patient was scheduled on 04Jan2021 for 2nd dose; This is a spontaneous report from a contactable nurse. A patient of unspecified age and gender received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiry date unknown) via an unspecified route of administration on 15Dec2020 at single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient was inoculated on 15Dec2020 and currently on 28Dec2020 the patient was symptomatic of Covid. The patient was scheduled on 04Jan2021 for 2nd dose. The outcome of the events symptomatic of Covid was unknown. Follow-up activities are possible, information on the batch number has been requested.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available.

got the vaccine within the past 24 hours and resulted positive for the test; got the vaccine within the past 24 hours and resulted positive for the test; This is a spontaneous report from a contactable consumer (patient). A 24-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL1284), via an unspecified route of administration on an unspecified date in 2020 at a single dose for COVID-19 immunization. There were no medical history or concomitant medications. The patient got the vaccine within the past 24 hours and resulted positive for the test, the patient took 48 hours ago like was that going to some adverse reaction like patient had the positive results before knowing the result patient got the vaccine so at present patient was just kind of anxious about what going to happen. Next shot will be due on 20Jan2021. The outcome of events was unknown.

tested positive for Covid a week after receiving the vaccine; tested positive for Covid a week after receiving the vaccine; patient stated that she was pregnant; patient stated that she was pregnant; patient stated that she was pregnant; This is a spontaneous report from a contactable nurse (patient) from a Pfizer sponsored program. A 37-year-old female patient received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EH9899), via an unspecified route of administration on 18Dec2020 at left deltoid for Covid-19 immunisation. The patient medical history was not reported. There were no concomitant medications. The patient experienced tested positive for Covid a week after receiving the vaccine on 28Dec2020 (as reported), the patient stated that she was pregnant. The patient underwent lab tests and procedures which included Covid test: positive on 28Dec2020. The outcome of events was unknown.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further information like confirmative virus genome /nucleic acid detection is needed for meaningful medical assessment.

had the vaccine and later tested positive for COVID-19; had the vaccine and later tested positive for COVID-19; This is a spontaneous report from a non-contactable consumer. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on Dec2020 at single dose for COVID-19 immunisation. Medical history included that the patient previously was positive from the virus COVID-19. The patient's concomitant medications were not reported. The patient that had the vaccine and later tested positive for COVID-19. The outcome of

the events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

Severe anaphylaxis; This is a spontaneous report from a non-contactable consumer. This consumer reported similar events for six patients. This is the second of six reports. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced severe anaphylaxis on an unspecified date. The outcome of the event was unknown. No follow up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021003207 same drug/event; different patient

severe anaphylaxis; This is a spontaneous report from a non-contactable consumer. This consumer reported similar events for 6 patients. This is 5th of 6th reports. A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiration date were not reported), via an unspecified route of administration on an unspecified date at a single dose for vaccination. tested positive for COVID after receiving the COVID Vaccine; tested positive for COVID after receiving the COVID Vaccine; This is a spontaneous report from a contactable other HCP from a Pfizer-sponsored Program Pfizer First Connect. A female patient (sister) of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiry date were not provided), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. Caller stated that her sister tested positive for COVID after receiving the COVID Vaccine. Caller stated that her sister is a respiratory therapist and she has it (COVID) at the same time as the caller. Caller's sister tested positive at the same time as the caller on 01Jan2021. Caller's sister received the COVID Vaccine from a different facility from the caller. The outcome of the events was unknown. Information on the Batch/Lot number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the

suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further information like confirmative virus genome /nucleic acid detection is needed for meaningful medical assessment.

He received his first dose on 22Dec2020, then on 29Dec2020, he tested positive COVID.; He received his first dose on 22Dec2020, then on 29Dec2020, he tested positive COVID.; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A contactable healthcare professional (patient) reported for himself that a 30-year-old male patient received his first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899), via an unspecified route of administration on 22Dec2020, at single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. The healthcare professional is physician assistant. He received his first dose on 22Dec2020, then on 29Dec2020, his COVID 19 test revealed positive. He is supposed to get a second dose on 14Jan2021. He wondered if he is going to be able to take second dose or not. He doesn't have a prescribing doctor. He got it (vaccine) at work/at the hospital he works at. Outcome of the events was not recovered.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further information like confirmative virus genome /nucleic acid detection is needed for meaningful medical assessment.

Abdominal pain, chills, n/v, dark urine, elevated LFT's, Bilirubin in urine. Patient currently admitted to hospital

Received Moderna vaccine on 12/29/2020. 12/30/2020 fever of 100.4 Tylenol given and monitored and fever went down. 12/31/2020 Chest x-ray completed and sent to the hospital and admitted with pneumonia. 1/3/2021 reported by the hospital that Covid-19 results were positive. He had had Covid-19 positive results back on 11/4/2020 prior to vaccine.

"Pt experiencing and c/o left nasal burning, left upper lip tingling progressing to numbness with slight swelling noted, scattered patchy hives to upper front chest, sharp HA above right eye, denies SOB, no acute respiratory distress noted or reported, slurring of words shortly after onset of other symptoms. Pt repeating ""something ain't right"". Pt received Moderna COVID vaccine at 4:35pm with no reactions or side effect noted within the post 15 and 30 minutes. EMS notified at 5:49pm. MD notifed and ordered Benadryl 50mg IM (given at 5:53pm), EpiPen and DepoMedrol 40mg IM if needed. No respiratory distess noted, pt denies SOB. EMS arrived and transported pt to ER."

Developed SOB and fatigue 1 day after vaccine, went to urgent care and tested positive for COVID at urgent care. Returned to our ED after going to urgent care again on 1/7/21, had o2 sat of 84% on room air, impoved to 98 on 3 liters. Was transferred to another facility for admission.

vomiting later on 01/05/21. Lethargy and hypoxia in pm of 01/06/21. Hypotension am of 01/07/21. Hospitalized, intubated, cardiac arrest, died 01/07/21.

Swollen lips/tongue, shortness of breath, cough, hives, nausea, headache Epi shot, Benadryl, Pepcid, prednisone

Less than 5 minutes after vaccine, nose drained, weird taste in mouth, tingle in nose and on tongue. Throat and tongue swelled, couldn?t speak. Dizzy and slurring speech. Was taken to ambulance outside, BP was 191/101. Given beta blockade. Confused and dizzy for next 2 hours in ER. Evaluated for stroke and given a 12-lead ECG. Given benedryl and prednisone. Felt better after 3 1/2 hours. Continued steroids for 5 days and had to take benedryl every 4 hours for 3 days or swelling/itching/bad taste in mouth would return. Sore arm on day 3.

symptoms:chest and stomach pain Has markedly elevated liver function tests that were normal 2 weeks prior to immunization Is being admitted the hospital to monitor liver function test.

headache, sore throat, runny nose, arm pain that migrated to the axilla and down the side of the body, joint pain (hands, wrist, feet, hips, knees, spine, neck), insomnia, general malaise, fatigue, and lower grade fever. Most symptoms lasted about 7 -10 days. However, it is now day 20 after the initial vaccine and I still have joint pain that has not gone away. esp in hands, wrists, and feet. When I sleep I still wake up with all my joints hurting it gets better as I start moving but the wrist, hands, and feet pain has not gone away. This pain will wake me in the night when I change positions. I called my doctor today to inquire if it is a good idea if I should take the second dose because the first dose made me so dibiliated. Awaiting for a response. I am due to take the second vaccine on 2/9/21.

Fever, coughing, drowsiness, generalized weakness. Was found to be hypercalcemic (corrected calcium 14) and admitted 1/2-4. No prior history of hypercalcemia.

Congestion Shortness of breath Tachycardia Transferred out 911. Per hospital, patient had a myocardial infarction, is unresponsive, and on hospice services.

Anaphylactic reaction, Severe edema and raised red rash entire body, Severe itching ,Soft tissue edema of throat. Swelling of, eyes, lips, face. Multiple trips to ER, treated with steroids, Benadryl, prevacid. , CURRENTLY IN ICU ON EPINEPHRINE DRIP, STEROIDS, MULTIPLE MEDS

Resident passed away in her sleep

Patient c/o fatigue and cough on 1.4.2021 and was encouraged to be tested for COVID. We were notified that the patient was hospitalized on 1.7.2021 with COVID symptoms and positive test results. She is currently on a ventilator and dialysis.

On December 25th I had mild chest pain and then on January 1st, 2021 I had severe chest pain that persisted and on January 3rd I was admitted into the hospital. My Ddimer was elevated and my Troponin levels were elevated. An angiogram was performed and Dr. injected nitro into my arteries because they were constricted from Coronary Spasms.

Sxs started 3-5 minutes post vax. Dizziness, hypotension, throat fullness, CODE called, given IM Epi at vax site. Taken to ED from vax site. Started on epi drip. Admitted to SHC.

Nausea/ dizzy, Syncope 12 hours later.

Patient felt warm with palpitations 5 minutes after vaccine administered. was monitored for 30 mins & then returned to work. on 12/30/2020 patient was at work in Presurgical testing dept & experienced near syncope, dizziness & elevated BP. reported to ED & was admitted to telemetry unit.

Dr. called this morning and reported that an employee that works in billing had her vaccine on Wednesday and developed and anaphylactic reaction to Moderna. This was 24 hours later with rash, SVT heart rate above 140, low grade fever, redness at site. Admitted and treated with steroids and Benadryl.

Came to ER on 12/20/20 with chills, heart palpitations, body aches and increased SOB. Had ST elevation on EKG in ER, taken to Cath Lab- no intervention done. D/C home 12/22/20. Previous Hx of COVID per patient

Initial event was soreness at site which resolved on its own within a few days. 2 days after receiving vaccine, I began having an allergy reaction to the same brand N95 that I had been utilizing since the beginning of the pandemic. Symptoms are swollen cheeks and welts , sudden itchiness at the site of my mask placement. The reason for this report is a sudden onset of excruciating and debilitating pain throughout my body specifically pain of my right shoulder radiating down my sprightly arm. I have been receiving testing and treatment for ongoing neuropathy due to Longhauler syndrome, however This recent pain is so debilitating, I spend most of my time in bed. I have been experiencing chills then profuse sweating. I also so fatigued, I sleep much of the day. I have been having episodes of tachycardia with chest tightness which has increased since after having the vaccine. I also become short winded on exertion. I?ve been waking up in a panic and sweating.

Patient received first dose of Pfizer COVID-19 vaccine on December 26. On the next day, December 27, patient started having pressure in her head and sinuses, weakness. Then she developed nonproductive cough and progressive shortness of breath. She was seen at urgent care and tested positive for COVID-19 on December 29. She had low oxygen saturation on home oximeter and severe shortness of breath. Patient's husband is also ill with COVID-19 at home. Patient was sent to the ED and admitted to the hospital.

Patient had been diagnosed with COVID-19 on Dec. 11th, 2020. Symptoms were thought to have started on 12/5/2020. Received Moderna vaccine on 12/23. Unexpected death on 1/8/2021. Resuscitation attempts unsuccessful

infection of SARS-COV-2; infection of SARS-COV-2; This is a spontaneous report from a contactable healthcare professional. A 31-year-old male patient started to receive received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot number EL0140), intramuscular into the left arm on 18Dec2020, at 10:30 as single dose for covid-19 immunization. There was no medical history and no concomitant medications. The patient experienced infection of SARS-COV-2 on 25Dec2020. Details were as follows: The patient received the first dose of the two dose series. On 20Dec2020, he was exposed to COVID-19. Official positive diagnosis of COVID-19 was made on 25Dec2020. Patient had symptoms of fatigue, joint pain and a small fever on an unspecified date, and had been exposed to SARS-COV-2 on 20Dec2020, and the infection on 25Dec2020. The patient underwent lab tests and procedures which

included sars-cov-2 test which was positive on 25Dec2020. The patient was scheduled to receive second dose of the vaccine; he will be out of quarantine around five to six days before that dose. The outcome of infection of SARS-COV-2 was recovering.; Sender's Comments: The efficacy of a drug varies from one patient to another and can be affected by different factors; however, a contributory role of the suspect drug BNT162B2 to the reported events drug ineffective and COVID-19 cannot be ruled out.

recipient of the covid 19 vaccine received a positive antigen test within 10 days of getting the vaccine; recipient of the covid 19 vaccine received a positive antigen test within 10 days of getting the vaccine; This is a spontaneous report from a contactable nurse. This nurse reported similar events for two patients. This is the second of 2 reports. A female patient of an unspecified age (Age: 30, Unit: Unknown) received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiration date were not reported), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received a positive antigen test within 10 days of the vaccine and wanted to know if the vaccine could cause a positive antigen test. There was no mention of exposure to a positive person. Outcome of the events was unknown. Information on lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of COVID-19 antigen test positive and LOE due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. "neuropathy/ started acutely in feet bilaterally / persist intermittently in left extremities; One-time episode of upper extremity (UE) numbness; This is a spontaneous report from a contactable health care professional (patient). A 40-year-old female patient (not pregnant) received her 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot unknown) at single dose via an unknown route at left arm on 26Dec2020 for Covid-19 immunization. COVID-19 vaccine was administered in Pharmacy or Drug Store. Medical history was reported as ""none"". Patient had no COVID prior vaccination, further reported as patient was not diagnosed with COVID-19 prior to vaccination. No known medications, food, or other products allergies. Concomitant drugs (Other-medications-in-two weeks) included levocabastine hydrochloride (ZYRTEC), diphenhydramine hydrochloride (BENADRYL) as needed, ibuprofen (MOTRIN), and multivitamin. No other-vaccine-in-four weeks received. Patient experienced adverse-event of neuropathy, which started acutely in feet bilaterally and now (as of 02Jan2021) persist intermittently in left extremities (LEs). One-time episode of upper extremity (UE) numbness. No weakness. Patient inquired if 2nd dose should be held. Adverse-event-start-date was 26Dec2020. The adverse event result in doctor or other healthcare professional office/clinic visit. No treatment received.

The event was reported as non-serious. Since the vaccination, patient had not been tested for COVID-19. Outcome of the event was not resolved. Information about lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of peripheral neuropathy and upper extremity (UE) numbness due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including head CT/MRI and nerve conduction tests, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

Became extremely flushed; tingling in hands and feet; disorientation; This is a spontaneous report from a non-contactable nurse (patient). A 34-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) (lot number: EL0140/expiration date unknown), via intramuscular route of administration, on 28Dec2020 (at the age of 34 years old) as a single dose in the left arm for COVID-19 immunization at hospital facility. Relevant medical history included Gastrooesophageal reflux disease (GERD), Attention deficit hyperactivity disorder (ADD), Generalised anxiety disorder (GAD). The patient did not have any known allergies to medications, food, or other products. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included esomeprazole sodium (NEXIUM), venlafaxine hydrochloride (EFFEXOR), amfetamine aspartate, amfetamine sulfate, dexamfetamine saccharate, dexamfetamine sulfate (ADDERALL). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 28Dec2020, at 09:00 PM, the patient became extremely flushed, tingling in hands and feet, disorientation. Treatment was received for the events became extremely flushed, tingling in hands and feet, disorientation included Diphenhydramine 50mg @2200 and again at 0200. The outcome of the events became extremely flushed, tingling in hands and feet, disorientation was recovered on unknown date. Since the vaccination, the patient had not been tested for COVID-19.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of extremely flushed, tingling in hands and feet and disorientation due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including chemistry panel and Head CT/MRI, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Around 10:30pm I felt like my throat was closing and I was choking; Around 10:30pm I felt like my throat was closing and I was choking; I had chest pain, chest tightness; I had chest pain, chest tightness; Very

SOB at rest; Throughout the day I was cough and my face started flushing so I tool Benadryl/severe facial flushing; On 23Dec I got nerve blocks for my migraines.; Throughout the day I was cough and my face started flushing so I tool Benadryl.; This is a spontaneous report from a contactable nurse who reported for herself. A 36-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot: EK5730) dose number 1, via an unspecified route of administration on 19Dec2020 11:30 at single dose for COVID-19 immunization. Medical history included von willebrand's disease, narcolepsy with cataplexy, IIH (Idiopathic intracranial hypertension), HTN (hypertension), GERD (gastrooesophageal reflux disease), migraines. Patient also had known allergies: PCN (penicillin), shellfish, IV contrast, cefdinir and bees. On 23Dec2020, patient got nerve blocks for her migraines. Throughout the day patient was cough and her face started flushing so she tooled diphenhydramine hydrochloride (BENADRYL). Around 22:30, patient felt like her throat was closing and she was choking. She had chest pain, chest tightness. EMS (emergency medical services) was called and patient was brought to the hospital. On 25Dec2020, patient felt like her throat was closing, like someone was sitting on her chest and chest tightness still with chest pain. Very SOB (shortness of breath) at rest. Patient went to the ER (emergency room) and received IV dexamethasone (DECADRON) and diphenhydramine hydrochloride. On 26Dec2020, patient had the same symptoms but with severe facial flushing and patient went back to the ER and was given IV dexamethasone. Patient was sent home on a maximum amount of medications. I had seen her primary care, ENT (ear nose throat centre), Allergy, ID (infectious disease), and pulmonology. Her CT (computerised tomogram) of chest on 25Dec2020 was negative along with her COVID test. Patient SOB on rest and exertion still. Onset date of the adverse events was reported as 23Dec2020, 22:30. Patient received treatment for the events included multiple medications and high dose prednisone. Lab data on 25Dec2020 included CT of chest: negative, influenza type A/B combo: negative, Covid 19: negative and nasal swab: negative. Action taken in response to the events for bnt162b2 was not applicable. Outcome of the events was not resolved.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events due to temporal relationship. The clinical presentation of the events is suggestive of possible allergic reactions. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

I tested positive for COVID today; I tested positive for COVID today; This is a spontaneous report from a contactable other Health Care Professional (HCP). A female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number and expiration date unknown) via an unspecified route of administration on 24Dec2020 (at an unknown age) at an unknown dose for COVID-19 vaccination. The patient's medical history was not reported. The patient's concomitant medications were not reported. The patient tested positive for COVID on 01Jan2021. The patient was inquiring as to if she can still get the second dose since she has tested positive in between. The patient underwent lab

tests and procedures which included SARS-COV-2 test: positive on 01Jan2021. The clinical outcome of COVID-19 virus test positive was unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

experienced loss of smell, taste and a headache/she came down with signs and symptoms/she got tested and got the results on Thursday that she was positive for covid 19 virus; experienced loss of smell, taste and a headache/she came down with signs and symptoms/she got tested and got the results on Thursday that she was positive for covid 19 virus; This is a spontaneous report from a contactable Other Health Professional (patient). A 45-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Solution for injection, lot number, via an unspecified route of administration from 14Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient had the first dose of COVID vaccine on 14Dec2020. Eleven days following first dose, she experienced loss of smell, taste and a headache. She stated that she came down with signs and symptoms on 25Dec2020 and she got tested and got the results on Thursday that she was positive for Covid 19 virus. She was due for the 2nd dose of the COVID vaccine on the 6th of January. She asked what she should do about the second dose. She mentioned that her symptoms and positive test results were reported where she works in (State name). She wanted to know information as to whether she should get the second dose. Her second dose's scheduled was 6Jan2021. The event outcome was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of suspected LOE and COVID 19 infection due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

had a positive covid test results; had a positive covid test results; This is a spontaneous report from a contactable physician. A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 17Dec2020 at a single dose for COVID-19 immunization.On 22Dec2020 he started to experience COVID like symptoms. On 26Dec2020, he had a positive COVID test results. On 28Dec2020, he received the Regeneron antibody infusion. Patient wants to know more about receiving the 2nd dose based on his positive diagnosis/antibody

treatment. Outcome of the event was unknown. Information on batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of SARS-CoV-2 test positive and suspected LOE due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

diarrhea; headache; lower back pain; Fatigue; arrhythmia; Tachycardia; High Blood pressure; Redness on chest; Chest tightness; Lightheaded; possible tongue swelling; possible tongue swelling (felt heavy after vaccine); dry mouth; sore throat; This is a spontaneous report from a contactable nurse (patient) who reported for herself that a 31-year-old female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899) via an unspecified route of administration, on 20Dec2020 14:15 at left arm/arm right (pending clarification), single dose for COVID-19 immunization. Medical history included factor II, history of melanoma. She has no known allergies. She was not pregnant at the time of the vaccination. Concomitant medications included bupropion hydrochloride (WELLBUTRIN), ibuprofen (MOTRIN), multivitamin. Nurse reported administering COVID-19 vaccine at hospital, experiencing tachycardia, high blood pressure, redness on chest, chest tightness, lightheaded, possible tongue swelling (felt heavy after vaccine), arrhythmia, dry mouth, sore throat (after leaving emergency department) at 14:30 on 20Dec2020; After one day, she experienced diarrhea, headache, lower back pain and fatigue since 21Dec2020. Fatigue lasting for several days. Adverse events resulted in emergency room/department or urgent care (pending clarification). Nurse received intravenous diphenhydramine hydrochloride (BENADRYL) and fluids as treatments. Nurse assessed the events as non-serious. Nurse also reported that, prior to vaccination, she was not diagnosed with COVID-19; since the vaccination, she has not been tested for COVID-19. She did not receive other vaccine in four weeks. Outcome of fatigue was not recovered, outcome of the rest of the events was recovered.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the tachycardia, high blood pressure, arrhythmia and the other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including EKG at baseline and during subject drug therapy, echocardiogram, cardiac enzymes, electrolytes, chemistry panel and serum toxicology screen, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"Chills; Soreness at the injection site; generalized body aches/Body aches; Shortness of breath; Asthma attack; Difficulty sleeping; Light headed and dizzy; Nausea; high BP 140's; HR 110's to 120s; Nasal congestion; Swelling of the face; Sore throat; This is a spontaneous report from a contactable nurse. A 42-years-old female patient received her first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EK5730, expiration date not reported), intramuscular on the right arm on 31Dec2020 at 10:15 AM, at a single dose for Covid-19 immunization. Medical history included asthma, allergy, hypothyroidism, and some fish allergy. There were no concomitant medications (no other vaccine in four weeks and no other medications in two weeks). Patient previously took ibuprofen and experienced allergy. The patient is not pregnant. On 31Dec2020, after ten-15 minutes (10:30 AM) of receiving the vaccine, she was light headed and dizzy with some nausea. Monitored in the emergency room (ER) with high BP 140's and heart rate (HR) 110s to 120s. After an hour of saline bolus, she was better but she got nasal congestion and swelling of the face with sore throat. On 01Jan2021, after 24 hours, she got some soreness at the injection site with generalized body aches. Also she got some shortness of breath which lead to her asthma attack and difficulty sleeping. On 02Jan2021, after 48hours, she was feeling still light headed with some sore throat, chills, body aches and severe headache which lead her to go to the ER and got herself tested for flu, covid and strep, which came back all negative but her signs and symptoms (s/sx)still after discharge was getting worst especially the headache and generalized body aches. As well as congestion and sore throat. The patient had given ""Ivf"" for the events. The patient was not diagnosed with Covid prior to vaccination and was not Covid tested post vaccination. The outcome of the events was not recovered. The reporter assessed the events as non-serious.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate."

becoming incoherent and talking nonsense; This is a spontaneous report from a contactable physician (patient). A female patient of an unspecified age received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date not reported), via an unspecified route of administration on 23Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Physician calling about whether or not she should receive the second dose of vaccine. She received dose on 23Dec2020. On 26Dec2020 she started experiencing several side effects including becoming incoherent and talking nonsense. Her daughter who is an EMT suggested that she go to the ER. While in the ER she received TPA but it was later decided she did not have a stroke. Her EKG, bloodwork and other testing came back negative. She otherwise healthy and has no comorbidities. She already spoke with agency. She has also already spoken with an infectious disease doctor and her neurologist. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the event incoherent is conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety

evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to agencys, Ethics Committees, and Investigators, as appropriate.

tingly feeling to my lips; some lip swelling; tightness in my throat.; This is a spontaneous report from a contactable Other HCP. A 35-years-old female patient started to receive BNT162B2, via an unspecified route of administration from 30Dec2020 12:00 to 30Dec2020 12:00 at SINGLE DOSE for covid-19 immunisation. Medical history included hypersensitivity from an unknown date and unknown if ongoing, gastritis from an unknown date and unknown if ongoing, anxiety from an unknown date and unknown if ongoing, depression from an unknown date and unknown if ongoing. Concomitant medication included lorazepam (ATIVAN), ivermectin (IVERMECTIN), escitalopram oxalate (LEXAPRO), esomeprazole magnesium (NEXIUM [ESOMEPRAZOLE MAGNESIUM]), levocetirizine dihydrochloride (XYZAL). The patient previously took tamiflu and experienced drug hypersensitivity. The patient experienced tingly feeling to my lips (paraesthesia oral) (non-serious) on 30Dec2020 15:30 with outcome of recovered, some lip swelling (lip swelling) (non-serious) on 30Dec2020 15:30 with outcome of recovered, tightness in my throat. (throat tightness) (non-serious) on 30Dec2020 15:30 with outcome of recovered. The action taken in response to the event(s) for BNT162B2 was not applicable. Therapeutic measures were taken as a result of tingly feeling to my lips (paraesthesia oral), some lip swelling (lip swelling), tightness in my throat. (throat tightness). This is a spontaneous report from a contactable other HCP. This 35-year-old female other HCP reported that: Report about covid vaccine: Yes Reporter type: Patient Age group: Adult (18-64 Years) Is pregnant: No Race: (race provided) Ethnicity: (ethnicity provided) Patient occupation: Other Health Professional Covid vaccine details: product-COVID 19, Lot number-EL1284, Lot unknown-False, Administration date-30Dec2020, Administration time-12:00 PM, Vaccine location-Left arm, Dose number-1 Facility type vaccine: Hospital If other vaccine in four weeks: Yes Other vaccine 4weeks details: other vaccine 4weeks product -Allergy Immunotherapy injections , Other vaccine 4weeks vaccine date -07Dec2020, Other vaccine 4weeks dose number -2 , Other vaccine 4weeks vaccine location-Left and right arm. Other medications in two weeks: Nexium, xyzal, Ativan, Lexapro, Ivermectin Adverse event: At about almost 4 hrs after receiving the injection I started to experience a tingly feeling to my lips, some lip swelling and tightness in my throat. I had my epi pen on hand incase I needed it but I ended up taking 25mg of Benadryl, then 50 mg of Benadryl 5 hrs later. The following morning my lips where feeling tingly again so I took 25mg of Benadryl again and continued for the next 48 hrs at the advice of my doctor. Adverse event start date: 30Dec2020 Adverse event start time: 3:30PM AE resulted in: None of the above If patient recovered: Recovered If treatment AE: Yes AE treatment: Benadryl for 48 hrs If covid prior vaccination: No If covid tested post vaccination: No Known allergies: Tamiflu Other medical history: Chronic allergies, gastritis, anxiety, Depression Identification of the case safety report Serious: No Seriousness criteria-Results in death: No Seriousness criteria-Life threatening: No Seriousness criteria-Caused/prolonged hospitalization: No Seriousness criteria-Disabling/Incapacitating: No Seriousness criteria-Congenital anomaly/birth defect: No VAERS Primary Reporter Addl Qualification: Patient Relevant medical history and concurrent conditions: Structured information (Patient episode name): Chronic allergies, gastritis, anxiety, depression Reaction(s)/Event(s): Reaction/event as reported by primary source: At about almost 4 hrs after receiving the injection I started to experience a tingly feeling to my lips, some lip swelling and tightness in my throat. I had my epi pen on hand incase I

needed it but I Reaction/event in terminology (LLT) : At about almost 4 hrs after receiving the injection I started to experience a tingly feeling to my lips, some lip swelling and tightness in my throat. I had my epi pen on hand incase I needed it but I ended up taking 25mg of Benadryl, then 50 mg of B Date of start of reaction/event: 30Dec2020 Outcome of reaction/event at the time of last observation: RECOVERED/RESOLVED Drug(s) Information: Characterization of drug role: Suspect Batch/lot number: EL1284 Date of start of drug:30Dec2020 Anatomical location: Arm left Dose number:1 Active drug substance information: Active drug substances name: COVID 19 Drug(s) Information: Characterization of drug role: CONCOMITANT Proprietary medicinal product name: Allergy Immunotherapy injections Date of start of drug:07Dec2020 Dose number:2 Narrative case summary and further information: Case narrative Age at vaccination: 35 Pregnant at the time of vaccination?: No Start Date/Time:30Dec2020 12:00 PM Facility where the most recent COVID-19 vaccine was administered: Hospital Did the patient receive any other vaccines within 4 weeks prior to the COVID vaccine: Yes List of any other medications the patient received within 2 weeks of vaccination: Nexium, xyzal, Ativan, Lexapro, Ivermectin Reported Event: At about almost 4 hrs after receiving the injection I started to experience a tingly feeling to my lips, some lip swelling and tightness in my throat. I had my epi pen on hand incase I needed it but I ended up taking 25mg of Benadryl, then 50 mg of Benadryl 5 hrs later. The following morning my lips where feeling tingly again so I took 25mg of Benadryl again and continued for the next 48 hrs at the advice of my doctor. Was treatment received for the adverse event?: Yes: Benadryl for 48 hrs Prior to vaccination, was the patient diagnosed with COVID-19?:No Since the vaccination, has the patient been tested for COVID-19?:No Allergies to medications, food, or other products: Tamiflu Vaccine Facility information available. Ethnicity information is available. Race information is available. Location of injection information is available for other vaccines within 4 weeks PRIOR.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

About 15 minutes after receiving the vaccine she felt palpitations. She was monitored for another 15 minutes and while she was walking to her car se started noticing sore throat associated with inability to talk, unable to swallow secretions, and swelling the lips. Patient presented to the emergency room where she received EpiPen dose. Received diphenhydramine, famotidine, and prednisone. Lip swelling and sore throat began improving in ED.

I was given a vaccine on Dec17th, on Dec21st I tested positive for Covid; I was given a vaccine on Dec17th, on Dec21st I tested positive for Covid; This is a spontaneous report from a contactable nurse. A 46-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EK5730), via an unspecified route of administration on 17Dec2020 at a single dose for COVID-19 immunization. There was no relevant medical history. The patient's concomitant medications were not reported. The patient was given a vaccine on 17Dec2020, the on 21Dec2020, the patient tested positive for COVID. The outcome of the event was unknown.; Sender's Comments: Based on the information

available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

TSH level has been borderline hypothyroidism; Almost feel like somebody is gently holding my throat, so I could still breathe, talk, eat but I had the feeling that my throat was being kind of squished; This is a spontaneous report from a contactable nurse. A 64-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EK5730), via an unspecified route of administration in right deltoid on an unspecified date at a single dose for covid-19 immunization. Medical history included hypertension and high cholesterol. Concomitant medication included evolocumab (REPATHA) for high cholesterol and two unspecified medications for hypertension. The got the first dose of Pfizer Vaccine for COVID, and for about 3 or 4 almost 5 days afterwards, she felt like somebody, it almost feel like somebody was gently holding her throat, so she could still breathe, talk, eat but had the feeling that throat was being kind of squished. The patient had her lipid panel liver and TSH level done because of the Repatha and TSH level has been borderline hypothyroidism, so she haven't really been on medicine for it but it might be. The patient added that the events had certainly correlated with the vaccine. She didn't have the events until she got the vaccine, so she feel like it was and then her concern was it wouldn't be safe to take the second one. The patient did not visit emergency room and physician office because of the issue 'feel like somebody was gently holding her throat' and all she did was take Benadryl at night. The outcome of the events was unknown.; Sender's Comments: The causal relationship between bnt162b2 and the event hypothyroidism cannot be excluded as the information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

test positive for COVID-19/fever, chills, body aches, joint pain; test positive for COVID-19/fever, chills, body aches, joint pain; This is a spontaneous report from a contactable other HCP. A 35-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5703), via an unspecified route of administration in left arm on 15Dec2020 17:30 at a single dose for covid-19 immunization. Administration was done in the hospital. Medical history included seronegative rheumatoid arthritis and allergies to latex and actemra. Concomitant medication included tofacitinib citrate (XELJANZ), and ibuprofen. Eight days after vaccination, on 23Dec2020 at 13:30, the patient came down with fever, chills, body aches, joint pain. The patient was initially tested negative for COVID (nasal swab) and influenza on 27Dec2020 but did test positive for COVID-19 on 29Dec2020 (nasal swab). The patient stated that she knew that the vaccine did not cause COVID however as she was on immunosuppressants (Xeljanz), she wanted to record this information. There was no treatment included for the events. The outcome of the events was recovering. Prior to vaccination, the patient was not

diagnosed with COVID-19.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available.

COVID-19 rapid POC test positive; COVID-19 rapid POC test positive; the amount of vaccine given as 1 cc; This is a spontaneous report from a Pfizer-sponsored program, IBCC (Inbound Call Center for HCPs). A contactable nurse (patient) reported that a 52-year-old female patient received first dose of BNT162B2 (Pfizer-BioNTech COVID-19 mRNA vaccine; lot number: EH9899), via an unspecified route of administration on 17Dec2020 at 1 mL, single dose for COVID-19 immunization. Medical history included ongoing hypertension diagnosed when she was 33 years old. There were no concomitant medications. The patient got the vaccine on 17Dec2020. The patient stated that the amount of vaccine given was 1 cc. She took a COVID-19 rapid POC test on the 28Dec2020 and tested positive. She wanted to know if she should have the second dose of the vaccine. The outcome of the events was unknown.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

"When she went back to work on 25Dec2020 it was positive/On the weekend she had to come back to do a PCR test on28Dec2020 and it was positive.; When she went back to work on 25Dec2020 it was positive/On the weekend she had to come back to do a PCR test on28Dec2020 and it was positive.; This is a spontaneous report from a contactable nurse. A 43-year-old female patient receive bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899), via an unspecified route of administration given in the left arm on 22Dec2020 at a single dose for covid-19 immunization. The patient medical history included ""patient's a blood donor"" reported as, she donated blood on 12Sep2020 and it was negative for covid. The patient's concomitant medications were not reported. The patient experienced ""when she went back to work on 25Dec2020 it was positive/on the weekend she had to come back to do a pcr test on28dec2020 and it was positive"" on 25Dec2020 with an unknown outcome. It was further reported that the patient was a registered nurse that works night shift. She clarified that the rapid test was taken each time she goes to work. When she went to work on the night of 21Dec2020 the rapid test was negative.Then she got the Covid vaccine in the morning of 22Dec2020. When she went back to work the night of 22Dec2020 the rapid test was negative. When she went back to work on 25Dec2020 it was positive. On the weekend she had to come back to do a PCR test on28Dec2020 and it was positive. Caller clarifies that the rapid tests were Nasal Swabs. The patient's latest test was on 28Dec2020, she was told that when she comes back, they do not have to do the rapid test daily anymore, it will now be every 90 days. The patient did not have a test before the vaccine. She has had no issues with Vaccines in the past.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported event positive

for corona virus infection based on the known safety profile. However given the short duration of 3 days since the vaccine first dose, it is unlikely patient would have fully developed immunity."

positive COVID-19 test with symptoms/had like a head cold and cold like symptoms/he tested positive for COVID.; positive COVID-19 test with symptoms/had like a head cold and cold like symptoms/he tested positive for COVID.; This is a spontaneous report from a contactable nurse. A 67-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EJ1685), intramuscular on left deltoid on 18Dec2020 at single dose for COVID prevention. The patient had no medical history. There were no concomitant medications. The patient got his first dose of the COVID Vaccine on 18Dec2020, and he states that he did fine and had no problems. But on 28Dec2020, when he was going to work, he noticed that he had like a head cold and cold like symptoms. He was swabbed and tested for COVID PCR on that day, and he tested positive for COVID. After his positive COVID test, he was tested for monoclonal antibodies, and at first, he was told that test came back positive, but then about 12 hours later, he was told that the staff had misread it, and he was actually negative for monoclonal antibodies, so the caller was given monoclonal antibody therapy and he did fine with that, and he is recovered now. He is scheduled to go back to work this Thursday, and he is supposed to receive the second dose of the vaccine, on Friday. He checked the schedule for getting the second dose, and he was not on the list, so he called the infection control nurse, and she told the caller that because he received the monoclonal antibody therapy, he now has to wait 90 days to receive the second dose of the vaccine. Caller states that he looked for that information, and he did not see that anywhere, so he is wondering if that is correct, because it almost seems to him that if he waits 90 days, he would have to start the series again. The outcome of the event was recovered on an unspecified date.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available.

low grade fever/low grade fever of 103; chills; dry cough; lethargy; This is a spontaneous report from a contactable nurse. A 62-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EJ1685 with expiry date Mar2021), via an unspecified route of administration in left deltoid on 30Dec2020 14:30 at a single dose for COVID-19 immunization. The administration was one in a local pharmacy. There were no relevant medical history and concomitant medications. On Saturday night, 02Jan2021, the patient started getting a low grade fever of 103, had chills, lethargy and an intermittent dry cough. The outcome of the events was not recovered. The events were considered medically significant events.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

a left sided nystagmus; urgent MRI showing multiple brain lesions consistent with Acute disseminated encephalomyelitis; Patient developed paresthesias on entire right side of body / The paresthesias continued, not progressing; a brief headache; episode of dizziness / developed severe dizziness; This is a

spontaneous report from a contactable physician (patient). A 34-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730) intramuscularly at right arm on 21Dec2020 07:00 at single dose for COVID-19 immunization. Medical history included known allergies to sulfa meds. The patient's concomitant medications included multivitamins [vitamins nos] within 2 weeks of vaccination. Patient developed paresthesias on entire right side of body after a brief headache and episode of dizziness, all since 29Dec2020 15: 00. The paresthesias continued, not progressing, but patient was advised to obtain an MRI Brain and C spine as an outpatient. On 02Jan2021, the patient developed severe dizziness and a left sided nystagmus. She went to the ER and underwent urgent MRI showing multiple brain lesions consistent with acute disseminated encephalomyelitis. Lumbar puncture (LP) was performed, awaiting final results. Patient was admitted and was receiving IV steroids (solumedrol). Duration of hospitalization was 5 days since Dec2020. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient underwent lab tests and procedures, which included Nasal Swab and Rapid covid swab, both on 02Jan2020 with result of negative. The outcome of the events was recovering.; Sender's Comments: Based on temporal association and lack of other provided etiology, a possible contributory role of suspect BNT162B2 vaccine cannot be excluded for reported acute disseminated encephalomyelitis, paraesthesia, headache, dizziness and nystagmus. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

hives; face swelling; itching; rash; This is a spontaneous report from a contactable nurse (patient). A 71-year-old female patient received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EH9899), intramuscular in left arm on 22Dec2020 11:08 at single dose for COVID-19 vaccination. Medical history included ongoing blood pressure high, ongoing cholesterol, ongoing depression. Concomitant medication included atenolol (tablet, strength 50 mg) from an unknown date and ongoing for blood pressure high, simvastatin (tablet, strength 20 mg) from an unknown date and ongoing for cholesterol, paroxetine hydrochloride (PAXIL, tablet, strength 40 mg) from an unknown date and ongoing for depression. The patient experienced hives, face swelling, itching and rash on 27Dec2020. No additional vaccines administered on same date of the Pfizer suspect. Prior vaccination within 4 weeks was none. She got the first Covid 19 dose on 22Dec2020 and was fine, then on 27Dec2020 she had hives, itching, and face swelling for several days. Caller stated her lungs were clear and she was okay other than the extreme itching. The face swelling was what worried her. The hives and itching went away within about 36 hours. The face swelling kind of got worse for a couple of days before it went away. Caller verifies she recovered from the hives/rash/itching within 36 hours. She got a steroid shot and things like that and it went away pretty quickly. The face swelling was completely gone but did last for a good 5 days. She didn't know if this reaction was related to the vaccine. She wanted to call and let Pfizer know and see if there was any reports of anything else like that or similar to that type of reaction. She was not sure if that really matters or not except she was not sure about taking the booster. She was kind of leaning towards taking the second vaccine. She didn't have any breathing issues. She asked as far as the second

dose after those side affects, was it recommended? Her doctor said she could get the second one and prescribed her an Epi pen and would give a dose of Benadryl at the time of the second vaccine. She may take some Benadryl before getting the second vaccine and have her EpiPen with her just in case. She hadn't seen her doctor about this experience with the COVID-19 vaccine. She only went to an urgent care. The caller stated she went to urgent care twice. She received a steroid shot but doesn't have any name, NDC/UPC, Lot number or expiration date for any of the medication she received. She probably threw that paperwork out. She knew she wasn't given anything the second time she went to the urgent care. The second time she went back was because the face swelling was getting worse. She was prescribed an EpiPen and was told to take Zyrtec which did help. Everything had gone away. She would consider these events to be medically significant because of the face swelling, it kind of scared her. She made the comment she was taking high blood pressure medicine and cholesterol medicine, but other than that she was very healthy. She was not really an allergic person. She had not had any testing done since she received the vaccine. She did have bloodwork done prior but not since the vaccine. The patient underwent lab tests and procedures which included blood work prior vaccine with unknown result. The outcome of hives, rash and itching was recovered on an unspecified date of Dec2020 (within about 36 hours); face swelling was recovered on 01Jan2021.; Sender's Comments: Based on the time gap between the vaccine and the events there is not a reasonable possibility that the reported events were related to the suspect product, events are most likely due to patient underlying contributory factors The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators as appropriate.

drop in blood pressure resulting in fainting; drop in blood pressure resulting in fainting; Severe headache; fever; This is a spontaneous report from a contactable other healthcare professional (patient). A 26-year-old female patient (non-pregnant) received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EK9231), via an unspecified route of administration on 03Jan2021 at single dose at left arm for immunization. Medical history included allergies to Penicillins. The patient's concomitant medications within 2 weeks of vaccination included birth control pill, prenatal vitamin. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, patient was diagnosed with COVID-19. Since the vaccination, patient has not been tested for COVID-19. The patient experienced severe headache, fever, and drop in blood pressure resulting in fainting the morning following receiving the vaccine on 04Jan2021 with outcome of recovering. Patient didn't receive treatment for events. Adverse events resulted in doctor or other healthcare professional office/clinic visit. This report is considered non-serious. No follow-up attempts are possible. Information about Batch number cannot be obtained. No further information is expected.; Sender's Comments: Based on the close temporal relationship, the association between the event fainting with BNT162b2 can not be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Test positive for COVID-19/have symptoms on 26, 27 and 28Dec2020; Test positive for COVID-19/have symptoms on 26, 27 and 28Dec2020; This is a spontaneous report from a contactable physician (patient). A 59-year-old male patient started to receive first dose of BNT162B2 (Batch/lot number: EH9899) intramuscular into left deltoid on 15Dec2020 at single dose for covid-19 immunisation. Medical history included hypertension and the patient was on blood pressure (BP) medications. The patient received no other vaccines on the same day as the COVID Vaccine. The patient received first dose on 15Dec2020 and was exposed to someone with COVID on 24Dec2020 and tested positive for COVID 28Dec2020. The patient stated that he was wondering what the recommendations are for receiving the second dose of the product, if someone contracted COVID-19 after receiving the first dose. He tested Positive for COVID-19 on 28Dec2020 and he does not know if it is ongoing or not, as he does not re-test for COVID-19 until Wednesday (30Dec2020), but he currently has no symptoms. The patient stated that he did have symptoms on 26, 27 and 28Dec2020. The lab tests and included COVID-19 PCR test: positive on 28Dec2020. The outcome of events was unknown.; Sender's Comments: The association between the event lack of effect (COVID-19) with BNT162b2 can not be completely excluded.

Patient fainted in the ICU setting.; dizziness; hypotension; This is a spontaneous report from a contactable Other HCP. A 25-year-old male patient received BNT162B2 (Lot number: eh9899) via an unspecified route of administration on 24Dec2020 13:00 at single dose for covid-19 immunisation. The patient did not have any known allergies or medical history. Prior to vaccination, the patient was not diagnosed with COVID-19. There were no concomitant medications. On 24Dec2020, patient experienced dizziness and hypotension. Patient's blood pressure (BP) was 50/30 and heart rate (HR) 45. Patient fainted in the intensive care unit (ICU) setting. This happened during work hours while treating a patient. Patient was treated in the emergency department (ED). The adverse events resulted in emergency room/department or urgent care. It was unknown if treatment was received for the adverse event. Since the vaccination, the patient has not been tested for COVID-19. The outcome of events was recovered.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

temperature of 101 ¦F; body aches; headache; nausea; chills; This is a spontaneous report from a contactable Other HCP (patient). A 26-year-old female patient started to receive BNT162B2 (Batch/lot number: EK9231) at right deltoid via an unspecified route of administration on 03Jan2021 12:20 at single dose for covid-19 immunisation. Medical history was none. The patient's concomitant medications were not reported. The patient experienced temperature of 101 ¦F, chills, body aches, headache and nausea on 04Jan2021 02:00. Patient stated for the second one, she was hoping for the best, but she got the vaccine yesterday (03Jan2021), at 12:20, and today (04Jan2021), at 2 AM, she had a temperature of 101, and chills, body aches, headaches, and nausea. She was out of it today, she was not feeling good, and was told to do this. Caller got the vaccine at Employee Health. After 4 hours of Tylenol (expiry is May2021, lot is P115252), her temperature went right back up. It was about 99 when she had Tylenol.

Chills started late this morning (04Jan2021) and were ongoing when she was not on Tylenol, but her body aches were ongoing. 9AM was when her headache started, and she was intermittently on Tylenol, but if past the 4 hour mark, they were as bad as they were this morning, but with Tylenol they were better. Nausea was mostly this morning, and had gotten better. Patient stated that due to her current symptoms her employer had required her to be tested for COVID-19. She had not yet received the results of that test. Seriousness for events temperature of 101 ¦F, chills, body aches, headache and nausea was Medically significant. Lab data included COVID test on 23Dec2020 was negative. The outcome of temperature of 101 ¦F, headache and nausea was recovering; of body aches was not recovered; of chills was unknown. Primary Source Reporter (Method of assessment was Global Introspection) considered the events were related to BNT162B2.; Sender's Comments: There is a reasonable possibility that the events reported were related to BNT162b2 based on known drug safety profile and close temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

"Itching and redness over whole body/I turned all red and was itching all over my body by about 10:30-10:45 am/I still have mild itching; Itching and redness over whole body/I turned all red and was itching all over my body by about 10:30- 10:45 am/I still have mild itching; Elevated heart rate and blood pressure; Elevated heart rate and blood pressure; Had an allergic reaction; This is a spontaneous report from a contactable nurse (patient). A 43-year-old female patient received the first dose of bnt162b2 (BNT162B2) lot no: EK9231, via an unspecified route of administration in left arm on 30Dec2020 09:00 at a single dose for COVID-19 immunization. Medical history HTN and exercise-induced asthma, both from an unspecified date and unknown if ongoing. The patient was not pregnant at the time of vaccination. The patient had no covid prior to vaccination and was not covid tested post vaccination. Concomitant medication included colecalciferol (VITAMIN D), montelukast sodium (SINGULAIR), and biotin. No other vaccines were administered in four weeks. Known allergies include tapendalol (NUCYNTA) and trimethoprim/sulfamethoxazole (BACTRIM). On 30Dec2020 09:30, the patient experienced itching and redness over whole body, elevated heart rate, and blood pressure. The patient was given IV diphenhydramine (BENADRYL) 50 mg, IV famotidine (PEPCID), IV methylprednisolone (SOLU MEDROL), ""flui"" as treatment for AEs. The patient further clarified that she received the COVID 19 vaccine on 30Dec2020 at 9:00 and she had an allergic reaction. She turned all red and was itching all over her body by about 10:30- 10:45 am and was at the ER by about 11am. She started on prednisone 40mg for 3 days and diphenhydramine every 6 hours, as needed on 30Dec2020. On Sunday (03Jan2021), she was still severely itching and turning red so prednisone was continued for an additional 3 days and was switched to cetirizine (ZYRTEC) because she can't function on diphenhydramine. Cetirizine was not helping so she had to take diphenhydramine yesterday morning (04Jan2021). Last night (04Jan2021), she was ok without any diphenhydramine but this morning (05Jan2021), she still have mild itching, and no redness. The redness comes and goes; it is on the face, chest, arms, legs. When it first started, it was whole body redness. Then it moved to different areas on different days; she don't have a rash or hives, just redness. She had a 4 inch band of redness on both arms one day. The events were reported as non-serious. The

patient had not recovered from the events.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of allergic reactions cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The underlying predisposing condition of drug allergies to multiple materials may put the patient at high risk of allergic reactions. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate"

contracted Sars-Cov-2 in between her two doses; contracted Sars-Cov-2 in between her two doses; This is a spontaneous report from a Contactable Other HCP. A female patient of an unspecified age started to receive the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on unknown date at single dose for covid-19 immunisation. The patient medical history was not reported. The patient's concomitant medications were not reported. Patient was due for her 2nd dose of Pfizer-Biontech Covid19 vaccine on 06Jan2020. She contracted Sars-Cov-2 in between her two doses, want to know if she should receive her second dose as scheduled. Patient had COVID-19 test with unknown result. Outcome of events was unknown. Information about lot/batch number has been requested.; Sender's Comments: The association between the event lack of effect (contracted SARS CoV 2) with BNT162b2 cannot be completely excluded.

tested positive for COVID-19 more than a week after receiving our COVID-19 vaccine; tested positive for COVID-19 more than a week after receiving our COVID-19 vaccine; This is a spontaneous report from a non-contactable consumer. A 45-years-old patient of an unspecified gender started received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiration date not reported), via an unspecified route of administration from an unspecified date at a single dose for Covid-19 immunization. The patient medical history and concomitant medications were not reported. The patient tested positive for COVID-19 more than a week after receiving COVID-19 vaccine. Outcome of the event was unknown. No follow up attempts are possible. Information on lot/batch number cannot be obtained.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

"I was pretty sick, I felt palsy; I was pretty sick, I felt palsy; I developed the fever for all about 30 hours after the vaccination; Headache; This is a spontaneous report from a contactable physician. This physician reported for himself that a 67-years-old male patient received BNT162B2 (BioNTech Covid 19 vaccine; Batch/lot number: EL1284), via an unspecified route of administration on 30Dec2020 at SINGLE DOSE for ""Because I am a physician, a healthcare provider"" (covid-19 immunization). Medical history included had Covid back on the 4th of December. There were no concomitant medications. Physician stated he was wondering he just took your Pfizer Covid vaccination, the first one. He took it couple of

days ago. He took it on the 30th of this month, two days ago. Physician further stated he developed the fever for all about 30 hours after the vaccination. Just because he developed the fever with the first one, it was like a 101.7 that was about 36 hours. So the question was just because he developed the fever with the first one, he was pretty sick, he meant he felt palsy, you know headache and all that it was like probably developed the same with the second one? Patient weight was maybe 125 pounds. When probed if vaccine was prescribed by any Physician, Physician stated he went himself. Causality by physician stated as ""he think so"". Lab work reported as He did not have the results yet. He just look a Covid screening test because he had Covid back on the 04Dec. So, he just took a Covid screening test. Treatment received included aspirin. The outcome of all events was unknown.; Sender's Comments: The causal relationship between BNT162B2 and the event palsy cannot be excluded as the information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate."

had the COVID-19 vaccine on 28Dec2020 and was tested positive today (04Jan2021) for COVID-19; had the COVID-19 vaccine on 28Dec2020 and was tested positive today (04Jan2021) for COVID-19; This is a spontaneous report from a contactable other hcp via the Pfizer-sponsored program. A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 28Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient had the COVID-19 vaccine on 28Dec2020 and was tested positive today (04Jan2021) for COVID-19. Outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The reported positive with Covid 19 test after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

blurriness on the right eye with consistent optic neuritis; read up on transverse myelitis that may be related to her condition; blurriness on the right eye with consistent optic neuritis; This is a spontaneous report from a contactable physician. This physician (patient) reported for self that the 31-year-old female patient received bnt162b2 (BNT162B2, PFIZER-BIONTECH COVID-19 VACCINE, lot: EK5730), via an unspecified route of administration on Deltoid, Left on 20Dec2020 13:00 at single dose for covid-19 immunisation. Medical history and concomitant medications were none. Reported she has a flu vaccine in Sep2020, and had no reaction to the flu vaccine. She clarified she has never had a reaction to a vaccination before. The patient received the vaccine last 20Dec2020 and has reported to have blurriness on the right eye with consistent optic neuritis since 24Dec2020. She has already consulted with an ophthalmologist who said her case was interesting and referred her to Pfizer. She is scheduled to have her second dose on 10Jan2021 and is asking if she should still take it. She also mentioned that she read up on transverse myelitis that may be related to her condition and is asking for any information we may have on this. Doctor reporting she is having a possible adverse event to the COVID-19 Vaccine. The

patient clarified she received the COVID-19 Vaccine on Sunday, 20Dec2020 at approximately 1:00PM. Reported the COVID-19 Vaccine was administered at her employer. Doctor reported she is experiencing blurry vision in her right eye only, consistent with optic neuritis in Dec2020 (Medically significant). She said her right eye blurry vision gets worse after working out or showering. She said she has read some medical information that states some kind of autoimmune reaction, like transfer myelitis, may occur after receiving the COVID-19 Vaccine. The patient asked if she should get the second COVID-19 Vaccine, clarifying she is scheduled to receive her second dose on 10Jan2021. Clarified she started experiencing the right eye blurry vision on either 24Dec2020 or 25Dec2020. Treatment: Reported she saw an ophthalmologist, and the ophthalmologist said he didn't see anything concerning or not normal. She said the ophthalmologist referred her to see a neurologist, and to get a MRI of her head. She clarified her MRI appointment is on 19Jan2021. She clarified her ophthalmologist called her back 2 hours after she left her appointment. She said the ophthalmologist told her he found what she was experiencing to be interesting, as to when she received the COVID-19 Vaccine, and the start of her right eye blurry vision, and that he wanted her to get further evaluation. She said the ophthalmologist performed visual field testing, and took a fancy picture of her retina. No further details provided. Vaccination Facility Type was hospital. No Vaccine Administered at Military Facility. History of all previous immunization with the Pfizer vaccine considered as suspect (or patient age at first and subsequent immunizations if dates of birth or immunizations are not available) was none. Additional Vaccines Administered on Same Date of the Pfizer Suspect was none. No AE(s) required a visit to Emergency Room but AE(s) required a visit to Physician Office. Prior Vaccinations (within 4 weeks) was none. Patient's Medical History(including any illness at time of vaccination) was none. Family Medical History Relevant to AE(s) was not provided. Relevant Tests included Visual field test, and picture of her retina. The outcome of the events was not recovered.; Sender's Comments: Based on temporal association, the causal relationship between bnt162b2 and the events optic neuritis, vision blurred and myelitis transverse cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

tested positive for Covid-19; tested positive for Covid-19; This is a spontaneous report from a contactable healthcare professional (reporting for herself). A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date not reported) via an unspecified route of administration, on 24Dec2020, single dose for COVID-19 immunization. Relevant medical history and concomitant medications were not reported. The patient tested negative for Covid-19 on 22Dec2020, received her first vaccine dose on 24Dec2020 and then tested positive for Covid-19 on 26Dec2020. Outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The efficacy of a drug varies from patient to patient and can be affected by different factors; however, a contributory role of the suspect product bnt162b2 to the reported drug ineffective and SARS-CoV-2 test positive cannot be ruled out.

Cp initially that resolved in seconds. Then severe muscle aches, fatigue, temp 1 week,excruciating joint pain continues now. Malaise.

full body rash; heart palpitations; reaction to drug excipient; This is a spontaneous report from a contactable nurse, the patient. A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: UNKNOWN), via an unspecified route of administration on 26Dec2020 as a single dose for COVID-19 immunization. Medical history included several outdoor allergies, but no known food allergies. The patient's concomitant medications were not reported. On 28Dec2020, the patient experienced full body rash and heart palpitations. The clinical course was as follows: the patient developed a full body rash and heart palpitations on 28Dec2020 and went to the emergency room. The patient had a full work-up which included electrocardiogram, troponin levels, and electrolytes, and all were normal. She was instructed to take diphenhydramine hydrochloride (BENADRYL). She thought it may have been due to the polyethylene glycol; however, she did mention that she previously took macrogol 3350 (MIRALAX) on unknown dates for an unknown indication and was fine. The clinical outcomes of the full body rash, heart palpitations, and reaction to polyethylene glycol, were unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported full body rash and the administration of the suspect, BNT162B2, based on the reasonable temporal association. While the possibility of allergic to polyethylene glycol (drug excipient) might have provided alternative explanations. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

neuropathy; This is a spontaneous report from a contactable Nurse. A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. Reporter called about Covid vaccine and has a question connected to the AE he has reported. Wants to know if neuropathy is a side effect of the vaccine. Event outcome was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Very limited information was provided in this case, pending further details such as medical history, clinical course, specified event description, at this moment, the mentioned neuropathy is considered related to BNT162B2 for reporting purpose. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

Development of microemboli on distal, fourth right phalange on the ventral surface. Just past the DIP. Small blue hue below skin surface with mild tenderness on deep palpation.; This is a spontaneous report from a non-contactable Physician (patient). This adult female patient (not pregnant at the time of vaccination) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number:

EH9899), intramuscular on 23Dec2020 09:30 at single dose on right arm for COVID-19 immunisation. Medical history included migraine with aura. Concomitant medication included propranolol, loratadine (CLARITINE) and multivitamin. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient previously took cefprozil (CEFZIL) and experienced allergies. The patient experienced development of microemboli on distal, fourth right phalange on the ventral surface. Just past the DIP. Small blue hue below skin surface with mild tenderness on deep palpation on 24Dec2020 12:00. The event was considered as non-serious. Treatment for the events was unknown. The outcome of the event was unknown. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient had not been tested for COVID-19. No follow up attempts are possible. No further information is expected.; Sender's Comments: Based on the close temporal relationship, the association between the event microemboli on distal phalange with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Went to ER left side of face sagging. They did MRI it showed he had stroke. happened before 4pm that same day as vaccine. Happened between 2-4 pm; Went to ER left side of face sagging. They did MRI it showed he had stroke. happened before 4pm that same day as vaccine. Happened between 2-4 pm; This is a spontaneous report from a contactable consumer (patient). A 78-year-old male patient receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number: EK5730), on 31Dec2020 11:00 AM via unknown route of administration at single dose for COVID-19 immunization. Medical history included high blood pressure, but went up and down and had to readjust. His BP was high and not sure how long it was that way. Concomitant medications included unspecified blood pressure medications. There were no known allergies. Patient went to ER left side of face sagging. They did MRI it showed he had stroke. It Happened before 4pm that same day as vaccine on 31Dec2020 02:00 PM. And it Happened between 2-4 pm. Patient received treatment. Patient had ER test blood, cat scan, MRI. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient did not have been tested for COVID-19. The outcome of the events was recovering. This case was assessed non-serious by reporter. And the events did not result in death, Life threatening, Caused/prolonged hospitalization, Disabling/Incapacitating, Congenital anomaly/birth defect.

occipital neuralgia; left-side Bells Palsy; bilateral headache; This is a spontaneous report from a contactable physician (patient). A 65-year-old male patient received BNT162b2 (Lot/batch number and Expiration date were not provided), via an unspecified route of administration at right deltoid on 21Dec2020 19:00 at single dose for covid-19 immunization. The patient's medical history included low high density lipoprotein (HDL). There were no concomitant medications. The patient previously took influenza vaccine (longer than 4 weeks ago, and he did not have any reaction), pravastatin for low HDL. Reported 2 days ago (02Jan2021) he developed a bilateral headache. He stated he was asymptomatic until then. He said he now has Bells Palsy on 02Jan2021, clarified he has left-side Bells Palsy. He said it is

unknown to him if the bilateral headache and Bells Palsy are related to taking the COVID-19 Vaccine. He stated he started wearing a N95 mask for the past 2 weeks. He said the N95 mask is very tight on the back of his head. He said he believes he is experiencing occipital neuralgia caused by wearing the N95 mask. He said studies show that the N95 mask can cause Bells Palsy, and the N95 mask maybe a confounding factor. He stated he doesn't have any further information on the N95 mask he was using. Initially he had a severe headache and administered to himself a sphenopalatine block of Lidocaine 1% in his nose. He stated being an ER doctor, he knows how to administer the sphenopalatine block to a patient. He went to the ER on 03Jan2021 to make sure he did not have a tumor or a stroke. He said the hospital performed a CT of his head, a MRA, labs, and a COVID-19 test (clarified as a PCR COVID-19 test) with a full viral count. He said all the tests were negative. His wife noticed his Bells Palsy yesterday, 03Jan2021. He said he thinks the Bells Palsy started the night before on 02Jan2021. He said he noticed on the night of 02Jan2021 when he was brushing his teeth, he hit a tooth on that side (clarified as left side) of his mouth with his tooth brush. He hasn't started taking steroids yet, but will be starting steroids real soon. He clarified his doctor prescribed a Medrol dose pack and Valtrex for the Bells Palsy. He stated he has not started the Medrol dose pack and Valtrex. He is ordering Lidocaine 1% viscous for himself, so he can do an internasal sphenopalatine block on himself. He does not know if the bilateral headache and Bells Palsy were caused by taking the COVID-19 Vaccine. The events required Emergency Room visit. The outcome of the event Bell's palsy was not recovered, Headache was recovering, Occipital neuralgia was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: A possible causal association between administration of BNT162b2 and the onset of Bell's palsy/Headache might not be excluded, considering the plausible temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Headache; Fever: She said that she started with kind of chills and shakes; Fever: She said that she started with kind of chills and shakes; she was not feeling too good; real high heart rate that were in the 110's that last for lasted for hours; Fever; This is a spontaneous report from a contactable nurse reported for herself. A 59-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot number: EK9231 and expiration date unknown), via intramuscular on left deltoid on 03Jan2021 09:13 at single dose for COVID-19 prophylaxis. The patient medical history and concomitant medications reported as none. The reporter is a registered nurse that reported that she had the first Covid-19 vaccine yesterday morning on 03Jan2021 and she had side effects. She reported that she had a fever, headache, and a real high heart rate that was in the 110's that last for lasted for hours. She said that she started with kind of chills and shakes 11 hours and 40 minutes after receiving the vaccine. One minute she was fine and the next minute she was feeling chilled. By the time she got home from her mother's house, which is a hours drive, she was not feeling too good. Her fever broke today 04Jan2021 at around 04:00 and when she checked her temperature it was 98.7 degrees. She said that 100.2 degrees was the highest temperature she recorded. The patient said that it was a mild fever. Her headache started about 22:00 03Jan2021. The patient said that she still has the headache a little bit and she has been treating it with Tylenol and it has gotten better. She said that she wears a fit bit that tracks

her heart rate and she can hear her heartbeat in her ears and she could hear it going fast. Caller said that her heart rate was down to 98 beats per minute at 06:30 this morning. She said that her current heart rate was Body temperature. Caller said that her high heart rate had her very concerned. She said that it is not normal. She is supposed to go back on 30Jan2021 to get her 2nd injection. Should she still plan on getting the second part of the vaccine? The reporter assessed event real high heart rate that were in the 110's that last for lasted for hours as serious with medically significant. Other events were assessed as non serious. The outcome of the events fever and real high heart rate that were in the 110's that last for lasted for hours was recovered on 04Jan2020, outcome of the event headache was recovering, outcome of the other events was unknown.; Sender's Comments: Based on the close temporal relationship, the association between the event high heart rate with BNT162b2 can not be completely excluded.

I was having trouble clearing my throat, felt like it was closing up; high heart rate/rapid heart rate agai; uncontrollable rigors; numb lips and hands; numb lips and hands; nausea; shortness of breath, difficulty catching my breath; This is a spontaneous report from a contactable Other Health Professional (patient). A 38-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) lot number: EJ1685, intramuscular in the left arm, on 30Dec2020 09:15 at a single dose for COVID-19 immunization. Medical history included bariatric surgery, had anterior vaginal repair and bladder sling, had her gall bladder and tonsils removed. Concomitant medication included rizatriptan and paracetamol (TYLENOL). The patient had no known allergies but mentioned that she cannot take the NSAIDs eventhough she was not allergic to them. She had no allergies to food or to other products. It was reported that within about 10 minutes of the injection of the vaccine, she had trouble clearing her throat, felt like it was closing up, had uncontrollable rigors, high heart rate, numb lips and hands, and nausea on 30Dec2020 at 09:30 AM. She was discharged from the ED (emergency department), went home and took a nap. Later that evening, she began to have a rapid heart rate again, began to had shortness of breath, difficulty catching her breath and she was admitted to the emergency department again and given more IV medications. The onset of the events was reported to be 30Dec2020 at 09:30 AM with outcome of recovering. As a result of the events, the patient visited that Emergency room/department or urgent care. Treatment received with IV medications (unspecified), breathing treatment, and epinephrine injection. The patient had no covid prior vaccination. She had not had Covid test post vaccination.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events throat tightness, heart rate increased, chills, hypoaesthesia oral, hypoaesthesia, nausea and dyspnoea cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

fibromyalgia and neuropathy on the lower cervical/pain has exacerbated; fibromyalgia and neuropathy on the lower cervical/pain has exacerbated; headache; channeled body pain; fever at 100.7F; This is a

spontaneous report from a contactable consumer (patient). A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on an unspecified date (reported as 31Jan2020) as a single dose for COVID-19 immunization. Medical history included fibromyalgia and neuropathy on the lower cervical. The patient's concomitant medications were not reported. The patient experienced fibromyalgia and neuropathy on the lower cervical/pain has exacerbated, headache, channeled body pain, and fever at 100.7 F on an unspecified date. It was reported that headache, channeled body pain, and fever at 100.7 F occurred 1 hour after vaccination. The patient underwent lab tests and procedure, which included: body temperature: 100.7 Fahrenheit on an unspecified date. The patient has been taking unspecified medications for the condition, in addition to acetaminophen (TYLENOL FOR ARTHRITIS). Therapeutic measures were taken as a result of all of the events as aforementioned. The clinical outcome of fibromyalgia and neuropathy on the lower cervical/pain has exacerbated, headache, channeled body pain, and fever at 100.7 F was unknown.

Fainting; This is a spontaneous report from a non-contactable consumer (patient). This consumer reported similar events for 02 patient. This is the 1st of 2 reports. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 23Dec2020 at single dose for COVID-19 immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient experienced fainting on 31Dec2020. The patient went to the emergency department in regards to fainting and was told the fainting couldn't be related to the COVID-19 Vaccine. Then she heard about someone else fainting. Outcome of the event was unknown. No follow-up attempts are possible, information about lot/batch cannot be obtained. No further information is expected; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021006463 same reporter/drug/event, different patient

difficulty breathing/swallowing; difficulty breathing/swallowing; Hives/hives all over including in her mouth; This is a spontaneous report from a contactable consumer (spouse). A 46-year-old female patient (wife) received BNT162B2 (Pfizer-Biontech Covid-19 Vaccine, lot number: EH9899) via unspecified route of administration at arm right on 29Dec2020 at single dose for Covid-19 vaccine. Medical history included ongoing anxiety diagnosed 22 years ago. Concomitant medications were not none. Patient received the vaccine and was one big hive (01Jan2021). She went to the ER on sat and will have to go back. Caller is asking where she should go. patient went through the VAERS report 3 times. She did not have any sides effects. patient is a frontline worker. On 29Dec2020 she got the Covid vaccine. On Sat 02Jan2021 she went the ER with hives all over including in her mouth, stated she had difficulty breathing/swallowing, was given medication to take home and discharged. She was readmitted yesterday 05Jan2020 with worsening symptoms and needed to be given a prednisone nebulizer. they had two ER visits. No Investigation Assessment. patient was not recovered from the event hives/hives all over including in her mouth, the final outcome of other events was unknown.

"What I believe may have triggered this reaction is that in October I had a carpal and ulnar tunnel release in the same extremity/affected the nerves; my entire upper arm began aching-pain from my trapezius down to my elbow; my index and middle finger began tingling; I am noting pain in each of the major joints of my arm-shoulder, elbow and wrist; I am noting pain in each of the major joints of my

arm-shoulder, elbow and wrist.; I am noting pain in each of the major joints of my arm-shoulder, elbow and wrist.; This is a spontaneous report from a contactable nurse (patient). A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration on the arm on 19Dec2020 as single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced the following: "" my entire upper arm began aching-pain from my trapezius down to my elbow "" in Dec2020 with outcome of unknown; ""my index and middle finger began tingling "" in Dec2020 with outcome of unknown; "" I am noting pain in each of the major joints of my arm-shoulder, elbow and wrist "" in Dec2020 with outcome of unknown; "" what I believe may have triggered this reaction is that in October I had a carpal and ulnar tunnel release in the same extremity "" in Dec2020 with outcome of unknown. Therapeutic measures were taken as a result of the events. Details were as follows: The injection itself was without any issues. However, 6-7 hours later, the patient described the following: patients entire upper arm began aching-pain from trapezius down to the elbow. This continued throughout the weekend and then Monday, patients index and middle finger began tingling (as if asleep). This symptom never subsided. The patient noted pain in each of the major joints of the arm shoulder, elbow and wrist. The patient tried trigger injections in the trapezius, ibuprofen, muscle relaxers, heat, exercises, and a steroid burst-all without relief of symptoms. Patient was able to move arm and had strength in the extremity. Patient saw a specialist in physical medicine and rehabilitation. The patient believed that what triggered this reaction is that in October the patient had a carpal and ulnar tunnel release in the same extremity. The patient wondered whether the medication affected the nerves that had been manipulated during surgery. The events outcome was unknown. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up .; Sender's Comments: Based on the time association, the possible contribution of suspect BNT 162B2 injection to the event Neuropathy peripheral cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

"Rash; Itching at different spot at different time; Hives; This is a spontaneous report from a contactable consumer. A 58-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL3246), via an unspecified route of administration on 02Jan2021 at single dose as reported for ""Indication: Consumer stated, ""Because I work in Covid testing, in healthcare."" Medical history included hypertension and allergy. Concomitant medication included amlodipine, lisinopril, metoprolol, hydrochlorothiazide (HYDROCHLORZIDE), desloratadine and montelukast. The patient stated, ""had the first dose of the Pfizer vaccine yesterday for the Covid 19, 2 hours after I started itching and it has been different places all over my body. I do not know has it anything to do with the way that it goes through the body, I do not know. I have had to take a lots of Benadryl. I have had to take some steroids that I had here at the house I never had started and I thought it was okay. Last night my husband put hydrocortisone cream (later clarified as treatment) on areas I was itching and had hives. I slept all night I did not have any problem since I got up this morning I started itching in other place. So, I have done the whole thing again. I am going to has to go. I did not want to go ER because I am not

having trouble on breathing or anything like that but I have got various places it is like different places every time it starts. So, I need to I am going to go and have a probably a strong steroid shot and have strong steroid given to me, not for oral but I just want to let you know if that is a side effect and I do not know whether I am going to take the second one or not?"" I have taken Benadryl and I have taken Methylprednisolone and I have used on the Cortisone Cream, the topical cream"". The outcome of the events was unknown.; Sender's Comments: A causal association between BNT162B2 and the events rash, pruritus and urticaria cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate."

"Coughing so hard; coughed during COVID but not like this; Hard to stand up; Pain/body wrecking pains; Fever; Started heaving; Dizzy; Nauseous; Throwing up; Chills; Draining; This is a spontaneous report from a contactable consumer. An adult female patient (consumer's daughter) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. Medical history included covid-19 from Nov2020. The patient had COVID in the middle of Nov2020 and her father and reporter had it two weeks before and then about two weeks later, she got it. She took her 14 days quarantine, she coughed and had some tummy issues. She had fever, the aches and pains with Covid, a little bit of dry cough. She did not feel good for probably about 5 days, after that she started working again. She had COVID and did not have to be hospitalized, any IV drip or anything before vaccination. 6 weeks later, she got the vaccine shot. The patient's concomitant medications were not reported. The vaccine came out on Wednesday (30Dec2020), the patient signed up at work to take it. Within about 12 hours (unknown onset date), she did start to feel 'oily', and had started having aches, pains and very shortly after that she started running a fever, all of a sudden the cough came out of the blue, she started heaving, dizzy, nauseous and it's three days later, she was coughing so hard. She coughed during COVID but not like this, this was like COVID ten times over, same symptoms though, throwing up, throwing up, hard to stand up, aches, pains, fever, chills, body wrecking pains. The patient can hardly talk because she kept coughing and draining. The reporter asked that ""Should her daughter be given vaccine? Does her antibodies, daughter was asked - Did you have any severe case, and she told - No, I was able to stay home and just stay in bed, they said - Okay we'll give it to you. Should she have gotten so close to the signs that she had COVID? Why her daughter be asked that question? What is going on regarding the symptoms. What should we do about it?"" Consumer tried to get daughter to go to a COVID Clinic today (02Jan2021), and know she didn't have COVID, that's not how it worked, but normal doctors didn't want to see her daughter. Consumer called the COVID Clinic and they said ""Yes, we could probably see her"". The outcome of events was unknown. Information about lot/batch number has been requested; Sender's Comments: A causal association between BNT162B2 and the reported events cough and difficulty standing cannot be excluded based on temporal relation of vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety

concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate."

3:07 pm lung sounds diminished oxygen sats 68%, oxygen applied Oxygen sats remained low for next 36 hours (patient on Hospice care) expired 6:22 am 1-8-21

1/6/21 Pt received vaccine and complained of difficulty swallowing and rapid heart rate. Pt received methylprednisolone 125mg IVP, diphenhydramine 25mg IVP, & famotidine 20mg IVP. Pt reported improvement and was discharged. Sent home on diphenhydramine and oral prednisone. 1/7/21 Pt unable to swallow her own secretions and experienced eyelid swelling. Pt vomitted. Pt received epinephrine and Benadryl X 1 dose each. Pt then transported to hospital via ambulance. Reason for admission - acute respiratory failure secondary to anaphylactic reaction. Decision was made to emergently intubate the patient for airway protection despite aggressive intervention. Pt successfully extubated 1/8/21. Plan to discharge home and start Medrol Dose Pack 1/9/21.

Sudden onset of tinnitus followed by complete hearing loss in Right ear upon awaking from sleep (7 hours)

Swelling of lips & tongue, tightening of throat. Quivering of arms & legs. Tightening of chest. Dizzyness lightheaded.

tested positive for COVID-19; tested positive for COVID-19; Headache; feeling unwell; muscle pain; This is a spontaneous report from a contactable nurse reporting on himself. A 61-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) (lot number/expiration date: not provided), via an unspecified route of administration, on 28Dec2020 at 08:15 AM (at the age of 61 years old) as a single dose in the left arm for COVID-19 vaccination. Relevant medical history and concomitant medication were not provided. The patient did not have any known allergies to medications, food, or other products. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 01Jan2021, the patient experienced mild side effects consisting of headache with feeling unwell and muscle pain. The patient reported this happened on 01Jan2021, and 02Jan2021 and on 03Jan2021 and later, the patient did not experience any side effect. Since the vaccination, the patient was tested for COVID-19 on 02Jan2021 with a Nasal Swab Rapid Test and tested positive for COVID-19. The adverse events resulted in Emergency room/department or urgent care visit. The patient did not receive any treatment for these events. The outcome of the events headache with feeling unwell and muscle pain and tested positive for COVID-19 was recovering. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

felt the need to have a COVID test, which turned out positive; felt the need to have a COVID test, which turned out positive; felt the need to have a COVID test, which turned out positive; Chills; Fever; This is a spontaneous report from a contactable Other HCP. A 55-year-old female patient received frist dose of BNT162B2 (Batch/lot number: EK5730) via an unspecified route of administration on 21Dec2020 at single dose for covid-19 immunisation. The patient medical history was not reported. There were no concomitant medications. The patient explained receiving the COVID-19 vaccine on the 21Dec2020 and experienced fever and some chills. She pursed explaining that she was fine afterwards but felt the need to have a COVID test, which turned out positive of the 31Dec2020. The patient stated that she only had chills and fever the evening of 29Dec2020 and had been fine every since. Her fever that night did not hit 100 degrees. She thought that it would be better if she did not go to work on that Wednesday since she had had a fever the night before. She called her doctor who told her to come into the office on 31Dec2020 to have a rapid COVID test done and it came back positive. She only had fever and chills that one night and has not had any other symptoms. She received no treatment and did not take anything for the fever. This all happened during the night. She felt fine when she got up the next morning. Because she had received the first dose of the COVID vaccine, she thinks that this helped her. She thinks if she had not had the vaccine, then the virus would have been a lot worse. She stated that her second dose of the vaccine is scheduled on the 11Jan2021, and asked if it is safe to get the second dose of the COVID-19 vaccine. The outcome of events chills and fever was recovered; of other events was unknown.; Sender's Comments: The association between lack of effect (suspected COVID-19, SARS CoV2 test positive) with BNT162b2 can not be completely excluded.

Caller tested positive for COVID after the first dose; Caller tested positive for COVID after the first dose; This is a spontaneous report from an other Health Care Professional (HCP). A male patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE lot number and expiration date unknown) via an unspecified route of administration on an unspecified date (at an unknown age) at an unspecified dose for COVID-19 vaccination. The patient's medical history was not reported. The patient's concomitant medications were not reported. The patient tested positive for COVID after the first dose. The patient underwent lab tests and procedures which included sars-cov-2 test: positive on an unspecified date. The clinical outcome was unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available.

got the 1st dose of the vaccine then tested positive after; got the 1st dose of the vaccine then tested positive after; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient got the 1st dose of the vaccine then tested positive after. She was asking if she can get the 2nd dose even if she is tested positive. She asked if it can cause to have a false positive result if she received the vaccine.

Outcome of the event was unknown. Information about lot/batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available.

his regular COVID test came back positive; his regular COVID test came back positive; This is a spontaneous report from a contactable nurse (reporting for himself) from a Pfizer-sponsored program. A 48-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date not reported) via an unspecified route of administration, on 23Dec2020, single dose for COVID-19 immunization. Relevant medical history and concomitant medications were not reported. On 23Dec2020, the patient received the COVID vaccine. On 28Dec2020, he had a negative rapid COVID test, and then on 01Jan2021 his regular COVID test came back positive. The patient would like to see if he should still get the second dose of the vaccine. Outcome of the events was unknown. Information on the Batch/Lot number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported event SARS-CoV-2 test positive based on the known safety profile. However given the short duration of 9 days since the vaccine first dose, it is unlikely patient would have fully developed immunity.

"tested positive for covid ""yesterday""/asymptomatic; tested positive for covid ""yesterday""/asymptomatic; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 21Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the first dose of the vaccine on 21Dec2020 and was scheduled for the second on 11Jan2021. The patient tested positive for COVID yesterday, 03Jan2021 and wanted to know what to do about her second dose. The patient added that she was asymptomatic at this point and not taking any medications. Outcome of the events was unknown. The events was assessed as non-serious. Information on the lot/batch number has been requested.; Sender's Comments: The reported positive test with Covid-19 after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration."

severe anaphylaxis; This is a spontaneous report from a non-contactable consumer. This consumer reported similar events for 6 patients. This is the first of 6 reports. A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an unspecified route of administration from an unspecified date at a single dose for vaccination. The patient's medical history and concomitant medications were not reported. The patient experienced severe anaphylaxis, on an unspecified date. Outcome of the event was unknown. No follow up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021003208 different patient/same drug/event;US-PFIZER INC-2021003209 different patient/same drug/event;US-PFIZER INC-2021003210 different patient/same

"diagnosed with COVID-19; diagnosed with COVID-19; This is a spontaneous report from a contactable nurse. A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date were not reported), via an unspecified route of administration on 19Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient stated, ""I received the first dose of the COVID-19 vaccine last 19Dec2020 and unfortunately was exposed to COVID-19 in the evening. I was diagnosed with COVID-19 on 22Dec2020 or 23Dec2020. Should I have my second dose as scheduled tomorrow considering that I have the COVID-19?"". The outcome of the event was unknown. Information on lot number has been requested.; Sender's Comments: The efficacy of a drug varies from patient to patient and can be affected by different factors; however, a contributory role of the suspect product bnt162b2 to the reported drug ineffective and COVID-19 cannot be ruled out."

"Received the first COVID vaccine and then tested positive for COVID; Received the first COVID vaccine and then tested positive for COVID; This is a spontaneous report from Pfizer sponsored program Pfizer First Connect. A contactable nurse (patient) reported that a 22-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an unspecified route of administration on 15Dec2020 at single dose for COVID-19 immunization. There were no medical history and concomitant medications. The patient received the first COVID vaccine on 15Dec2020 and then tested positive for COVID on the 25Dec2020. He was not sure on the time frame, but he wanted to call in for an adverse event, just in case (incomplete sentence) and then he was scheduled to get the second dose within the next week or so. He forgot what date it was but, he wants

to see if it was safe for him to get the second dose. The patient stated that he has a lot of lab work like blood cultures, basic metabolic panel, lactic acid, CBC; results were unknown. The outcome of the event was unknown. Information on the lot number/batch number has been requested.; Reporter's Comments: :; Sender's Comments: Based on available information, a possible contributory role of BNT162B2 vaccine cannot be completely excluded for reported ""tested positive for COVID""."

Tested positive for covid a week later after his first shot; Tested positive for covid a week later after his first shot; This is a spontaneous report from a contactable consumer. A 68-year-old male patient received the first dose of BNT162B2 (Pfizer-BIONTECH Covid-19 Vaccine), via an unspecified route of administration in the left arm on 28Dec2020 at 12:00 PM in a hospital at a single dose as a COVID vaccine. The patient's medical history and concomitant medications were not reported. The patient had no known allergies but had other medical history (unspecified). The patient did not receive any other vaccine within four weeks prior to the COVID vaccine, had other medications in two weeks (unspecified), and was not diagnosed with COVID-19 prior to the vaccination. The patient tested positive for COVID a week later after his first shot. The test used was via nasal swab on 04Jan2021. The patient did not receive any treatment for the events. Outcome of the events was reported as recovering. The case was reported as non-serious (did not result in death, was not life-threatening, did not cause/prolong hospitalization, was not disabling/incapacitating, and did not result to any congenital anomaly/birth defect). Information on the lot/batch number has been requested.

Patient received Positive Covid 19 test result on 02Jan2021; Patient received Positive Covid 19 test result on 02Jan2021; This is a spontaneous report from contactable consumers. An adult male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: IL0140), via an unspecified route of administration on 28Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received positive COVID 19 test result on 02Jan2021. The patient had unknown test with positive result on 31Dec2020. The case was identified as non-serious by reporter. Facility where the most recent COVID-19 vaccine was administered was in hospital. It was unknown that the patient received any other vaccines within 4 weeks prior to the COVID vaccine. It was unknown that the treatment received for the adverse event. Prior to vaccination, patient was not diagnosed with COVID-19. Since the vaccination, the patient had been tested for COVID-19. The outcome of event was recovering.

"developed active Covid within 24 hours of receiving vaccine; developed active Covid within 24 hours of receiving vaccine; This is a spontaneous report from a contactable physician received via a Pfizer sales Representative. A female patient (physician) of an unspecified age received first dose of BNT162B2 via an unspecified route of administration on an unspecified date at a single dose as vaccine. Medical history included exposed to COVID-19 a few days prior to receiving the COVID-19 vaccine (works within a hospital and had been exposed to COVID-19 active infected patients). Concomitant medications were not reported. A physician reported that a female physician developed active Covid within 24 hours of receiving vaccine (also reported as received the vaccine and within 24 hours developed active symptoms of Covid) on an unspecified date. Requested information on whether to receive the second vaccine at this point. Unsure of the need or complications that could potentially rise from receiving a second vaccine in the series. The events took place after use of product. The outcome of the events was

unknown. Information about Lot/Batch number has been requested.; Sender's Comments: There is not a reasonable possibility that reported ""active Covid"" is related to BNT162B2 vaccine. Event occurred within 24 hours of receiving vaccination, when the vaccine is not expected to achieve the effect. The event is most likely intercurrent medical condition."

"developed Covid infection after being vaccinated with COVID-19 vaccine; developed Covid infection after being vaccinated with COVID-19 vaccine; This is a spontaneous report from a contactable physician (patient) received via a Pfizer sales representative. A female patient of an unspecified age received BNT162B2 via an unspecified route of administration on an unspecified date at a single dose as COVID-19 vaccine. Medical history included exposed several days prior to patients with Covid (exposed prior to receiving the vaccine to individuals who had an active Covid infection). Concomitant medications were not reported. It was reported that on an unspecified date, the female physician developed Covid infection after being vaccinated with COVID-19 vaccine (also reported as she received the COVID-19 vaccine and developed active Covid a few days later). The events took place after use of product. The outcome of the events was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: There is not a reasonable possibility that reported ""Covid infection"" is related to BNT162B2 per current available information. The patient exposed to individuals who had an active Covid infection prior to receive the vaccine."

received a covid positive diagnosis; received a covid positive diagnosis; This is a spontaneous report from a contactable nurse (patient). A 35-year-old non-pregnant female patient received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular in the left arm on 21Dec2020 09:45 at a single dose for COVID-19 immunization at the hospital. The patient has no medical history. The patient has no known allergies. The patient's concomitant medications were not reported. The patient did not received any other vaccines within 4 weeks prior to the COVID vaccine and did not received other medications within 2 weeks of vaccination. The patient received a COVID positive diagnosis on 29Dec2020, 8 days later. The events led to a doctor or other healthcare professional office/clinic visit. The patient underwent COVID tests post vaccination on 29Dec2020 - Nasal Swab (NAA nasal swab) and Rapid COVID test, both showed positive test results. The patient was not diagnosed with COVID-19 prior to vaccination. Outcome of the events was recovering. No treatment was given for the events. The events were assessed as non-serious. Information on the lot/batch number has been requested.; Sender's Comments: The efficacy of a drug varies from patient to patient and can be affected by different factors; however, a contributory role of the suspect product BNT162B2 to the reported drug ineffective and COVID-19 cannot be ruled out.

tested positive after taking the first dose of the vaccine; exposed to a family member with the virus/tested positive after taking the first dose of the vaccine; tested positive after taking the first dose of the vaccine; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A contactable nurse reported for a 60-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 28Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient who tested and was positive for the virus after being exposed to a family member with the virus after taking the first dose of the vaccine. Patient was asymptomatic. The Nurse asking if

we have any recommendations for the 2nd dose. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The association between the events lack of effect (suspected COVID-19, tested and was positive) with BNT162b2 can not be completely excluded.

contracted covid after getting the vaccine; contracted covid after getting the vaccine; This is a spontaneous report from a Pfizer-sponsored program. A contactable physician reported similar events for 4 patients. This is 1st of 4 reports. A 46-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: Unknown, does not have lot number to provide) via an unspecified route of administration on 24Dec2020 at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. The patient contracted COVID after getting the vaccine on 01Jan2021. The outcome of the events was unknown. Information on the Lot/Batch number has been requested; Sender's Comments: The association between the event lack of effect (contracted COVID) with BNT162b2 can not be completely excluded.,Linked Report(s) : US-PFIZER INC-2021003894 same reporter/drug/event, different patient;US-PFIZER INC-2021003893 same reporter/drug/event, different patient;US-PFIZER INC-2021003895 same reporter/drug/event, different patient

Contracted covid after getting the vaccine; Contracted covid after getting the vaccine; This is a spontaneous report from a Pfizer Sponsored Program. A contactable physician reported similar events for 4 patients. This is 2nd of 4 reports. A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiration date not provided), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced contracted covid after getting the vaccine on an unspecified date. The report was non-serious per the reporter. The outcome of the events was unknown. Information on Lot/Batch number has been requested.; Sender's Comments: The association between the event lack of effect (contracted COVID) with BNT162b2 can not be completely excluded.,Linked Report(s) : US-PFIZER INC-2021003873 same reporter/drug/event, different patient

contracted covid after getting the vaccine; contracted covid after getting the vaccine; This is a spontaneous report from a Pfizer-sponsored program. A contactable Physician reported similar events for 4 patients. This is 3rd of 4 reports. A patient of an unknown age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: Unknown) via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient contracted COVID after getting the vaccine. The outcome of the events was unknown. contracted covid after getting the vaccine; contracted covid after getting the vaccine; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A contactable physician reported similar events for 4 patients. This is 4th of 4 reports. A patient of unspecified age and

gender received bnt162b2 (lot/batch number and expiration date not provided), via an unspecified route of administration, on an unspecified date, at single dose, for Covid-19 immunization. The patient medical history and concomitant medications were not reported. The patient contracted COVID after getting the vaccine. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The association between the event lack of effect (contracted COVID) with BNT162b2 can not be fully excluded.,Linked Report(s) : US-PFIZER INC-2021003873 same reporter/drug/event, different patient

"Headache; Body aches; This is a spontaneous report from a contactable nurse (patient). A 55-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EH9899), intramuscular (hope it was IM, but did not know for sure because she was not watching) at right arm deltoid on 29Dec2020 08:40 at single dose for COVID-19 immunization, at the hospital where she works. The vaccine was not administered at military facility. The patient's second dose was scheduled to be 19Jan2021. The patient's medical history included potassium low, hypertension, pericarditis, asthma, herniated disc in back, pain, gastrointestinal infection (GI), Vitamin D low, wheezing, exposed to someone who was positive with COVID at a wedding on 28Dec2020, ""diuretic"", ""cardiac/heart"" and ""Cholesterol"". Concomitant medication included ranolazine (RANEXA) for heart, isosorbide for cardiac, potassium chloride for potassium Low, furosemide for diuretic, atorvastatin (LIPITOR) for cholesterol, acetylsalicylic acid (ASPIRIN) for cardiac, montelukast sodium (SINGULAIR) for asthma, pregabalin (LYRICA) for herniated disc in back take for pain, nebivolol hydrochloride (BYSTOLIC) for blood pressure, pantoprazole sodium sesquihydrate (PROTONIX) for GI, celecoxib (CELEBREX) for pain, spironolactone for diuretic, vitamin D for Vitamin D low, nitroglycerin for angina, salbutamol (ALBUTEROL) for wheezing, and oxycodone for pain; all ongoing. History of all previous immunizations with the Pfizer vaccine considered as suspect was reported as none. No additional vaccines administered on same date of the Pfizer Suspect. No prior vaccinations within 4 weeks. The patient reported events on the Pfizer COVID Vaccine. She reported after getting the vaccine she had body ache and headaches. On 30Dec2020 16:00, the patient experienced headache and body aches. The event headache was reported as serious medically significant. She received the COVID vaccine on 29Dec2020 and had significant body aches, but she still had a headache that had not gone away since she got the vaccine. The patient explained the body aches were mild to non-existent/resolved, later confirmed as still ongoing, but better. Her main issue was the headaches that had not gone away. The events headache and body aches started around 16:00. She worked nightshift and she woke up with it. The events did not require a visit to the emergency room or physician office. The day after she received the COVID Vaccine she was tested for COVID. She found out she was exposed the day before she received the COVID vaccine, 28Dec2020 to someone who was positive with COVID at a wedding. She later found out her COVID test on 30Dec2020 was negative. The reporter assessed both events headache and body aches as related to the suspect vaccine. She believed the body ache and headache were related to the COVID Vaccine itself. She added, she felt it's related because these events are not part of her typical health problems. She added they're not going away even with medications (oxycodone, Celebrex, and ibuprofen). Oxycodone was located in an orange pharmacy filled bottle and she was unable to provide a lot/exp/NDC. Celebrex was located in an orange pharmacy filled bottle and unable to provide a lot/exp/NDC. She saw a use by date of 10Mar2021. Ibuprofen (Lot number: OCE2824A and expiration

date: Dec2021). The outcome of the event headache was not recovered, for the event body aches was recovering.; Sender's Comments: There is a reasonable possibility that the event headache was related to BNT162b2 based on known drug safety profile and close temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

covid 19 test result came up positive; covid 19 test result came up positive; severe left arm pain; This is a spontaneous report from a contactable unspecified Healthcare professional reporting for himself. This 52-year-old male patient received on 20Dec2020 02:30 PM first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot EK5730) at single dose intramuscular in the left arm for COVID-19 immunization. No allergies to medications, food, or other products. Medical history was not reported. Prior to vaccination, the patient was not diagnosed with COVID 19. Concomitant medications (all started on an unknown date and received within 2 weeks of vaccination) included buspirone hydrochloride (BUSPIRON), atorvastatin (manufacturer unknown) and acetylsalicylic acid (BABY ASPIRIN). On 21Dec2020, 10 hours after getting vaccine the patient had body aches, cold and severe left arm pain. 4 days after getting vaccine again the patient had cold, body aches and sore throat for couple of days. On 28Dec2020, covid 19 test (nasal swab) result came up positive. The patient went to Emergency room. Outcome was recovered on an unknown date. It was unknown if a treatment was performed.; Sender's Comments: The association between the event lack of effect (COVID 19 nasal swab test result came up positive) with BNT162b2 can not be fully excluded.

Anaphylactic reaction 6 days post vaccine 24Dec2020; I had severe chest tightness; SOB; throat soreness; hoarse voice; mouth swelling; This is a spontaneous report from a contactable physician, the patient. A 34-year-old non-pregnant female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EL0140), via an unspecified route of administration in the left arm on 18Dec2020 at 15:30 (at the age of 34-years-old) as a single dose for COVID-19 immunization. Medical history included severe dust mite allergy (based on skin test). Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included cetirizine hydrochloride (MANUFACTURER UNKNOWN), hydrocodone bitartrate/paracetamol (NORCO), ibuprofen (MANUFACTURER UNKNOWN), and ondansetron (ZOFRAN); all for unspecified indications from unknown dates and unknown if ongoing. The patient did not receive any other vaccines within four weeks prior to the vaccination. On 24Dec2020 at 10:00, 6 days post vaccination, the patient experienced anaphylactic reaction, severe chest tightness, shortness of breath, throat soreness, hoarse voice, and mouth swelling; all reported as life threatening. The events led to an emergency room visit and she was given epinephrine (EPI-PEN), methylprednisolone (SOLUMEDROL), and diphenhydramine hydrochloride (BENADRYL) as treatment. The patient stated that she developed the reactions 45 minutes after she took premedications for a dilatation and curettage procedure. The premedications included ibuprofen, hydrocodone bitartrate/paracetamol, ondansetron. She stated she had taken these medications several times before and this was the first time she had this reaction. Since the vaccination, the patient had not been tested for COVID-19. The clinical outcomes of the anaphylactic reaction, severe chest tightness,

shortness of breath, throat soreness, hoarse voice, and mouth swelling were recovered on unknown dates.; Sender's Comments: Anaphylactic reactions presented as chest tightness, shortness of breath, throat soreness, hoarse voice, and mouth swelling, developed 45 minutes after premedications including included ibuprofen, hydrocodone bitartrate/paracetamol, ondansetron for a dilatation and curettage procedure and 6 days post vaccination with BNT162B2, the event therefore is most likely attributed to these premedications unrelated to the vaccine use. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"Tested positive for covid; Received first Pfizer covid vaccine on 23Dec, tested positive for covid; This is a spontaneous report from a contactable pharmacist. A 75-year-old patient of an unspecified gender started to receive bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 23Dec2020 at SINGLE DOSE for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The reporter stated ""75 year old patient with some comorbidities who received first Pfizer covid vaccine on 23Dec, tested positive for covid on 28Dec. Patient has been treated at home and is doing well. What is the protocol for their second dose of Pfizer covid vaccine due on 13Jan?"" The outcome of the events was unknown. Information about lot/batch number has been requested."

Covid positive/ testing positive for the virus/ asymptomatic; Covid positive/ testing positive for the virus/ asymptomatic; This is a spontaneous report from a contactable consumer who reported for herself. A 30-year-old female consumer received her first single dose of BNT162B2 (Pfizer/ BioNTech Covid-19 vaccine, Lot number: EH9899) on 17Dec2020 per works recommendation (COVID-19 immunization). The patient had a history of back pain and had no concomitant medications. The patient got the vaccine and tested for Covid as a preventative to make sure she was safe to travel for a wedding. Her Covid test was pending and she found out that she was Covid positive the day after receiving her first dose of the Pfizer Covid vaccine. Her primary care informed her to get the booster despite testing positive for the virus. She was told since she was asymptomatic that she could get the vaccine. She received the second dose on 04Jan2021. The outcome of the event Covid positive was not reported.

COVID; COVID; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect from a non-contactable consumer (patient). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on Tuesday 29Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient was diagnosed with COVID on Saturday 02Jan2021. The outcome of the event was unknown. No follow up attempts are possible; information about lot/batch number cannot be obtained.

Tested positive for COVID; Tested positive for COVID; This is a spontaneous report from a contactable other HCP via a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A patient of unspecified age and gender started to receive BNT162B2, via an unspecified route of administration from

23Dec2020 to 23Dec2020 at first single dose for COIVD-19 immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. Pharmacy student on the line who had patient who received the first dose of the COVID vaccine shot on 23Dec2020. Then the patient went home on Christmas break and later tested positive for COVID on 29Dec2020. She was calling to see how to proceed with the second dosage. Outcome of the event was unknown. information on the lot/batch number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported event positive for corona virus infection based on the known safety profile. However given the short duration of 6 days since the vaccine first dose, it is unlikely patient would have fully developed immunity.

I tested positive for COVID-19; I tested positive for COVID-19; This is a spontaneous report from a contactable nurse. A 29-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899), intramuscular in left arm on 17Dec2020 19:45 at single dose for covid-19 immunisation. Medical history was not reported. There were no concomitant medications. The patient tested positive for COVID-19 on 03Jan2021. Outcome of event was recovering. Patient has not been diagnosed with COVID-19 prior to vaccination.

Patient tested positive for COVID-19 about 2 weeks after receiving the 1st dose of COVID vaccine; Patient tested positive for COVID-19 about 2 weeks after receiving the 1st dose of COVID vaccine; This is a spontaneous report from a contactable consumer reported that a male patient of unspecified age received his first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date, at single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. Patient is a health care worker who works with COVID patients as part of his daily work duties. He tested positive for COVID-19 about 2 weeks after receiving the 1st dose of BNT162B2. Outcome of the events was unknown. No follow up attempts are possible; information about lot/batch number cannot be obtained.

Tested positive; Tested positive; This is a spontaneous report from a contactable nurse via Pfizer sales representative. A 35-year-old female patient received BNT162B2 (lot: EKS730), via an unspecified route of administration on 17Dec2020 at single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. Patient received 1st COVID vaccine dose on 17Dec2020 and tested positive on 23Dec2020. Patient was exposed to COVID. She was curious if and when she should get a second dose having tested positive after her first dose. Outcome of the events was unknown.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported event SARS-CoV-2 test positive based on the known safety profile. However given the short duration of 6 days since the vaccine first dose, it is unlikely patient would have fully developed immunity.

C/o shortness of breath routine oxygen increased cannula changed to mask oxygen sats at 88%

started to feel a little sick; had COVID-19 test and results came back positive; had COVID-19 test and results came back positive; This is a spontaneous report from a contactable healthcare professional. A 27-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for

injection, lot number EH9899/expiration date unknown) via an unspecified route of administration on 27Dec2020 at a single dose for COVID-19 immunization. The patient had no relevant medical history. Concomitant medications were not reported. The patient stated that he got the vaccination on the 27th and then that same night he started to feel a little sick. He was assuming that it has just to be the side effect of the vaccine (unspecified vaccine). On 28Dec2020, he was feeling pretty sick; he did not go to the work. He had COVID-19 test (Dec2020) and results came back positive. He added that he didn't know if it was the COVID because he was reading up on the vaccines and it said that one could not get COVID from the vaccine. The outcome of the events was unknown.; Sender's Comments: The reported positive with COVID-19 test after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

Labored breathing with oxygen running at 4l/min, muscle weakness

Fever to 103.7F, respiratory rate 36. Was transferred from facility to hospital. Since then has been found to have gram-negative rod bacteremia, although urinalysis was negative, urine culture pending. Patient has since defervesced after receiving 1 dose of cefepime. Overall the most likely cause of fever seems to be urosepsis w/ bacteremia, pending confirmation with urine & blood cultures.

The patient was found deceased at home about 24 hours after immunization. Date of Death:: 12/29/2020; estimated time of death 6:00pm

Patient received vaccine on 1/4/2021. He was in Hospice for CHF and renal failure, but was able to get up in his wheelchair and eat and take medications and talk. On 1/5/2021 am, he was noted to be very lethargic an could only mumble, could not swallow. No localizing neurologic findings. He was too lethargic to get up in chair.

initial; swelling of tongue, tingling and numbness in legs, syncope. later; HA

Resident displayed with confusion/shaking at 1400, condition worsens at time went. Resident unable to state where he is, knows his name. can tell you he does not feel right. Temp 97.3, p 88, O2 91%, Bp 214/116 Transferred to ED with fever, temp of 103, and shortness of breath, admitted to ICU Positive COVID-19 test at hospital. Diagnoses include acute COVID-19 pneumonia and hypoxia. PO had confusion, fatigue, weakness, hypoxia, increased BP

Swelling of throat and tongue, anaphylaxis, hives, redness, swelling

shoulder joint pain, injection was given in joint.... I am now on prednisone, physical therapy, if this doesnt help will need a MRI .

She began with an earache and dizziness. Pain got so severe that she could no longer take it. Went to the doctor which she was put on pain medications. Went to ER on 1/6 and on 1/7 went to her PCP. Still in severe pain.

Patient experiencing Chest pain and elevated troponin. Patient taken to the cath lab and treated for suspected stress induced cardiomyopathy.

ITP Plt 2

Notified today that he passed away. No other details known at this time.

Hospital on 1/2 - then again on 1/5, transferred and admitted to hospital, discharged 1/6 Abnormal reflex/weakness back pain paresthesia and weakness of legs abdominal pain evaluation for possible GBS post covid 19 vaccine

29-year-old previously healthy female presenting today with difficulty sleeping, sore throat, and nausea after receiving the second Pfizer COVID-19 vaccine around 10 AM. Patient says that after her first dose of the vaccine she had mild sore throat and hoarse voice that resolved spontaneously. She had her vaccine around 10, several hours later before coming to the emergency department between 2--230 she had the sudden onset of difficulty speaking with associated sore throat and nausea. She has had dry heaving but no large amounts of vomiting. She has not had stridor, wheezing, shortness of breath, syncope, or the development of a rash or hives. She has not had a reaction to her prior vaccines she does not have any other allergies in general. She has otherwise been well recently without infectious symptoms including fevers, chills, cough, and has not been exposed to Covid to her knowledge. Medications administered in ED included diphenhydramine 50 mg IV once, dexamethasone 10 mg IV once, famotidine 40 mg IV once, ondansetron 4 mg IV once. Had brief episode of shaking and R arm rigidity in the ED. Patient denies LOC during the episode, did not have a post ictal state, no tongue biting or episodes of incontinence. Given single event without LOC, less concern about episode being a seizure. Patient has had no further episodes of shaking since admission. CT brain was wnl, no FNDs noted on exam.

I am breastfeeding. My daughter had seizure like episodes starting on Saturday 1/2, Sunday 1/3, Monday, 1/4 and 2 times on Tuesday 1/5.

Patient received first dose of vaccine on 12/28, developed COVID-19 infection shortly thereafter and expired on 1/6/2021.

Patient received first dose of vaccine on 12/28, developed COVID-19 infection shortly thereafter and expired on 1/4/2021

Cardiac event, 2 days after vaccination, patient expired.

Fever, shortness of breath and chest pain that resulted in a heart attack a few hours after vaccination

Acute allergic reaction Tongue swelling Facial swelling Throat swelling Rash on throat and chest Redness in throat Diaphoresis Momentary loss of consciousness

Altered Mental Status began the middle of the night of 01/06/21 and 01/07/21 with worsening overall status- definitive symptoms unknown to this reporter, this person was admitted to the local hospital at

approximately 1800 01/07/2021. This reporter was not told the admitting diagnosis or any defining symptoms, only that the person was admitted.

Medical docter state patient has a acute cardiac attack

Initial itching at injection site, observed and returned to work. Came back ~30-40 minutes later with itchiness in throat and hives to arm. Given Benadryl PO and observed for extended period of time. Symptoms not resolving. Patient transferred to Emergency Department for further care. At that point observed to have full body rash, SOB. Given Epi while in ED. Developed tachycardia, hypotension. Treatment continued.

After about 15 min: hr went to over 170bpm , flushed sensation, brain fog, was driving at the time and my brain wouldn?t figure out how to call 911 , eventually I figured it out but it took extreme mental effort. Paramedics came and my pulse was From 100 - 170 changing rapidly, bp 150-175/x changing rapidly, symptoms would come and go about 8 times on way to hospital. In ER same thing then about 2 hrs go by and then all started again. Pulse remained at 90- 100bpm at least until 2am. (My resting hr is between 40 and 50, my normal bp is usually sub 120/80) I later realized my hands were swollen, mostly on my left side. Lingering symptoms include brain fog, tiredness, and headache. Maybe an exasperating issue was I had low potassium levels likely making symptoms worse - I worked out heavily early in the morning, probably had low intake of potassium that day and day before, and maybe slightly dehydrated from my workout - I do Functional lifting, run, and other types of exercise regularly.

Developed hypercapnic respiratory failure, CHF exacerbation - readmitted to Hospital. In ICU with BIPAP

patient begin to feel bad that night was admitted into hospital sometime in the next couple of days for dehydration, patient discharged home and then readmitted to hospital for positive covid testing after feeling very ill.

At 1431, pt received the first dose of the Moderna COVID-19 vaccine. Hx of anaphylactic reactions to penicillin as a child. At 1445, pt started complaining of tongue swelling, which proceeded to increase in severity. At 1449, Epi-Pen administered (0.3 mg) in R deltoid. At 1450, 50 mg diphenhydramine IM administered in L deltoid, followed by an additional dose at 1452 in R deltoid. 911 was called between 1445 - 1450. Pt was moved to another exam room where she could lay down because she was hypotensive, lightheaded, and pale. O2 sats remained between 95-98%, BP 81/53-190/100, P 94-136, RR 16-24 throughout. Tongue swelling improved slightly after receiving Epi-Pen. EMS arrived and were able to start an IV before transporting her to the local hospital at 1502.

Patient presented to the emergency department with sensory loss and loss of reflexes, evaluated by neurology and diagnosed with Guillain- Barre Syndrome thought to be secondary to the Pfizer Covid Vaccine

Death

I had a myocardial infarction on December 27, 2020. I had received my first vaccination for COVID-19 on December 22, 2020. Not sure if these are related but I felt I should report it.

Low grade Fever, headache needing admission Intracranial hemorrhage with hypertension Medical management for hypertensive emergency Received surgical evacuation admitted in Intensive care,

1/4/21: Headache, Dizziness & Fatigue 1/7/21: Left Sided Facial Droop

Shortness of breath, cough, rash on face and neck, arthralgia

Patient received COVID vaccination around 12:15pm. Patient was monitored for the appropriate amount of time by nursing staff. Patient passed away at 2:15pm.

Diarrhea followed by death 24 hrs after vaccination

Patient is a 32 yo G2P1001 with EDD 5/2/2021 by 7w US. She had the first dose of the Pfizer Covid 19 vaccination on 12/17/2020 at the Health Clinic and the second dose on 1/7/2021 at 1115 am. She began having abdominal pain and vaginal bleeding at 315 sm on 1/8/2021 progressing to a previable (22w2d) preterm birth at 739pm on 1/8/2021.

Pt experienced extreme fatigue and sleepiness the day following her second vaccination for Covid 19 and was found by her family after collapsing on 1/6/21 at 05:30. Upon arousal, she experienced headache, vomiting, weakness, difficulty speaking and difficulty walking with lower extremity weakness. She was taken to urgent care and subsequently admitted for evaluation at hospital and found to have a normal chemistry, blood count, normal lumbar puncture and normal imaging of her neck and brain. Discharge summary notes 3/5 strength and hyporeflexia throughout. Pt had televisit consult with psychiatry and neurology. She is subsequently to be discharged to a Facility without explanation for her sudden onset of progressive lower extremity and vocal weakness. She is noted to have a history of shellfish allergy. She experienced mild symptoms after the first vaccination, but no neurologic or vascular symptoms at that time.

I am a physician and I got dose 2 at 1:30pm on Jan 4. Next afternoon, Jan 5, I got severe myalgias, fever up to 100, severe fatigue, went home after work and slept til the next morning, went to work, took ibuprofen, and the myalgias improved and felt better. But around 3 pm, Jan 6, I got mild vertigo. By about 7pm Jan 6, I noticed my L ear didn't hear well. I changed the battery in my hearing aide and cleaned it but It made no difference. I woke up on Jan 7 with severe vertigo and hearing loss. I did Epley's maneuvers with no effect. I have had similar episodes. I went to work, but gave up when I could not hear patients talking to me. I went to the Emergency Dept and got admitted. I was too unsteady on my feet. Audiogram showed profound hearing loss both ears and almost complete loss of discrmination in R ear. I was put on high dose steroids. Also having tinnitus (mostly whooshing sound of my own pulse). MRI negative. Blood work negative. Some mild improvement now, after 1 dose steroids.

Fever up to 102.9, chills, headache, hypertension, tachycardia, dyspnea.

"Myocardial Infarction: patient began to complain of severe chest pain 3 hours after the vaccine was given .. Vaccine NDC # 59267-1000-1. 0.3 ml given by RN. Patient called his PCP: ""... I had very bad chest and shoulder pains, neck pains and slight fever from 9 pm until early this morning (Jan 8). My blood pressure was 155/95 mmHg. Should I see you today? Still feel sore all upper body. Above message

received at 0720 am (Jan 8) and the patient was called back at 0757 am (Jan 8): patient was told that many of the side effects above were related to the vaccine but the chest pain was worrisome and the provider requested the patient go to the emergency room. Patient understood the importance to seek medical attention..... Emergency Room notes: seen by MD on Jan 9. Note at 0749: patient complained of chest pain on/off since received COVID vaccine on Jan 7. Pain was substernal and radiated to the left shoulder, assoc with some SOB. EKG obtained and revealed ST segment elevation and a ""cardiac alert"" was called."

At around 11:45pm tingling started in my left eyebrow. I thought there was something in my eyebrow and after time of wiping it a few times I went to look into the mirror and realized that nothing was there. about and hour later I got a drink and a snack to eat and I realized I had a numb sensation in the left corner of my lip. As a nurse I went though the signs of a stroke with 2 other nurses I called. Everything was normal other than that sensation. Thinking I was just overly tired I went to bed. When I woke up the next day I felt okay until I went to drink some coffee and the numb sensation in my corner lip was still there. Now I was concerned and called employee health and was instructed to go to the ER to role out a stoke. I followed employee health's instructions and went to the ER. I was diagnosed with facial paresthesia and discharged with instructions to come back if symptoms got worse. Symptoms persisted all day and around 7 I called my mom on video chat to show a visual facial twitch on the left side of my face. right after I got off the phone with her the left side of my face drooped and my fiance immediately drove me to the closest ER. I was seen immediately and they decided to admit me. The did labs and head CT. They admitted me to labor and delivery because there were no other rooms. The next day I was seen by a neurologist and many doctors.

Patient was unresponsive in her room during the night, had gotten the vaccine this morning, 911 called. Had right arm pain and loss of consciousness. EMS got 180/104 BP and blood glucose was 122. Was transported to hospital. Returned to the facility the next day with no complications, was just fatigued.

8 hours after vaccine I experienced stomach pain and nausea. I then became very ill and extremely weak. I was laying on floor. Very difficult to talk and very dizzy. Unable to walk. Called 911 and went to ER. Had chest pressure and cardia work up was done. Dx wi ST elevation.

7 day after site itching, hot swelling. Unsure if related 9 day after suffered CVA and have hyper coagulation

sudden sensorineural hearing loss in the right ear, audiology and ENT assessment, currently being treated with steroid medication

after receiving vaccine patient immediately felt warm, dizzy and started dry heaving. we dosed Zofran 4mg, gave one dose epi-pen, and 50mg Benadryl. patient still complained of chest pain and was dry heaving. she was then transported by ems to the hospital at 4pm.

Received vaccine 12/19/2020 at hospital around lunch time. Severe abd pain started 10 hours after vaccine administration with vomiting. I went to emergency room next morning Emergency appendectomy 12/20/2020. Had bleeding after surgery. Second surgery 12/21/2020

Anaphylaxis

After the vaccine was administered I walked away maybe 50' and I started to feel dizzy I felt light headed and as if I was drunk my legs feel real week they took me outside so I could catch some fridge fresh air and they set me down on a chair I was very dizzy my legs and my knees felt like I couldn't stand up and they were very weak I kept seeing a the rails double vision and I started to have a tightness in the back of my neck I felt they warrant come over my head and my forehead got very very cold And then I felt as I was gonna blackout and pass out and I was gasping for air and suddenly my tongue went into a spasm and it went to the top of my the roof of my Roof of my mouth and I couldn't breathe and I was able to send a message for someone to come and help me as I was sitting there by myself they rushed over by now looking at my text message it was for 02 which was within 15 minutes of the vaccine when I had my 1st episode and then minutes after that 3 more came with the same oh unable to swallow I lost the ability to swallow and my tongue fell like I had no control it was just automatically stuck to the roof of my mouth.. Upon the arrival of Ems I was told there was no treatment and there was nothing they could do told me to wait 24 to 48 hours in the symptoms should subside it's been over 72 hours in the symptoms are still occurring. I continue to feel dizzy light headed and now have high blood pressure which was not present before visit ER prescriptions for steroids with issued, I Told to go home and rest. Followed up with family doctor in the morning and was told it was not an allergic anaphylactic reaction probably more so neurologically ransom blood tests waiting for results continue to have loss of control over tounge spasms unable to eat Accompanied by fatigue dizziness and high blood pressure

On 01/07/2021 I woke up at 0300am with chills, headache, body aches, joint pain, fever of 101.2 and swollen left axillary lymph nodes. I took Tylenol and Benadryl and it relieved the fever/headache/body aches/joint pain, however the lymph nodes in my left axillary remained swollen. I continue to take Tylenol for the fever/body aches/pains without relief for the swollen and painful axillary lymph nodes. Warm compresses do help to relieve the pain temporarily but they remain painfully swollen. On 01/08/21 I called my doctors office to ask if it was normal to experience such painfully swollen axillary lymph nodes to which they stated ?we don?t know, it is too soon for us to tell what?s normal and what isn?t normal right now.? They did not offer any suggestions to relieve the pain or swelling. The morning of 01/09/2021 , I called Employee Health at my hospital (my place of work and also where I received the vaccine) and they also stated they didn?t know if this was a normal reaction due to the newness of the vaccine. A couple hours later, employee health emailed me a link to the VAERS reporting website and asked me to file a report.

I am currently breastfeeding my 5-month-old son. I received my first vaccine on 12/28/2020 and directly breastfed within 4 hours of receiving the vaccine. Two days after my vaccine my son was at daycare and had two large diarrhea blowouts and two large emeses followed by a 1-minute episode where he was limp with entire body cyanosis and in-and-out of consciousness. He also had a maculopapular rash on his torso. EMS was called. He was observed in the emergency department for a few hours then recovered well without intervention and did not require hospitalization. EKG was normal. He has continued to be well and back to baseline since the event.

"Dizziness started within 30 minutes after injection on 01/08/21 and felt ""off"". On 01/09/21 approx. 0800 Patient began feeling body aches, fevers, injection site pain, increased dizziness, and nausea. At approximately 1pm patient began vomiting and having diarrhea. Symptoms worsened over the next couple hours to where patient was unable to walk without stumbling. Wife witnessed patient becoming very pale and almost pass out at approx. 5:30pm. Patient states he feels like he's in slow motion. Patient is unable to maintain balance when walking and reports increasing fatigue and weakness."

Started severe belly pain and went to Emergency room and diagnosed with mesenteric vein thrombosis after the CT scan of the abdomen, treated with heparin drip, antibiotic and discharged with anticoagulant pills(Eliquis). I am not sure that it is because of the vaccine my doctors are also not sure about it, but I am sure that I am a healthy person without any health issues . I am working as registered nurse, our unit is for covid-19 patient's since march 2020 and I had covid -19 on August month and recovered after 3 weeks.

Pfizer-BioNTech COVID-19 Vaccine EUA Miscarriage - (date of vaccination 1/6/21, miscarriage symptoms (cramping) started 1/8/21, confirmed 1/10/21; estimated date of delivery 8/30/21)

Patient came into the emergency department on 1/8/21 with an acute ischemic stroke with complete occlusion of her left MCA. She had acute and complete flaccid paresis of her right face, arm, and leg, complete aphasia, and neglect of the right side of her body. NIHSS of 27. Onset of deficit was between 6:30pm-7:10pm. She recieved her 1st COVID-19 vaccine dose that morning at 10:31am.

I was injected high on my shoulder, significantly higher than I?ve ever been injected in my life. I believe I have SIRVA. The pain has become so severe that I cannot use my left arm. The pain is intolerable. I take four Advil every six hours, ice my arm regularly, and keep my arm in a sling. The pain has gotten significantly worse with time (not better). I?ve never experienced pain like this from a vaccine in my life. No history of bursitis or shoulder injury. Again, the pain gets worse with time. I?m almost 48 hours post injection

1/7-21 - Received second dose of pfizer covid-19 vaccine 1/8/21 - Fever, dizziness, headache 1/10/21 0250 was found not breathing. EMS performed CPR and patient deceased

The patient presented with left eye peripheral visual loss, left upper and lower extremity and facial numbness sensation and weakness. This started 1 hour after receiving COVID-19 vaccine at her place of employment. Pt was brought to CRMC via EMS.

Facial (cheek) numbness and swelling with slight face droop Swelling continued on 1/7/2021 On 1/8/2021, lip swelling and numbness and tongue numbness By 1/9/2021 4pm, swelling and numbness resolved but chills and muscle aches began

Patient received the Moderna Vaccine 1/2/21 at his VA Clinic. He received the vaccine that morning and by the evening he was not feeling well. He developed cough, weakness and fever and now is unable to ambulate. He has since been hospitalized and has tested positive for COVID-19.

Headache, Myalgia, Arthralgia, Fever, CoughWheeze & Syncope

NauseaVomiting History of vasovagal episodes; c/o warm feeling and nausea without vomiting. Recovered Narrative: 10 minutes after vaccine admin. c/o/ warmth and nausea. Triaged by the ER nurse and observed for 45 minutes. Discharged in stable condition 133/84, 104, 18

I am not sure if related on not. This event was 13 days after my COVID-19 1/2 immunization. Otherwise, I am a very healthy physician, normal BMI, I have also been tested 5-6 times negative for COVID. I do get exposed in my job, but wear proper PPE. Viral infection in FEB that was like COVID-19 sx, I did AB test as soon as it was available, and negative. ---The Event: Monday morning (1/4/21), after getting out of shower, I was talking to my husband (who is MD)and started having BROCA's aphasia sx (could not get words out coherently), then fell into bed and started right wrist and right foot posturing. This lasted 10 min. I have non-memory of it, but my MD husband witnessed it. After 10 minutes, I was back to normal, except shaky and some word finding difficulties. After 30 min, totally back to normal.

pt received Moderna vaccine. next day he had high fevers up to 103, confusion. admitted to hospital. infectious work up negative. improved off antibiotics.

Resident appeared to be jaundice with yellow skin and eyes. Resident also complained of not feeling well. Urine was dark yellow. Resident short of breath. Resident was admitted to hospital and diagnosed with post-covid pneumonia.

Throat closing Pruritic throat and tongue Tingling lips and tongue Throat clearing Hoarse voice

Acute ischemic stroke, basilar occlusion

SOB

Nausea/vomiting and diarrhea loss of appetite tachicardia sent to er for hydration.

I immediately felt dizzy, and there was ringing in my ears, I felt faint. I also felt shakey. I have had these symptoms for 12 days, unchanged. I cannot work because of these symptoms. I have been to urgent care and have had lab work and an EKG

RECIEVED VACCINE 1/8/21 EXPIRED UNEXPECTED 1/10/21, NO ADVERSE REACTIONS NOTED

Two days following the first COVID vaccination he developed epigastric pain and was evaluated in the ER and was admitted for gallbladder surgery. He has a 6 year history of gallbladder disease but was not experiencing symptoms until after the COVID vaccination.

The patient had an apparent cardiac arrest on 12/23/20 and was admitted to the ICU. He was taken off of life support on 12/30/20. He had known cardiac disease.

Severe thrombocytopenia (plts 3k/uL), oral mucosal bleeding, bruising

Sudden, severe worst headache of her life, coupled with onset of oral herpetic lesions and inflammation to unrelated body part (belly button piercing) occurred one week after vaccination received. She presented to ED 12/28 noted to have hypokalemia and head CT showed mild occipital encephalitis,

admitted overnight for obs subsequent brain MRI was normal. She was seen in my clinic 2 days later (1/4/21) and was started on 3 day course of Decadron, topical acyclovir for herpetic lesion. As she is a nurse, I kept her off work until resolution of symptoms. Seen again on 1/8/21, headache resolved. She did discuss CT and MRI results with neurologist. He was not convinced this was vaccine related. She is having 2nd dose of vaccine on 1/11/21.

Patient died, I have a copy of his vaccination card

Moderna vaccine dose #1 received in right shoulder on 12/31/20 at 2:15PM. Injection was uneventful other than sensation of pressure. I did notice at the time, but could not fully see, that the injection appeared to be much higher on the shoulder than normal. I immediately came home afterwards and relaxed. Approximately 2hrs later, I began experiencing extreme pain in my right shoulder. As the night progressed, the pain worsened to 10/10 with inability to move my arm. Later that night after requiring assistance to take off my shirt, I noticed that the bandaid overlying the injection site was very high, immediately below and bordering the acromion process. This was concerning but I was hopeful the pain would go away over the next few days. I took tylenol that night. I woke up multiple times during the night because the pain was so severe. When I woke up, the pain and inability to move my arm were still present. I began taking 800mg ibuprofen and 1000mg tylenol alternating Q4 throughout the next few days. The pain and disability remained so severe that I required assistance performing ADLs for the next 4 days. On day four, with the pain not resolved and still severe despite consistent advil and tylenol use, I began having concern for shoulder injury related to vaccine administration. The next day I decided to seek an evaluation by an orthopedist. I am a physician and was unable to perform basic tasks and ADLs. I happened to have a few days off after the injection but would not have been able to work had I not. After an evaluation by the an orthopedic PA, I obtained an MRI of my right shoulder with results shown below - as I expected evidence of rotator cuff tendinopathy and subdeltoid bursitis consistent with SIRVA. As of now, I still have limited range of motion and shoulder pain on the right which has improved slightly but is far from resolved. I still have difficulty with certain ADLs including putting clothes on and off, lifting items, and tasks that require raising my right arm above my head. I am concerned with the possibility of long term and/or permanent damage after reviewing the literature. I am also concerned about how many other healthcare workers the person who gave me my vaccine may be injuring and/or causing permanent harm to.

Pain at site of injection, eyes, throat, face swelling. Unclear thinking, hoarse speech, headache, hives, swelling. Intervention taken immediately. Ongoing 11 days: SOB, headaches, nose bleeds, coughing, blood sugars triple, hair falling out, major swelling, dizziness.

feeling flushed elevated HR dizzy nausea evaluated by EMS, VSS and wnl except HR 100 bpm lungs cta at 5:36 patient reported to be feeling better - drank water - declined transport to ER - felt able/safe to drive home

Headache, Muscle aches and chills

"Chills; Fever; Loss of consciousness x 2; GI upset; Diarrhea; Difficulty sleeping; Pallor; Stomach flu; A spontaneous report was received from a nurse concerning a 31-year-old, male patient, who received

Moderna's COVID-19 vaccine (mRNA-1273) and experienced loss of consciousness (LOC) x 2, gastrointestinal (GI) upset, diarrhea, difficulty sleeping, pallor, stomach flu, chills and fever. The patient's medical history, as provided by the reporter, included allergy to cefaclor and hereditary hemorrhagic telangiectasia. Concomitant medications reported included desvenlafaxine succinate, gabapentin and dexlansoprazole. On 23 Dec 2020 at 11:30 am, approximately six hours prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: 025J20A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On the morning of 23 Dec 2020, prior to receiving mRNA-1273, the patient felt ""achy"". At 5:30 pm, the patient experienced chills, fever to 102, GI upset and diarrhea. At 11:00 pm, the patient reported difficulty sleeping, GI upset, LOC x 2 and pallor. The patient was transported to the emergency room via ambulance. A COVID-19 polymerase chain reaction test and routine labs were collected; however, results were not provided. Treatment for the events included paracetamol, unspecified intravenous (IV) medications, ondansetron and ketorolac tromethamine. The emergency room discharge diagnosis was stomach flu. Action taken with mRNA-1273 in response to the events was not reported. The events, loss of consciousness (LOC) x 2, GI upset, diarrhea, difficulty sleeping, pallor, stomach flu, chills and fever, were considered resolved on 24 Dec 2020.; Reporter's Comments: This case concerns a 31-year-old, male subject with a medical history of hereditary hemorrhagic telangiectasia, who experienced the unexpected events of loss of consciousness (LOC) x 2, gastrointestinal (GI) upset, diarrhea, difficulty sleeping, pallor, and stomach flu, and the expected events of chills and fever. The events of chills, fever occurred approximately 6 hrs. and the events of GI upset, loss of consciousness, difficulty sleeping occurred after 12 hrs. after the first dose of Moderna COVID-19 Vaccine. The time to onset for the events of GI upset and diarrhea were unknown. The reporter did not provide the causality assessment for the events. Due to the temporal association between the LOC and the administration of the vaccine, a causal relationship cannot be excluded, however, the subject's medical history of hereditary hemorrhagic telangiectasia and other concurrent conditions of GI upset, diarrhea, and stomach flu remain as confounders."

Sharp shooting pain up my arm, upper chest, the shoulder, above my brest; Trouble swallowing, slurred speech, red across the chest and hoarse/raspy voice; A report was received from a consumer concerning a patient who was participating in the mRNA-1273 Emergency Use Program and who experienced sharp shooting pain up my arm, upper chest, the shoulder, above my brest, trouble swallowing - could not swallow my saliva, slurry speech, red across my chest, and hoarse/raspy voice. The patient's medical history included diphenhydramine hydrochloride allergy, shellfish allergy, and latex allergy. Concomitant medications included salbutamol sulfate. The patient received their first dose of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection in their right arm on 26 Dec 2020. Five minutes following administration of the vaccine, the patient felt sharp shooting pains up her arm, upper chest, the shoulder, above the breast. Five to 10 minutes after, the patient had trouble swallowing and began to have slurred speech. The patient was administered epinephrine in her right thigh. Following this, she began to experience redness across the chest and was administered another dose of epinephrine. She also experienced hoarse/raspy voice. The patient was then transported to the emergency room in an ambulance, where she received intravenous fluids and solumedrol after which she began feeling better. The patient was observed in the hospital for several hours and discharged on the same day. Action taken with mRNA-1273 in response to the event was not reported. The outcome of the event, sharp shooting

pain up my arm, upper chest, the shoulder, above my brest, was unknown. The event, trouble swallowing - could not swallow my saliva, was considered resolved on 26 Dec 2020. The outcome of the event, slurry speech, was unknown. The outcome of the event, red across my chest, was unknown. The outcome of the event, hoarse/raspy voice, was unknown. The reporter did not provide an assessment for the events, sharp shooting pain up my arm, upper chest, the shoulder, above my brest, trouble swallowing - could not swallow my saliva, slurry speech, red across my chest, or hoarse/raspy voice.; Reporter's Comments: This case concerns a female patient with a medical history of diphenhydramine hydrochloride allergy, shellfish allergy, and latex allergy who experienced the events of pains up her arm, upper chest, the shoulder, hypersensitivity reaction with symptoms of trouble swallowing, slurred speech, erythema of the chest and hoarse/raspy voice, occurring between five and ten minutes following administration of the first dose of mRNA-1273 vaccine. The patient was treated with 2 shots of epinephrine, was transported to the hospital and received and IV solumedrol, after which symptoms improved. Based on the information provided and temporal association, the event is assessed as possibly related to mRNA-1273. The patient's medical history of multiple allergies could have contributed to the event. Further information has been requested.

generalized itchiness; woke up with headache; feeling fatigued; anaphylactic reaction; right arm started going numb; right arm was tingling; A spontaneous report was received from a 26-year-old, female consumer who received Moderna's COVID-19 vaccine and experienced anaphylactic reaction, right arm numbness and tingling, headache, fatigue, and generalized itchiness. The patient's medical history was not provided. No relevant concomitant medications were reported. On 23 Dec 2020 prior to the onset of the events, the patient received their first of two planned doses of mRNA-1273 (Lot number: OU520A/011520A) intramuscularly in the left arm for prophylaxis of COVID-19 infection. On 23 Dec 2020, within minutes of receiving the vaccine, the patient experienced an anaphylactic reaction and was rushed to the emergency room (ER). When transported to the ER she began to experience throat swelling, redness of arms and chest, trouble breathing with lower chest pain shooting into lungs, and numbness with tingling in her right arm. Treatment for the event included epinephrine, steroids, and diphenhydramine. She was released from the ER on 23 Dec 2020. On 24 Dec 2020 patient awoke with a headache, fatigue, and generalized itchiness. Treatment for the event included ibuprofen and diphenhydramine. Action taken with the second dose of mRNA-1273 in response to the event was not reported. The outcome for the events, anaphylactic reaction, right arm numbness and tingling, were reported as resolved on 23 December 2020. The events of headache, fatigue, and generalized itchiness were considered resolving.; Reporter's Comments: This case concerns a 26-year-old female patient who received their first of two planned doses of mRNA-1273 (Lot OU520A/011520A), and who experienced the unlisted events of anaphylactic reaction, right arm numbness and tingling, and generalized itchiness, and the listed events of headache and fatigue. The events were considered to be possibly related to the vaccine due to the temporal relationship with onset on the day of vaccination.

Anaphylactic reaction; Chest pressure; Rash (on neck,belly and arm); Metallic taste in mouth; Hot flashes; Headaches; A spontaneous report was received from a 49-year-old female nurse, who was also a patient, who received Moderna's COVID-19 vaccine and experienced anaphylactic reaction, chest pressure, rash (on neck, belly and arm), metallic taste in mouth, hot flashes and headaches. The

patient's medical history was not provided. No relevant concomitant medications were reported. On 22 Dec 2020, at 7:00 pm, approximately 15 minutes prior to the onset of the events, the patient received her first of two planned doses of mRNA-1273 intramuscularly, for prophylaxis of COVID-19 infection. On 22 Dec 2020, approximately 15 minutes after the mRNA-1273 vaccination, the patient experienced anaphylactic reaction, chest pressure, rash (on neck, belly and arm), metallic taste in mouth, hot flashes and headaches. She was taken immediately to the emergency room. Laboratory values included a negative troponin level and low potassium at 3.3. All other laboratory results were normal. Treatment included prednisone for five days, diphenhydramine hydrochloride, famotidine and paracetamol. Action taken with mRNA-1273 in response to the events was not reported. The outcome for the events, anaphylactic reaction, chest pressure, rash (on neck, belly and arm), metallic taste in mouth, hot flashes and headaches was not reported The causality assessment for the events, anaphylactic reaction, chest pressure, rash (on neck, belly and arm), metallic taste in mouth, hot flashes and headache was not reported.; Reporter's Comments: This case concerns a 49-year-old, female patient who received their first of two planned doses of mRNA-1273 (Lot-# and expiration date -unknown), reporting an unexpected event of anaphylactic reaction, chest pressure, rash, metallic taste in mouth, hot flush and an expected event of headache. The events occurred the same day, 15 minutes after vaccine administration. The reporter did not provide the causality assessment for the events. Due to the temporal association between the events and administration of the vaccine, a causal relationship cannot be excluded, and the events are assessed as possibly related to vaccine.

Anaphylactic type of reaction; A spontaneous report was received from a female consumer who received Moderna's COVID-19 vaccine (mRNA-1273) and experienced an anaphylactic type of reaction. The patient's medical history was not provided. Concomitant product use was not provided by the reporter. On an unknown date, the patient received their first of two planned doses of mRNA-1273 intramuscularly for prophylaxis of COVID-19 infection. On an unknown date, after receiving the Moderna vaccine, patient reported that she had some adverse side effects and believed she needed an Epi-pen before getting a second dose due to the anaphylactic type of reaction she had. Treatment information was not provided. Action taken with mRNA-1273 in response to the event was not provided. The outcome of the event, anaphylactic type of reaction, was not reported.; Reporter's Comments: This case concerns a female patient of unreported age. The patient's medical history is not provided. The patient experienced an unexpected event of anaphylactic type of reaction. The event occurred on an unknown date and unknown duration after receiving the first dose of mRNA-1273. Very limited information regarding this event has been provided at this time. Based on temporal association between the use of the product and the event, a causal relationship cannot be excluded. Additional information about the event details are required for further assessment.

"I developed symptoms on 29Dec2020 and test obtained on 30Dec2020. My results are back today and I'm positive.; I developed symptoms on 29Dec2020 and test obtained on 30Dec2020. My results are back today and I'm positive.; This is a spontaneous report from a contactable other HCP (healthcare professional) who reported for himself. A male patient of unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) via an unspecified route of administration on 16Dec2020 (at an unspecified age) as a single dose for COVID-19 immunization. Medical history and

concomitant medications were not reported. The patient tested positive for coronavirus on 30Dec2020. It was reported that the patient obtained his first Pfizer vaccine dose on 16Dec2020. The patient reported that he was a physician assistant and worked in a dedicated COVID patient care area. The patient developed symptoms on 29Dec2020, and a test was obtained on 30Dec2020. The patient's results were back ""today"" and he was positive. The patient was scheduled for his second dose of the vaccine on 06Jan2021. He reported that he would cancel that because he would still be in his 10-day isolation period. Given those circumstances, the patient inquired as to ""when would be the most ideal time to obtain my second dose of the vaccine? When should I take my second dose of the vaccine if I contracted COVID after receiving the first dose?"" The clinical outcome of the event ""I developed symptoms on 29Dec2020, and test obtained on 30Dec2020. My results are back today and I'm positive"" was unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender's Comments: Based on a compatible temporal asociation, a causal relationship between event ""patient developed symptoms on 29Dec2020 and test obtained on 30Dec2020. was positive"" (coded to Drug ineffective / COVID-19) and BNT162B2 vaccine cannot be completely excluded."

person then became symptomatic and tested positive within 7 days of receiving the vaccine; person then became symptomatic and tested positive within 7 days of receiving the vaccine; This is a spontaneous report from a contactable pharmacist. A patient of unspecified age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE lot number and expiration date unknown) via an unspecified route of administration on an unspecified date (at an unknown age) at an unknown dose for COVID-19 vaccination. The patient's medical history was not reported. The patient's concomitant medications were not reported. The patient became symptomatic and tested positive within seven (7) days of receiving the COVID-19 vaccine. The patient underwent lab tests and procedures which included sars-cov-2 test: positive on an unspecified date. The clinical outcome was unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

Complete loss of smell and taste; Complete loss of smell and taste; This is a spontaneous report from a contactable physician reported for herself. A 37-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; brand: PfizerbioNtech, lot number: EH9888) intramuscularly at left arm on 17Dec2020 at 03:00 PM at a single dose (dose number: 1) for COVID-19 immunization. Medical history was reported as none. No known allergies (no allergies to medications, food, or other products). The patient was not pregnant. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No other medications the patient received within 2 weeks of vaccination. Facility where the most recent COVID-19 vaccine was administered was at hospital. The patient experienced adverse event complete loss of smell and taste on 19Dec2020 at 07:00 AM. The event was considered as serious due to resulted in disability or permanent damage. No treatment received for the event. The outcome of

event was not resolved. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events complete loss of smell and taste cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

ball palsy, facial dropping; painful shingles; This is spontaneous report from a contactable consumer reported for herself. A 47-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; batch/lot number: EK5730; dosage form: injection) via an unspecified route of administration as injection to left arm on 24Dec2020 at 7:30 am at a single dose for COVID-19 immunization. Relevant medical history and concurrent conditions included slight hypertension from Jul2020 and ongoing. Concomitant medications included lisinopril from Jul2020 and ongoing for slight hypertension. The patient developed ball palsy, facial dropping which did not lasted long but she still had the painful shingles on 27Dec2020, after the first dose. She wanted to know the recommendations for taking the second dose which is due in 10 days. The patient wanted to know if she should receive the shingles vaccine. This caller was a lab tech who works in the healthcare industry and manages a medical office; but clarified she did not call on behalf of a healthcare professional. She was the patient who received her first dose of Pfizer SARS-CoV-2 Vaccine on 24Dec2020. She reported onset of what the Urgent Care Physician believed was Shingles on 27Dec2020. She called to ask if she should or should not receive the second dose of Pfizer SARS-CoV-2 Vaccine on 14Jan2021 as scheduled due to the Shingles. The Urgent Care Physician advised her to still get the second dose, as there was about a 1:10,000 chance of developing shingles with the vaccine. She reported shingles as a reaction subsequent to the Pfizer SARS-CoV-2 Vaccine. Initially on 27Dec2020 she developed sites of what she thought were canker sores or fever blisters in her mouth which had gotten pretty large and stopped her from being able to eat on 29Dec2020. Then on 30Dec2020 she developed sites on her face which have gotten scarily large; and was causing some deep nerve pain going to her eye and down her chin; the sites felt like lesions on her face with roots. The sites in her mouth were now completely gone; but the sites on her face are ongoing. Now it has kind of taken over her face. She saw the Urgent Care Physician regarding this who believed the sites to be shingles. She had never had fever blisters or shingles before this event. She was still kind of reeling. The report was reported as non-serious. The outcome of event ball palsy/facial dropping was resolved and of shingles was unknown.

received the Covid 19 vaccine/then tested positive for the virus/symptomatic; received the Covid 19 vaccine/then tested positive for the virus/symptomatic; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 17Dec2020 at a single dose as Covid 19 vaccine. Medical history and concomitant medications were not reported. It was reported that the patient received the Covid 19 vaccine on 17Dec2020 and then tested positive for the virus on an

unspecified date. She was scheduled to have the second vaccine on 07Jan2021, but she was not able to go to work because she's still symptomatic. She would like to know if there's an extension to the 21 days since she has the virus now. The outcome of the events was unknown. Information about Lot/Batch number is requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available.

developed UTI very quickly; Puffy face and eyes; Puffy face and eyes; Burning inside digestive tract; Diarrhea; Dehydrated; arm pain; Headache; At bedtime neck stiffness began and worsened; This is a spontaneous report from a contactable healthcare professional. A 39-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EL3246/expiration date unknown), dose number 1, via an unspecified route of administration on 02Jan2021 10:30 at a single dose on the left arm for COVID-19 immunization. The patient had no relevant medical history. Concomitant medications included alprazolam (XANAX). The patient experienced arm pain and headache 4 hours post injection requiring Excedrin. At bedtime, neck stiffness began and worsened. She was treated with lidocaine patches and Aleve. She developed diarrhea 33 hours post injection. She went ER because she was dehydrated. She developed UTI very quickly by hour 35 post injection. She had puffy face and eyes, and burning inside her digestive tract. She was treated with Benedryl at home for allergic reaction, Toradol for pain, IV fluids for dehydration and Keflex for infection. The patient was not diagnosed with COVID-19 prior vaccination and was not tested for COVID-19 since vaccination. The outcome of the events was recovering.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of event Dehydration cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"vomited; diarrhea; a severe headache; severe muscle pain; severe fatigue like being ""beat up in a bar""; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot and expiry not reported), via an unspecified route of administration on 28Dec2020 at single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. On 29Dec2020, patient experienced a severe headache, severe muscle pain and severe fatigue; further reported as like being ""beat up in a bar"" for over 1 week. It was also reported that the patient vomited and experienced diarrhea on an unspecified date. The patient was also inquiring if there is difference between the symptoms in dose 1 and 2. Outcome of events was unknown. Information of lot and batch number has been requested.; Sender's Comments: Based on the available information and known BNT162B2 vaccine safety profile, a causal relationship between events severe headache, severe muscle pain and severe fatigue and BNT162B2 vaccine cannot be excluded. The impact of this report on the benefit/risk profile

of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

Bell's Palsy; This is a spontaneous report from a contactable physician (patient). A 62-years-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular on left arm on 19Dec2020 19:00 at single dose for COVID-19 immunisation. Known allergies: No. Other medical history: None. No other vaccine in four weeks. No other medications in two weeks. The patient experienced bell's palsy on 03Jan2021 21:00 and required visit to physician office. Covid test type post vaccination: Nasal Swab (PCR) on 29Dec202: Negative. Therapeutic measures were taken as a result of bell's palsy included Prednisone, Valtrex. Outcome of event was not recovered. Information on the lot/batch number has been requested.; Sender's Comments: Based on a compatible association, causality between event Bell's palsy and BNT162B2 vaccine cannot be completely excluded. The case will be reevaluated should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"Tested positive with covid 19 with symptoms; Tested positive with covid 19 with symptoms; This is a spontaneous report from a contactable healthcare professional. A male patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date were not reported), via an unspecified route of administration on 22Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient stated, ""I received the covid 19 vaccine on 22Dec; was supposed to have 2nd dose on 12Jan2021. Tested positive with covid 19 on 01Jan2021 with symptoms. I want to know how long I need to wait to get the second dose"".The outcome of the events was unknown. Information on the lot number has been requested.; Sender's Comments: Although, BNT162B2 vaccine immunogenicity is not in full effect after short time (10 days in this case) of first dose administration, a causal relationship between event ""Tested positive with covid 19 with symptoms"" (coded to Drug ineffective / COVID-19) and BNT162B2 vaccine cannot be completely excluded."

"received covid vaccine then contracted covid-19, 9 days after getting the vaccine; received covid vaccine then contracted covid-19, 9 days after getting the vaccine; This is a spontaneous report from a contactable physician. A male patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date were not reported), via an unspecified route of administration on Dec2021 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. It was stated, ""received covid vaccine then contracted covid-19, 9 days after getting the vaccine, should he get his 2nd dose which is on Friday? Tested positive on the 30th, received monoclonal antibody infusion on the 31st. Any information regarding this?"". The outcome of the event was unknown. Information on the lot number has been requested.; Sender's Comments: Although, BNT162B2 vaccine immunogenicity is not in full effect after

short time (9 days in this case) after first dose administration, a causal relationship between event ""received covid vaccine then contracted covid-19"" (coded to Drug ineffective / SARS-CoV-2 test positive) and BNT162B2 vaccine cannot be completely excluded."

"Bell's palsy/Face was turning side ways; This is a spontaneous report from a contactable nurse. A female patient of unspecified age received BNT162B2 (reported as ""Covid-19 Vaccine, manufacturer: Unspecified"", Batch/lot number: not provided) via unspecified route of administration on unspecified date at single dose for COVID-19 immunization. Medical history and concomitant medication were not reported. A woman received a Covid vaccine. She did not know which one. The woman experienced Bell's Palsy. The woman was crying and her face was turning sideways. Outcome of the event was unknown. Pfizer is a marketing authorization holder of Covid-19 Vaccine in the country of incident or the country where the product was purchased (if different). This may be a duplicate report if another marketing authorization holder of Covid-19 Vaccine has submitted the same report to the regulatory authorities. Information on the Batch/Lot number has been requested.; Sender's Comments: Based on a compatible temporal relationship, causality between reported event Bell's Palsy and BNT162B2 vaccine cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

memory care patients received Pfizer-BioNTech covid vaccine, and then were diagnosed with COVID, all three had COVID symptoms; memory care patients received Pfizer-BioNTech covid vaccine, and then were diagnosed; This is a spontaneous report from a contactable other health professional. This reporter reported same events for three patients. This is first of three reports. A patient of unspecified age and gender received BNT162B2 (Pfizer BioNTech COVID vaccine), via an unspecified route of administration on an unspecified date at single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The memory care patient received Pfizer-Biontech Covid vaccine, and then was diagnosed with Covid and had Covid symptoms on an unspecified date, the patient was scheduled to receive monoclonal antibody. Event took place after use of product. The outcome of events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to possibly short number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information,Linked Report(s) : US-PFIZER INC-2021004747 same reporter/product/event, different patient;US-PFIZER INC-2021004748 same reporter/product/event, different patient

Diagnosed with COVID; Diagnosed with COVID; This is a spontaneous report from a contactable other health professional. This reporter reported same events for three patients. This is second of three reports. A patient of unspecified age and gender received BNT162B2 (Pfizer BioNTech COVID vaccine),

via an unspecified route of administration on an unspecified date at single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The memory care patient received Pfizer-Biontech Covid vaccine, and then was diagnosed with Covid and had Covid symptoms on an unspecified date, the patient was scheduled to receive monoclonal antibody. Event took place after use of product. The outcome of events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to possibly short number of days passed since the vaccine is given. had a positive test for COVID; had a positive test for COVID; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect from a contactable physician who reported for himself. A male patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 19Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. Patient had a PCR COVID-19 swab performed on 23Dec2020 which returned positive on 26Dec2020. The action taken in response to the event for bnt162b2 was not applicable. Outcome of the event was unknown. Information for lot number has been requested in follow up activity.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for

the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

positive COVID-19 test with symptoms; positive COVID-19 test with symptoms; This is a spontaneous report from a non-contactable pharmacist via Pfizer Sales Representative. A 25-year-old male patient (nurse) received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiration date unknown as did not have this information), via an unspecified route of administration in Dec2020 (reported as received either 17Dec2020 or 18Dec2020) at single dose for COVID-19 immunization in hospital. The patient's medical history and concomitant medications were not reported. One of the reporter's employees (patient) got the COVID-19 Vaccine. Ended up testing positive for COVID probably due to patient care. Patient was taking care of two to three people who were not positive for COVID while in the hospital, but tests came up as positive. Patient developed symptoms in Dec2020 and tested positive for COVID on 24Dec2020. Patient received COVID-19 Vaccine either 17Dec2020 or 18Dec2020. Began coughing three to four days after vaccination in Dec2020. Rapid test was negative in Dec2020. On 24Dec2020, the M20 test came back as positive for COVID. Only other symptom patient experienced was loss of taste and smell in Dec2020. Had been a stressful situation for the patient. The outcome of the events was unknown. Information on the Lot/ Batch number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

encephalitis; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender received BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE) , via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient was allergic to UTI(urinary tract infection) infection medication (i.e. sulfamethoxazole, trimethoprim etc.). Concomitant medications were not reported. The patient got encephalitis and was put in the ICU(intensive care unit) after getting vaccinated, led to hospitalization. Outcome of event was unknown. Information about lot/batch number has been requested.

Anaphylactic reaction

Pronounced dead 1/9/2021 at 12:42. Received first dose of vaccine 1/8/2021

"Staff member checked on her at 3am and patient stated that she felt like she couldn't breathe. 911 was called and taken to the hospital. While in the ambulance, patient coded. Patient was given CPR and ""brought back"". Once at the hospital, patient was placed on a ventilator and efforts were made to contact the guardian for end of life decisions. Two EEGs were given to determine that patient had no brain activity. Guardian, made the decision to end all life saving measures. Patient was taken off the ventilator on 1/9/2021 and passed away at 1:30am on 1/10/2021. The initial indication from the ICU doctor was the patient had a mucus plug that she couldn't clear."

Aprox 5 minutes after vaccine was given, patient stated he was not feeling well, asked for water and stated he was having trouble breathing. Was then assisted to clinic treatment room, vitals were taken: 08:45 B/P 171/110, HR 84, R 28 O2 97. EMS was activated. At 0900 158/94 HR 84 R 24 O2 97. Patient then voice he was having tightness in his throat. Epi Pen 0.3mg administered at 0900. At 0904 EMS arrived and patient taken to the nearest hospital.

Numbness and tingling bil upper extremities, seizure, temporary paralysis R arm. Started day after vaccine given, was observed overnight in hospital.

"Manager was notified that the employee had suffered a stoke-like ""serious medical event"" hours after the end of her shift, while at home."

Patient had vaccine in Left arm. That same night patient had temp of 100.1 and the right neck at base of head to shoulder began to hurt patient was unable to swallow without pain in the next few days. Patient went to ER and was hospitalized for 2 days treated with IV steroids and 2 antibiotics (clindamycin and acyclovir). Patients symptoms resolved and patient was discharged without additional issues. The admitting physician was unable to identify the cause of these symptoms, but the vaccine could not be ruled out.

"1-2-2021 10:30 PM Complained Right arm/back hurt - took Tylenol 1-3-2021 Complained Right arm hurt, dizzy 1-4-2021 Felt better - did laundry, daughter found her deceased at 3:30 pm. Dr. at hospital said it was ""cardiac event"" according to death certificate."

Upon assessment resident noted to have increased respirations, lungs CTA. Resident c/o increased fatigue and muscle aches. VS 202/180, 118, 22, 97.1, 96%.

Sever thrombocytopenia (platelet count 2,000) 8 days following Moderna COVID vaccine. Clinically suspicious for ITP.

Received vaccine on 1/5, began having swelling in bilateral hands and lower extremities on 1/7, along with fatigue. On 1/8 she reports new swelling started in her face (eyes and cheeks). Swelling has not improved today and fatigue has worsened.

Found on floor by CNA at 6 am. On assessment by charge nurse, VS: 99.6-94-16 212/105 manual. Noted increased confusion. Temp. 99.6 FBS 114. Resident had been provided tylenol just prior in shift for general discomfort (sore muscles) and low grade temp. On call for Dr notified of all and received order to send to ER.

Staff reported that patient was found Friday morning (Jan 8) sitting at a table with his head tilted forward and unresponsive to verbal or physical stimuli. Staff lowered patient to floor and started CPR. EMS was called and continued CPR at scene, however they were not able to revive patient. Patient was pronounced dead at the scene. Staff written statements following the death of patient show that he had a fall about 1 hr. prior. It is unknown if this fall contributed to patient's death. An autopsy has been requested.

Acute anterior MI with death

Approximately 15 minutes after receiving the vaccine, client started c/o itching to face and lips. Transported to triage area. Where she started c/o burning lips also. vital signs monitored, Benadryl 50mg po given. In a few minutes she reported chest tightness, labored breathing. 1:44pm Epinephrine was given IM. client was on 02 increased to 15 Liters. She admits to decreased chest tightness and itching of face improving. She was taken by ambulance to hospital, where she was admitted overnight for observation. She was given Benadryl and epi X2 more time, once in ambulance and once at the hospital. She denies any problems since then. She did say that approx 3 weeks ago she was a contact to a case of covi

Patient is a 41 y.o. female who presented to the ED with complaints of a reaction after she took the COVID vaccine. Patient is an RN here and had earlier received COVID-19 vaccination (Moderna) around 0130 this afternoon. Soon after she experienced rash which was burning and itchy on her arms thighs and back. She reported to Occ health and was directed to the ED. While in the ED she experienced throat tightness and nausea. She had one episode of diarrhea. No tongue, lip swelling, SOB or difficulty swallowing. Denies any chest pain, palpitations, pre-syncope/syncope. No vomiting abdominal pain. H/o of allergy to fish mix and dust mite.

01/06/21 at 6 pm, body aches, and chills 01/07/21 at 12am T102.2, SPO2 62% on room air. Was sent to ER and returned. 01/08/21 at SPO@ less then 60% on room air, non responsive to verbal tactile stimuli. Responsive to sternal rub only. Was sent to ER and admitted to ICU.

The resident resides in an independent living facility/apartment. The reporter at the center was informed by his daughter he was not feeling well on 1/1/2021 (specific symptoms could not be ascertained). He reportedly went to be COVID tested on 1/1/2020 and observed to be deceased in his apartment on 1/2/2020. I do not have confirmation of his COVID results, although the reporter indicates his daughter reports his test was positive.

Patient went to bed around 11pm on Saturday PM and sometime between then and 1:30am on Sunday morning got up and went into the living room without waking up her husband (which is normal). At 1:30am, the husband got up to use the restroom and she was out of bed then, but the husband did not know if she was having any problems at this time. When he got up at 7:45am, she was in the recliner and did not move or anything, which is normal for her. At 8:45am, the husband went back into the living room and tried to wake his wife and that is when he noticed there was no pulse and he called 9-1-1 at this time. EMS got on scene and did CPR for 30 mins and she was pronounced dead at 9:21am.

Approximately 10 minutes after receiving the vaccine she started experiencing numbness and inability to move all 4 extremities. No difficulty breathing or swallowing. Benedryl 25 mg was administered with no relief. EMS was called, she was transported to the ED and admitted to the hospital for evaluation. She was given Ativan 0.5 mg IV with some mild improvement in symptoms. She has had gradual improvement in her symptoms, now able to move her arms normally. She has persistent weakness and discomfort in both lower extremities and is unable to ambulate without assistance.

1/8/2021 tachycardia Pulse 140, Fever T99.4 then 100.2 Lethargy, Somewhat Altered Mental status

"Her voice became raspy, she could hardly talk, she could barely talk; her hand and whole arm swelled up; her hand and whole arm swelled up; Trouble breathing; This is a spontaneous report from a contactable healthcare professional (patient). A 57-year-old female patient received the 1st dose of bnt162b2 (BNT162B2, Manufacturer Pfizer-BioNTech) (lot# EK9231, exp date Apr2021), via an unspecified route of administration in the right arm, on 29Dec2020, at single dose, for COVID-19 immunization and diphenhydramine hydrochloride (BENADRYL), via an unspecified route of administration, at unknown posology, on 29Dec2020 (20 minutes prior to taking bnt162b2), for anaphylactic reaction. Medical history included ongoing thyroid disorder. Concomitant medications included apixaban (ELIQUIS), diltiazem (unknown trade name), losartan (unknown manufacturer), rosuvastatin calcium (CRESTOR), levothyroxine (unknown trade name), ongoing levothyroxine sodium (SYNTHROID) for thyroid disorder and metformin (unknown trade name). Previously the patient received unspecified influenza vaccine (reported as flu shot) for immunisation, on unspecified date, and experienced anaphylactic reaction treated with Benadryl. On 29Dec2020, an hour after getting the vaccine, the patient experienced her voice became raspy, she could hardly talk, she could barely talk with outcome of unknown, her hand and whole arm swelled up with outcome of unknown, trouble breathing with outcome of unknown. The reporter stated that her voice and everything reacted and made her go to the emergency room on 29Dec2020. She reported that had adverse effect more than normal. The event ""Her voice became raspy, she could hardly talk, she could barely talk"" caused patient's hospitalization on unknown date. The action taken as a result of the events with diphenhydramine hydrochloride was post-therapy. Therapeutic measures were taken at the emergency room as a result of the events and included treatment with Topcid and Benadryl every 6 hours, 2x 40 mg of steroid. The information on the lot/batch number has been requested. Follow-up (02Jan2021): New information received from the same contactable healthcare professional reporting for herself includes: patient's details, medical history, events updated, vaccine lot# and exp date, concomitant, seriousness of event ""Her voice became raspy, she could hardly talk, she could barely talk"" added as hospitalization, historical vaccine, suspect Benadryl details, therapeutic measures updated.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate."

Resident died suddenly and expectantly on 01/05/2021

Patient received COVID-19 (Moderna) vaccine from the Health Department on afternoon of January 8, 2021 and went to sleep approximately 2300 that night. Was found unresponsive in bed the following morning and pronounced dead at 1336 on January 9, 2021

Chills Hip pain

Resident had seizure like activity followed by a vagel response with large bowel movement. Resident then began to show signs of blood clot to left lower extremity. No pedal pulse, area on leg warm to touch. Left lower leg now cold to touch, stiff, purple and white in color. No other signs of modeling, body warm to touch, no fever noted. Respirations and pulse increased with low oxygen levels. Resident not responding to stimuli.

38-year-old female who is healthcare worker and received first dose of COVID vaccine (Pfizer). Immediately after receiving the vaccine, patient developed lightheadedness, flushing, hives, wheezing and throat swelling. Patient was treated in an emergency department with epinephrine, gradually improved and was able to be sent home with an EpiPen, prednisone, hydroxyzine, and famotidine. The next day, patient again developed shortness of breath and her husband administered the EpiPen. EMS arrived and gave another dose of IM epinephrine and IV diphenhydramine. On arrival to the emergency department, the patient was altered, diaphoretic, tachypneic, tachycardic, and stridulous. Patient was given multiple doses of IM epinephrine and started on epinephrine drip. Stridor continued and was unresponsive to nebulized albuterol. Patient was then intubated and placed on mechanical ventilation. Other treatments included solumedrol, pepcid, magnesium sulfate, nebulized epinephrine, and IV fluids. admitted to the intensive care unit, weaned off epinephrine drip, and extubated the next day. Patient was monitored on hospital floor for one additional day and was then discharged with no residual symptoms.

Patient had a rash prior to COVID vaccine. Prednisone 10mg started on 1/5/21 (only one dose administered) 1/6/21, 1am - Rash worsened with increase redness, warmth and extending of body surface, Temp 100.4, 1/6/21, 1:20am Benadryl 25mg administered, (Keflex was ordered at this time, however never administered). 1/6/21, 3am rash improved, temp 99.1 1/6/21, 6:50am Right facial droop and right sided weakness, sent to ER 1/6/21 transferred to hospital, continues to be hospitalized 1/11/2021

Patient expressed: Pain in the left side of the face and migraine on 25Dec2020, and came to emergency room where apparently they diagnosed facial paralysis; Patient expressed: Pain in the left side of the face and migraine on 25Dec2020, and came to emergency room where apparently they diagnosed facial paralysis; This is a spontaneous report from a contactable nurse. A 42-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number EK5730) intramuscular, on 17Dec2020 04:15, single dose arm left for COVID-19 immunization. Relevant medical history included hypothyroidism, hypertension, hyperlipidemia, obesity, and penicillin allergy. Concomitant medications included levothyroxine sodium (SYNTHROID), butalbital, caffeine, paracetamol (FIORICET 50-40- 325mg), dexamethasone 4mg Inj., diclofenac (VOLTAREN 1% Gel), Magnesium, valsartan (VASOFLEX) (pending confirmation), cyanocobalamin (VITAMIN B12), losartan potassium. The patient was not pregnant and did not received any vaccine in four weeks. The patient previously took cephalosporin and experienced allergy. On 24Dec2020, the patient experienced pain left side of the face and migraine, and came to emergency room where apparently they diagnosed facial paralysis. The events resulted in emergency room visit/ urgent care where the patient was administered dexamethasone 4mg Inj, Medrol dose pack, Vit B12 500mcg, and Fioricet 50-325-40. Facility where the most recent COVID-19 vaccine was administered was in the doctor's office/urgent care. It was unknown if the patient was diagnosed with

COVID-19 prior or since the vaccination. The events were assessed by the nurse as non-serious. Outcome of the events was recovering at the time of the report.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

HPI narrative: Patient was fine until 2 days ago. Patient does have chronic dementia but got Covid vaccine 11:00 2 days ago and that night seem to be confused and not able to walk since then. Patient poor appetite since yesterday. Patient had diarrhea 3 x 2 days ago. No vomiting no fever no cough does not appear to be short of breath. Patient also with left hip pain for few days with no injury.All history obtained from caretaker at bedside.

Started as a red raised rash under my arms and my waistline; rash turned to hot to touch; raised red large hives all over my body including my face/head; numbness to my hands/feet/chest area; the SOB started; This is a spontaneous report from a contactable nurse, the patient. A 53-year-old non-pregnant female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EU9231), via an unspecified route of administration in the left arm on 30Dec2020 at 08:30 as a single dose for COVID-19 immunization. Medical history included hypothyroidism and chronic low back pain. Prior to the vaccination, the patient was not diagnosed with COVID-19. Concomitant medications included levothyroxine (MANUFACTURER UNKNOWN), baclofen (MANUFACTURER UNKNOWN), and etodolac (MANUFACTURER UNKNOWN). The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient previously took miconazole nitrate (MONISTAT) on unknown dates for an unknown indication and experienced drug allergy. On 31Dec2020 at 10:00, the patient started with a red raised rash under her arms and waistline and as the day progressed the rash turned hot to touch with raised red large hives all over her body including her face/head. By 23:00 on 31Dec2020, the patient had already taken 3 doses of diphenhydramine (BENADRYL) which was not effective. Then, later on 31Dec2020, shortness of breath started with numbness in the hands/feet/chest area. Her daughter took her to the emergency room. She was started on intravenous diphenhydramine, dexamethasone, and famotidine (PEPCID). The medications took time to work but they did resolve her shortness of breath and the hives subsided to mild redness. She was sent home and given the following medications to take: diphenhydramine 50 mg every 4 hours, methylprednisolone (MEDROL DOSE PAK), cetirizine (ZYRTEC) daily, and famotidine (PEPCID) daily. Since the vaccination, the patient had not been tested for COVID-19. The clinical outcomes of the red rash, rash was hot to touch, shortness of breath, and numbness, were reported as recovered with lasting effects; while that of the hives was recovering as they still flared up if she did not take the medications every 4 hours. The reporter assessed all the events as non-serious.; Sender's Comments: The reported shortness of breath together with red rash was probably related to the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE together with rash was probably related to the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), due to temporal relationship and clinical course. The impact of this report on the

benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory authorities, Ethics committees and Investigators, as appropriate.

Rectal bleeding; Stomach ache; Diarrhea; sick; This is a spontaneous report from a contactable consumer (patient) from a Pfizer sponsored program Pfizer First Connect. A 41-year-old female patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: EK5730 and Expiration Date: 31Mar2021), via an unspecified route of administration in the right arm on 20Dec2020 at a single dose for COVID-19 immunization. The patient's medical history was reported as none. There were no concomitant medications. On 01Jan2021, the patient experienced: rectal bleeding, stomachache, diarrhea, sick; all assessed as medically significant. The clinical course was reported as follows: The patient received the first dose of the COVID-19 vaccine on 20Dec2020; as she was at high risk due to working with COVID patients in the hospital. The patient became sick on 01Jan2021. The patient experienced a stomach-ache, diarrhea, and rectal bleeding. When these events occurred, the patient went to the emergency room (ER). A doctor there prescribed the patient the antibiotics metronidazole 500 mg and cefdinir 300 mg. The patient was also scheduled to follow up with a gastrointestinal (GI) doctor. The patient called asking if she should get the second dose since she was taking antibiotics. The patient was scheduled for the second dose on 08Jan2020.The patient reported she had improved. The symptoms, at the time of the report, were not that bad. Therapeutic measures were taken as a result of rectal bleeding, stomachache, diarrhea, and sick. The clinical outcome of the events was recovering.

Numbness lips,mouth; Was feeling bad; leg numbness/numbness in head, face; pain in head; increased BP; blood pressure was up and down; This is a spontaneous report from a contactable consumer (patient). A 55-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL0140) via an unspecified route of administration in left arm on 29Dec2020 6 am at single dose for covid-19 immunisation. Co-suspected drug amoxicillin;clavulanic acid (AUGMENTIN, Batch/lot number: KN4291, Expiry Date: Mar2022) by mouth from Dec2020 to 28Dec2020 at 875mg, 1 tablet twice daily for pain or infection; MOXIFLOXACIN HYDROCHLORIDE (AVELOX, strength:400mg) by mouth from 29Dec2020 and ongoing at 400mg, 1 tablet once daily for infection; fluconazole (DIFLUCAN, strength:200mg) orally (by mouth) from unknown date and ongoing at 200mg, 1 tablet once daily for Infection.The patient's medical history was reported as ongoing high blood pressure, ongoing pains in her fingers and toes and they thought she had an infection from 02Dec2020, white count went down on 09Dec2020, ongoing pain was up and down. No other vaccines given at that time and none given 4 weeks prior. Had a Flu shot back in Oct2020, but no problems. None diagnosed allergies and family medical history relevant to adverse event. The concomitant medications included unspecified blood pressure medication by mouth daily for high blood pressure. She had also started 2 antibiotics around the same time that she received the vaccine. No further details provided Was on antibiotics at the time she was given the Pfizer COVID-19 vaccine. Patient experienced increased BP/ high blood pressure, pain in head, and leg numbness; all started 2 days (on 31Dec2020) after receiving the vaccine and persisted for 48 hours. First her blood pressure was up and they had to get it

stable and had numbness in her head, face, and mouth for 48 hours. Her blood pressure was up and down and she has history of blood pressure and takes medicine. Was taken off work for a few hours and went to the emergency department on Fri night about 2am. Her blood pressure was 170/92 on 01Jan2021. Not sure if this was related to the vaccine, but the numbness in her head started from her upper neck to face to the right side of her check and she also had leg numbness. Wanting to know if this was related because she was worried about getting the second dose. Had a hard time for 48 hours. Weight was between 150-155 pounds. Stated everything improved after 48 hours. Her lip was also just a little bit numb, but it is feeling better. Patient was feeling bad from 01Jan2021, all Fri and Sat and much better by Sun. Events of increased BP/ blood pressure up and down, leg numbness, numbness in lips, head, face, mouth with emergency room visiting. Wanted to know if she should have the second dose. The action taken in response to Augmentin was permanently discontinued on 28Dec2020, for Avelox and Diflucan was dose not changed. The outcome of events was recovering.

eventually inability to move arm; pain; joint pain; tenderness at injection site; loss of strength; This is a spontaneous report from a contactable nurse. A 36-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Batch/lot number: EJ1685) intramuscular at arm left, on 19Dec2020 06:45 at single dose for covid-19 immunisation. Medical history included ongoing acne. Patient had no known allergies. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Concomitant medication included isotretinoin (ACCUTANE). On 19Dec2020 11:30, approximate 5 hours after vaccine, the patient experienced pain, joint pain and tenderness at injection site, progressively loss of strength and eventually inability to move arm. Since the vaccination, the patient hasn't been tested for COVID-19. The outcome of events was recovered.; Sender's Comments: Based on the compatible temporal association, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the reported events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

she is positive for blood in her stool; left hip/back/kidney pain; left hip/back/kidney pain; left hip/back/kidney pain; This is a spontaneous report from a contactable consumer reporting for herself. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number and expiration date unknown) via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the vaccine on 28Dec2020 (reported on 05Jan2021 as 'a week ago Monday'). After getting the vaccine (2-3 days after getting the vaccine) she started to have some events happen that she was not sure were side effects from the vaccine. She mentioned she started to experience blood in her stool - following a test at her doctor's she was positive for blood in her stool. Also, the left side of her lower back and hip started hurting. She was experiencing left hip/back/kidney pain, as reported. She took hydrochlorothiazide. The outcome of the events was unknown. She wanted to know if this had anything to do with the vaccine and if this could be a side effect. These events did

not start happening until after she got the vaccine. Information on the lot/Batch number has been requested.

difficulty of breathing; chest pain; nearly passing out/fainting; This is a spontaneous report from a contactable consumer. A 50-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiry date unknown) via unspecified route of administration on unspecified date at single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter called in behalf of her friend that has been experiencing serious adverse event. The patient experienced difficulty of breathing, chest pain, nearly passing out/fainting on unspecified date. They felt that the vaccination provider did not provide enough support about the adverse event that happened. Follow-up activities are possible, information on the batch number has been requested.

believed it was injected incorrectly because she didn't have pain in her deltoid but she did have all the pain inside her shoulder, like in the bursa; received the first dose 17DEC2020 / received the second dose 4JAN2021; anterior medial shoulder joint/shoulder pain/pain in shoulder after second dose of COVID 19 vaccine; can't actively use shoulder / can't move her arm; weakness in her hand; bone pain; This is a spontaneous report from a contactable healthcare professional (HCP) reporting for herself. A 40-year-old female patient received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EJ1685, expiry date not provided) via an unspecified route of administration in the left arm on 17Dec2020 13:30, and the second dose (lot number EK9231, expiry date not provided)via an unspecified route of administration in the left arm on 04Jan2021 13:30, for COVID-19 immunization. There was no relevant medical history. The patient's concomitant medications were not reported. The patient experienced anterior medial shoulder joint/shoulder pain/pain in shoulder after second dose of the vaccine on 04Jan2021, and couldn't actively use shoulder. She believed it was injected incorrectly because she didn't have pain in her deltoid but she did have all the pain inside her shoulder, like in the bursa, and she couldn't move her arm and felt weakness in her hand. She noticed the pain and all other symptoms immediately when they were injecting it. She told the nurse who said she was tensing up. The events were considered medically significant by the patient. She also reported experiencing bone pain, unable to put in sutures at work. She was taking 600mg Ibuprofen and 1000mg paracetamol (TYLENOL) every 6-8 hours. The events were not resolved. The pain had gotten worse. The other symptoms were persisting.; Sender's Comments: Based on the compatible temporal association, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

SEVERE ABDOMINAL PAIN

"tongue not swollen but felt sluggish/tongue felt strange, it was sluggish to swallow; tongue felt strange like hard to swallow/tongue felt strange, it was sluggish to swallow/Her tongue felt strange; tongue felt strange like hard to swallow/tongue felt strange, it was sluggish to swallow/felt hard to swallow; hot

flash; flush feeling all over her face/flush all over her face/she felt flush; arm was sore; arm was sore and heavy; drowsiness; pain and redness at injection site; pain and redness at injection site; This is a spontaneous report from a contactable nurse reporting for herself. A 36-year-old female patient received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EL1284, expiry date not provided) on 23Dec2020 09:15 intramuscularly in the left arm for COVID-19 immunisation (reported as preventive). There was no relevant medical history and no concomitant medications. The nurse (patient) received her first dose of the vaccine on 23Dec2020 at the hospital that she worked at. She was kept there for 15 min for monitoring and she felt fine. About 30 minutes post vaccination she got a hot flash, a flush over her face, she does not know if she was red but she felt flush. Her tongue felt strange, nothing swelled that she could tell, it felt hard to swallow, to make the motion to swallow it felt kind of sluggish. She felt weird swallowing which lasted for only a few minutes. She never struggled to breathe. She went back to park in the hospital parking lot since she was not sure if she was experiencing a anaphylactic reaction and then after a few minutes it went away. Her arm was sore and heavy feeling for that day. She had drowsiness for a couple of hours and pain and redness at the injection site for a couple of days that was not bothersome, it was mild. No relevant test. She wanted to know if she should get the second dose of the vaccine due to the symptoms she had after the first dose. The pain and redness at injection site was resolved on an unspecified date in Dec2020, while the other events were resolved on 23Dec2020. The reporting nurse considered the events hot flash, flush all over her face, arm was sore and heavy, drowsiness, pain and redness at injection site were non-serious, while the events ""tongue felt strange, it was sluggish to swallow"" were serious that she drove back to the hospital (no emergency room/phycian office visit). She considered the events were related to the vaccine.; Sender's Comments: A possible contributory effect of suspect BNT162Bw on the reported events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

Sudden and rapid onset of generalized Urticaria accompanied by dyspnea; sudden and rapid onset of generalized uritcaria accompanied by dyspnea; This is a spontaneous report from a contactable nurse (patient). A 34-year-old female patient (non-pregnant) received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899), intramuscular on 30Dec2020 11:00 at single dose at right arm for covid-19 immunization. Medical history included Grave's dse, psoriasis, bronchial asthma. Concomitant medication in two weeks included propranolol, methimazole, fluticasone furoate, vilanterol trifenatate (BREO ELLIPTA), colecalciferol (VITAMIN D). Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient previously took adalimumab and experienced drug allergies. The patient was not diagnosed with COVID-19 prior to vaccination. Since the vaccination, patient has not been tested for COVID-19. 9hrs post-vaccine, patient developed sudden and rapid onset of generalized uritcaria accompanied by dyspnea on 30Dec2020 20:00 with outcome of recovered with sequelae. Adverse events resulted in emergency room/department or urgent care. Patient received intramuscular epinephrine, intravenous solumedrol & benadryl, and oral prednisone x5 for events. This report is considered as non-serious.; Sender's Comments: Based on temporal

association, the causal relationship between bnt162b2 and the events urticaria and dyspnoea cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

Facial paralysis; stress; This is a spontaneous report from a contactable Nurse. A 42-year-old female patient received first dose of BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter felt worried about the patient(partner) that had facial paralysis and asked if they could administer the second dose of the vaccine of covid-19 from Pfizer. The paralysis it was previous from the fist dose of the vaccine, a consequences of the stress, the partner had 42 years. The reporter considered that the event was non-serious. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2and the event facial paralysis cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

"experienced symptoms of TIA; Severe aphasia; blurred vision; confusion; short term memory loss; elevated blood pressure; This is a spontaneous report from a contactable Other-HCP(Patient). A 57-year-old female patient received first dose of BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration at right arm, on 22Dec2020 08:15 at single dose for COVID-19 immunization. The patient was not pregnant. Medical history included herpes simplex on lips, post menopause, elevated cholesterol w/lifestyle changes. Known allergies reported as no. Concomitant medication included varicella zoster vaccine rge (cho) (SHINGRIX) for immunization. On 04Jan2021 08:30, the patient experienced symptoms of transient ischaemic attack(TIA), severe aphasia, blurred vision, confusion, short term memory loss, elevated blood pressure. The patient admitted to (Hospital name) (still here, hospitalization days reported as 2). Symptoms resolved except very mild aphasia. The patient had very few risk factors for TIA but did have family history of cardiovascular(CV) disease at young age, low density lipoprotein(LDL) was 192. The patient did not have diabetes, HTN, or known heart disease. She did not have severe anxiety. She did not smoke or use any substances. She walked about five miles 4x a week. Weigh reported as 157. Events reported as serious due to hospitalization. The patient had no Covid prior vaccination. Covid(nasal swab) was tested post vaccination on 04Jan2021, Covid test result was Negative. The event resulted in emergency room/department or urgent care. Treatment received for the adverse event included clopidogrel bisulfate(PLAVIX),

acetylsalicylic acid (ASPIRIN), statin; potassium, CT, MRI, ""telemet"". The outcome of the events was recovering. Information on the lot/batch number has been requested.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported symptoms of transient ischaemic attack(TIA), severe aphasia, blurred vision, confusion, short term memory loss, elevated blood pressure and the administration of BNT162B2, based on the reasonable temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, Agency, as appropriate."

"two skin procedures performed in his surgeons office the day before- one on his nose and one on his arm; nose was still slightly bleeding; This is a spontaneous report from a contactable consumer(patient). áA 72-year-old male patient received first dose of BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 30Dec2020 at single dose for COVID-19 immunization. Medical history included phlebotomy in Sep2020 because his blood was ""too thick"" and he had no history of a clotting problem until the time of the report. The patient's concomitant medications were not reported. He reported having two skin procedures performed in his surgeons office the day before- one on his nose and one on his arm. The surgeon nicked a vein on his arm and it began bleeding again last night. The arm was addressed in the emergency deportment(ED) and was fine at time of the report. His nose was still slightly bleeding. This morning his blood was drawn for a CT scan and it took a little while to get the bleeding to stop. He had a ""phlebotomy"" in Sep2020 because his blood was ""too thick"" and he had no history of a clotting problem until the time of the report. The patient asked if the Covid vaccine act as an anticoagulant. He had not spoken to this HCP yet. He was not on a blood thinner. The reporter considered that the event was non-serious. The outcome of the event arm bleeding/bleeding was recovered, of event ""nose was still slightly bleeding"" was not recovered. á Information about lot/batch number has been requested."

soreness around the injection site; Had severe arm pain; Had a fever on the night of the 31Dec2020 of 101.3; I have painful lymph nodes/the swollen lymph nodes under her right arm, the armpit area had swollen and painful lymph nodes; I have painful lymph nodes/the swollen lymph nodes under her right arm, the armpit area had swollen and painful lymph nodes; had joint pains/knees and hip joint pain; severe fatigue; muscle pain; This is spontaneous report from a contactable nurse (patient). A 59-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK9231), via an unspecified route of administration in right arm on 30Dec2020 14:15 at first single dose (0.3 cc, but really uncertain of dose) for covid-19 immunization. Medical history included COVID virus from Nov2020 to 2020 (The patient was not hospitalized. It was a mild case and lasted about 10 days. she had any positive antibodies at that time. Was off work for about 12 days and was very lucky to have had a very light case with fever, cough, cold, and super fatigue). The patient's concomitant medications were not reported. The patient did not receive any other vaccines at the same time or 4 weeks prior. No problems with vaccinations in past or events. Caller reported she had the first injection of the Pfizer BioNTech COVID-19 vaccine on the 30Dec2020 and having some side effect symptoms and her supervisor recommended for her to report these things, they are not life threatening, obviously, but things were

still lingering. Side effect of severe fatigue started on the 31Dec2020 and lasted for 72 hours. It was so severe, now it is mild. The patient reported soreness around the injection site. Had a fever on the night of the 31Dec2020 of 101.3 and had that for 6 hours then it dissipated and was gone. Had never had a fever after injections before. Had severe arm pain that usually goes along with an injection. It started also that night of 31Dec2020. She had rolled over in the middle of the night and it hurt. That lasted for about 48 hours, but it has improved. Had some muscle aches since 31Dec2020 but that had improved and had joint pains since 31Dec2020. What was worrisome was the swollen lymph nodes under her right arm, the armpit area had swollen and painful lymph nodes, since 31Dec2020. The patient was still having that and that is why she was so concerned because shouldn't that have gone away after a week. Had knee and hip joint pain, but that had improved. Again, mentioned she had never had that before with an injection. The patient received vaccine at her workplace. Some of her coworkers got it the same day and no one else has this. Mentioned she did have COVID virus back in Nov2020 and wonders if this correlates with her getting the vaccine. Was not hospitalized or notified she had any positive antibodies at that time. Was off work for about 12 days and was very lucky to have had a very light case with fever, cough, cold, and super fatigue. This is the same way she felt back when she had the virus back in November. The patient was concerned about having these side effects would it be okay for her to get the next injection in 3 weeks. AEs did not require a visit to emergency room and physician office. No further details provided. Outcome of the events Fever was recovered, of event swollen and painful lymph nodes was not recovered, of events knees and hip joint pain, fatigue, muscle pain, severe arm pain was recovering, of event soreness around the injection site was unknown. The reporter considered the events severe fatigue, fever, swollen lymph nodes and pain under right arm, knees and hip joint pain as serious (medically significant). The reporter considered the events severe fatigue, fever, severe arm pain, muscle ache, swollen lymph nodes and pain under right arm, knees and hip joint pain as related to BNT162B2.; Sender's Comments: Based on the compatible temporal association, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the reported events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

chest pressure; tightness /pressure in throat; Face red; BP 186/90; within 2 min. of injection had near syncope that would come in waves every 2-3 minutes; Headache; rapid HR; Chills; mild cough; Dizziness; fatigue; This is a spontaneous report from a non-contactable health care professional nurse, the patient. A 53-years-old non-pregnant female patient (nurse) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: EJ1685), in the right arm on 28DEC2020 08:15 as a single dose, for COVID-19 vaccination. Facility where the most recent COVID-19 vaccine was administered was a Hospital. Medical history included asthma and gastroesophageal reflux disease from an unknown date and unknown if ongoing. Known allergies include Tape, Walnuts, and Cat hair. Concomitant medication received within 2 weeks of vaccination included acyclovir [aciclovir] (ACYCLOVIR [ACICLOVIR]), ferrous gluconate, herbal nos, vitamins nos (FLORADIX), lansoprazole (PREVACID), cholecalciferol (VITAMIN D [COLECALCIFEROL]). No other vaccines were given within 4 weeks. Prior to vaccination, the patient was not diagnosed with COVID-19. On 28DEC2020 08:15 within

2 min. of injection had near syncope that would come in waves every 2-3 minutes, face red, chest pressure, tightness /pressure in throat, headache, BP 186/90, rapid HR. The patient Spent 1 hour in ER. Later in day 28Dec2020, continued to have dizziness, chest pressure, chills, headache, fatigue. This continued for 4 days and had mild cough. The adverse events resulted in an emergency room (ER) visit. and Physician Office Visit. Treatment included Xyzal which relieved majority of symptoms. Laboratory test and procedures on 28Dec2020 include Electrocardiogram (EKG) with normal results, Blood Pressure Measurement 186/90 and Heart Rate Rapid. Treatment was given for chest tightness, throat tightness and red face and No treatment was given for chills, cough, dizziness, fatigue, headache, heart rate increase, blood pressure high and near syncope. The clinical outcome of near syncope that would come in waves every 2-3 minutes, face red, chest pressure, tightness /pressure in throat, headache, BP 186/90, rapid HR, dizziness, chest pressure, chills, headache, fatigue, mild cough was recovered. No follow-up attempts are possible. No further information is expected.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported face red, chest pressure, tightness /pressure in throat, blood pressure increased (BP 186/90), near syncope and the administration of BNT162B2, based on the reasonable temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

DVT; have pain in same site where DVT is; This is a spontaneous report from a contactable consumer. A 28-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EK9291), via an unspecified route of administration in left deltoid on 24Dec2020 10:00 at first single dose for COVID-19 immunization. Medical history was none. There were no concomitant medications. Caller was calling to report a possible adverse reaction to the Pfizer Covid-19 vaccine. The patient was currently at hospital, she was admitted for deep vein thrombosis (DVT) of left iliac vein, the patient had no past history as to why this would happen, that she is only 28 years old. Received the vaccine on 24Dec2020, the following day she did have pain in same site where DVT was. Took ibuprofen for the pain. The patient was admitted yesterday 04Jan2020 for the DVT, they were currently treating her with Lovenox injections and prescribing dose for discharge is Eliquis. CT scans and three shots of Lovenox for it, doing a doppler of bilateral legs and echocardiogram (echo) of her heart to make sure there is nothing else. The AEs require a visit to emergency room. The patient was asking if she can still get the 2nd dose based off the adverse event she experienced. Outcome of DVT was not recovered, of pain was unknown.

Chills; Headache; Coughing; Tiredness; Nasal congested; Feels like her sinus were blocked; Body ache; feeling sick; Sneezing; This is a spontaneous report from a contactable nurse (patient, front line health care worker). A 51-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot#: EH9899) via an unspecified route of administration in the left arm on 28Dec2020 (at 10:30 or 11:00 AM) at single dose for COVID-19 immunization. Medical history included hypertension, diabetes, and stroke, all reported as family history (her parent). There were no concomitant medications. There was no history of all previous immunization with the Pfizer vaccine considered as suspect. There was no additional vaccines administered on same date of the Pfizer

suspect. The patient did not have prior vaccinations within 4 weeks. The patient had body ache (reported as medically significant) on 01Jan2021 with outcome of recovering, had been sick for a week/ very ill on 28Dec2020 with outcome of unknown, sneezing on 28Dec2020 with outcome of not recovered, chills on 01Jan2021 with outcome of unknown, headache on 01Jan2021 with outcome of recovering, coughing on 01Jan2021 with outcome of not recovered, tiredness on 01Jan2021 with outcome of unknown, nasal congested on 01Jan2021 with outcome of not recovered, feels like her sinus were blocked on 01Jan2021 with outcome of unknown. Treatment was received for the events. Reported she had a lot of sickness, by evening that day (28Dec2020) she got sneezing and feeling sick. Then the next day was the same, then the third day. She became very ill with chills, body ache, headache, coughing, and tiredness on 01Jan2021 (also reported as 3 days later vaccination). And she had no fever, but stated she had been sick for a week. Added the headache and body ache were a little better but still she felt so congested. Clarified she had nasal congested that feels like her sinus were blocked. She treated herself with acetaminophen, once daily 500 mg by mouth starting 01Jan2021. Added the body ache pain was still on the back of her chest but her legs and arms were better. She used steam inhalation for the congestion. She was not scheduled for the next dose yet, she was just waiting. The patient was wondering if she should do a test for COVID 19. Mentioned she had been healthy all through this year and digging in the COVID 19 all the time but then after the vaccine she got so sick. This was the first day she could get up and did anything. Advised caller to consult her HCP.; Sender's Comments: Based on the information currently provided, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the body ache. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

TB test; This is a spontaneous report from a contactable consumer. This female consumer (patient) reported that received received bnt162b2 (BNT162B2, PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 30Dec2020 at single dose for covid-19 immunisation. Medical history and concomitant medications were unknown. Certified Nursing Assistant got the first dose of the covid vaccine on January 2nd and also she needs to get her TB test. She was told to wait 2weeks between the application and the TB test but the 2 weeks period ends on January 15th and she needs to have the test before that day, so she was wondering if she could get the test done a couple of days early. The outcome of the event was unknown. Information about lot/batch number has been requested.

"miscarriage at 5 weeks of gestation; pregnant patient received the vaccine; pregnant patient received the vaccine; This is a spontaneous report from a contactable physician (patient herself) from a Pfizer Sponsored program. This physician only reported information for the mother (herself). This is the maternal case. A pregnant female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Lot number: EK5730), via an unspecified route of administration, on 17Dec2020 as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The pregnant patient received the vaccine on 17Dec2020

and experienced miscarriage at 5 weeks of gestation on 31Dec2020. The clinical outcome of pregnant patient received the vaccine and miscarriage at 5 weeks of gestation was unknown.; Sender's Comments: The association between the event ""miscarriage"" with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

2 week migraine; headache; flushed/Got flushed; persistent extreme dizziness; This is a spontaneous report from a contactable nurse (patient). A 37-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Batch/lot number: EK5730, Intramuscular at single dose on 17Dec2020 19:00 on right arm for precaution as front line health care worker. Medical history included Hemiplegic migraine. Her mother also had migraines. Concomitant medication included ranitidine hydrochloride (ZANTAC) and H1 and H2 blocker. The patient called to report AE of flushed, persistent extreme dizziness, and a headache that has evolved into a 2 week migraine. She has a history of hemiplegic migraines and was taking and h1 and h2 blocker when she received the vaccine. She was calling on guidance whether or not to receive the second vaccine. She was scheduled for second dose on Thursday, but wanted to speak with someone before she got it to see if it was OK. About 15 minutes after receiving the first dose, she got flushed and extremely dizzy. She had a mild headache when she woke up on 18Dec2020 06:00, which then developed into a severe migraine on 22Dec2020 08:00 that she has had for 2 weeks and dizziness continues. She received it at work and there was no prescriber. She called and left a message with Pfizer but has not heard back from anyone yet about this. She would say the flushed and dizziness would be medically serious because she had allergies and had medication on board. She takes daily allergy medication and Zantac and not sure she would not have had a worse reaction if she hadn't had that on board. She took it every night. She had an H1 and H2 blocker on board. Flushed has improved but the dizziness has stayed constant. She had been treated twice for headache and now they have put her on a Prednisone taper. She got it on her right arm so she could work her arm out. On 22Dec2020, she saw a Neurologist for the Migraine. They gave her Toradol 30 mg and Zofran 4mg injection in office. They were given IM. Then, she had another office visit for urgent care on 02Jan2021, and that was for the exacerbation of the migraine. They prescribed 1 liter of fluids and then another Toradol injection, Zofran injection and Decadron injection. The dose of the Toradol was 30 mg, Decadron was 6 mg, and Zofran was 4mg. These were given IV in urgent care. The patient had no prior vaccinations within 4 weeks. The outcome of flushed/Got flushed was resolving. The outcome of other events was not resolved.; Sender's Comments: Based on the compatible temporal association, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the events flushing, dizziness, headache and migraine. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

syncope; diaphoresis; varying HR; blurred vision; This is a spontaneous report from a contactable physician (patient). A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration on 05Jan2021 as single dose for COVID - 19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced syncope, diaphoresis, varying HR (heart rate) and blurred vision in Jan2021. The patient underwent lab tests and procedures which included heart rate: varying in Jan2021. Details were as follows: Patient received the vaccine in the morning. He reported diaphoresis, syncope, varying HR, and blurred vision within 10 minutes of receiving the vaccine. He was taken to the emergency room and therapeutic measures were taken as a result of the events; he was given fluids. The patient generally tolerated vaccines and has recovered from the episode. The events, syncope, diaphoresis, varying HR (heart rate) and blurred vision recovered in Jan2021. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up .; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event due to temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators as appropriate.

one of those biopsies was bleeding pretty heavy/looked at the incision/The one on his nose is still dripping blood and its coming up on 24 hours now; This is a spontaneous report from a contactable consumer (patient). A 72-year-old male patient received his first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Batch/lot number: E70124), Intramuscular in arm on 30Dec2020 at single dose for COVID-19 vaccination. Medical history included ongoing blood pressure high and he had been treated for that for a number of years, diabetes from 2009 and ongoing, COPD (chronic obstructive pulmonary disease) issues from 2020 and ongoing and his issues began within the last year, ongoing kidney failure and this started occurring within the last 2 or 3 years, had a urostomy done, had bladder cancer and he had had phlebotomy performed around 3-4 months ago in 2020 and he knew his blood was thick at the time. There were no concomitant medications. The patient received the first vaccine on Wednesday, 30Dec2020. He had noticed something. He had a couple of things happen that basically involved a couple of skin biopsies. He had some lab work drawn for a CT scan, and he didn't clot right away on 05Jan2021. Last night 04Jan2021, he went to the emergency room because one of those biopsies was bleeding pretty heavy. He wanted to know if there is any known connection with the COVID vaccine and anti-clogging. He was going to follow up with the surgeon that did the biopsies. He stated its weird. He had had phlebotomy performed around 3-4 months ago in 2020 and he knew his blood was thick at the time. There had been 2 or 3 incidents where he was not clogging up. He clarified they were skin cancer biopsies, which was something diagnosed prior to receiving the vaccine. It was a follow-up because they didn't get it all the first time and they had to go back in. His skin biopsies were done yesterday, 04Jan2021. He verified when he went to the emergency room last night 04Jan2021 he was not admitted into the hospital. It was outpatient and they looked at the incision and put a little clotting tape (or whatever it is) on him and wrapped it up. He hadn't been bleeding. He knew the doctor nicked a vein. There were 2 biopsies done- one was on his nose. The one on his nose was still dripping blood and its

coming up on 24 hours now. The blood drawn for the CT scan was drawn early this morning 05Jan2021 around 7:30 AM. The outcome of the event was not resolved.

Followed by neurological symptoms staring day 4; parasthesias of both upper extremity; progression to muscle weakness of all four extremities/Currently with significant muscle weakness, Left hand weakness leading to dropping of objects and left foot drop; progression to muscle weakness of all four extremities/Currently with significant muscle weakness, Left hand weakness leading to dropping of objects and left foot drop; Flu like symptoms first 3 days; This is a spontaneous report from a contactable physician (patient). A 39-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: ek5730) at left arm, via an unspecified route of administration on 16Dec2020 at single dose for covid-19 immunisation. Medical history included hypertension, diabetes, migraines, Eosinophilic granulomatosis with polyangiitis (EGPA) remission. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient did not have any allergies to medications, food, or other products. The patient's concomitant medications were not reported. On 21Dec2020, the patient experienced flu like symptoms first 3 days. Followed by neurological symptoms staring day 4, parasthesias of both upper extremity with progression to muscle weakness of all four extremities. Leading to 2 ER visits and hospital admission. Evaluation by internal medicine, neurology and rheumatology. Currently with significant muscle weakness, Left hand weakness leading to dropping of objects and left foot drop. The events resulted in Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, Hospitalization, Disability or permanent damage. The treatment for events included High dose steroid. Covid test included Nasal Swab: negative on 19Dec2020. The outcome of events was not recovered.; Sender's Comments: Based on temporal association, the causal relationship between bnt162b2 and the events influenza like illness, neurological symptom, paraesthesia, muscular weakness and peroneal nerve palsy cannot be excluded. The information available in this report is limited. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

tired; no energy; low back pain; her fingers are hurting; passed out on toilet; Nauseated; hit head on wall, head just hurts; hit head on wall, head just hurts; Chills; she was very cold; could not sleep good; site of vaccine was sore; Muscle pain; Joint pain; This is a spontaneous report from a contactable consumer. A 58-year-old female patient started to receive first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, Batch/lot number: EK9231) by injection once to left arm, via an unspecified route of administration on 04Jan2021 12:30 at single dose for covid-19 immunisation. Medical history included thyroid disorder. Concomitant medication included levothyroxine sodium (SYNTHROID) for thyroid disorder; patient started it after she had her son, and her son is 18 years old. The patient had her vaccine yesterday (04Jan2021) at 12:30, and at nighttime, around 22:00, she started having chills, she was very cold, so she went to bed, she could not sleep good, she kept waking up, and the site of vaccine was sore, she had muscle pain, joint pain, she didn't have fever, but she got up late

today (05Jan2021), around 11:00, and had breakfast and felt nauseated, so she stopped eating, and she went to the bathroom and passed out on the toilet, when she woke up, she had her nightgown inside the toilet, it was all wet, she felt better, so she stood up and then she woke up again, and was inside the tub, her legs were inside the basin, she was lying down with her back inside the tub, she thinks she hit her head on the wall, and it just hurts, it didn't bleed or nothing. The patient stated she had the paper she was given. Again stated she can not even function. Patient still feels Chills a little bit, not as bad as last night. She is awake now, but she feels very very tired, like she has no energy, she is laying down on couch right now. She kept waking up and noticed this morning, she had low back pain, in the muscles, even her fingers are hurting. Regarding hitting her head on the wall, states she has a terrible headache, not a little pain, she thinks it is because she hurt her head. The patient is supposed to get second vaccination on 25Jan2021. The outcome of events Chills, Joint pain and nauseated was recovering; of events site of vaccine was sore and muscle pain was not recovered; of other events was unknown.

Fainting; This is a spontaneous report from a non-contactable consumer. This consumer reported similar events for 2 patients. This is 2nd of 2 reports. A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunisation. The patient medical history and concomitant medications were not reported. The patient experienced fainting on an unspecified date with outcome of unknown. The action taken in response to the event for bnt162b2 was not applicable. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021006219 same reporter/drug/event, different patient

Auditory & visual hallucinations; Auditory & visual hallucinations; tachycardia; extreme panic; confusion; felt like skin was on fire/pulsating; felt like skin was on fire/pulsating; severe pain especially at knees/hips/base of head and neck; severe pain especially at knees/hips/base of head and neck; severe pain especially at knees/hips/base of head and neck; uncontrollable vomiting; bad chills and fever; bad chills and fever; insomnia; felt as if she had been given drugs; This is Spontaneous report from a contactable Other Healthcare Professional reported for herself. This 40-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number: EK9231), via an unspecified route of administration on 04Jan2021 14:30 at single dose on right arm for COVID-19 immunization. Medical history included COVID prior vaccination and latex allergy. There were no concomitant medications. No other vaccine in four weeks. The patient previously had allergic to diazepam (VALIUM), clonazepam (KLONOPIN), ondansetron (ZOFRAN) and lorazepam (ATIVAN). The patient experienced auditory & visual hallucinations, tachycardia, extreme panic, confusion, felt like skin was on fire/pulsating, severe pain especially at knees/hips/base of head and neck, uncontrollable vomiting, bad chills and fever, insomnia. She felt as if she had been given drugs. All of the events happened on 05Jan2021 01:30 and resulted in Doctor or other healthcare Recovering professional office/clinic visit. No treatment received for the events. No COVID tested post vaccination. The outcome of the events was recovering.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Auditory hallucinations and Visual hallucinations cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of

this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

rash; All over rash with some itching; This is a spontaneous report from a contactable Nurse reported for self. This 34-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 05Jan 2021 12:50 on right arm at single dose (Lot # EK4176, Expiration Date: Mar2021) for covid-19 immunisation. Medical history was not provided. Concomitant medications were none. Past drug history included the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 15Dec2020 16:00 at age of 34 year old at single dose (Lot # EH9899) for covid-19 immunisation. About 30 minutes after being administered (05Jan2021 13:20) that second dose she developed all over rash with some itching. She took Benadryl and Pepcid in response. Today the all over rash with some itching came back at the same persistent level. She wants to know what kind of timeframe she can expect with the continued allergic reaction of all over rash with some itching. She was made to check into the emergency room for observation, but did not have any testing/lab work/investigations done and was not admitted to the hospital. Outcome of the events was not recovered. Reporter seriousness for All over rash with some itching was Medically significant. Drug result was related.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Rash and Itching cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Chills with no fever; Cramping in legs; super tired with no energy; Body aches; tiredness/Feeling super tired with no energy; This is a spontaneous report from a contactable consumer. This consumer (patient) reported for self that the 45-year-old female patient who receive first dose of bnt162b2 (BNT162B2, PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899), via an unspecified route of administration on Saturday (02Jan2021) at single dose (once by injection in the right arm) for covid-19 immunisation. Medical history included ongoing Hypothyroidism from 2008. Concomitant medications included levothyroxine at 75 ug ongoing from 2008 for Hypothyroidism. Medical Professional and told by her work that she could get it because contact with COVID patients. The consumer calls for information about if the side effects she is experiencing after the administration of the COVID-19 vaccine will last for more days. The consumer reported tiredness and other side effects to DSU. A Consumer calls for information about if it would be appropriate the second dose of the COVID-19 vaccine is not administered considering that she had adverse reactions. Consumer calls for information about if the second dose of the COVID-19 vaccine would cause her more side effects than the first one. Received the vaccine on Saturday, 02Jan2021. The day she got it she did not feel anything at all. She was completely fine. She did not even have pain at the injection site. The next day, on Sunday she started

feeling super tired with no energy, had body aches, and cramping in legs from 03Jan2021. She has had these for the past 3 days now. She also had chills with no fever from 03Jan2021 to 05Jan2021. She took Tylenol for the first 2 days, but it did not help her at all. She is feeling a little better today, but not much. Her question is, how long will these side effects last? Tylenol: She says it did help a little bit. She think she would just sleep because she was uncomfortable. The Tylenol just did not make her symptoms go away completely. LOT/Batch: AA46487, EXP: Apr2022 UPC: The consumer says the number under the barcode is: 5187536. Feeling super tired and body aches: Has improved about 20%. She says these are all medically significant as she is not able to do what she was able to do before getting the vaccine. She is super tired with no energy and she is confined to her bed most of the time. The consumer confirms this is her first dose of the COVID Vaccine. She thinks she got the standard dose. Vaccine card does not have the expiration date or NDC written on it. Unknown causality. She said that she could be positive for COVID. She is unsure. The outcome of the event Chills with no fever was recovered. The outcome of the event Cramping in legs was not recovered. The outcome of the other events was recovering.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of reported events cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

I was in a low disease state of SLE, 2 days after injection i had a severe flare of lupus requiring steroids; This is a spontaneous report from a contactable other Hcp (patient). This 36-years-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number: EH9899), intramuscularly on 16Dec2020 13:30 at single dose in Arm left for COVID-19 immunisation. Facility where the most recent COVID-19 vaccine was administered was Hospital. Medical history included systemic lupus erythematosus (SLE) and in remission. No Pregnant at the time of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient did not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19.Concomitant medication received within 2 weeks of vaccination included hydroxychloroquine, topiramate (TROKENDI), prucalopride succinate (MOTEGRITY). The patient was in a low disease state of SLE, 2 days after injection and had a severe flare of lupus requiring steroids on 18Dec2020. The adverse event result in Doctor or other healthcare professional office/clinic visit. Steroids received as treatment. The outcome was recovering. The events were assessed as non-serious; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of event Systemic lupus erythematosus syndrome aggravated cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this

review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

experiencing an allergic reaction; Hives all over her face and neck/hives on face and neck; This is a spontaneous report from a contactable Physician (patient). A 30-years-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number: EL0140, Expiry Date: 31Mar2021) via an unspecified route of administration in left upper arm on 31Dec2020 13:25 at single dose for COVID-19 immunisation. Medical history included crohn's disease from Jul2005 and ongoing, ongoing psoriasis, gastrooesophageal reflux disease (GERD), hand tremor. Concomitant medication included ongoing infliximab (REMICADE) for Crohn's, ongoing esomeprazole sodium (NEXIUM) for GERD, ongoing propranolol for hand tremor, copatsol topical steroid for Psoriasis, ongoing Multivitamin, ongoing vitamin B complex (B COMPLEX), ongoing biotin, ongoing iron, ongoing Calcium/Vitamin D, ongoing curcuma longa (TURMERIC). The patient had an allergic reaction after getting the COVID vaccine. She had an allergic reaction after getting the vaccine. She had hives all over her face and neck. She already had a Medrol Dose Pack at home and some Benadryl. She contacted her doctor who prescribed an Epi Pen for her, but she did not have to use the Epi Pen. She stated she used the Benadryl for three days. She started to get hives all over her face and neck the same date she got the vaccine. It started 2 hours after she got the vaccine (31Dec2020 15:25). She confirmed this was the first dose of the COVID Vaccine. She asked that if it is safe to take the second dose after experiencing an allergic reaction to the first dose. Symptoms include hives on face and neck. Patient had no trouble breathing. Took steroids and Benadryl for 3 days or until symptoms have been managed. No any of the events require a visit to emergency room. Reporter seriousness for hives all over her face and neck was reported as medically significant. Events outcome was recovered on 03Jan2021.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Allergic reaction and Hives cannot be totally excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

blasting headaches; chills all night; dry heaving all night; Nausea; no fever but her skin felt hot; sore left arm; This is a spontaneous report from a contactable nurse for herself. This 64-year-old female patient started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), intramuscular on 18Dec2020 at single dose on left upper arm (lot: EKS730), via an unspecified route of administration on 05Jan2021 14:30 at single dose (lot: EL1284 or EKI284) for COVID-19 immunisation. Medical history and concomitant medications were none. The patient did not have anything with the first shot except a sore left arm on 18Dec2020. She stated that if she lays on left side it is sore. The patient had the sore left arm both times that she got the vaccine. She got second dose of vaccine on 05Jan2021 at 2:30pm and had a blasting headache and just had chills that went away about hour ago on 05Jan2021. She did not have a fever but her skin felt hot on 05Jan2021. She stated that she had dry heaves on 05Jan2021. The patient started that she had a blasting headache within a few hours of the vaccine and it gradually got worst by

the time she went to bed. Stated that the chills and dry heaves started then and throughout the night. The chills stopped an hour before she got up. Stated that she went to check her temperature and did not have a fever despite having chills and her skin feeling hot. Stated that nausea started about 10 at night on 05Jan2021. Seriousness for blasting headache, chills and dry heaves was disabling, for nausea was medically significant, for other events was non-serious. The patient took Ibuprofen for the headache. Stated that she was going to try to drink something. The outcome of sore left arm was not recovered; of chills was recovered on 06Jan2021. The outcome of other events was recovering. The causality for blasting headache, chills, dry heaves, nausea and skin felt hot was related (Source of assessment: Primary Source Reporter, Method of assessment: Agency Information on the batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the headache, chills, dry heaves and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

severe muscle pain, diagnosis of polymyalgia rheumatica; This is a spontaneous report from a contactable other HCP (patient). A 53-year-old female patient received the first dose of BNT162b2 (Lot/batch number and Expiration date were not provided), at the age of 53-year-old, via an unspecified route of administration at right arm on 18Dec2020 08:30 at single dose for covid-19 immunization. Medical history included hypertension (htn), allergies: penicillin. Concomitant medication included cefatrizine propyleneglycolate (CEFTIN), lisinopril, levothyroxine sodium (SYNTHROID). The patient experienced severe muscle pain, diagnosis of polymyalgia rheumatica on an unspecified date. The patient was not pregnant at the time of vaccination. The patient underwent lab tests and procedures which included COVID test rapid (Nasal Swab): negative on 06Jan2021. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: A possible contributory effect of suspect drug BNT162B2 on reported event cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

shaking; weak; cough; shortness of breath; very ill/ sick; horrible chills; I had a 103 degree fever for 4 days, horrible chills that were just debilitating; ached everywhere/ severe aches; site soreness; This is a spontaneous report from a contactable nurse (patient). A 62-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899) via an unspecified route of administration at left upper arm on 18Dec2020 at single dose for COVID-19 immunization. Medical history included auto immune problems, diabetes, thyroid condition, all ongoing since age 28;

pemphigusvulgarism since Sep2020 and ongoing. No concomitant medications. Patient is a frontline worker. She received the vaccine on 18Dec2020 at (Name) where she works. 9 days later she got very ill. she didn't know if it's unrelated. She wanted to know if there is anything she need to be watching out for in order to get her second vaccine on Friday. She was so sick and she did have some autoimmune problems. She was really healthy. On 26Dec2020, she had a 103 degree fever for 4 days, horrible chills that were just debilitating. She was just shaking. She ached everywhere, she had severe aches since 26Dec2020. She got tested for Covid and it was negative on 28Dec2020, she had no cough and no vomit. She stayed in bed and drank lots of fluids and toughed it out. By New Year's Day (reported as 30Dec2020) her fever broke but she was so weak and didn't work. She was back at work now. Also, she experienced site soreness from the injection since 19Dec2020. She did have a cough or any shortness of breath. She felt awful. She had recovered. She was just a little nervous because everything she read said the reaction was more severe with second injection. She planned on getting the second shot. She would have a repeat Covid test on 07Jan2020. Reporter seriousness for fever 103: Medically significant. Reporter seriousness for severe aches: Medically significant. Reporter considered the causality of the event site soreness was related with bnt162b2, of the events fever 103 and severe aches was unknown. The outcome of the event fever was recovered on 30Dec2020, of event ache was recovered on 31Dec2020, of event chills was recovering, of event vaccination site pain was recovered on an unspecified date in Dec2020, of events cough and shortness of breath was recovered on an unspecified date.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the fever, pain and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

(doctor) was not sure whether or not he might get a staph infection, a viral infection; (doctor) was not sure whether or not he might get a staph infection, a viral infection; thought he had a mosquito bite; area on the opposite side of his body, on the left hand side, he noticed that there were several small pustules; the area was raised, it was red, it was warm; Pain; extremely uncomfortable; It was very, very itchy and the area felt like it got itself swollen; It was very, very itchy and the area felt like it got itself swollen; irritation; Initially an area under his left arm which was very swollen it appeared to be filled with fluid of some type/thought it was edema/now had it under his right arm, it's probably impacting lymph system; This is a spontaneous report from a contactable consumer (patient wife). A male patient of an unspecified age started to receive bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EH9899, expiration date not reported), via an unspecified route of administration on 03Jan2020 16:00, at a single dose for Covid-19 immunization. Medical history included heart bypass 15 years ago and some orthopedic problems. The patient's concomitant medications were not reported. The patient previously took codeine and epinephrine experienced sensitivity. On 03Jan2020, the patient

had an injection the Pfizer vaccine in county (not clarified further) (place name withheld) which is the (place name withheld) area on Sunday at approximately 4:00 PM EST. He has no significant medical problems other than the prior history of, he had heart bypass 15 years ago and some orthopedic problems, but nothing else other than that. She had never had any adverse reactions to any medications although he has, he shouldn't say, he does have a sensitivity to Codeine which he reported and Epinephrine which he had a sensitivity to also. He got the vaccine after waiting three and half hours in line and they went off, last night that would be Sunday night, several hours later he noticed an odd sensation and did not really take a look at it, he thought he had a mosquito bite perhaps as they live in (place name withheld) and they live in the land that has lots of mosquito, so he didn't pay too much attention to it. Approximately four hours after the injection, he was going to go to bed and removed his shirt and found that the area on the opposite side of his body, on the left hand side he noticed that there were several small pustules, the area was raised it was red it was warm, it was on the opposite side under his arm on his chest he was extremely uncomfortable. It was very, very itchy and the area felt like it got itself swollen and he shared with his wife, the wife suggested that he contact the physician of course he didn't contact, his primary physician said he can see a dermatologist and sent images and yesterday he went to see a dermatologist, so prophylactically he took the 25 mg of diphenhydramine hydrochloride (BENADRYL) and also 2 acetaminophen (EXTRA STRENGTH TYLENOL) and he treated the pain and itching with ice. He slept with an ice bag and woke up just in morning and in New Year they were able to see a dermatologist, he thought it was dermatological. He was concerned but not overly concerned with the area pretty swollen. He saw a dermatologist yesterday, and gave him a topical treatment, the dermatologist gave him three different, naproxene (NAPROSYN), the other one is Triamcinolone Acetonide cream now the irritation he got the MUPIROCIN ointment now as the dermatoligist told him to do, continue what he was doing as he was comfortable, The dermatologist took some specimens from the pustules and send them to lab and she (doctor) is not sure whether or not he might get a staph infection, a viral infection he was not sure. Initially there was an area under his left arm which is very swollen it appeared to be filled with fluid of some type, he was not sure what was it. He thought it was edema but when he popped it, it felt very much like fluid not like blood but it is some type of fluid filled area most likely his wife said the size are greater and less that it was yesterday and that seems to go down over the last night but not all the way it's decreased by what 20%, 30%, 40% he can't tell, alright 50% but now he has it under under right arm, it's probably impacting his lymph system and he put a call into his cardiologist. So he was asking now what does he do. The outcome of the events were unknown.

Her arm is a little sore; the tissue paper is red after wiping her anal area/ reddish looking poop/ there are pieces of blood or something is different; This is a spontaneous report from a contactable other Health Professional (patient). A 75-year-old female patient receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL0142), via an unspecified route of administration on 05Jan2021 at single dose for covid-19 immunization, also reported as for work. Medical history included ulcer (15 to 20 years before 06Jan2021). Concomitant medication included prasugrel from Apr2020 and ongoing as blood thinner, acetylsalicylic acid, ascorbic acid (ASPIRIN) from Apr2020 and ongoing as blood thinner. The patient went to the bathroom in the morning 06Jan2021, she had to poop. When she wiped, it was reddish looking. The patient stated her stool color was normal, but the tissue paper is red after wiping

her anal area. At first she thought hm oh well. Then she had been to the bathroom a couple of times 06Jan2021, and that the same thing happened. She had never experienced that before. It seems to her that there were pieces of blood or something was different. She wasn't hurting or anything. She was not weak or anything at this time. Her arm was a little sore, but she expected that. She was concerned about the color. She worked in the mammography department. She didn't have a prescribing doctor. She got it at work. She had noticed a difference of color in her poop. It had been the same all day. The outcome of the reddish poop was not recovered, of sore arm was unknown. The patient asked would the vaccine cause rectal blood upon wiping after defecation?; Sender's Comments: Reported blood in stool is considered intercurrent and unrelated to BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

The subject experienced acute pericarditis on 27Dec2020; Other vaccine same date vaccine date= 23Dec2020; This is a spontaneous report from a contactable consumer. A 50-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 23Dec2020 at single dose for covid-19 immunization. The facility type vaccine was hospital. None medical history. The patient's concomitant medications were not reported. Other vaccine same date vaccine date on 23Dec2020. The patient experienced acute pericarditis on 27dec2020 with outcome of recovered. The adverse event resulted in Doctor or other healthcare professional office/clinic visit. It's unknown if treatment was received for the adverse event. The event was reported as non-serious. Pfizer is a marketing authorization holder of [BNT162B2] in the country of incidence or the country where the product was purchased (if different). This may be a duplicate report if another marketing authorization holder of [BNT162B2] has submitted the same report to the regulatory authorities. Information on the lot/batch number has been requested.

Joint pain /felt like it was worsening joint pain; just severe pain to where she couldn't walk; This is a spontaneous report from a contactable Other HCP. A 70-year-old female patient received BNT162B2(Lot Number: ET1685), via an unspecified route of administration at Deltoid Left on 23Dec2020 08:00 at the 70 years old at single dose for COVID-19 immunization. The medical history included rheumatoid arthritis. The concomitant medications were none. The patient received the shot on 23Dec2020 and experienced Joint pain afterward on 02Jan2021. The patient did have rheumatoid arthritis so there was that. The patient felt like it was worsening joint pain on 02Jan2021. She has had no fever, just severe pain to where she couldn't walk on 02Jan2021. The joint pain has gotten worse and it has gotten to where she is going to advise her not to take the second shot. The Reporter assessed the seriousness for the events was Disabling. The events did not require a visit to Emergency Room but required a Physician Office visit on 06Jan2021. The patient received a steroid injection on 06Jan2021. There was none History of all previous immunization with the Pfizer vaccine considered as suspect. There was none Additional Vaccines Administered on Same Date of the Pfizer Suspect. There was no Prior Vaccinations within 4 weeks. The patient underwent lab tests and procedures, which included x-rays on 06Jan2021: unknown results (they were awaiting the X-rays). The outcome of the events was not recovered. The information

on the batch number has been requested.; Sender's Comments: Based on the available information the events worsening joint pain and walking difficulty are attributed to underlying Rheumatoid arthritis; however, based on a compatible temporal association, contributory role of BNT162B2 vaccine to events occurrence cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

it was debilitating for her at work; It even hurts to move the right eye in one direction and hurts to speak, the pain was so bad.; pain in right leg and bottom sole of right foot; hurts to speak; numbness right upper side of lip; pins and needle feeling right upper quadrant of face; pain and dull aching right upper side of face; right hand numbness, wasn't able to feel anything; generalized headache; generalized muscle weakness and pain; generalized muscle weakness and pain; This is a spontaneous report from a contactable other hcp (patient). A 31-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 03Jan2021 at single dose in deltoid right for covid-19 immunization. There were no medical history or concomitant medications. The patient received the vaccine on 03Jan2021 and within 15 minutes had a generalized headache. Later that night she had generalized muscle weakness and pain, but really didn't think too much about it. The next day at work (04Jan2021), she had numbness on the right upper side of her lip and a pins and needle feeling in the right upper quadrant of the face. Had a lot of pain in the area as well on the right upper side of the face as well as a dull aching pain that lasted for hours. Later that day when using the computer and she was trying to reach for her mouse she noticed her right hand wasn't able to feel anything and that lasted about 20-25 minutes. Kept slapping the mouse with her hand, but could not feel anything, her hand went numb. Yesterday (05Jan2021), she had the same pins and needle feeling in the same area of the face and that dull achy feeling and it occurred for hours and it was very kind of debilitating for her at work. Later that night she had pain in her right leg and felt the same way, that very severe achiness, which was the pins and needles feeling up and down the leg and underneath the right foot. All these symptoms tend to be on her right side and it definitely lasted for hours. It started about 1 and didn't end until 6-7pm. It even hurts to move the right eye in one direction and hurts to speak, the pain was so bad. This morning (06Jan2021) she had to call out of work because at 3am the generalized headache, pain was unbearable. She was still experiencing the pain in right leg and bottom sole of right foot. She did not receive any vaccines the same day or 4 weeks prior. No problems with vaccines in past. She had made an appointment with a neurologist and will have a MRI done on Friday, 08Jan2021. No further details provided. All events required a visit to physician office. All events were reported as serious per medically significant. The outcome of all events was not resolved. The reporter considered all events were related to the vaccine. Information about Lot/Batch number has been requested.; Sender's Comments: Based on a compatible temporal relationship, causality between reported events and BNT162B2 vaccine cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as

well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

soreness/The pain radiates down to her left elbow and also goes up the neck; The pain radiates down to her left elbow and also goes up the neck; The pain radiates down to her left elbow and also goes up the neck; This is a spontaneous report from contactable other HCP (patient' husband). A 43-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EK9231), via an unspecified route of administration on 31Dec2020 at single dose for COVID-19 immunization. Medical history reported as none. No concomitant medications. The patient had a whole lot of soreness on 01Jan2021 and it was not getting any better. His wife had called her health care provider. She had an appointment in several days. The pain radiates down to her left elbow and also goes up the neck in Jan2021. The reporter seriousness for soreness: Medically significant. The outcome of event pain was not recovered. The outcome of rest events was unknown.; Sender's Comments: Based on a compatible temporal relationship, causality between event pain and BNT162B2 vaccine cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

She is having an allergic reaction; Itching was reported as worsened/Swelling was reported as worsened/loss of appetite was reported as worsened; From the time she got the vaccine to now, she has lost 20 lbs; shake/shaking; swelling in the lips, throat, and eye lids; swelling in the lips, throat, and eye lids; swelling in the lips, throat, and eye lids; She has been sick since Wednesday; itching all over from head to toe; loss of appetite; This is a spontaneous report from a contactable consumer (patient). A 59-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration at left arm on 30Dec2020 at single dose for COVID-19 immunization. Medical history included hypertension and allergic to ace inhibitors. There were no concomitant medications. Patient was calling about the Covid Vaccine. She was having an allergic reaction. She did not know what to do to stop it. She went to the ER yesterday (04Jan2021). She had been sick since Wednesday (30Dec2020), she was itching all over from head to toe since 30Dec2020, she got a prescription for Prednisone, she took 2 doses yesterday, 1 dose today, and would take another this evening. She took Benadryl, an hour ago and had an episode, and so she had to jump in the shower and let the cold water run to stop itching, the itching did not stop but it has minimized. She put Benadryl gel and she was still itching, she had taken enough Benadryl. Patient asked what is the best way and if she needed an IV of something, she went to ER on Sunday, she was not seen by doctor, it was a nurse practitioner, she didn't do anything but just listen to her and she only looked at ankles to check for swelling. Patient stated that she had been drinking water and urinating, she had no appetite and lost 20 lbs. Patient confirmed that she got her first dose of the Covid vaccine on 30Dec2020 at 1 o clock, the itching started the same day at 5 o clock, the itching was from head to toe. She experienced swelling in the lips, throat, and eye lids, which started 02Jan2021. She began losing her appetite on 30Dec2020. From the time she got the vaccine to now (05Jan2021), she has lost 20 lbs. An hour ago (05Jan2020) she had an episode, which made her shake, and she did not have the shakes before, this was the first date

she started shaking. Itching was reported as worsened/Swelling was reported as worsened/loss of appetite was reported as worsened. Her 2nd dose was scheduled in 21 Days. However, she may not get the second dose, patient stated that she could not get through this no more. She had no positive test for Covid prior to vaccine. She had no antibody test prior to the vaccine. She had not any issues with vaccines in the past. Patient stated that if she was still feeling this way, she would go to a different hospital. When she went to the ER, she was not hospitalized, they sent her back home the same day. Patient would like to know if there was anything that can remove the vaccine from the body. The outcome of the events itching all over from head to toe, loss of appetite, swelling in the lips, throat, and eye lids was not recovered, of the other events was unknown. Information about lot/batch number has been requested.

Acute demyelinating encephalomyelitis; Slurring his speech; Stroke; This is a spontaneous report from a contactable physician. A 35-year-old male patient received first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular in deltoid (unknown if right or left) on 17Dec2020 at 30 ug, single for 'Preventative'. Medical history included hypertension. There were no concomitant medications.(Physician) He is calling about the Pfizer Covid 19 vaccine. States what is going on with the patient may be associated as a side effect. The patient got the vaccine two to three weeks ago, he clarifies the patient received the vaccine on 17Dec2020 and the patient ended up acutely developing (states it is a presumptive diagnosis) Acute demyelinating encephalomyelitis, states it looks like a radiologic diagnosis. The patient is an employee at hospital. When querying seriousness states it is medically significant but could be disabling but he thinks the patient will recover. Reporter seriousness for acute demyelinating encephalomyelitis: Medically significant, Hospitalization. Patient was hospitalized on Sunday and he is still admitted at this time. Dates when patient was in hospital for acute demyelinating encephalomyelitis was from 03Jan2021 to ongoing. Caller thinks the patient was flown to (Place) yesterday. The patient's mother asked the caller if the caller thought the acute demyelinating encephalomyelitis was from the vaccine and the caller responded that he did not think it was from the vaccine. He confirms the patient is still admitted in the hospital and the patient's attending neurologist is doctor. The caller heard about the patient from doctor. When querying covid vaccine dose, the caller states the standard dose is 30 mcg. This was clarified and documented as provided. The patient has not received his second dose yet. He asks if the patient should receive the second dose. He asks a general question if a pregnant patient can be given the Pfizer covid vaccine. He heard the patient had a stroke then the CFO tried to talk to him and the patient was slurring his speech. Caller spoke to the patient's mother this morning and caller told the mother that he would try to find out what is going on with the patient. He asked that the patient get an HIV test even though he does not think the patient is at risk. Vaccination facility type was Hospital. Vaccine administered at military facility was No. None additional vaccines administered on same date of the PFIZER suspect. AE acute demyelinating encephalomyelitis require a visit to Emergency Room, not visit to physician office. Prior Vaccinations (within 4 weeks) was none. He has heard of acute demyelinating encephalomyelitis being associated with vaccines in the past and states that it is rare and usually in kids. States he saw patients that may have had acute demyelinating encephalomyelitis back in the 80s and 90s. Therapeutic measures were taken as a result of acute demyelinating encephalomyelitis (Patient will get steroids tonight pending the review of the x-ray). The outcome of the events was unknown. Information on the lot/batch number has been

requested.; Sender's Comments: The reported stroke with speech slurred, and the presumptive diagnosis of acute demyelinating encephalomyelitis (looks like a radiologic diagnosis by the reporting physician), was most likely an intercurrent disease, and unlikely causally related to the first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE). The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"her nerve was bad; Getting all sick, cold, sick and experiencing terrible side effects; Getting all sick, cold, sick and experiencing terrible side effects; Fatigue; Muscle ache; Nauseous; Felt awful; Can't eat all the day, no appetite; phobic something to drinking water; This is a spontaneous report from a contactable consumer (patient). A 49-year-old female patient received bnt162b2 (lot/batch number and expiration date not provided), via an unspecified route of administration, on an unspecified date, at single dose, for COVID-19 immunization. No relevant medical history. The patient's concomitant medications were not reported. The patient experienced getting all sick, cold, sick and experiencing terrible side effects, fatigue, muscle ache, nauseous, cannot do anything, felt awful, cannot eat all the day, no appetite, phobic something to drinking water. The patient has been sick for three days now. The patient was a ""senior"" (not clarified) care giver at the nursing home. Everybody at nursing home at the nursing home got the shot and now everybody has cold and sick. She has only one day of work and she has to come into her job to take care of elderly people. As since current everybody is experiencing the terrible adverse, terrible side effects, everything. Fatigue, muscle ache everything. The bosses at her nursing home cannot give them three days or even seven days off of work after receiving a contract to give them shot. It was confirmed that the patient received the COVID vaccine. The patient also stated that they are off of that side effects. They are not interrupted not just the ""arm"" (not clarified) been there. The patient said she getting everything. She was getting all the side effects. So when they had this Pfizer drug shot ""they didn't get seven days off of"" (not clarified) work. If a person gets a shot, they are feeling fatigue, nauseous (incomprehensible voice). They can't do anything. They should be allowed to stay home from work. Right now everybody in the nursing home is feeling the adverse effect. The entire building. So, she was telling Pfizer to report the report is that all of sudden that the nursing home ""seniors"" (not clarified) and nurses they got the shot, they can't even get to work. The effects are so bad that they can't do anything. The patient also stated that fatigue, she had fatigue all day. The first day she got the shot her nerve was bad but the second day was everything fatigue. She felt awful, she could not eat, she had no appetite. She was phobic something to drinking water, she cannot eat all the day. ""Fruit or something 5 I can eat"" (incomprehensible voice)."" When probed for the LOT#, the reporter stated, ""No they did not give me anything. All they did is I think 037 I think it looks like a 'K' 20A. (further not clarified) like it says (further not clarified) 037K20A that's (further not clarified)."" The outcome of the events was unknown. Information on lot number/batch number was requested."

aware of 6 cases of Bell's Palsy by the companies making these vaccines; This is a spontaneous report from contactable Other HCP. This Other HCP reported same events for 6 patients. This report is for 2nd

of 6 patients. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. The other HCP was aware of 6 cases of Bell's Palsy by the companies making these vaccines since an unknown date. The event was reported as non-serious. The event outcome was unknown. Information about lot/batch number has been requested.; Sender's Comments: Based on a compatible temporal relationship, causality between event Bell's Palsy and BNT162B2 vaccine cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly

notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2021007605 same reporter, same drug, same event, different patient

aware of 6 cases of Bell's Palsy by the companies making these vaccines; This is a spontaneous report from a contactable other health professional (HCP). This other HCP reported similar events for 6 patients. This is the 5th of 6 patient. A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiration date not provided), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter reported since the use of modified RNA in covid vaccines, he/she had aware of 6 cases of Bell's Palsy by the companies making these vaccines since an unknown date. The outcome of the event was unknown. Information about batch/lot number has been requested.; Sender's Comments: Based on temporal association, the causal relationship between bnt162b2 and the event facial paralysis cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2021007605 Different patient, same drug/event.

"Looked like an encephalopathy; Face was all swollen; Head swelled; Glands swelled; Fatigue; Headache/ So much pain in my head; Couldn't talk; Complete brain fog; nausea; This is a spontaneous report from a contactable nurse. This 60-year-old female nurse (Patient) reported that received bnt162b2 (BNT162B2, Pfizer COVID-19 vaccine), via an unspecified route of administration on 30Dec2020 at single dose for covid-19 immunisation. Medical history included Atrial fibrillation, Chronic Lyme, Lupus and Autoimmune. Concomitant medications included Metoprolol at 12.5 mg for Atrial fibrillation and acetylsalicylic acid (BABY ASPIRIN). No diabetes, no hypertension. None of the usual common diseases. Registered Nurse stated, ""I received vaccine this past Wednesday. I was just talking to a couple of my colleagues and honestly I received the vac. at work. I did not really read through the paperwork and was 'weird' sharing reactions to the vaccine which for me was pretty bad reaction and thought like I need to go through your paperwork and report it. So I thought I should call and just give some information. The usual fatigue which I go to after being normal, my arm was not sore. However, as the week progressed into Friday I had a constant headache but it was manageable and then by Friday night my glands swelled, my nerves behind my ears, my neck and I was extremely fatigued, bad headache and went to bed and I had not gone out and finally I got out today I spoke with my Physician yesterday. What happened it looked like an encephalopathy but my head swelled, my face was all swollen, complete brain fog, fatigue and I couldn't talk. I was in so much pain in my head resulting in (incomplete sentence)."" Lab work included the only thing is the PCR swabbing. No blood test. Registered Nurse further stated, ""I don't know if that is important. But I will tell you and if it is you can send me the questions. I do have a history of Autoimmune. So my Physician thought that this was just like an enhancement of like my bodies reaction I have Chronic Lyme and I have lupus like my ANA has

always been stressful. But we think that it is a family thing. No treatment for the Lyme. I did a lot of antibiotic and a lot of naturopathic stuff but that is in the past. But anyhow for anything else what I did was when I got the injection they said try and just take Tylenol not Ibuprofen but there was no way I was going to make it through with just that . So I took Ibuprofen. I called my Physician yesterday morning because I was not sure about what was is happening and I thought it might be secondary sinus infection or something else going on and it reassured me that it is definitely due to the vaccine. He said it is just your body's reaction, take the Ibuprofen, hydrate. Had me take what I had in my house Tigan for nausea. So I was extremely nauseous from the severity of the headache."" Registered Nurse stated, ""I just wanted to let you know what happened and the intensity of what it was because normally I would expect a headache. But this was a 'go dated'. Registered Nurse stated, ""I guess the only question that I have is so do my work has this question and I was going to call my doctor tomorrow may be might know it better. I know that I have to take the second dose. But I understand the second round can be worse than the first. Is there anything that they are recommending that I can do may be prior to ease the reaction?"" The outcome of the events was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: The reported clinical manifestations including swelling face and head swelled, which was suspected as encephalopathy by the reporting nurse, was probably related to the bnt162b2 (BNT162B2, Pfizer COVID-19 vaccine), due to temporal relationship. The subject's underlying Chronic Lyme, Lupus and Autoimmune were likely the risk factors to the onset of the events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory authorities, Ethics committees and Investigators, as appropriate."

"Swollen lymph nodes; blood pressure was 90/50; Chills; body aches; Fatigue; Joint pain; Bone pain; Headache; Swelling, pain, redness and soreness at the injection site; Swelling, pain, redness and soreness at the injection site; Swelling, pain, redness and soreness at the injection site; Tachycardia / heart rate was 144-152; painful to breath and she was grunting; also said that the injection site itched a little bit.; Fever; First dose on 17Dec2020, second does on 04Jan2021; This is a spontaneous report from a contactable nurse reporting for herself. A 35-year-old female patient received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) ((lot number was unknown) intramuscularly on 17Dec2020 at 0.3ml, and the second single dose (lot number EJ1685) intramuscularly on 04Jan2021 07:45 at 0.3ml, for COVID-19 prophylaxis. Medical history included ongoing diabetes. Her diabetes was diagnosed about 6 months ago (reported on 06Jan2021) and was well controlled. Her glucose was at 140 at the ER (emergency room) even after drinking a drink that had sugar in it. The patient's concomitant medications were not reported. The patient received the second dose on 04Jan2021 at 07:45 and experienced a severe reaction hours after she received it, and she ended up having to go the ER and that they were baffled about what happened. She reported her symptoms were: fatigue, joint pain mainly in her knees, bone pain that did not feel like muscle pain, headache, swollen lymph nodes in the left axilla, and swelling, redness, pain, and soreness in the left arm at the injection site and also said that the injection site itched a little bit. Her symptoms started about 9-10 at night on 04Jan2021. She said that she felt like with the second dose she noticed the soreness and pain and redness at injection site after about 2 hours after receiving the second dose, which was sooner than with the first injection.

The fever started with the chills and body aches. The chills and body aches started at 22:00 on 04Jan2021. She took acetaminophen and melatonin to try and sleep it off. Fever was after that at around midnight 04Jan2021 and she was burning in fever and her temperature was 104. She stated she started taking layers off and got out from under her covers. She had a sweater on when she took her temperature and her axillary temperature was 105. She said that she got into a hot shower because that was the only thing that provided comfort to her chills. She had not had any chills in about the last 12 hours though (as reported on 06Jan2021). She said that the body aches were so severe that she just sat in her bed and cried. She had tachycardia and she was grunting in pain. She was rotating ibuprofen and acetaminophen and then her fever was not as high. She stated that if her fever came back it was lower each time, and if she did not take the medications though, the bone pain was excruciating. She said that with the bone pain it was like no-one can hold her hand or hug her. Fatigue started at around midnight 04Jan2021. Her headache was at midnight. She felt like she had a headband on and was radiating down the back of her neck. She noticed the lymph nodes were swollen after she went to the ER at around 07:00-08:00 05Jan2021. She was walking with pillow under her arm, and if she moved or lifted her arm it hurt. She went to the ER at 01:00 05Jan2021. Her blood pressure was 90/50, her heart rate was 144-152 at rest, temperature was 102.8, O2 saturation was 95-96. She said that it was painful to breath and she was grunting, but did not have any breathing issues. The nurse thought she was septic and notified the doctor. The nurse and the doctor did not think it was the vaccine and thought that she was COVID-19 positive. But after they tested her, she was negative for flu and COVID and they were baffled. They were unclear on what happened and did not think it was from the vaccine. They bolused her 1 liter of Normal Saline and gave her a dose of Fentanyl that minimally helped with the bone pain. She was also given 30mg of ketorolac (TORADOL) IV (intravenous) and that significantly improved her pain. She was there a total of 3 hours. She was admitted to the back area of the ER. She said that they drew labs and everything was within normal limits. Her CRP (C-reactive protein) was 30 and her lactate was at 1.5. She said that they told her that she was most likely having an immune response to the vaccine. Her heart rate and blood pressure came to a more normal range and everything returned to baseline. Her heart rate was 109. She was told to rotate paracetamol (TYLENOL) and ibuprofen for at least the next 24 hours and hydrate. The events fever, chills, fatigue, joint pain, bone pain, headache, swollen lymph nodes, and swelling, pain, redness and soreness at the injection site were serious due to hospitalization from 05Jan2021 to 05Jan2021. The patient was recovering from fever, chills, joint pain, headache, heart rate and blood pressure, not recovered from fatigue, bone pain, swollen lymph nodes and swelling, pain, redness and soreness at the injection site. The event swollen lymph nodes worsened. The outcome of ""injection site itched a little bit"" was unknown. The reporter considered the events fever, chills, fatigue, joint pain, bone pain, headache, swollen lymph nodes, and swelling, pain, redness and soreness at the injection site were all related to the vaccine; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events pyrexia, chills, fatigue, pain, arthralgia, bone pain, headache, lymphadenopathy, vaccination site erythema, vaccination site swelling, vaccination site pain, blood pressure decreased, tachycardia, grunting and vaccination site pruritus cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern

identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate."

Death; This is a spontaneous report from a contactable Physician. An elderly male patient received BNT162B2 (COVID vaccine), via an unspecified route of administration on an unspecified date in Dec2020 at single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient experienced death in Jan2021. It was unknown if an autopsy was performed. It was unknown if any treatment was received for the event. It was unknown if the patient was diagnosed with COVID prior vaccination or if the patient had been tested for COVID post vaccination. Seriousness criteria for the event was reported as death and hospitalization. Pfizer is a marketing authorization holder of [COVID vaccine] in the country of incidence or the country where the product was purchased (if different). This may be a duplicate report if another marketing authorization holder of [COVID vaccine] has submitted the same report to the regulatory authorities. Information about lot/batch number has been requested.; Sender's Comments: Current information is very limited for full assessment. Further information such medical history, concomitant medications, concurrent illness and event term details especially death cause and autopsy results are needed for meaningful evaluation. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Death

"The lip starting ripping and the face started itching; The lip starting ripping and the face started itching; It started spreading from the ear to the neck, it started itching bad and getting hive in that area; having trouble in breathing because it was swelling up; having trouble in breathing because it was swelling up; The lip was swelled to red and then it started to going up the jaw; The lip was swelled to red and then it started to going up the jaw; This is a spontaneous report from a contactable consumer (patient). A 64-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot#: EJ1686, expiration date: Mar2021) via an unspecified route of administration on the arm right in Dec2020 at single dose for COVID-19 immunisation. Medical history included ongoing blood pressure high. Concomitant medication included lisinopril taken for blood pressure high. The patient had the BNT162B2 on Thursday morning (Dec2020) and Thursday evening the patient had a reaction to that, the lip was swelled to red and then it started to going up the jaw. So the next day it was in the jaw and in the lip and then the lip starting ripping and the face started itching and that's didn't go away and then yesterday it started spreading from the ear to the neck, it started itching bad and getting hive in that area. The patient went to the emergency room, consumer stated that she had nurse practitioner that called her on a steroid (treatment). The consumer stated, ""the thing she called her also in an Epi Pen in case she has started having trouble in breathing because it was swelling up. The patient didn't have to end up using that but she just has to use in case she has"". Treatment was received for the events. The outcome of the events was unknown."

COVID-19; COVID-19; Pneumonia; respiratory failure; This is a spontaneous report from a contactable consumer. An 80-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19

VACCINE) via an unspecified route of administration on 02Jan2021 for COVID-19 immunization. Medical history included Alzheimer's and others. No known allergies. Concomitant medications included unspecified medications. The reporter's mother in law was tested for COVID-19 at a nursing facility on 25Dec2020 and she was negative. On 02Jan2021, she received the first dose of Pfizer vaccine. On 04Jan2020, she developed a high fever, needed oxygen and was positive for COVID-19. Date of death was 04Jan2021. The cause of her death was listed as pneumonia, respiratory failure and COVID-19. No autopsy performed. No treatment received. No one knew if the vaccination contributed to her death. It was hard to know if her death was due to the administration of the vaccine or it exacerbated the COVID19 symptoms which led to her death. Since this was unknown, it could have been a possibility. The reporter wanted to give us this information because we might want to consider having high risk population, patients with underlying conditions, older population tested for COVID-19 prior to the vaccination, as this is not currently a recommendation or a requirement. All is very new and they are all learning so the reporter wanted to share this information with us. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. There are medications the patient received within 2 weeks of vaccination. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has been tested for COVID-19. The outcome of the events was fatal. Information about Lot/Batch has been requested.; Sender's Comments: The association between the fatal event lack of effect (pneumonia, respiratory failure and COVID-19) with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.; Reported Cause(s) of Death: Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19; Pneumonia, respiratory failure and COVID-19

he passed away; not responsive; mind just seemed like it was racing; body was hyper dried; Restless; not feeling well; ate a bit but not much; kind of pale; Agitated; Vomiting; trouble in breathing; This is a spontaneous report from a contactable consumer (brother of the patient). A 54-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 04Jan2021 (at the age of 54-years-old) as a single dose for COVID-19 immunization. Medical history included diabetes and high blood pressure. Concomitant medications included metformin (MANUFACTURER UNKNOWN) taken for diabetes, glimepiride (MANUFACTURER UNKNOWN) taken for diabetes, lisinopril (MANUFACTURER UNKNOWN), and amlodipine (MANUFACTURER UNKNOWN). The patient experienced not feeling well, ate a bit but not much, kind of pale, vomiting, trouble in breathing, and agitated on 04Jan2021; body was hyper dried and restless on 05Jan2021; mind just seemed like it was racing on 06Jan2021; and not responsive and he passed away on 06Jan2021 at 10:15 (reported as: around 10:15 AM). The clinical course was reported as follows: The patient received the vaccine on 04Jan2021, after which he started not feeling well. He went right home and went to bed. He woke up and ate a bit but not much and then was kind of pale. The patient then started to vomit, which continued throughout the night. He was having trouble in breathing. Emergency services were called, and they took his vitals and said that everything was okay, but he was very agitated; reported as not like

this prior to the vaccine. The patient was taken to urgent care where they gave him an unspecified steroid shot and unspecified medication for vomiting. The patient was told he was probably having a reaction to the vaccine, but he was just dried up. The patient continued to vomit throughout the day and then he was very agitated again and would fall asleep for may be 15-20 minutes. When the patient woke up, he was very restless (reported as: his body was just amped up and could not calm down). The patient calmed down just a little bit in the evening. When the patient was awoken at 6:00 AM in the morning, he was still agitated. The patient stated that he couldn't breathe, and his mind was racing. The patient's other brother went to him and he was not responsive, and he passed away on 06Jan2021 around 10:15 AM. It was reported that none of the symptoms occurred until the patient received the vaccine. Therapeutic measures were taken as a result of vomiting as aforementioned. The clinical outcome of all of the events was unknown; not responsive was not recovered, the patient died on 06Jan2021. The cause of death was unknown (reported as: not known by reporter). An autopsy was not performed. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Reported Cause(s) of Death: not responsive and he passed away

Acute appendicitis; Severe acute abdominal pain; Chills; Fever; This is a spontaneous report from a contactable Nurse (patient). A 42-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (expiration date Mar2021, incomplete lot number L0140, not sure the first letter it is C or E), via an unspecified route of administration on 23Dec2020 at single dose for covid-19 immunization. None medical history. Concomitant medication included escitalopram oxalate (LEXAPRO). The patient experienced a little bit chills and fever she felt coming exactly on the 26th but she expected that and that was all fine but patient ended up in (Incomplete sentence). She went to work on 30th December and had some onset of severe acute abdominal pain and she ended up in an emergency appendectomy by 6 O'clock that evening. So she had an acute appendicitis and she did some research and it says that she can be listed in to the severe complications that the number in the vaccinated group was double back to the procedural group. The 26th it resided and patient felt better until the 30th when she have acute severe abdominal pain onset. She left work went for emergency room and she was in surgery within four hours. The outcome of events chills and fever was recovering, the other events was unknown. Because of the research that is on the website patient cannot help and think that it is related. Patient believed the relatedness of drug to events was related. Information about lot/batch number has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate

26-year-old lady came in after she noticed she had bruises on her left hand after a CPR procedure at hospital. Patient was apparently in well health, she had received COVID-19 mRNA vaccine on January 7 at 3 PM, she has taken 2 pills with ibuprofen and tylenol for pain in right deltoid following vaccination. She was doing the CPR at 1:00 this afternoon, and she noticed that her left dorsum had some bruises. She took day off and went home and noticed that she also had bruises in both medial thighs, above the

knee and some bruises in scalp. Patient presented to the Emergency Room 1/9/2021 ~6PM and platelet count was found to be 2x10^3/uL. Patient required transfusion of 7 units of platelets, steroids, and IVIG.

SOB, Sleeplessness,

Scratchy throat, dizziness and eventually feeling like her throat is closing in

Patient was reported to be deceased at home by law enforcement on 1/7/21

"Patient presents with abdominal pain that started in the middle of the night. Had first COVID vaccine the previous day. Patient states the pain is intermittent ""comes and goes"" ""cramping"" ""pressure and bloating"" feeling. Patient states her normal bowel movements are 12 times per day. The last time she went was this morning. She is concerned about an ""obstruction"" Patient states she has ""some nausea"" She states she has ate and drank normally today. Patient has a history of ulcerative colitis and a complete colectomy with a ileal rectal pouch. She has had abdominal pain since this morning which is crampy, associated with nausea and recurrent vomiting. She normally has 6-12 bowel movements a day, but none since this morning. She does feel her abdomen is distended as well. The last time she had anything like this was when she developed pouch itis last spring, but that was much less painful than this. Her appendix is gone, but she believes she still has her gallbladder."

Went into the ED for bilateral hand and feet tingling. Worked up for possible Guillain Barre.

"Patient reported stroke-like symptoms as he was driving to work: started ""feeling funny"" with dizziness; progressed to feeling weakness in left side of face with facial drooping; tingling in left hand progressed to numbness and weakness in left arm and leg; difficultly coordinating motor movement in right arm; difficulty/ diminished speech ""tongue felt fat."" Symptoms resolved within appx 1+ hour from onset. Per patient, he was given an injection at the hospital (unsure for what?) and was discharged with a prescription for chlorthalidone 25mg daily, blood pressure was elevated."

There were no adverse reactions. Resident Died, she had a history of issues with her health prior to the vaccine.

Patient was found unresponsive at home with SpO2 20% 1/2/2021

1/6/21 8pm started with Nasuea, vomiting, diarrhea and fever. 1/7/21 started having intermittent chest pain in the morning. Then in the evening it became constant. Went to ER that evening due to chest pain. EKG showed t wave abnormality. 1st Trop was negative went from 0.08 to 2.3 Had 2 Echo's done and they were normal. Platelets were 85. Was discharged without chest pain. Troponin on discharge was 0.67 and platelets 61. Was admitted due to Chest pain and troponin. Attending provider diagnosed as myocarditis and thrombocytopenia R/T vaccine.

right after vaccine was given i got a head to toe hot flush. i thought it was just anxiety. within 2 minutes i had expolsive diarrhea, felt dizzy. looked in the mirror and saw my neck and chest covered in red rash and hives. felt hot flush again. dr came in noticed hives all over both my arms as well. felt sob and if someone was holding my neck with their hand. given benadryl and epi taken to local er.

Patient received the 1st dose of Moderna and was found deceased in her home the next day.

In the first 2 days (probably a couple of hours after the shot) I felt achiness, and it got worse body pains, joint pains and fatigue. Almost a week after I started getting sick, aches, shore throat, headache and fever (101.5F) that is when I went to the ED and it lasted about 2 days and then it went away. At the ED they did COVID and strep tests both negative. This was with my first dose and my second one the same thing happened.

Pfizer COVID-19 Vaccine A couple hours after the vaccination the patient experienced pain in the vaccine arm, headache, and feeling ache. Day 1 post vaccination patient experienced sore arm, headache, low grade fever, feeling ache, and GI symptoms with diarrhea. Day 2 post vaccination patient experienced sore arm, Migraine, and diarrhea. Day 3 post vaccine patient woke up with chest pain that radiated into her left arm and some weakness. Patient's blood sugar was >500 and was admitted to hospital for DKA.

My mother was given Pfizer vaccine on Thursday and she died 3 days later yesterday on Sunday!!!

Extremely tired went to bed at 8:30. At 11:00, tossed and turned until 12:16 a.m. Did not think she could stand up. Walked in the bathroom had pain in stomach, was very hot and freezing at the same time, was shaking. Head hurt was hurting so bad. Tried standing up from toilet, was passed out. Eye, half of face is bruised and swollen , eye shut for two days. More than forty minutes passed before she could call her husband. Does not remember anything because she was passed out. Husband came in and grabbed her, to get her back into bed. she could not stand. Went to ER at Hospital. Had CT scan, blood work , EKG, chest xray. Was still kind of out of it but was able to communicate with nurses. Face is still black and blue. Last night got up at 4:00 a.m. something was wrong with her throat. Felt like a walnut was in her throat. Went to doctor this morning. They said it was a reaction from the shot. Got an EpiPen, prednisone. Call them in 2 days to let them know how she's doing and also wear a heart monitor because they do not know how to take care of her, Has had vision blurriness in both eyes. Has not felt well at all.

Difficulty breathing, death.

Noted left lymph nodes left neck. On January 7, 10 days post injection had acute appendicitis requiring emergency appendectomy.

Metallic taste in the back of throat between 15-20 minutes post vaccination, noticeable swallowing and throat irritation at 20-25 minutes post vaccination, tongue and lip numbness and throat tightness at 25-30 minutes, dry hacking cough at 30 minutes. Treated in the ED approximately 1 hour post vaccination, at time of arrival in respiratory distress with subcostal retractions, coughing, speaking 1-2 word sentences, with tachycardia and tachypnea. Treated with IM epinephrine, IV solumedrol and IV Benadryl and IV Benadryl with marked improvement in symptoms.

Woke up 1/4/21 with right sided facial weakness consistent with Bell's Palsy. Started high dose Prednisone and Valtex. Received IVIG infusion on 1/6/21 and 1/7/21. Mild improvement 1/11/21.

About 15 minutes after vaccine, hr 155, fever 102, covered in hives, sick to her stomach and a pounding headache. Has had headache since then and been extremely fatigue.

Anaphylaxis within 5 minutes of dose given. Tachycardia 130-140s, hot body temperature, trouble swallowing, lightheaded/dizzy, ekg changes, feeling like I was going to pass out even when in bed. IV fluids, benedryl, soul-medrol, famotadine and IM epi given.

Trouble swallowing, tingling around the mouth within 5 minutes of vaccine administration. IV started with 25mg Benadryl within 5 minutes of symptom onset. Transfer to ER at 1430. Symptoms unresolved, hr - 120, bp 140/100, O2 sats 100, resp: 21 Additional 25mg Benadryl, 125mg solumedrol, 1ml Ativan given IV at 1435. Symptoms began to resolve, patient discharged at 1600 to home with instructions to return if needed. Patient returned to ER Sunday January 10 at 1300 complaining of throat tightness. Patient was seen by doctor, no acute distress and airway issues seen. Patient elected to stay for 50mg benadryl and 40mg prednisone PO. Patient was discharged to home with script for 40mg prednisone q day for 3 days. Patient feels any remaining allergic symptoms have resolved.

RESIDENT 1ST DOSE OF MODERNA VACCINE ADMINISTERED ON 01/04/2021 AT 8:30PM, RESIDENT FOUND UNRESPONSIVE ON 01/05/2021.

Herpatic infection left eye causing a herpatic dendrite

One week after administration, I had sudden onset inability to move left arm. I was transported to ER immediately. Treated, scanned with CT of brain, MRI of brain, c-spine and brachioplexus. In hospital for 2 days and no answers. Still no answers to left arm paresthesia and proprioreceptor deficits. Spreading into left leg and mild systemic symptoms. I have been to the ER, seen by primary physician, Physiatrist and Neurology and Occupational Therapy. I am scheduled for many more appointments and trying to find and answer.

COVID-19/Caller received the first dose of the vaccine and she tested positive with Covid; COVID-19/Caller received the first dose of the vaccine and she tested positive with Covid; arm pain; she felt like crap the night; chills; This is a spontaneous report from a contactable pharmacist (patient). A 51-year-old female patient received her first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EH9899, expiration date Mar2021), intramuscular on left arm, on 18Dec2020 at 0.3 mL, a single dose for vaccination. The patient medical history and concomitant medications were not reported. The patient received the first dose of the vaccine and she tested positive with Covid. She received the Pfizer Covid vaccine on 18Dec2020. She was exposed to the virus through close personal contact right around this same time-frame and did develop the virus herself. She wanted to know if there were any recommendations regarding her needing to get the second dose in series. She stated that her husband, who was not vaccinated, had the virus and developed more serious symptoms than she did. She is concerned about worsening side effects with the second dose and stated that she felt like crap the night after her first dose with chills and arm pain. The patient tested positive for COVID-19 on 26Dec2020. Specific test name was unknown, but she knows it was not a rapid test. She is scheduled to get the second dose of the Pfizer COVID-19 Vaccine on 08Jan2021. She called to ask if she should or should not get the second dose relative to the COVID-19 diagnosis. She has not been able to find the

information she is asking about. The outcome of the event of Covid-19 was recovering while other events was unknown. The Covid-19 was assessed as unrelated to the suspect drug.; Sender's Comments: No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the positive COVID represents the pre-existing infection prior to vaccine use. Further information like confirmative COVID 19 Nucleic acid/ PCR test together with any associated symptoms are needed for full medical assessment. COVID-19 antigen test positive.

tested positive for Covid-19 after receiving 1st dose; COVID-19 PCR test: positive on 31Dec2020, Covid-19 rapid test: positive on 31Dec2020; smell was gone/no sense of smell; no sense of taste; This is a spontaneous report from a contactable nurse (patient). A 59-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EH9899, expiry date unknown) via unspecified route of administration in the left arm on 26Dec2020 at single dose for Covid-19 immunization. Medical history included cholesterol, blood pressure (controlled blood pressure), hypothyroidism. Concomitant medications included TELMISARTAN (MICARDIS) for blood pressure and ATORVASTATIN (LIPITOR) for cholesterol; both on unspecified date. The patient was asking if she was able to get the 2nd dose of vaccine, since she was tested positive for Covid-19 (31Dec2020) after receiving 1st dose. The patient was asking information about missing 2nd dose and when can she get it and wanted to know if it was still okay to get the second dose. The patient asked if she needed to have a test negative for covid-19 prior to receiving 2nd dose. The patient experienced no sense of taste and actually realized it on 29Dec2020 that her food was not tasting good. The patient didn't notice her smell was gone until she was cooking the chicken curry, she even tested it out by spraying some perfume, she has no sense of smell on 30Dec2020. The patient informed that both her taste and smell returned 02Jan2021 but was not recovered completely. The patient underwent lab tests and procedures which included A1C: 6.4 on 12Dec2020, COVID-19 PCR test: positive on 31Dec2020, Covid-19 rapid test: positive on 31Dec2020. The patient informed that she had no positive test before the Covid-19 vaccine, she took Covid-19 antibody test in Apr2020 and it was negative. The outcome of the events tested positive for Covid-19 after receiving 1st dose was unknown, no sense of taste and smell was gone/no sense of smell was recovered with sequel on 02Jan2021.; Sender's Comments: No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the positive COVID represents the pre-existing infection prior to vaccine use.

congestion; positive for Covid-19; positive for Covid-19; This is a spontaneous report from a contactable healthcare professional (patient). A 61-years-old female patient received her first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EH9899, expiration date not reported), via an unspecified route of administration on left arm on 31Dec2020 at 08:15 at a single dose for Covid-19 immunization/precaution because she works with hospice patients. Medical history included blood pressure (abnormal), diabetes, cholesterol (abnormal), and acid reflux, all are ongoing. The patient has no family medical history. Concomitant medications included amlodipine besilate, benazepril hydrochloride for blood pressure taking about 4-5 years, metformin for diabetes taking about 5 years, rosuvastatin for cholesterol Taking about 5 years, pantoprazole for acid reflux taking 5 years, and vitamin D as supplement taking for 3 years. No previous immunization nor vaccines administered on

same date of the suspect drug. The patient was calling about the COVID vaccination, which she received on Thursday, 31Dec2020. Her husband tested positive on Thursday, so she took the test on Thursday after she took the vaccination and they just told her today, 04Jan2021, that she is positive for Covid-19. She wanted to know if that was going to mess up her vaccination in any way and if there are recommendations for second dose. She is a CNA. There was no prescriber. She received it because she works with hospice patients. Test was administered on 31Dec2020. COVID Test resulted on 10:00 04Jan2020 as positive. ER or physician's office required: She just went to get a COVID test when her husband tested and they gave her a azithromycin (Z-PACK) 250 mg because she had congestion. Take two tabs first day and then one daily for 4 more days. She is taking last one today (04Jan2021). Outcome of the events was unknown.; Sender's Comments: A causal association between reported events and BNT162B2 cannot be excluded.

slight sore arm; slight chest congestion; positive COVID-19 test after first dose of vaccine; positive COVID-19 test after first dose of vaccine; Fever; cold like symptoms; stuffy head; horrible headache; Cough; This is a spontaneous report from a contactable healthcare professional (patient) from a Pfizer-sponsored program, Pfizer First Connect. A 44-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 16Dec2020 as a single dose (reported as 0.3 mL) (at the age of 44-years-old) for COVID-19 immunization. Medical history included ongoing hypothyroidism, one thyroid gland removed due to a nodule on an unspecified date (years ago), ongoing acid reflux, ongoing hypercholesteremia, ongoing fluid retention, and ongoing history of headaches. Concomitant medications included levothyroxine sodium (SYNTHROID) taken for hypothyroidism and for one thyroid gland removed due to a nodule from an unspecified date and ongoing, dexlansoprazole (DEXILANT) taken for acid reflux from an unspecified date and ongoing, atorvastatin (LIPITOR) taken for hypercholesterolemia from an unspecified date to an unspecified date, and hydrochlorothiazide (MANUFACTURER UNKNOWN) taken for fluid retention from an unspecified date and ongoing. Additional concomitant medications included unspecified vitamins. The patient had a positive COVID-19 test after first dose of vaccine on 01Jan2021; cold like symptoms, stuffy head, horrible headache, cough, and fever on 31Dec2020; slight chest congestion on 02Jan2021; and slight sore arm on an unspecified date. The events, stuffy head and horrible headache, were reported as medically significant. The events, cough, fever, and slight chest congestion, were reported as non-serious. The clinical course was reported as follows: It was reported that the patient was vaccinated on 16Dec2020, became symptomatic on 31Dec2020, and tested positive for COVID-19 on 01Jan2021. The patient stated that she became symptomatic one day prior to testing positive for COVID-19, on 31Dec2020. She initially had cold-like symptoms with a stuffy head, cough and a horrible headache; the worst headache she had ever had. These symptoms occurred earlier in the day on the 31Dec2020. Then later that night about 10:00 PM, she had a fever with a body temperature of 102 degrees Fahrenheit. Her body temperature had been normal at 98 degrees all day that day until that night. She also had slight chest congestion and then was fever free for over 48 hours. The patient stated that she had a history of headaches and can tolerate a headache. The headache started 31Dec2020 and was significant. It was reported that after the vaccine, she had no other symptoms other than a slight sore arm, which lasted a day; maybe 24 hours after she received the vaccine. The patient stated that she does not think any of the other symptoms, other than the sore arm, have anything to do with the

vaccine. The clinical outcome of positive COVID-19 test after first dose of vaccine and slight sore arm was unknown; cold like symptoms, horrible headache, and cough was recovering; fever was recovered on 02Jan2021; and stuffy head and slight chest congestion was not recovered. The reporter assessed the causality assessment between the events, positive COVID-19 test after first dose of vaccine, cold symptoms, stuffy head, cough, horrible headache, fever, and slight chest congestion, as unrelated. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Sender's Comments: The efficacy of a drug varies from one patient to another and can be affected by different factors; however, a contributory role of the suspect drug BNT162B2 to the reported events cannot be ruled out. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

suspected COVID-19; suspected COVID-19; Fatigue; Body aches; Headache; chills; The initial case was missing the following minimum criteria: no adverse event. Upon receipt of follow-up information on 04Jan2021, this case now contains all required information to be considered valid. This is a spontaneous report from a contactable healthcare professional, the patient, from a Pfizer sponsored program IBCC (Inbound Call Center for HCPs). A 32-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: EK5730), intramuscular in the left deltoid on 15Dec2020 at 21:00 (at the age of 32-years-old) as a single dose for COVID-19 immunization. Medical history included ongoing hypertension from 2009 and COVID-19 from 10Jun2020 to an unknown date in 2020. Ongoing concomitant medications included fosinopril (MANUFACTURER UNKNOWN) taken for hypertension from 2017. The patient did not receive any other vaccines on the same day as the BNT162B2 vaccine. On 19Dec2020, shy of about 96 hours of getting the vaccine, the patient experienced fatigue, body aches, headache and chills. He did not have any fever. The patient stated that he recovered from the fatigue, body aches, headache and chills by 19Dec2020. The patient was fine from 19Dec2020 until 01Jan2021. On 28Dec2020, the patient had a COVID-19 PCR test that came back negative. On 01Jan2021, the patient suspected that he had COVID-19. He had a fever of 103.1 degrees Fahrenheit, body aches, chills like he was freezing to death, fatigue, diarrhea; however, he did not have nausea or loss of taste or smell. He had swollen lymph nodes, but no sore throat and his oxygen saturation was okay in Jan2021. He was also having chest pain but it was more like intercoastal pain. He stated that these current symptoms were significantly worse than the ones he had just after getting the vaccine and felt more like the symptoms he had when he had COVID-19 before on 10Jun2020 (positive IgG for COVID-19-tested in 2020). The patient had a COVID nasal swab (PCR) done at an urgent care (physician's office) on 02Jan2020 or 03Jan2020 and was awaiting the results. The clinical outcome of the suspected COVID-19 was not recovered.; Sender's Comments: A causal association between reported suspected COVID-19 cannot be excluded.

Patient complained of itching starting on her legs, which went upwards; Redness on her arms, neck, face; Redness on her arms, neck, face; Redness on her arms, neck, face; Itching up to her scalp; Dry cough; Rash; This is a spontaneous report from a contactable nurse (patient). A 44-year-old non-

pregnant female patient received the first dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine) at single dose, in the left arm, on 26Dec2020, at 09:00 AM, for COVID-19 immunisation. COVID-19 vaccine was administered at hospital. The patient had not received any other vaccines within 4 weeks prior to the BNT162B2 vaccine. Relevant medical history included asthma, hypertension, hypothyroidism, penicillin allergy, food allergy (melon and pineapple) and latex allergy. Concomitant medications, received within 2 weeks of vaccination, included omalizumab (XOLAIR), levothyroxine sodium (LEVOXYL), levocetirizine dihydrochloride (XYZAL), losartan and formoterol fumarate, mometasone furoate (DULERA). After covid vaccination, the patient was advised to stay 30 minutes for observation. On 26Dec2020 at 09:15, less than 15 minutes later, the patient complained of itching starting on her legs, which went upwards. The patient took 25 mg oral diphenhydramine hydrochloride (BENADRYL). She noted to have redness on her arms, neck, face, itching up to her scalp. By then she started to have a dry cough, removed her mask, nurse who was with her called for a rapid response team. Patient's epi pen was used, they then started IV and pushed emergency meds and transported to ED. Emergency room/department or urgent care was required. Another dose of epinephrine IM and additional meds were given. Placed on oxygen via non-rebreather with albuterol. Epinephrine drip started. Stabilized after 3 hours, stayed in observation for 12 hours then discharged to home. Around the clock 50 mg diphenhydramine hydrochloride (BENADRYL) at home x 2 days, then levocetirizine (ZYXAL) thrice daily x 7 days to control itching and redness/rash. Other treatment included steroids, pepcid. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient has been tested for COVID-19 (PCR, Nasal Swab) on 26Dec2020 and the result was negative. Clinical outcome of the adverse events was recovering at time of this report. Information on the lot/batch number has been requested.; Sender's Comments: Based on a close temporal association, a causal relationship between reported events and BNT162B2 vaccine cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

anaphylaxis; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), on an unspecified date as single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced anaphylaxis on an unspecified date. The outcome of anaphylaxis was unknown.

tested positive for COVID-19; tested positive for COVID-19; loss of taste and smell; loss of taste and smell; excruciating headache; runny nose; congestion; shortness of breath when she started talking; having aches and pains; lightheaded, experienced dizziness; tied; This is a spontaneous report from a contactable consumer(patient). The 58-year-old female patient received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EJ1685, intramuscular injection), intramuscularly in left arm on 23Dec2020 at single dose for COVID-19 vaccination in nursing home. Medical history included she had a right knee injury so she had some inflammation, She had stomach issues in the past-Barrett's syndrome, H. pylori(Helicobacter infection), GERD(Gastrooesophageal reflux disease), so,

Pantoprazole is just a maintenance medicine, she was stable right now. She had a Vitamin D deficiency at one point. Ongoing concomitant medication included meloxicam for inflammation, thyroid for thyroid(Thyroid disorder), pantoprazole for stomach issues, colecalciferol (VITAMIN D 3) for supplementation therapy. There was no vaccination within 4 weeks. She received her first vaccine on 23Dec2020. There no other vaccine received in the same day. By 26Dec2020, she started with symptoms and then she tested positive for COVID-19 on 29Dec2020. She felt horrible with an excruciating headache and was wondering if she was going to die now. She can really feel for the residents she works with who get it. Right now, she was hopefully going back to work next week, but she was wondering about the second vaccine. People are saying she got COVID-19 because of receiving the first vaccine and she was hoping it was not the case. Is it going to be an issue getting the second vaccine after testing positive? The caller declines to include her healthcare professional for this report, stating she has been talking with her doctors over the week. Her symptoms included runny nose, congestion, and what seemed like shortness of breath when she started talking. She started having aches and pains over the weekend. By Monday, 28Dec2020, there was loss of taste and smell, it was totally gone. She also was lightheaded, experienced dizziness, was tied. She went through a lot of symptoms which was shocking to her. She clarified these symptoms first began the morning of the 26Dec2020. Christmas she was fine, and then she to go out to get snow off of her car and do some running around on 26Dec2020 and she noticed she started having symptoms. When probed for outcome, the caller state she was most definitely feeling better. She was having some excruciating headaches and she has worked with her doctor on what they needed to do. She is still working with the doctor on her lightheadedness. She has set up a follow-up appointment, but she was feeling better. There was no emergency room nor physician office. Relevant test was none. It was also reported lot number was either EJ1685 or EJ1085, she can't tell. Outcome of loss of taste and smell was recovered, of dizziness was not recovered, of other events was recovering.

tested positive for COVID virus; tested positive for COVID virus; cold all day; tiny cough; chills; sweating/ woke up sweating wet; arm pain/Very sore arms; body aches; fever; some muscle aches; This is a spontaneous report from a contactable consumer(Patient's Wife). A 67-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in left arm on 02Jan2021 13:30 at single dose for COVID-19 vaccination. There were no concomitant medications nor medical history. He did not receive any other vaccines that day or 4 weeks prior. No history of any other vaccines or events. He got his vaccine on Saturday(02Jan2021) at 1:30pm(13:30) and by 5:30pm(17:30) had very sore arms/arm pain, at 7:30pm(19:30) he had chills off and on and was sweating. He woke up soaking wet and did that on Sunday, but was feeling a little better today. He also experienced body aches and fever in Jan2021. Today is testing day at his work and he tested positive for COVID virus on 05Jan2021. Not sure if it's a coincidence. Again, he got the shot and then started having all these symptoms at 5:30 and 7:30. Now they are both on quarantine for the 10-14 days. He wanted to see if it's possible to test positive for the virus after getting the shot or is it just a coincidence. He also had some muscle aches in Jan2021. Last night (04Jan2021), he woke up again sweating, but not like on Saturday, but he got really warm and started to sweat a little, and on Sunday(03Jan2021) he was cold all day and had a tiny cough, but it wasn't significant. Ever so often she would hear him cough. All of a sudden patient would wake up sweating. Again, Saturday he soaked everything. There was no

Emergency Room nor Physician Office. Outcome of Very sore arms, sweating was recovering, of pain and fever was unknown, of other events was not recovered. Information on Lot/Batch has been requested.

a little bit of a cough.; headache; runny nose; Aside from her taste and smell still being gone; Aside from her taste and smell still being gone/loss of taste; fogginess; Patient had since tested positive; Patient had since tested positive; patient likely had exposure on 22Dec2020; This is a spontaneous report from a contactable physician. A female patient of an unspecified age received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 21Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient likely had exposure on 22Dec2020. She showed the first covid symptoms on 31Dec2020. Patient experienced loss of taste, headache, fogginess, runny nose, and a little bit of a cough on unspecified date. Patient received her first covid dose on 21Dec2020. The first dose likely helped her, she has rapidly gotten better and was feeling much better today. Aside from her taste and smell still being gone. The patient was scheduled to receive her second dose on 11Jan2021. Patient had since tested positive. Caller clarified that the patient didn't get a test until 03Jan2021. Outcome of events taste and smell still being gone was not recovered, and outcome of other events was unknown. Information on batch/lot number was requested.; Sender's Comments: No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the positive COVID likely represents the pre-existing infection prior to vaccine use. Further information like confirmative COVID 19 Nucleic acid/ PCR test together with any associated symptoms are needed for full medical assessment.

tested positive; tested positive; runny nose; headache; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A contactable consumer reported that a 51-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced tested positive, runny nose, headache after getting the vaccine on an unspecified date with outcome of unknown. This report is considered as non-serious.

"tested positive for COVID-19; tested positive for COVID-19; This is a spontaneous report from a contactable nurse (patient) from a Pfizer-sponsored program Pfizer First Connect. A 55-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK5730), via an unspecified route of administration in the right arm on 18Dec2020 at single dose for covid 19 immunisation as healthcare professional and husband was high risk. Medical history included hypertension from 2019 and ongoing. Concomitant medication included amlodipine besilate (NORVASC, 5 mg) from 2019 and ongoing for high blood pressure. The patient experienced tested positive for covid-19 on 03Jan2021 with outcome of not recovered, congestion and headache in Jan2021 with outcome of unknown. The patient underwent lab tests and procedures which included COVID test on 03Jan2021 and the results came back positive on 04Jan2021. The patient was scheduled to receive her second injection on 08Jan2021. Since her first injection she had tested positive for COVID-19. The second dose had to be given a certain amount of days after the first. She would be outside that window. She would like to

know if there is any guidance regarding the if/when she should get the second dose. The reporter would like to know if she waits longer than the recommended 21 days to receive her second dose of the COVID-19 vaccine would she need to restart the vaccination series. The reporter said this was not serious as she only had congestion and headache with treatment: using over the counter stuff. Event relatedness with COVID vaccine was unknown.; Sender's Comments: Based on available information, a possible contributory role of suspect BNT162B2 vaccine cannot be completely excluded for reported ""tested positive for COVID-19""."

it was like having Covid again; it was like having Covid again; body aches; dry mouth; generalized weakness; temp was 38.1 Celsius; head feels weird; can't sleep; decreased appetite; pain at the injection site; This is a spontaneous report from a contactable Nurse (patient). A 36-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 04Jan2021 at single dose for COVID-19 immunization. Medical history included COVID-19 from Mar2020 to an unknown date. The patient's concomitant medications were not reported. The patient experienced body aches, dry mouth, can't sleep, generalized weakness, decreased appetite, and pain at the injection site, temp was 38.1 Celsius, head feels weird in Jan2021. The patient got her first dose and was looking online to see the symptoms. She said that she saw that during the trials, people were experiencing the symptoms she was experiencing after the second dose and she was concerned. She said that she wanted to make sure her symptoms are ok and to make sure that the symptoms are not just caused from the booster, but also from the first dose. The caller said that her mom told her that someone died from the Pfizer vaccine. No further details provided. The patient was having body aches, could not sleep, her mouth is really dry, her temp was 38.1 Celsius, her head feels weird, she has generalized weakness, pain at the injection site, and decreased appetite. She said that it was like having Covid again. She said that she had Covid back in Mar2020. The patient underwent lab tests and procedures which included body temperature: 38.1 centigrade. The outcome of all the events was unknown. The events were reported as non-serious. Information on the lot/batch number has been requested.; Sender's Comments: No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the suspected COVID likely represents a pre-existing infection prior to vaccine use. Further information like confirmative COVID 19 Nucleic acid/ PCR test is needed for full medical assessment.

she is pregnant as well; she reported to be diagnosed positive for COVID last 01Jan2021 after showing symptoms on 31Dec2020; she reported to be diagnosed positive for COVID last 01Jan2021 after showing symptoms on 31Dec2020/tested positive for COVID-19; This is spontaneous report from a contactable Other Health Professional (patient) via a Pfizer Sponsored Program. A 29-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EJ1685), intramuscularly in right deltoid on 23Dec2020 14:30 at single dose for COVID-19 vaccination while pregnant. Medical history was none. Concomitant medication included ongoing ascorbic acid, betacarotene, calcium carbonate, colecalciferol, docosahexaenoic acid, ferrous fumarate, folic acid, nicotinamide, pyridoxine hydrochloride, riboflavin, thiamine mononitrate, tocopheryl acetate, vitamin b12 nos, zinc oxide (PRENATAL MULTIVITAMIN + DHA, Prenatal Multi + DHA), one soft gel, every morning as prenatal medication. The reporter was asking for recommendations for her in taking the second dose as she

reported to be diagnosed positive for COVID last 01Jan2021 after showing symptoms on 31Dec2020. She received the first dose of the vaccine last 23Dec2020. She is asking if she should wait 90 days before taking the 2nd dose. Agent has a physical therapist on the phone. She had her first dose of the COVID vaccine on 23Dec2020. She started to show symptoms of COVID on 31Dec2020. She tested positive on 01Jan2020. Caller wants to know does she need to wait 90 days for the second dose. Caller wanted to add she is pregnant as well. She declined to include a healthcare professional for the report. The caller states she started to feel symptoms towards the end of the day on 31Dec2020. She clarifies she felt like she was having a cold coming on. She had some congestion. When probed for outcome, caller stated it had improved quite a bit. She had been improved but today, its kind of like she had a cold again, but that had improved. Vaccination Facility Type: Hospital. Vaccine Administered at Military Facility: No. Prior Vaccinations (within 4 weeks): None within 4 weeks. Additional Vaccines Administered on Same Date of the Pfizer Suspect: None. Relevant Tests: None. Investigation Assessment: Yes. Is a sample of the product available to be returned, if requested (Y/N): Vaccine was administered in hospital. No AE required a visit to emergency room and physician office. The reporter stated her symptoms have been pretty mild. The patient underwent lab tests and procedures which included COVID Fast-acting (rapid) test: positive on 01Jan2021. Outcome of events was recovering.; Sender's Comments: Based on available information, a possible contributory role of suspect BNT162B2 cannot be completely excluded

She did a rapid antigen test and was positive; She did a rapid antigen test and was positive; her arm hurt after vaccination; she lost taste; This is a spontaneous report from a contactable Consumer. An adult female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 04Jan2021 at single dose for COVID-19 immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. Friend shared that the patient's arm hurt after vaccination and the following day she lost taste. She did a rapid antigen test and was positive. Adverse event start date was 04Jan2021. No treatment was received for the adverse event. AE resulted in doctor or other healthcare professional office/clinic visit. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had been tested for COVID-19. Test name: antigen (positive). Outcome of the events was not recovered. Information on the lot/batch number has been requested.

"Received the Pfizer COVID-19 on 21Dec2020. I got Covid from a family member, sore throat, felt like a flu or bad cold,headache, body aches and sinus issue. She now has congestion and cough; Received the Pfizer COVID-19 on 21Dec2020. I got Covid from a family member, sore throat, felt like a flu or bad cold,headache, body aches and sinus issue. She now has congestion and cough; This is a spontaneous report from a contactable health care professional nurse, the patient. A female patient (nurse) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 21Dec2020 as a single dose for COVID-19 vaccination. The patient had no known medical history. The patients concomitant medications were not reported. On an unspecified date the patient experienced I got Covid from a family member. She reported being symptomatic on 1Jan2021 started with a sore throat, felt like a flu or bad cold. She reported sore throat, headache, body aches and sinus issue. She now has congestion and cough. She had no issue when she got the vaccine. The patient will be getting the second dose 11Jan2021 and she would like to know if she is eligible to receive the second dose Pfizer Covid-19

Vaccine. The clinical outcome of the event was unknown . Information on the Lot number has been requested.; Sender's Comments: The reported ""got COVID from a family member"" after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration."

received the vaccine on December 17th and tested positive for Covid on December 27th/COVID PCR (polymerase chain reaction) test: positive on 28Dec2020; received the vaccine on December 17th and tested positive for Covid on December 27th/COVID PCR (polymerase chain reaction) test: positive on 28Dec2020; This is a spontaneous report from a Pfizer sponsored program Pfizer First Connect. A contactable nurse (patient) reported that a 65-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK5730), via an unspecified route of administration on 17Dec2020 11:00 in left deltoid at single dose for covid-19 immunization. Medical history included thyroid cancer from an unknown date and unknown if ongoing, bilateral thyroidectomy in 2014. Family Medical History: Father died of lung cancer. Mother died of cardiac arrest in 1972. Concomitant medication included levothyroxine sodium (SYNTHROID) for bilateral thyroidectomy. The patient received the vaccine on 17Dec2020 and tested positive for covid on 27Dec2020. The adverse events resulted in emergency room visit. The patient underwent lab tests and procedures which included tested positive for COVID on 27Dec2020, COVID PCR (polymerase chain reaction) test: positive on 28Dec2020. Vaccination facility type was hospital. No additional vaccines administered on same date of Pfizer suspect. Received COVID Vaccine on 17Dec2020. Tested positive for COVID in emergency room on 27Dec2020. Tested positive on a COVID PCR test on 28Dec2020. Prior vaccinations within 4 weeks was none. Caller received the first dose of the COVID Vaccine. Tested positive for COVID on 27Dec2020. Is about to get the second dose of COVID Vaccine and would like to know if she should proceed or wait. Since quarantine, she has had no fever. Is slightly short of breath and has a headache. Works in COVID units in a hospital. Wants to make sure she can receive the second dose. Stated she had no adverse reaction to the COVID Vaccine unless an adverse reaction can occur two weeks after. Is attributing the shortness of breath and headache to testing positive for COVID. Shortness of breath and headache only occurred after testing positive for COVID. Reason she went to the hospital is because she lost her sense of smell. She got tested and was positive for COVID. Lost sense of smell, went to Emergency Room, and notified doctor of positive test the following day, 28Dec2020. Clarified she just went to the emergency department to get tested for COVID and then went home. Was called with positive results in an hour. Caller wanted to know when she should proceed with getting her second dose of Covid vaccine. She is supposed to receive her second dose tomorrow. She thought she was going to take second dose when I completely recovered. Caller asked if she waited until the 13th to receive second dose of Covid vaccine, would it be effective. She would feel more comfortable doing that. The outcome of events was unknown.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported COVID-19 based on the known safety profile. However the short duration of 9 days since the vaccine first dose is given it is unlikely patient would have fully developed immunity.

"Felt like he couldn't breath; He still has his sense of taste, but it is dulled; Recently got the vaccine and also came down with covid; Recently got the vaccine and also came down with covid; Exhaustion/feeling

tired; Loss of smell; Mild congestion/The congestion went into full nasal drainage; This is a spontaneous report from a contactable pharmacist (patient). A 30-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL0140, Expiry Date: 31Mar2021), via an unspecified route of administration on 31Dec2020 13:00 at single dose for Covid-19 immunization. The patient had no relevant medical history and concomitant drug. The patient experienced recently got the vaccine and also came down with covid on 04Jan2021 00:30, mild congestion/the congestion went into full nasal drainage on 31Dec2020, loss of smell on 02Jan2021, exhaustion/feeling tired on 03Jan2021, felt like he couldn't breathe, he still has his sense of taste, but it is dulled on an unspecified date. He was a pharmacist. He received his first dose of the COVID vaccine on Thursday 31Dec2020 1pm. Shortly thereafter, he got the typical side effects of the vaccine that are posted. Then 2.5 days letter he no longer had a sense of smell. Everything he read said that he probably came in contact with COVID prior to administration. His questions was since he test positive for COVID, should he still get the second shot. He got it at a clinic. He did experience mild congestion which started by 6 o'clock. He started to notice slight congestion that kind of went away. Then, on Friday, about 24 hours later, he really noticed he had congestion. He took pseudoephedrine hydrochloride (SUDAFED) and paracetamol (TYLENOL). Then his sense of smell diminished with the congestion and felt like he couldn't breathe. On Saturday, he decided to not take medication. That was when he noticed he could not smell anything. He had full blown congestion. It probably took two days when he started to lose his sense of smell. He received the shot on Thursday. On Saturday, he lost his sense of smell. He still has his sense of taste, but it was dulled. Sunday, he was just exhausted and feeling tired. These were all listed as typical side effects except for the loss of smell. Saturday was the worst. The congestion went into full nasal drainage. On Sunday he had no sinus issues. He still hasn't gained his sense of smell back. The exhaustion set in Sunday 03Jan2020. He doesn't feel like any of the side effects are serious. The exhaustion has started to let up some so it is improving. He was pretty much back to normal. He just couldn't figure out why he had a loss of smell. He had a COVID rapid test on 04Jan2021 at 8:30 am (as reported). He received an alert and hour later that it was positive. He was wondering whether the loss of smell could be from the vaccine. The patient underwent lab tests and procedures which included COVID-19 rapid POC test: positive on 04Jan2021. The outcome of events for mild congestion/the congestion went into full nasal drainage was resolved on 03Jan2021, for loss of smell was not resolved, for exhaustion/feeling tired was resolving, for other events was unknown. The events were reported as non-serious.; Sender's Comments: Reported event ""recently got the vaccine and also came down with covid"" is considered possibly related to suspect BNT162B2 based on temporal association and known drug safety profile."

"Doctor had the 1st dose last 16Dec2020 then tested positive for COVID 17Dec2020; Doctor had the 1st dose last 16Dec2020 then tested positive for COVID 17Dec2020; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect, received from a contactable physician (patient). A male patient of an unspecified age started to the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), unspecified route of administration on 16Dec2020 as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The physician inquired ""is it recommended to receive the 2nd dose despite having antibodies and recovered from COVID?"" The doctor had the 1st dose on 16Dec2020 then tested positive for COVID

17Dec2020. He will receive the 2nd dose tomorrow 06Jan2021 and he was recovering. The patient underwent lab tests and procedures which included COVID test: result positive on 17Dec2020. Outcome of the event doctor had the 1st dose last 16Dec2020 then tested positive for COVID 17Dec2020 was recovering. Information on the lot/batch number has been requested.; Sender's Comments: The reported tested positive for COVID after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration."

"he received his first dose of the vaccine on 22Dec2020 and tested positive for Covid yesterday (04Jan2021).; he received his first dose of the vaccine on 22Dec2020 and tested positive for Covid yesterday (04Jan2021).; This is a spontaneous report from a contactable other healthcare professional (patient). A male patient of an unspecified age started to the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), unspecified route of administration on 22Dec2020 as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. He received his first dose of the vaccine on 22Dec2020 and tested positive for COVID yesterday (04Jan2021). He stated his ""symptoms were general at first, then weakness after 10 days, chilly and muscle strain"". The other HCP reported ""do I need to take the second dose on 11Jan2021?"" The patient underwent lab tests and procedures which included COVID test: result positive on 04Jan2021. Outcome of the event he received his first dose of the vaccine on 22Dec2020 and tested positive for COVID yesterday (04Jan2021) was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The reported positive test for Covid after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration."

she had COVID symptoms; she had COVID symptoms; chills; low grade fever; muscle joint pain; muscle joint pain; exhausted with a headache/ She doesn't want to get up she is tired; exhausted with a headache/slight headache; muscle joint pain which is a stabbing pain all over her body; feeling unwell; This is a spontaneous report from a contactable nurse (patient). A 47-year-old female patient receive first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899, manufacturer: Pfizer), via an unspecified route of administration on 04Jan2021 14:00 at single dose for Covid-19 immunization. Medical history included ongoing childhood asthma, COVID 19 positive from 07Dec2020 to an unknown date. There were no concomitant medications. The patient felt like she had covid symptoms, chills, low grade fever, muscle joint pain, exhausted with a headache/ she doesn't want to get up she was tired, muscle joint pain, which was a stabbing pain all over her body, feeling unwell, all on 05Jan2021 05:00. The events were reported as non-serious. Caller had Sars-COV-2 infection diagnosed 07Dec2020. Received first dose of vaccine 04Jan2021 at 14:00. She was experiencing chills, low grade fever, muscle joint pain, exhausted with a headache. Asking for information on efficacy of second dose. She didn't have any side effects or anything initially. Then, 12 hours later at 5- 6 am she felt like she had COVID symptoms. She already had COVID so she known what it feels like. She was wondering how long would last. It was almost like having real COVID. She didn't have a prescribing doctor. She had COVID 07Dec2020. She was currently experiencing Chills, fever low grade, muscle joint pain which was a stabbing pain all over her body, and she was feeling unwell. She didn't want to get up

she was tired. She has a slight headache. This all started at 5 am on 05Jan2021. Even with medication. She has been taking paracetamol (TYLENOL) and excedrin. She cannot work if she wanted to, but these effects are not serious. Her fever has went down. The chills have stayed the same. She was diagnosed with childhood asthma. Caller asked about interval information between the SARS-COV-2 infection diagnosed 07Dec2020 and her first dose of vaccine 04Jan2021 at 14:00. The outcome of events for felt like she had covid symptoms was unknown, for low grade fever was resolving, for other events was not resolved.; Sender's Comments: There is not a reasonable possibility that event suspected COVID-19 is related to BNT162B2. There is no test done to confirm whether patient got COVID-19 or not. And symptoms that were suspected by reporter as due to COVID-19 occurred one after the vaccination, when vaccine was not expected to achieve the effect.

he tested positive for COVID; he tested positive for COVID; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs) from a contactable physician (patient). A 73-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on the right deltoid on 28Dec2020 09:30 at single dose for COVID-19 immunization. Medical history included diabetic (he is a diabetic, but he is not on medication for it) from Nov2018 and ongoing, hepatitis (not ongoing) (He had hepatitis virus for 15 to 20 years. It resolved 5 or 6 years ago. It corrected on it's own), supplement, hypertension and carcinoma of the lung. Everyone in his family has hypertension. His sister had carcinoma of the lung. There was no history of all previous immunization with the Pfizer vaccine considered as suspect. The patient did not have additional vaccines administered on same date of the Pfizer suspect. There were no prior vaccinations within 4 weeks. There were no adverse events following prior vaccinations. Concomitant medication included doxazosin mesilate (CARDURA), bisoprolol fumarate, hydrochlorothiazide (ZIAC), nystatin (STATIN) taken for lipids, colecalciferol (VITAMIN D) taken for supplement, fish oil, acetylsalicylic acid (BABY ASPIRIN), vitamin C [ascorbic acid]. The patient also received multivitamin. He has been on all concomitant medications for at least three to four years. The patient was scheduled for the next dose on 18Jan2021. On 05Jan2021 he tested positive for COVID. The event was reported as serious as medically significant. The patient was given the antibody infusion and steroid injection. It was outpatient. He was not admitted. Treatment was received for the events. The outcome of the events was unknown. Information on lot number/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. However individuals may not be protected until at least 7 days after their second dose of the vaccine.

she previously had a SARS-Cov-2 infection; she previously had a SARS-Cov-2 infection; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunisation. Caller just had wisdom teeth extracted and was currently on antibiotics. She stated she previously had a SARS-Cov-2 infection on an unspecified date. Outcome of SARS-Cov-2 infection were unknown. Information on the lot/batch number has been requested.

following the receipt of the first dose of the COVID-19 vaccine; testing positive to COVID; This is a spontaneous report from a non-contactable other Healthcare Professional reported for herself. A female

patient of an unspecified age (Age: 47, Unit: Unknown) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 20Dec2020 at single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient explained testing positive to COVID on the 29Dec2020, following the receipt of the first dose of the COVID-19 vaccine on the 20Dec2020. She stated that minor symptoms remain, and asked if she could receive the second dose of the vaccine due on the 10Jan2021. The outcome of the events was not reported. No follow-up attempts are possible; information about lot/ batch number cannot be obtained.; Sender's Comments: The reported testing positive to COVID after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

"Flu-like symptoms; Cold symptoms; tested positive for SARS-COV-2 infection; tested positive for SARS-COV-2 infection; muscle and body aches; muscle and body aches; loss sense of taste; Congestion nasal; Sore throat; Loss of smell; Sinus pressure; Headache; general fatigue; This is a spontaneous report from a contactable consumer (patient). A 28-year-old female patient received BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE) Batch/lot number: EJ1685, via an unspecified route of administration on 17Dec2020 16:00 at single dose for COVID-19 immunisation. Medical history was none. There were no concomitant medications. The patient got the COVID Vaccine and the day after, was exposed to the virus, got sick right away and tested positive for the virus. The patient stated that she got vaccinated around 4pm, 17Dec2020. She was exposed to the virus by the same coworker twice on 18Dec2020 and then the next week, she believed, on 22Dec2020, the coworker tested positive for COVID. Patient stated that her symptoms started 24Dec2020. She did not think she had a fever as she did not feel feverish. She had flu like symptoms from an unspecified date with muscle and body aches from 25Dec2020. She lost her sense of taste and smell from 25Dec2020. She had cold-like symptoms from an unspecified date with congestion nasal and sore throat from 25Dec2020, sinus pressure and headaches from 24Dec2020. She had general fatigue from 24Dec2020 for a while. Patient had not had another COVID test since the one she had 28Dec2020, when she tested positive for COVID. She became symptoms-free on 03Jan2021. Patient was asking should she still get the 2nd dose of the COVID Vaccine. She was also concerned about the reaction her body was going to have to the vaccine after being sick. The patient had recovered from Flu-like symptoms and Cold symptoms on an unspecified date, recovered from muscle and body aches on 29Dec2020, recovered from loss sense of taste and loss of smell on 31Dec2020, recovered from congestion nasal, sinus pressure and headache on 03Jan2021, recovered from Sore throat on 01Jan2021, recovered from general fatigue on 02Jan2021. And outcome of ""tested positive for COVID after receiving the COVID Vaccine"" was unknown."

He received the 1st dose of the vaccine on Friday 18DEC2020. He developed COVID the following Thursday.; He received the 1st dose of the vaccine on Friday 18DEC2020. He developed COVID the following Thursday.; This is a spontaneous report from a contactable Physician (patient's wife). A 55-year-old male patient received the 1st dose of bnt162b2 (BNT162B2) on 18Dec2020 at single dose for Covid-19 immunisation. The patient medical history and concomitant medications were not reported. The patient experienced developed Covid on 24Dec2020 (reported as the following Thursday). The patient underwent lab tests and procedures which included Sars-Cov-2 test: developed Covid. He was

fairly symptomatic for 7 days but he was doing well now. The outcome of events was recovering. The reporter quereide whether he should receive the 2nd dose, which is due on 08Jan2021 or should it be deferred. Information on Lot/Batch number requested.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported positive Sars-Cov-2 test, which is considered ineffective of BNT162B2, and the administration of BNT162B2.

began having Covid symptoms on 24Dec and tested positive for Covid on Christmas; began having Covid symptoms on 24Dec and tested positive for Covid on Christmas; Arm was sore; This is a spontaneous report from a contactable physician reported for herself. A 55-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730), via an unspecified route of administration on 17Dec2020 at single dose for COVID-19 vaccination. Medical history was not reported. There were no concomitant medications. Patient had arm sore on 18Dec2020. She started having COVID symptoms on 24Dec2020. She tested positive on Christmas, 25Dec2020. She was asking if she should get the second vaccine. When she got the vaccine she didn't pay attention to the paperwork. She was busy. Her arm was a little sore for a day that was the only reaction she had. She was hoping when she developed COVID symptoms that she was not sick. She was not hospitalized, and she is wondering if maybe the vaccine helped her not get as sick, and not end up in the hospital. It was the first dose she received. She has no other medical conditions. All the previous agent did was read off information to her. It sounds to her like she should go ahead and get the second dose. Outcome of event Arm was sore was recovered in 19Dec2020, of others was unknown.; Sender's Comments: Based on available information, a possible contributory role of BNT162B2 vaccine cannot be completely excluded for reported events.

developed covid like symptoms a few days later/ tested positive on the 26th; developed covid like symptoms a few days later/tested positive on the 26th; This is a spontaneous report from a contactable physician. A patient of unspecified age and gender received the first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 18Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the vaccine on 18Dec2020 and developed covid like symptoms a few days later in Dec2020 and believed the patient was likely exposed. The patient was tested positive on 26Dec2020. The outcome of the events was unknown. Information about Lot/Batch number has been requested.; Sender's Comments: The reported covid like symptoms a few days with tested positive after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

tested positive for the COVID-19 virus; tested positive for the COVID-19 virus; This is a spontaneous report from a contactable nurse. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient was tested positive for the COVID-19 virus on an unspecified date after being administered with the vaccine. The outcome of the event was unknown. Information on Lot/Batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further

information like confirmative virus genome /nucleic acid detection is needed for meaningful medical assessment. ,Linked Report(s) : US-PFIZER INC-2021005630 same reporter and drug, different patient and event

"was tested and diagnosed positive for the SARS-CoV-2 infection; was tested and diagnosed positive for the SARS-CoV-2 infection; developed symptoms after being exposed at work on 27Dec2020; This is a spontaneous report from a contactable nurse. A male patient (reporter's husband) of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) as the first dose via an unspecified route of administration on 22Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient got exposed as a first line nurse working in the emergency room. The nurse reports that her husband developed symptoms after being exposed at work on 27Dec2020 five days after being administered with the first dose of BNT162B2 and he was tested and diagnosed positive for the SARS-CoV-2 infection on 27Dec2020. The outcome of the events was unknown. Information about Lot/batch number has been requested.; Sender's Comments: There is not a reasonable possibility that reported ""tested and diagnosed positive for the SARS-CoV-2 infection"" is related to BNT162B2. Event occurred only 5 days after receiving first vaccine and patient was exposed to virus at work."

positive COVID test result; positive COVID test result; cough; This is a spontaneous report from a contactable consumer reporting for herself. A 49-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE) (lot number/expiration date: not provided), via an unspecified route of administration, on 16Dec2020 (at the age of 49 years old) as a single dose for COVID-19 vaccination. Relevant medical history and concomitant medication were not provided. On 21Dec2020, the patient experienced a strange cough. The patient reported that she received the first dose of COVID vaccine on 16Dec2020 and that she was then exposed to her husband who tested positive on 17Dec2020. Due to a strange cough, she was tested on 21Dec2020, which resulted in a positive COVID test result. The outcome of the events strange cough and positive COVID test was unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.

Developed covid symptoms 21Dec, tested positive 26Dec; Developed covid symptoms 21Dec, tested positive 26Dec; This is a spontaneous report from a contactable physician reporting for a patient. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 18Dec2020 as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient developed COVID symptoms 21Dec2020, tested positive 26Dec2020. The outcome of the event was unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. However individuals may not be protected until at least 7 days after their second dose of the vaccine.

received the first dose of the Pfizer COVID vaccine on 28Dec2020 and tested positive for COVID 03Jan2021 (nasal swab) & symptomatic; received the first dose of the Pfizer COVID vaccine on

28Dec2020 and tested positive for COVID 03Jan2021 (nasal swab) & symptomatic; This is a spontaneous report from a contactable Nurse (patient). A female patient of unspecified age received BNT162B2 (Pfizer, lot number: EL0140) first dose on 28Dec2020 at single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. Patient was tested positive for COVID 03Jan2021 (nasal swab) & symptomatic, her second dose of the vaccine is scheduled 18Jan2021. She was wondering if she still get the second dose. The outcome of the events was unknown.; Sender's Comments: The reported tested positive for COVID (nasal swab) & symptomatic after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

within 6 hours experienced severe chills and covid-like symptoms, she also tested positive for COVID-19; within 6 hours experienced severe chills and covid-like symptoms, she also tested positive for COVID-19; This is a spontaneous report from a contactable nurse. A 30-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were not reported), via an unspecified route of administration in left arm on 04Jan2021 11:30 at a single dose for COVID-19 vaccination. Medical history included allergies to Sulfa diagnosed in 2008, Allergies to Strawberries diagnosed when she was very young, Diamox allergy diagnosed in 2008, dyslexic, and Obesity but never been treated. Concomitant medication included levothyroxine (LEVOTHYROXINE), ascorbic acid, betacarotene, calcium sulfate, colecalciferol, cyanocobalamin, ferrous fumarate, folic acid, nicotinamide, pyridoxine hydrochloride, retinol acetate, riboflavin, thiamine mononitrate, tocopheryl acetate, zinc oxide (PRENATAL VITAMINS), zinc (ZINC), nd cetirizine hydrochloride (ZYRTEC). The patient previously took diamox [acetazolamide] and experienced drug hypersensitivity. Patient received first dose Monday, 04Jan2021, then she experienced severe chills and Covid like symptoms. Apparently, she tested positive for COVID 19. She ws not sure if it was a false positive or if she actually has COVID, but was concerned because her husband has cancer and was immunocompromised. Literally, she got the vaccine because her OB/GYN told her she needs to get it as soon as possible. She did blood work and she tested negative for pregnancy. There was no prescriber as it was given as part of her work. Fifteen minutes after receiving the vaccine, she had the worst headache she has ever had in her life. Six hours after that, she had such bad chills. That night, it worsened and it got better every hour when she took something. She said her congestion was still present. She stated she took Tylenol and hour later and it subsided. The outcome of the events was not recovered. The patient underwent laboratory date including negative antibodies on an unknown date, blood work on Mar2020 with unknown result, then on 05Jan2020 tested positive to COVID 19 by saliva test at 09:15 and nasal test at 11:30 Information about Lot/batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available

patient got the first dose of the COVID vaccine on 18Dec2020/was positive via COVID PCR test on 26Dec2020; patient got the first dose of the COVID vaccine on 18Dec2020/was positive via COVID PCR test on 26Dec2020; had a COVID exposure on 23Dec2020; This is a spontaneous report from a contactable physician. A patient of unspecified age and gender received the first dose of bnt162b2

(PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiration date not provided), via an unspecified route of administration on 18Dec2020 at single dose for COVID-19 immunization. Patient's medical history was not reported. Concomitant medication included chemotherapy. It was reported that patient got the first dose of the COVID vaccine on 18Dec2020 and then had a COVID exposure on 23Dec2020 and was positive via COVID PCR test on 26Dec2020. It was mentioned that patient is a chemotherapy patient. The patient was given the antibodies for COVID on 28Dec2020 and the patient is currently doing well. Reporter's question was that the patient was scheduled to get the second dose of the vaccine on 08Jan2021 and the reporter is wondering if given this patient's situation, is it safe for the patient to receive the second dose or if there are any recommendations on when the patient should receive the second dose. Outcome of the events was recovering. Information on the lot/batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and SARS-CoV-2 test positive cannot be totally excluded. The case will be reassessed if additional information becomes available.

tested positive for covid; tested positive for covid; This is a spontaneous report from a contactable consumer. A 35-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration at the left upper arm on 18Dec2020 15:30 at a single dose for COVID-19 immunisation. Medical history included high blood pressure and had electrocardiogram (EKG) unknown result a week before vaccination in Dec2020. Concomitant medication included acetylsalicylic acid (ASPIRIN), lisinopril, and guaifenesin (MUCINEX). It was reported that patient tested positive for COVID on 31Dec2020. She has not gotten her second dose but it was scheduled for 08Jan2021 for which will still be in quarantine then and requested guidance on when/if she should get the second dose. Patient explained her parents have COVID and that the rapid test for the COVID test was how she found out she had COVID. The patient has not recovered from the events.

Developing symptoms of covid/ symptoms of Covid after having the vaccine; Developing symptoms of covid/ symptoms of Covid after having the vaccine; This is a spontaneous report from a contactable consumer (patient) via a Pfizer-sponsored program. A 31-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection) lot number: EJ1688, via an unspecified route of administration in the left arm, on 21Dec2020 at a single dose for covid-19 immunisation as she works with disabled people and for general community health. Patient's medical history was none. Family history included her kids/children had covid (unknown if ongoing). There were no concomitant medications. It was reported that the patient had symptoms of covid after having the vaccine with outcome of recovering. The patient received the first dose of covid vaccine on 21Dec2020 and on the 02Jan2021 she started developing symptoms of covid. She mentioned that her children have virus and she had the covid test done. She wanted to know if she can get the second dose of the vaccine. She queried for her co-worker who has the Covid and was told to not take the vaccine yet and how long they need to wait. She was tested this morning. She has not gotten the results. Her kids had Covid and she felt certain she had it because she has symptoms. It comes and goes. It was better during the day and worse at night. She received the vaccine because she works with disabled people where

there are extremely high numbers of the virus. She also got it for general community health. The Covid test was done on 06Jan2021 with unknown result.

had a positive Covid test after receiving the vaccine; had a positive Covid test after receiving the vaccine; This is a spontaneous report from a contactable nurse (patient) via a Pfizer Sponsored program, Pfizer First Connect. A 30-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection) lot number: EH9899, intramuscular in the left arm, on 18Dec2020 at 0.3 mL, single dose for COVID-19 immunization. Medical history included was none. There were no concomitant medications. The patient had a positive Covid test after receiving the vaccine with outcome of unknown. It was reported that the patient got the first dose of the vaccine on 18Dec2020, and tested positive on 28Dec2020 due to some exposure. She asked for any recommendations on the second dose whether or not she could get it. She is scheduled to get it this weekend. The reporter considered the event as non-serious and unrelated to the use of the vaccine.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 virus test positive cannot be totally excluded. The case will be reassessed if additional information becomes available.

He tested positive last Tuesday for SARS-Cov-2; He tested positive last Tuesday for SARS-Cov-2; This is a spontaneous report from a Pfizer Sponsored Program, Pfizer First Connect via a contactable other health professional (HCP) (patient). A male patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 18Dec2020 at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. The patient tested positive last Tuesday (05Jan2021) for SARS-Cov-2 and the patient wanted to know if he could receive his second dose of vaccine. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further information like confirmative virus genome /nucleic acid detection is needed for meaningful medical assessment.

she received the COVID-19 vaccine and the next day she tested positive for the viral infection; she received the COVID-19 vaccine and the next day she tested positive for the viral infection; This is a spontaneous report from a contactable consumer (patient) from a Pfizer sponsored program Pfizer First Connect. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 05Jan2021 at single dose for COVID-19 immunisation. The patient medical history and the concomitant medications were not reported. The patient was tested on 02Jan2021, and did not get the results till 06Jan2021 and tested positive. The patient wanted to know if she could have any side effects if she received the COVID-19 vaccine and the next day she tested positive for the viral infection. She is unsure of when she contracted the infection. The outcome was unknown. Information on the lot/batch number has been requested.

chest tightness; palpitations; elevated heart rate; fatigue; This is a spontaneous report from a contactable Other HCP. A 37-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19

VACCINE), via an unspecified route of administration on 31Dec2020 at single dose for covid-19 immunisation. Medical history included Dermatographia. The patient is allergic to Penicillin, lactose, Cephalosporins and Beepen-VK. There were no concomitant medications. Seventy two hours after the vaccine was given the patient had an elevated heart rate, chest tightness and fatigue. Are this consistent with the vaccine. She does not have a history of elevated heart rate or palpitations. She checked her heart rate with her Apple watch and sent in a strip to the doctor. The doctor is concerned and is asking if this is related. She went to the ER to make sure she was ok but was not admitted. Outcome of event heart rate increased as recovered on 05Jan2021, of fatigue was not recovered, of others was recovering. Information about Lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of elevated heart rate, chest tightness, palpitations and fatigue due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including 12-lead EKG , counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

if a patient experienced an allergic reaction to the first dose is there anything prophylactically needing to be done when administering the second dose of the Covid vaccine; delayed hyper sensitive reaction; Angioedema; Urticarial rash; This is a spontaneous report from a contactable other hcp. A 47-years-old male patient received first dose of bnt162b2 (BNT162B2), unknown on 18Dec2020 (lot number: EK5730) at SINGLE DOSE for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. Caller is a Physician Assistant. Caller states that she is calling about the Covid Vaccine. She had a patient received his first dose of the vaccine on Friday 18Dec2020, 3 days later on 21Dec2020 he had an urticarial rash that persisted, The urticarial rash was treated with prednisone and resolved by 27Dec2020, it has not reoccurred. The allergist said it was a delayed hyper sensitive reaction that was Prompted by the immune simulation from the vaccine. The Patient was treated for the urticaria. Caller would like to know if a patient experienced an allergic reaction to the first dose is there anything prophylactically needing to be done when administering the second dose of the Covid vaccine? Caller is very upset and frustrated and stating she wants to speak to someone that is a clinician with the clinical trial team who can give her recommendations for a specific patient. Caller asks if they should do Prophylaxis with antihistamines for the second dose. He did not have anaphylaxis but he had angioedema. Caller states that she did a Vaers report on 22Dec2020, but no one contacted her. He started taking Zyrtec and Vistaril. The Allergist said it was fine and he will still need the 2nd Booster Dose. The Angioedema started on 22Dec2020, it was also treated with prednisone, in addition to being administered Benadryl IM, and Vistaril. The outcome of the event urticarial rash was recovered on 27Dec2020 and Angioedema was recovered on 22Dec2020. No follow-up attempts are needed; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the angioedema and the other reported events due to

temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including serum tryptase level and complement panel, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Angioedema; Tongue numb observer notified about 10 minutes after vaccine, then tongue and Lower lips numb; tachycardia with throat tightness; tachycardia with throat tightness.; This is a spontaneous report from a contactable nurse (patient). The 37-years-old female patient received first dose of bnt162b2 (BNT162B2, Lot number: EK9231), unknown on 05Jan2021 07:45 at SINGLE DOSE on left arm for COVID-19 immunisation. The patient is not pregnant. No covid tested post vaccination. Medical history included Idiopathic angioedema, HTN, PCOS, Allergies to medications, food, or other products: Latex, penicillin, coconut. Prior to vaccination, the patient was diagnosed with COVID-19. Concomitant medication included spironolactone (ALDACTONE), fexofenadine hydrochloride (ALLEGRA), hydrochlorothiazide, amlodipine besilate (NORVASC). The patient did not take other vaccine in four weeks. The patient experienced Angioedema event occurred approximately 18 hrs later with repeat of treatment in ER on 06Jan2021, tongue numb observer notified about 10 minutes after vaccine, then tongue and lower lips numb on 05Jan2021 08:00, taken to ER became tachycardia with throat tightness on 05Jan2021 08:00. EPIPEN administered, benadryl and prednisone (steroids), and famotidine administered along with a saline bolus. The outcome of the events was recovered. No follow-up attempts are needed.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the angioedema and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including complement levels, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"extremely bad dry mouth; lips were going numb; facial numbness; rash from his neck to his nipple line; BP was 180/110 / BP stayed around 160/100; felt an ""amped"" feeling; felt flush; uncomfortable; This is a spontaneous report from a contactable healthcare professional. A 44-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number/expiration date unknown), dose number 1, intramuscularly on 21Dec2020 14:00 at a single dose on the right arm for COVID-19 immunization. Medical history included gluten allergy with causes dermatitis herpetiformis, osteoporosis, and fibromyalgia. The patient previously took Benadryl and experienced allergies. Concomitant medications were not reported. The patient reported that immediately after receiving

vaccine on 21Dec2020, he felt an ""amped"" feeling and felt flush. It was uncomfortable but not alarming at first. About ten minutes after shot, he started to have extremely bad dry mouth. He went back to work, but he went back downstairs after feeling like he was getting seriously ill and his lips were going numb. His BP was 180/110. The facial numbness went away but his BP stayed around 160/100. He was asked to go to ER, but he refused because he would have to pay for it and he was feeling better. He also noticed after going back upstairs that he had a rash from his neck to his nipple line. The doctor asked for Benadryl, but he was not given due to possible Benadryl allergy. He went home and his BP returned to normal 2 hours later. The patient was not diagnosed with COVID-19 prior to vaccination, and was not tested for COVID-19 since the vaccination. The outcome of the events was recovered in 21Dec2020 for blood pressure increased and facial numbness, and recovered on an unspecified date for the other events. Information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the BP increased and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including EKG and chemistry panel, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

crystals in her urine; muscle pain; joint pain; flu like symptoms/feeling like she has the flu; having no energy; feeling tired/Tiredness; kidney stone; pain in her back; did not feel good; This is a spontaneous report from a contactable consumer (patient). A 54-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot EL0140) intramuscular on 31Dec2020 16:00 at a single dose on left arm for Covid-19 prophylaxis. Medical history included rheumatoid arthritis. There were no concomitant medications. The patient wanted to know if she could receive the second dose of the COVID-19 vaccine if she presented the following side effects with the first shot: feeling tired/tiredness on 02Jan2021; having no energy on 03Jan2021; muscle pain, joint pain, and flu like symptoms/feeling like she has the flu, on 04Jan2021. She went to work on Monday and has taken the last couple of days off because she did not feel good on Jan2021. She did have rheumatoid arthritis, but it was different and has not been like this. She went to the doctor on Monday after she got off of work and thought at first maybe she had a UTI; treated herself with AZO, but had a urinalysis that was negative on an unspecified date. She was told some of the pain in her back might have been a kidney stone on Jan2021 because they found crystals in her urine on 04Jan2021, but she did not know about that. She noticed having no energy on Sunday. She wanted to know if it was recommended that she get the second vaccine since she was having side effects. The events required a visit to physician office and did not require a visit to Emergency Room. Prior vaccinations within 4 weeks was noted as none. Family medical history relevant to the events (AE) was noted as none.The outcome of the events of feeling tired/tiredness was not recovered; of having no energy, muscle pain, joint pain, flu like symptoms/feeling like she has the flu was recovering; of the rest of events was unknown.

Left Bell's palsy/left side of face, inability to raise left eyebrow; numbness and paresthesia of tongue; numbness and paresthesia of tongue; pain in left upper arm between elbow and shoulder; tachycardia; elevated blood pressure; This is a spontaneous report from a contactable physician. A 35-year-old female patient (not pregnant at the time of vaccination) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899), intramuscular at arm left on 31Dec2020 at single dose for covid-19 immunization. The vaccine was administered at other (as reported). Medical history included asthma (Allergy induced asthma). Concomitant medication within 2 weeks of vaccination included cetirizine hydrochloride (ZYRTEC) from Dec2020 at 10mg daily. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. On 31Dec2020, the patient experienced Left Bell's palsy, numbness and paresthesia of tongue, left side of face, inability to raise left eyebrow, pain in left upper arm between elbow and shoulder, tachycardia, elevated blood pressure. The adverse events result in emergency room/department or urgent care. The patient received treatment for the adverse events which included Prednisone 20mg daily, Valacyclovir 1000mg twice a day. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient was not been tested for COVID-19. The outcome of events was not recovered.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the Bell's palsy and other reported events due to temporal relationship. However, the Bell's palsy may possibly represent a concurrent medical condition. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including viral serologies, and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Shortness of breath, stridor, migraine for 5 days and 10 days later cellulitis at injection site.; Shortness of breath, stridor, migraine for 5 days and 10 days later cellulitis at injection site.; Shortness of breath, stridor, migraine for 5 days and 10 days later cellulitis at injection site.; Shortness of breath, stridor, migraine for 5 days and 10 days later cellulitis at injection site.; This is a spontaneous report from a contactable Nurse (patient). A 51-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EH9899), intramuscularly on 28Dec2020 14:30 at single dose for covid-19 immunization. Vaccine location was left arm and it was the first dose. The facility type vaccine was hospital. Medical history included migraine from an unknown date. Concomitant medication included erenumab aooe (AIMOVIG), estradiol, diphenhydramine hydrochloride (BENADRYL), trazodone hydrochloride (TRAZODON). No known allergies. Patient was not diagnosed with COVID-19 prior to vaccination nor tested for COVID-19 since the vaccination. The patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced shortness of breath, stridor, migraine for 5 days and 10 days later cellulitis at injection site on 28Dec2020 15:00. Patient received Antibiotics, steroids epi as treatment for the adverse events. The adverse events resulted in Doctor or other healthcare professional office/clinic visit. The outcome of event migraine was recovered in Jan2021, other events was recovered on an unknown date. The events were reported as non-serious.;

Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of Vaccination site cellulitis, shortness of breath, stridor and migraine, due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

to get Botox injection for her Dystonia; got her 1st dose of Covid vaccine last 04Jan and was scheduled to have her 2nd dose on 22Jan; This is a spontaneous report from a Pfizer-sponsored program. A contactable consumer(patient) reported that a 62-year-old female received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 04Jan2021 at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. The patient got her 1st dose of Covid vaccine last 04Jan2021 and was scheduled to have her 2nd dose on 22Jan2021, but she had an appointment 2 days prior this to get botulinum toxin type a (BOTOX) injection for her Dystonia. The patient wanted to know if it's ok for her to get 2nd dose of Covid vaccine after getting botulinum toxin type A. Outcome of the events was unknown.

she tested positive 5 days after taking the first COVID19 Vaccine dose; she tested positive 5 days after taking the first COVID19 Vaccine dose; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiration date were not reported), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. On an unspecified date, the patient tested positive 5 days after taking the first COVID-19 vaccine dose. Outcome of the events was unknown. Information about lot/batch number has been requested.

received first dose of covid vaccine on 19Dec2020 tested positive on 31Dec2020; received first dose of covid vaccine on 19Dec2020 tested positive on 31Dec2020; This is a spontaneous report from a contactable other HCP (patient). A male patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) , via an unspecified route of administration on 19Dec2020 at the first single dose for covid-19 immunisation. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient received first dose of covid vaccine on 19Dec2020 tested positive on 31Dec2020. The outcome of events was unknown. Information about Lot/Batch has been requested.; Sender's Comments: A causal association between reported event and BNT162B2 cannot be excluded.

tested positive for covid19; tested positive for covid19; This is a spontaneous report from a contactable nurse (patient). A 22-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 21Dec2020 at single dose for COVID-19

immunization. The patient medical history and concomitant medications were not reported. The patient received vaccine 1st dose on 21Dec2020 and on 29Dec2020 she tested positive for covid19. She is coming up on 2nd dose on Friday (will be out of quarantine on the same day), she asked if she should get the vaccine. Her primary care physician advised her not to receive, within 30 days because there had been reports of people having reactions (ie: high fevers) to the vaccine. If she has a high fever she can't go to school. She asked if waiting 90 days make the vaccine not as effective and if she need to restart the series. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Test positive for covid19 found 7 day following the vaccination, no adequate effect of the suspect vaccine thus could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag

collapse/rapid progression of symptoms; hypotension/rapid progression of symptoms; respiratory distress with stridor; respiratory distress with stridor; dizziness/rapid progression of symptoms; not limited to abdominal pain/rapid progression of symptoms; blood pressure abnormality/rapid progression of symptoms; chest pain/rapid progression of symptoms; drooling/rapid progression of symptoms; increased swelling/rapid progression of symptoms; wheezing; dyspnea and increased work of breathing; skin changes; tongue swelling and vomiting; tongue swelling and vomiting; This is a spontaneous report from a non-contactable other health professional. A 35-year-old female patient (Age at vaccination: 35) received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK9231), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. During her 15 minute waiting period after the injection, the patient began to experience dizziness. Monitored patient for severe reaction symptoms, including but not limited to abdominal pain, blood pressure abnormality, chest pain, collapse, drooling, hypotension, increased swelling, rapid progression of symptoms, respiratory distress with stridor, wheezing, dyspnea and increased work of breathing, skin changes, tongue swelling and vomiting. Treatment included: no therapy. The outcome of the events was unknown. No follow up attempts are possible. No further information is expected.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the collapse, hypotension, respiratory distress and other reported events due to temporal relationship. There is very limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including BP measurements, chest x-ray, EKG and chemistry panel, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Escherichia Coli infection; This is a spontaneous report from a non-contactable consumer (daughter) from a Pfizer sponsored program Pfizer First Connect. A female patient of unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. Medical history and

concomitant medications were not reported. The reporter's mother has Escherichia Coli infection and is taking Nitrofurantoin antibiotic (Macrodantin). Asked if it is safe to take the second dose of the vaccine while on antibiotic. Caller asking if we could update info regarding antibiotic as even her doctor does not have info on this. Saying that even her doctor is unsure as Pfizer should know information regarding this more than her doctor. Treatment for event was Nitrofurantoin antibiotic (Macrodantin). Outcome of event was unknown. No follow up attempts are possible; Information about lot/batch number cannot be obtained.

"tested positive for Covid; tested positive for Covid; This is a spontaneous report from a contactable physician (patient). A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 20Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient tested positive for Covid on 22Dec2020. She wanted to know if there is any more information on receiving the second dose after testing positive. The outcome of the event was unknown. Information on the Lot/batch number has been requested.; Sender's Comments: Based on the mechanism of action of BNT162B2 vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine was given (in this case 2 days). However, a causal relationship between event ""tested positive with Covid "" (coded to Drug ineffective / SARS-CoV-2 test positive) and BNT162B2 vaccine cannot be completely excluded."

she received the Pfizer-BioNTech Covid-19 Vaccine .She said she tested positive for Covid-19 after being exposed to someone infected with the virus last Christmas; she received the Pfizer-BioNTech Covid-19 Vaccine .She said she tested positive for Covid-19 after being exposed to someone infected with the virus last Christmas; after being exposed to someone infected with the virus; This is a spontaneous report from a contactable Physician (patient). A female patient of an unspecified age receive the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) , via an unspecified route of administration on 18Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient she received the Pfizer-BioNTech Covid-19 Vaccine on 18Dec2020. She said she tested positive for Covid-19 after being exposed to someone infected with the virus last Christmas (25Dec2020). Now, she wanted to know if she can still take the 2nd dose. The outcome of the events was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: A causal association between reported event and BNT162B2 cannot be excluded.

tested positive for covid; tested positive for covid; This is a spontaneous report from a contactable consumer received from a Pfizer-sponsored program Pfizer First Connect. A 64-years-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EH9899, expiry date Mar2021, NDC 59267-1000-1), intramuscular in right arm on 18Dec2020 11:45 at a single dose as prevention. The vaccine was administered in the hospital. Medical history included ongoing cardiomyopathy diagnosed about 32 years ago and had pacemaker defibrillator Placed about 12 years ago. There were no concomitant medications. She was supposed to get the second dose of the Covid vaccine but she was positive for Covid. She found out she was positive for covid on Monday 04Jan2021 after she had a nasal swab test on 02Jan2020. The outcome of the event was unknown.

Bell's Palsy; developed flu like symptoms; This is a spontaneous report from a contactable pharmacist. A female patient of an unspecified age (reported as 32-40) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date in 2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient developed side effects side effects from first vaccine, Bell's palsy 4 days after vaccination (Dec2020) which lasted for 2 weeks and flu like symptoms (Dec2020) which also lasted 2 weeks. The events outcome was unknown. The patient was receiving 2nd dose on 06Jan2021, the reporter asked any information regarding this? Information on the lot/batch number has been requested.; Sender's Comments: Based on a compatible temporal relationship, causality between event Bell's palsy and BNT162B2 vaccine cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Fatigue; tested positive after receiving Covid-19 vaccine; tested positive after receiving Covid-19 vaccine; severely congested; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A contactable consumer (patient) reported that a 47-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EJ1685, Expiry Date: Mar2021) via an unspecified route of administration at right deltoid on 20Dec2020 at single dose for COVID-19 immunization. Medical history included ongoing severe asthmatic diagnosed as a child. There were no concomitant medications. Patient (a front line worker) is Grief Counselor. She tested positive after receiving BNT162B2 on 29Dec2020. She was supposed to get the second dose on 10Jan2021. She was having fatigue since 01Jan2021 and was severely congested since 26Dec2020. She was asking if she should get the second dose. The outcome of the events severely congested and fatigue was recovering, of the other events was unknown.

recently got vaccinated unwillingly knowing she had Covid; recently got vaccinated unwillingly knowing she had Covid; This is a spontaneous report from a contactable Other healthcare professional (HCP) reporting for herself. A female patient of an unspecified age received her first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient recently got vaccinated unwillingly knowing she had covid on an unspecified date. The patient wanted to known if she should get her second dose still and in the same timely manner. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of suspect BNT162B2 cannot be completely excluded for reported event.

she received the first dose of the vaccine on the 22nd of December and tested positive on the 28th; she received the first dose of the vaccine on the 22nd of December and tested positive on the 28th; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A contactable consumer(patient) reported that a female patient of an unspecified age received first dose BNT162B2, via an unspecified route of administration on 22Dec2020 at single dose for COVID-19 immunization. The

medical history and concomitant medications were not reported. The patient received the first dose of the vaccine on the 22nd of December and tested positive on the 28Dec2020, she was scheduled to get the 2nd dose on Jan 12th. The reporter wanted to know if it was safe for her to take the 2nd dose. The outcome of the events was unknown. Information about lot/batch number has been requested.

testing positive for COVID on nasal swab after first dose of COVID vaccine; testing positive for COVID on nasal swab after first dose of COVID vaccine; This is a spontaneous report from a non-contactable pharmacist. A patient of unspecified age and gender received 1st dose of BNT162B2 (reported as COVID vaccine), via an unspecified route of administration on an unspecified date at single dose for Covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient experienced testing positive for Covid on nasal swab after first dose of Covid vaccine on an unspecified date with outcome of unknown. No follow-up attempts are possible. Information about lot/batch number cannot be obtained. Pfizer is a marketing authorization holder of COVID vaccine in the country of incidence or the country where the product was purchased (if different). This may be a duplicate report if another marketing authorization holder of COVID vaccine has submitted the same report to the regulatory authorities.; Sender's Comments: The reported testing positive for Covid on nasal swab after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

She thinks there has been more anaphylactic reactions than usual and said that a physician female friend had experienced one; This is a spontaneous report from a non-contactable Other Health Professional via Pfizer sales representative. A female patient of unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. During a conference call, (Name) mentioned that she thinks there has been more anaphylactic reactions than usual and said that a physician female friend had experienced one. It was unclear whether it was after a Pfizer or Moderna vaccine. She did mention that her friend recovered without any issues. Outcome of event was recovered on an unspecified date. No follow-up attempts are possible. Information about lot/batch number cannot be obtained.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of anaphylaxis cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Tested positive for COVID; Tested positive for COVID; This is a spontaneous report from a Pfizer-sponsored program from a contactable consumer (patient). A 68-year-old female patient received first dose of bnt162b2 (Pfizer BioNTech COVID vaccine), via an unspecified route of administration on an unspecified date at a single dose in left arm for COVID-19 immunization. Medical history included ongoing rheumatoid arthritis, open heart surgery had this done a year ago, knee replacement, and hip

replacement. Concomitant medications included patient took a lot of different medications, but no additional details provided. The test done on Saturday 02Jan2021 and on Sunday 03Jan2021, she got the results that she was positive for COVID. Clinical details: She received the first dose of her COVID vaccine, and she will be due for her second dose on Saturday. However, she tested positive for COVID after getting her first dose. The doctor informed her she should have a COVID infusion. She took the COVID infusion and now after getting the infusion she is told she is not able to get her second dose of the COVID vaccine for 60-90 days. She is not sure what to do. She cannot remember the date she got the COVID vaccine, she knew she is due for her second one on Saturday. She received the COVID infusion this morning, originally she was told she would be able to have a second shot even after getting the COVID infusion. Now they are saying she cannot have the next dose on Saturday. She was told later she would have to wait two weeks. Then she was told she would have to possibly wait 90 days. She was thankful for the vaccine because even though she tested positive it probably kept her from dropping dead. Information on the lot/batch number has been requested.

"got Covid/She tested positive for SARS-Cov-2 04JAN2021; got Covid; This is a spontaneous report from a contactable other healthcare professional (patient). A female patient of an unspecified age received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 21Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient indicated she received her first dose of vaccine 21Dec2020. She tested positive for SARS-Cov-2 04Jan2021. She was asking how she ""got Covid"" and if she should receive the second dose. The outcome of the event was unknown. Information on Lot/Batch number has been requested.; Sender's Comments: The reported tested positive for SARS-Cov-2 after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration."

The day after vaccine administration, pt was still experiencing vertigo, spinning and headache.; The day after vaccine administration, pt was still experiencing vertigo, spinning and headache.; This is a spontaneous report from a non-contactable other healthcare professional (hcp). A 27-year-old female patient receive first dose of bnt162b2 (Pfizer BioNTech COVID vaccine, lot number: EL0140), intramuscularly on 30Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. There is unknown if any other vaccine received in four weeks. The patient experienced the day after vaccine administration, patient was still experiencing vertigo, spinning and headache, all on 31Dec2020 the day after vaccine administration. The outcome of events was unknown. This is a non-serious report. It's unknown if patient was diagnosed with COVID-19 or tested for COVID-19 since the vaccination. The adverse did not result in 'doctor or other HCP visit or emergency room or urgent care, hospitalization or prolongation, life threatening illness, disability or death or congential anomaly'. No follow-up attempts are possible. Information about Lot/Batch cannot be obtained.

anaphylaxis; throat tightening; throat tightening/tingling; throat tightening/tingling/soreness; dry wheezy cough a little dizziness; dizziness; tachycardia; Itching; chills; numb R foot; Low grade temp; h/a today; This is a spontaneous report from a contactable Nurse (patient). A 51-years-old female patient (no pregnant) started to receive bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number el3248),

via an unspecified route of administration on 06Jan2021 11:00 at the first single dose at left arm for covid-19 immunisation. Medical history included supraventricular tachycardia, adrenal insufficiency, hypothyroidism, attention deficit hyperactivity disorder, hypermobility syndrome, developmental hip. Concomitant medication included hydrocortisone, trazodone, levothyroxine sodium (LEVOTHROID), bupropion hydrochloride (WELLBUTRIN). The patient previously took erythromycin, morphine and experienced drug hypersensitivity. The patient experienced anaphylaxis, throat tightening/tingling/soreness, dry wheezy cough a little dizziness and tachycardia. Itching, numb R foot, Low grade temp and chills and headache on 06Jan2021 11:15. Seriousness criteria reported as life threatening. Taken to ER had IV benadryl, solumedrol, pepcid for anaphylaxis. Placed on O2 and given albuterol nebulizer. Had IV fluid bolus. Now on benadryl and 5 days of prednisone. The patient felt completely fine prior to vaccine. The patient underwent lab tests and procedures which included sars-cov-2 test: negative on 06Jan2021. The outcome of events was recovering. No other vaccine in four weeks; No covid prior vaccination.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of anaphylaxis presented as throat tightening/tingling/soreness, dry wheezy cough a little dizziness and tachycardia. Itching, numb R foot, Low grade temp and chills and headache cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The underlying predisposing condition of drug allergies may put the patient at high risk of anaphylactic reactions. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Soreness at injection site started at 1600 Body aches, headache, and low grade fever woke me up around 0100

Patient with Covid between their first and second doses of the Covid vaccine; Patient with Covid between their first and second doses of the Covid vaccine; This is a spontaneous report from a Pfizer-sponsored program from a contactable Pharmacist reported similar events for 2 patients. This is the 2nd of 2 reports. A patient of an unspecified age and gender received the first dose of BNT162B2 (Pfizer/BioNTech Covid-19 vaccine) on an unspecified date for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. On an unspecified date, the patient got Covid between first and second doses of the Covid vaccine. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The association between the event lack of effect (got COVID between first and second doses) with BNT162b2 can not be fully excluded.,Linked Report(s) : US-PFIZER INC-2021011515 same reporter/drug/AE, different patient

patient with covid between their first and second doses of the covid vaccine; patient with covid between their first and second doses of the covid vaccine; This is a spontaneous report from a Pfizer sponsored program IBCC (Inbound Call Center for HCPs). A contactable pharmacist reported similar events for two patients. This is the first case out of 2 cases. A patient of unspecified age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK9231, expiration date: Apr2021, NDC#59267-1000-1), via an unspecified route of administration on an unspecified date at

single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient with Covid between the first and second doses of the Covid vaccine on an unspecified date. The reporting pharmacist wanted to know if the patients with covid between their first and second doses of the covid vaccine what their risk would be, Reportedly 2 different patient. The outcome of the events was unknown.; Sender's Comments: The association between the event lack of effect (COVID between first and second dose) with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2021011471 same reporter/drug/event, different patient..

tested positive and also received the vaccine from COVID-19; tested positive and also received the vaccine from COVID-19; This is a spontaneous report from a Pfizer sponsored program. This contactable physician reported similar events for the physician herself and a patient. This is the second report, the patient report of 2 reports. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. The physician reported there was another person in her clinic that tested positive and also received the COVID vaccine on an unspecified date with outcome of unknown. The information on the batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further information like confirmative virus genome /nucleic acid detection needed for meaningful medical assessment.,Linked Report(s) : US-PFIZER INC-2021000799 Same reporter, same drug, different patients

"did develop COVID that week probably symptoms in general by 25Dec/probably infected whenever got the vaccine; did develop COVID that week probably symptoms in general by 25Dec/probably infected whenever got the vaccine/I don't feel very well right now; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EJ1685), via an unspecified route of administration on 21Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received 1st vaccine on 21Dec2020. The patient did develop COVID that week probably symptoms in general by 25Dec2020. She was probably infected whenever she got the vaccine and the patient was scheduled to have second vaccine on 11Jan2021 which was next Monday and the patient was still sick, should the patient delayed that. The patient also did not feel very well on an unknown date (""right now""). The outcome of the events was not recovered."

"had covid after his first dose; had covid after his first dose; headaches; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect from a contactable Physician. A male patient of an unspecified age received his first single dose of BNT162B2 (Pfizer/ BioNTech Covid-19 vaccine) on an unspecified date in Dec2020 for Covid-19 immunization. The patient previously had Covid in Apr2020.

Concomitant medications were not reported. After his first dose of vaccine, in Dec2020, the patient had Covid and headaches. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The reported ""had Covid"" after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration."

Got the first dose of the vaccine on 23Dec2020, this week the patient was tested positive for COVID; Got the first dose of the vaccine on 23Dec2020, this week the patient was tested positive for COVID; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect from a contactable other healthcare professional (HCP) (patient). A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 23Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient got the first dose of the vaccine on 23Dec2020, this week the patient was tested positive for COVID in Jan2021. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The reported tested positive for COVID after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

she tested positive in the middle; she tested positive in the middle; This is a spontaneous report from a contactable female consumer (patient) via a Pfizer-sponsored program . A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 16Dec2020 at first single dose for COVID-19 immunization. The patient medical history was not reported. The patient's concomitant medications were not reported. Caller was asking if it was safe for her to get the second dose, she had the 1st dose on the 16Dec2020 and scheduled for the second dose today (reported on 06Jan2021), however she tested positive in the middle. Outcome of the event was unknown. information on the lot/batch number has been requested.

tested positive for Covid-19; tested positive for Covid-19; This is a spontaneous report from a contactable healthcare professional (HCP) reporting for himself via a Pfizer-sponsored program Pfizer First Connect. A male patient of an unspecified age received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number and expiry date not reported) via an unspecified route of administration on 21Dec2020 for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient was tested positive for COVID-19 on 28Dec2020 and he was wondering if he was still able to receive the second dose of the vaccine. The outcome of the event was unknown. Information on the lot/ batch number has been requested.; Sender's Comments: The reported tested positive for COVID-19 after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

Anaphylactic reaction; Flushed; Diaphoretic; redness and rash; hives on chest; Tachycardia; shortness of breath; Chest tightness; Dizziness; Headache; This is a spontaneous report from a contactable nurse, the patient. A 47-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-

19 mRNA VACCINE; Lot Number: EL1283), via an unspecified route of administration on 08Jan2021 at 08:49 (at the age of 47-years-old) as a single dose for COVID-19 immunization. There were no known medical history or concomitant medications. The patient previously received the first dose of BNT162B2 on 18Dec2020 (Lot Number: EK5730) for COVID-19 immunization and experienced nausea, headache, and fatigue. On 08Jan2021, about 5-10 minutes after the second dose, the patient experienced anaphylactic reaction, flushed, diaphoretic, redness and rash, hives on chest, tachycardia, shortness of breath, and chest tightness, reported as life-threatening. She reported that these events occurred within less than 10 minutes of receiving the vaccine. She went to the emergency room and was treated with methylprednisolone (SOLUMEDROL), diphenhydramine hydrochloride (BENADRYL), famotidine (PEPCID), and epinephrine (MANUFACTURER UNKNOWN). She was sent home and prescribed methylprednisolone and epinephrine (EPI-PEN). Later on 08Jan2021, she experienced dizziness and headache, which were consistent. She stated she would most likely take ibuprofen (MOTRIN) as treatment (not specified if taken). The clinical outcomes of the flushed, diaphoretic, redness and rash, hives on chest, tachycardia, shortness of breath, and chest tightness were recovered on 08Jan2021; while the outcomes of the dizziness and headache were not recovered and that of the anaphylaxis was reported as recovering.; Sender's Comments: The reported information is limited. Based on the close temporal relationship and the description of the events, there is a reasonable possibility that the events are related to BNT162 vaccine. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Approx 10-15 post vaccine, employee said she felt lightheaded and like her heart was racing. Within 10 minutes she said she felt difficulty breathing, She then vomited. The observation nurse at the clinic administered Epi Pen and called a Code. The employee was transported to the Emergency Dep't and then to intensive care. She was placed on an Epi drip.

loss of consciousness Narrative: Patient received COVID-19 vaccine dose #1 on 1/6/21 w/o complications. Per 1/6/21- 1/9/21 nursing notes, patient did not experience any injection site reactions, denied pain or tenderness at injection site, no dizziness, no n/v, remained afebrile. Around 1/9/21 @1810, patient became acutely nonresponsive after being helped to the edge of bed. Per nurses, he was previously awake/alert, talking and asymptomatic. Patient is DNR/DNI but facility rapid response emergency team called d/t patient's sudden change of condition. Emergency team helped patient into lying position. Per 1/9/21 ICU emergency team note, patient appeared comfortable w/ no palpable radial pulse and had minimal shallow agonal breathing. Pulse ox 94%, HR in 60s per machine. BP unmeasurably low by BP cuffx3. Resident passed at 18:20 pm.

Approximately 1 - 2 hours after receiving I had numbess and soreness to my neck. A few days later started experiencing tingling, buzzing, weakness and heaviness to my right arm and leg. I reported this to my MS doctor who ordered an MRI of the brain and told me to report to you

Patient received the vaccine on 12/22/20 without complication. It was reported today that the patient was found unresponsive and subsequently expired at home on 1/11/21.

Increased weakness leading to a fall and fever of 101.3

Patient began experiencing fevers, body aches, back pain, fatigue, chills the night she received the vaccine. Symptoms progressed for the following four days when she was ultimately seen in PCP office. Laboratory evaluation demonstrated atypical pneumonia and elevated WBC count. Patient was diagnosed with Acute Myeloid Leukemia via bone marrow biopsy and is receiving treatment at the hospital.

LEFT FACIAL AND TONGUE NUMBNESS - WORK UP CVA NEG Narrative: Developed left facial and tongue numbness 4 hours after vaccine - went to ER and admitted for 2 days, negative workup for CVA or other acute etiology. Symptoms resolved prior to discharge from hospital

Reported feeling faint and nauseated during observation period. Placed on cart in trendelenberg

Within 24 hrs, developed headaches, burning sensation down spine and neck. fullness in head intensified next day. balance was off, numbness and tingling throughout body. Went to ER. Diagnosed Paresthesia

The facility had positive cases of COVID when we were able to begin vaccinating residents. Within about a week of vaccination, patient was tested positive for COVID. He was 91 years old and his immune system did not have the time to allow the vaccine to begin working before exposure. His age was a major contributing factor to his death.

The facility had positive cases for COVID 19 when the vaccine was received and administered to patient. With her advanced age and chronic conditions, she did not have time to build immunity between the time of vaccination and her testing positive.

The facility had a number of positive COVID 19 cases prior to patients vaccination. Due to her advanced age, chronic condition, and exposure, patient did not have the time to build immunity after exposure before becoming positive.

Within approximately 30 minutes after vaccine (Thursday), patient presented with red rash to upper chest, severe headache, dizziness and nausea. Was treated with Benadryl and Tylenol per anesthesia onsite. Symptoms remained throughout the day with minimal improvement. The following morning (Friday) only headache remained. patient began having abdominal pain, and was admitted to hospital the next day (Saturday). It is now Tuesday and patient is still hospitalized. Unclear if this entire event is vaccine related.

Pt expired due to possible cardiac arrest. Unsure if this was vaccine related.

Resident was found deceased at approximately 6pm in her apartment

Pt experienced the following morning: fever (100 F) chills, malaise, nausea, and numbness in hands at 0624 and 0836. Pt went to hospital at 1000, tx with IV fluids.

"In the early morning of Monday, January 11th the patient developed a significant headache with neck pain. She also reported parathesia and tingling in bilateral upper extremities with weakness of the right upper extremity. She reported feeling very anxious and ""wound up"". Patient presented to the Emergency Department 3 hours later. CT of the head/brain, EKG, CBC,CMP, Magnesium and Cardiac profile were performed with no significant findings. Ativan 0.5mg was administered orally. Patient was admitted to the facility for observation. Symptoms gradually resolved with no additional treatment."

Large red area surrounding injection site.

unsure if related to vaccine, but was notified by her next of kin that she died on 1/4/2021. No reports of side effects or hospitalization were reported to the facility prior to the notification of death.

patient reported expired 1/7/2021

On 12/31/2020, at approximately 00:15, pt developed a fever of 102.9 F and tachycardia with rate of 120. He was treated with acetaminophen. Later in the morning, he complained of nausea, generalized muscle aches, intermittent increase in confusion. At approximately 14:00, he had a fall out of bed and at that time noted to be short of breath, tachypneic. He was taken via ambulance to Emergency Department. From there he was transferred to Hospital for admission with acute respiratory distress, suspected sepsis with lactic acid 7.4 and Bilateral Pulmonary Emboli. He was started on heparin and broad spectrum antibiotics and transitioned to ELIQUIS on 1/3/2021. Infectious etiology of sepsis was unclear. He continued broad spectrum antibiotics with clinical improvement. Abdominal CT scan was obtained due to intermittent nausea, vomiting, abdominal pain, loose stools. His heart rhythm flipped to Atrial Fibrillation with RVR on 1/2 and his rate improved with titration of metoprolol. He was also treated with prednisone for suspected underlying undiagnosed COPD. It is noted in his hospital summary that PEs presumed provoked in the setting of his recent COVID 19 infection. He was discharged from the hospital on 1/8/2021 and readmitted to the Veterans Home. He has been stable.

Received Moderna vaccine on 1/5. Had a single episode of vomiting approximately 1 hour after vaccine. Hx of Asthma, started to develop SOB approximately 2 days later. She reached out to PCP and used inhaler with little relief. SOB worsened and she was admitted to the hospital on 1/8/21. Eval was negative for COVID (3 tests completed), flu and pneumonia. She has elevated WBCs and was given steroids and supplemental oxygen. She is improving but remains inpatient.

Patient was sent to the ED due to significant hematuria. He was afebrile.

Patient presented with myalgias, fevers, and chest pain on 1/10/21 and was found to have diffuse ST elevation and elevation troponin. He was evaluated by cardiology and diagnosed with acute myopericarditis. He was treated with NSAIDs and colchicine. He improved with this treatment and was discharged on 1/12/21 with ibuprofen and colchicine and outpatient cardiology follow up.

Rash on neck; gall bladder attack; This is a spontaneous report from a contactable nurse (patient). A 34-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730), via an unspecified route of administration at the left arm on 18Dec2020 10:30 at a single dose for COVID-19 immunization in the hospital, and morphine sulfate (manufacturer unknown), via an unspecified route of administration from an unspecified date at unspecified dose and frequency for an unspecified indication. Medical history included S/P rouxen-y gastric bypass, sleep apnea, cholelithiasis, HSV-2, obesity, and Hashimoto hypothyroid disease. The patient was not pregnant at the time of vaccination. Concomitant medications included ursodiol, valacyclovir, levothyroxine sodium (LEVOTH) and vitamins. The patient previously took morphine and experienced allergies. The patient did not receive any other vaccine within 4 weeks prior to the vaccine. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient experienced Rash on neck, morphine reaction and May or may not be related - gall bladder attack on 18Dec2020 14:30. The events resulted in Doctor or other healthcare professional office/clinic visit and Emergency room/department or urgent care. The patient was administered with NS bolus, diphenhydramine (BENADRYL) and also morphine in response to the events. Since the vaccination, the patient had been tested for COVID-19 via Nasal Swab/COVID-19 rapid ABBT which was negative on 18Dec2020. The action taken in response to the events for morphine sulfate was unknown. The outcome of the events was recovered with sequel. The patient assessed the events as non-serious. Pfizer is a marketing authorization holder of morphine sulfate in the country of incidence or the country where the product was purchased (if different). This may be a duplicate report if another marketing authorization holder of morphine sulfate has submitted the same report to the regulatory authorities.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

mild elevation of his sed rate and leukocytosis; mild elevation of his sed rate and leukocytosis; myalgia (was reported as worsened); Arthralgia; Ten days later and still having pain/started in neck and migrated to his back, the buttocks and gluteal and quadriceps area; Ten days later and still having pain/started in neck and migrated to his back, the buttocks and gluteal and quadriceps area; Ten days later and still having pain/started in neck and migrated to his back, the buttocks and gluteal and quadriceps area; Ten days later and still having pain/started in neck and migrated to his back, the buttocks and gluteal and quadriceps area; This is a spontaneous report from a contactable physician (patient). A 76-years-old male patient received bnt162b2 (Pfizer-Biontech Covid-19 Vaccine), via an unspecified route of administration on 23Dec2020 at single dose on deltoid Right for covid-19 immunisation. Medical history included ongoing type 2 diabetes mellitus (diagnosed about 8 years ago). There were no concomitant medications. Patient developed myalgia on 27Dec2020 and arthralgia on 28Dec2020. Patient also experience ten days later and still having pain/ started in neck and migrated to his back, the buttocks and gluteal and quadriceps area in Dec2020. He had labs a few days ago. He had a mild elevation of his sed rate and leukocytosis. Events myalgia and arthralgia considered serious due to medically significant.

Outcome of events myalgia (was reported as worsened) and arthralgia was not recovered. Information about batch/lot number has been requested.; Sender's Comments: Based on the time association, the events myalgia and arthralgia are possibly related to suspect bnt162b2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

blood pressure increased and her pulse; blood pressure increased and her pulse; Chest pain; Numb fingers and later numb face; Mind fog; This is a spontaneous report from a contactable other HCP. This 37-year-old female other HCP (patient) reported that she received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: 1685), via intramuscular at left arm on 02Jan2021 08:15 AM at single dose for COVID-19 immunization. Facility type of vaccine was pharmacy or drug store. Medical history included panic disorder (last attack 2 years prior) and known allergies: latex, Iodine dye. Concomitant medications were not reported. No other vaccine in four weeks. No covid prior vaccination. No covid tested post vaccination. On 02Jan2021 08:15 AM, within a few minutes while still under observation at pharmacy, her blood pressure increased and her pulse. Numb fingers and later numb face. Chest pain presented. She went to ER (emergency room) 3hours later with ongoing symptoms that never resolved until 6 or 7 that evening while still in ER waiting room. Mind fog (02Jan2021 08:15 AM) was currently ongoing. The treatment for events included lorazepam (ADIVAN), diphenhydramine (BENADRYL), ibuprofen. Outcome of event mind fog was not recovered, and the rest of events was recovered/resolved with sequel.; Sender's Comments: Based on the compatible temporal association, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the reported events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

lost the sense of smell and taste; lost the sense of smell and taste; nasal congestion/stuffy nose; runny nose; tiredness/felt tired; eye pain; pain in the muscles; chills; sore pain in the arm; This is a spontaneous report from a contactable Other HCP (Dentist) reporting for herself. A 43-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) at single dose on 31Dec2020 at 10:00AM in the left arm for COVID-19 immunization. Lot number was EJ1685. Medical history and concomitant medications were none. On 01Jan2021 in the morning, she had a sore pain in her arm, and by nighttime she had chills. On 02Jan2021 and on 03Jan2021, Saturday and Sunday she had pain in her muscles, felt tired, and had some pain around her eye every time she moved her eyes. On 04Jan2021, Monday everything went away but she had stuffy nose and runny nose. Her stuffy and runny nose was better but she still had some congestion, but she could not blow anything out of her nose. On 05Jan2021, Tuesday she noticed she could not smell and she still could not smell. On 06Jan2021, she had no smell and no taste either. Stated everything was good at the time of report but she still could not smell or taste anything. She treated herself with Tylenol for the muscle aches. She

took one 500mg Tylenol by mouth on 02Jan2021 at bedtime and then one Tylenol 500mg by mouth again on 03Jan2021. She was scheduled for the next dose 19Jan2021. Mention she was planning to get a COVID 19 test to see if she had the disease. The patient recovered from fatigue, eye pain, pain in muscles on 03Jan2021, the patient recovered from chills on 02Jan2021, the patient recovered from sore pain in the arm on 01Jan2021, the patient was recovering from nasal congestion/stuffy nose, the patient did not recover from runny nose and loss the sense of smell and taste. Information on the lot/batch number has been requested.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported pain in her muscles, felt tired,had some pain around her eye every time she moved her eyes, had no smell and no taste, and the administration of the COVID-19 vaccine, BNT162B2, based on the reasonable temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

aware of 6 cases of Bell's Palsy by the companies making these vaccines; This is a spontaneous report from a contactable Other HCP. This Other HCP reported similar events for 6 patients. This is 1st of 6 reports. A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunisation. The patient medical history was not reported. The patient's concomitant medications were not reported. The reporter reported since the use of modified RNA in covid vaccines,he/she had aware of 6 cases of Bell's Palsy by the companies making these vaccines since an unknown date. The event outcome was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Bell's Palsy is not uncommon in general population. The information provided in this case is limited and does not allow a full medically meaningful assessment. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics committees and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2021009409 Different patient, same drug/event.;US-PFIZER INC-2021009412 Different patient, same drug/event.;US-PFIZER INC-2021009410 Different patient, same drug/event.;US-PFIZER INC-2021009411 Different patient, same drug/event.;US-PFIZER INC-2021009408 Different patient, same drug/event.

joint pain and muscle; joint pain and muscle; Vertigo; an itchy rash bilaterally on her arms; developing swollen, tender, and hard lymph nodes under the Left subclavian area/ swollen left subclavian lymph nodes; developing swollen, tender, and hard lymph nodes under the Left subclavian area; extreme fatigue; Runny nose; Headache; This is a spontaneous report from a contactable nurse (RN) reporting for herself. A 42-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) first dose on 23Dec2020 h 09:00 intramuscularly in left deltoid (left arm) lot number: EK5730 at single dose for COVID-19 immunization. Concomitant medications were not provided. Patient stated that she has had double mastectomy, and missing a lot of lymph nodes, states she got the first dose of Pfizer Covid

vaccine on 23Dec2020, states it made her left subclavian lymph nodes swollen and hard. States that when she gets the flu vaccine at her hospital every year, she gets swollen lymph nodes ever since she had a double mastectomy and chemotherapy. She originally was wondering if she could get the vaccine in another large muscle group. States she even went as far as to cross reference flu shot ingredients with the Pfizer Covid ingredients to see if something in the vaccines were causing the swollen lymph nodes but was unable to come to any conclusion, the only think in common is the Sodium Chloride and she does not feel like that would cause any issue. States the swollen lymph nodes occurred after the Sanofi brand flu vaccine (no other information known or provided). Patient is on day 15 post vaccination and they are still swollen and hard, she is wondering if there is any data on how long this side effect can last. She made an appointment with her oncologist, she knows that the swollen lymph had the first dose, lymph nodes are still swollen and hard, knows it can cause swollen lymph nodes but wants to know what is the typically length of the event. Patient also experienced other side effects, on 30Dec2020 (last week), she developed vertigo that lasted through the weekend intermittently, states she at first thought she was having a stroke. States it seems to have subsided as of 05Jan2021 (yesterday). Patient also reported she had an itchy rash twice as part of her side effects reported from the COVID 19 vaccine. She noticed an itchy rash and it went away but she is unsure exactly the day or time. Stated she definitely remembered the rash on 28Dec2020 as she took pictures. It was gone in about three hours on the same day. She did not treat the rash because it was gone and not itching. The rash came and went and had not come back. It was mostly on the bends of the arms, bilateral arms. Patient reported developing swollen, tender, and hard lymph nodes under the Left subclavian area the day after the injection, on 24Dec2020. They were not as tender at the time of the report but were continuing and this was 15 days from her vaccination. Patient also experienced an itchy rash bilaterally on her arms that occurred twice and only lasted a few hours each time, onset date reported as 25Dec2020. She was advised to take diphenhydramine hydrochloride (BENADRYL) for it however she did not take it. On 23Dec2020 patient experienced headache. On 24Dec2020 patient experienced extreme fatigue, swollen left subclavian lymph nodes and runny nose. On 30Dec2020 patient experienced joint pain and muscle and vertigo. The events headache, experienced extreme fatigue, swollen left subclavian lymph nodes, runny nose, joint pain and muscle and an itchy rash bilaterally on her arms were considered serious as medically significant events. Patient had not recovered from swollen left subclavian lymph nodes, joint pain and muscle, extreme fatigue and swollen, tender, and hard lymph nodes under the Left subclavian area, she was recovering from headache, runny nose and vertigo and recovered completely from an itchy rash bilaterally on her arms on 28Dec2020.; Sender's Comments: The Causality between the events, headache, experienced extreme fatigue, swollen left subclavian lymph nodes, runny nose, joint pain and muscle and an itchy rash bilaterally on her arms, and the administration of the COVID 19 vaccine cannot be denied based on the reasonable temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

Seizure; This is a spontaneous report from a contactable physician (patient). A female patient of an unspecified age received BNT162B2 (Pfizer-Biontech Covid-19 Vaccine) on an unspecified date, at single

dose, for COVID-19 immunisation. Relevant medical history and concomitant medications were unknown. On an unspecified date, after the vaccination, the patient had a seizure. Clinical outcome of the adverse event was unknown at time of this report. The information on the lot number has been requested.; Sender's Comments: A possible causal relationship between seizure and BNT162B2 cannot be completely ruled out considering the temporal relationship. However, more information would allow for a full medically meaningful assessment, especially medical history, concomitant medications, concurrent illness and event details description including time lag between the onset of the event and vaccination date of BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"Her INR was 5.8 (normal range 1 to 2)/increasing INR; Scratched arm; Scratched arm and bled through 3 shirts, it kept bleeding; This is a spontaneous report from a contactable nurse (patient). A 64-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EC1284), via an unspecified route of administration administered to left arm/deltoid on 29Dec2020 13:15 at single dose for COVID-19 immunization at a research medical facility; and received warfarin sodium (COUMADIN, strength 2 mg), oral (by mouth) from an unspecified date in 2017 and ongoing at ""3 1/2 tablets once daily in the evening at 5:30pm (total 7mg)"" for metal heart valve. The patient's medical history included had the surgery (for her metal heart valve), about 01Mar in 2017 (about 4 years ago) and so she thought she had been on Coumadin for about 4 years, had been on the 7mg dose for over a year; and has a history of metal heart valve and takes Coumadin for the metal heart valve. Denied illness. Denied family medical history relevant to event. There were no concomitant medications. The patient previously received Shingrix vaccine in past and remenbered she had the usual side effects from it, had mild symptoms. History of all previous immunization with the Pfizer vaccine considered as suspect was none. The patient did not receive any other vaccines the same date of the Pfizer Suspect or 4 weeks prior. On Jan2021, the patient experienced scratched arm and bled through 3 shirts, it kept bleeding. On 04Jan2021, her international normalised ratio (INR) was 5.8 (normal range 1 to 2). The events did not lead to emergency room visit, however led to physician office visit. The events were reported as serious medically significant. The nurse got the first Pfizer COVID-19 shot on 29Dec2020 because she is a healthcare provider. She wanted information on increasing INR. The nurse has a history of metal heart valve and takes Coumadin. Her INR was typically 1.7 to 2.3. She reported her last INR, before the covid-19 vaccine was given, was ""some time ago"" but it had not varied much over the years. Normally she got her INR run and it was about 2. She had to be scheduled for her INR on the 04Jan2021 and it was 5.8 (normal range 1 to 2) and they asked about anything that may have changed and the only thing was that she got her first shot. The nurse reported not having any changes in her medications, food, or life style to account for the change, other than receiving the COVID-19 vaccine. The patient stated that it could be a serious problem if she had an accident or fell and started bleeding. A normal person's lab result is between 1 and 2, but they like to keep people with the metal heart valves between 2 and 3. She had been bleeding. She had barely scratched her arm the other day and went through 3 shirts because she kept bleeding. This is more than unusual for her, it's kind of unusual.

Getting the vaccine is the only variant she has had since getting her last INR. The patient underwent lab tests and procedures which included INR (normal range 1 to 2): typically 1.7 to 2.3 on an unspecified date; it's about 2 on an unspecified date: and 5.8 on 04Jan2021. The action taken in response to the events for warfarin sodium was dose not changed. The outcome of the event INR was 5.8 was not recovered, for the other events was unknown. The nurse (patient) assessed the event ""INR was 5.8; it's normally about 2"" as related to the COVID-19 vaccine.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of International normalised ratio increased and wound hemorrhage due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics coagulation panel, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

Dizziness; palpitations; resting tachycardia that persisted for 3 days; muscles aches; Chills; Restlessness; feeling unwell; arm pain; This is a spontaneous report from a contactable physician reported for herself. This 37-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: Ek5730) via intramuscular on 23Dec2020 09:30 AM on left arm at single dose for COVID-19 immunisation. Medical history included chronic kidney disease, HTN (hypertension), persistent proteinuria. No known allergies. Concomitant medication included losartan. The patient did not have other vaccine in four weeks and did not diagnosed with COVID-19 prior to vaccination. The patient was not pregnant at the time of vaccination. On 24Dec2020, the patient experienced dizziness, palpitations, resting tachycardia that persisted for 3 days, muscles aches, chills, restlessness, feeling unwell and arm pain, and resulted in Emergency room/department or urgent care. Treatment included paracetamol (TYLENOL). The patient had COVID tested on 28Dec2020 post vaccination, covid test type post vaccination=Nasal Swab, covid test name post vaccination=PCR, covid test result=Negative. Outcome of events was recovered.; Sender's Comments: The reported events dizziness, palpitations, resting tachycardia that persisted for 3 days, muscles aches, chills, restlessness, feeling unwell and arm pain, were likely related to the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) due to temporal relationship and clinical course. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics committees and Investigators, as appropriate.

Hellucinogenic visions of monsters and violent events; This is a spontaneous report from a contactable consumer (patient). A 68-year-old female patient (not pregnant) received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK5730), via an unspecified route of

administration on 05Jan2021 at 14:30 on Right arm at single dose for COVID-19 immunization in hospital. The patient medical history included Hypertension, Hypothyroid. Prior to vaccination, patient was not diagnosed with COVID-19. Concomitant medications included levothyroxine sodium (LEVOXYL); Olmesartan; aluminium hydroxide gel, dried, magnesium carbonate (PEPCID); bifidobacterium bifidum, bifidobacterium lactis, bifidobacterium longum, lactobacillus acidophilus, lactobacillus rhamnosus (PROBIOTIC); ascorbic acid, biotin, folic acid, iodine, pantothenic acid, pyridoxine hydrochloride, retinol, vitamin b12 nos, vitamin d nos, vitamin e nos, zinc (CENTRUM MULTIGUMMIES). Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient previously took and had known allergies with bacitracin zinc;neomycin sulfate;polymyxin b sulfate (NEOSPORIN) and bacitracin zinc;neomycin sulfate;polymyxin b sulfate (POLYSPORIN). The patient experienced hellucinogenic visions of monsters and violent events on 06Jan2021 at 02:00 AM. Since the vaccination, patient had not been tested for COVID-19. No treatment was received for the event. The outcome of the event was recovering. The report was reported as non-serious, with seriousness criteria-Results in death: No; Life threatening: No; Caused/prolonged hospitalization: No; Disabling/Incapacitating: No; Congenital anomaly/birth defect: No.

severe ITP; This is a spontaneous report from a contactable physician. A 22-years-old male patient received his first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 17Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient developed severe ITP (Idiopathic thrombocytopenic purpura) on 20Dec2020, 3 days after first dose of the vaccine on 17Dec2020. He was hospitalized for 3 days and now the patient was healthy with a normal platelet count on an unspecified date. The physician wanted to know if this patient can get the second dose. The outcome of the event was recovered on an unspecified date. Information on the lot/batch number has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported ITP cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

"immune deficiencies; She said the joint pain felt like ""flu"" joint pain; She said she was really sweaty, so much so, that she had sweat under her eyes; thyroid problems; feels shaky inside; Numbness facial; Exhaustion; Foggy feeling in head/feeling rundown; felt exasperated; sweating like crazy and then gets chills; felt yucky/she didn't feel good at all; Joint pain; Nausea; Chills; after receiving the COVID-19 Vaccine on (Dated), she had left upper shoulder pain.; She clarified she had some injection site pain; and the injection site was a little itchy; This is a spontaneous report from a contactable consumer (patient). A 58-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot EL3246), via an unspecified route of administration on 02Jan2021 14:30 at single dose in the left upper arm for COVID-19 immunization. Medical history included Pernicious anaemia from 2006 and ongoing, Hashimoto's disease ongoing, stated she was diagnosed with Hashimoto's disease in either 1994 or 1995. Psoriatic arthritis from Nov2020 and ongoing. Potassium low ongoing, reported she has

had low potassium off and on for years. She said she can't remember when she didn't have low potassium. She said she normally finds out her potassium is low when she has blood work done. She stated she has had low potassium most of her adult life. IgA deficiency from Feb2019 and ongoing, Psoriasis ongoing, paralysis in her left trapezius muscle. Concomitant medication included B-12 for pernicious anemia. She said she had the typical reactions that one might get with a vaccine. She clarified she had some injection site pain and the injection site was a little itchy on 02Jan2021. She stated on the second day (03Jan2021) she had joint pain, felt yucky, had nausea, and chills. She said the next day (04Jan2021) she felt a little better, but still had chills. She said yesterday (05Jan2021) she thought she was feeling better, but by yesterday, clarified as late afternoon and evening, she crashed. She said she has a lot of autoimmune issues and immune deficiencies, saying she has pernicious anemia and Hashimoto's disease. She said yesterday evening she experienced extreme body temperature issues. She said she was really sweaty, so much so, that she had sweat under her eyes. She said she would get really hot and had chills. She said she was feeling really bad and was feeling shaky inside. She said she thought it was important that she report what she was experiencing to Pfizer. She stated she has psoriatic arthritis, too. Reported after receiving the COVID-19 Vaccine on 02Jan2021, she had left upper shoulder pain. She clarified that she had a previous history of paralysis in her left trapezius muscle and had surgery in 1998 on her left shoulder. She said she had a weird feeling that went around where her scar was from the surgery on the back of her left shoulder. She said maybe the left shoulder pain had to do with how she held her left shoulder. She said on Monday, 04Jan2021, she had a little bit of pain in her left shoulder and by yesterday night, 05Jan2021, there was not much pain at all. Clarified her joint pain was in her ankles, wrists, hips, neck, back, and knees. She said the joint pain felt like ""flu"" joint pain. She stated she normally has joint pain with the other issues she has, but this joint pain felt different. She said the joint pain she experienced after taking the COVID-19 Vaccine was all over her body. She said yesterday (05Jan2021) her joint pain felt so much better, but later in the afternoon she didn't feel right. She said she has pernicious anemia, and thought maybe she needs her B-12 shot. She said yesterday (05Jan2021) she experienced a lot more symptoms. She said she had numbness in her face, felt extremely exhausted, had a foggy feeling, and felt exasperated. She said the symptoms didn't start until late in the afternoon into the evening of 05Jan2021. She said she did not feel well and went to bed at 8:45PM, which is early for her. She said she did give herself a B-12 1mcg/ml shot intramuscularly yesterday. She provided the B-12 1mcg/ml NDC Number: 7006900510, Lot Number: C0495, and Expiration Date: Aug2022. She said the name (company name) was listed on the B-12 1mcg/ml packaging. She said she gives herself a B-12 shot every 10 days. She said she still has some joint pain, but the joint pain is not like it was on 03Jan2021. She said she still has a tiny bit of heaviness in her joints with a constant throbbing pain, which is a different joint pain from her normal. Reported last night (05Jan2021) she didn't feel good at all. She said she felt horrible, and had to go to bed. She said she felt shaky inside all night, and still feels that way now. She said she was sweating like crazy, and then would get chills. She clarified she is used to being hot and cold in her normal life because of her thyroid problems, but stated what she experienced last night was beyond that. She said her hot and cold issue was bumped up several levels last night. She said she was chilled or sweating all the time last night, but did not have a temperature. She clarified her normal body temperature is 96.7, and when she checked her temperature at one point, her temperature was 98 degrees. Reported the hot and cold with sweating and chills, and nausea come and go. She said if she has nausea, it is a mild feeling of nausea.

Clarified if Sunday, 03Jan2021. was a work day, she would have called out sick. She said Monday (04Jan2021) and Tuesday (05Jan2021) she did go to work. Reported she has low potassium and made herself an electrolyte cocktail. Reported if her system feels off, she said her electrolytes maybe off. She said her heart felt like it may be shaky, so she ate a banana to get potassium in her system. She said she does her little routine before she would call her doctor to get blood work done. She said she had her blood work done not too long ago. She said she wasn't feeling this way before she had the COVID-19 Vaccine, and is feeling rundown now. She said she was feeling good before she had the COVID-19 Vaccine. She said she feels like something is going on with her body now. Reported her last blood work was done on 04Dec2020 and everything was kind of normal. She clarified her thyroid was a little off, and her doctor adjusted her medication. She said her potassium was a little down. Reported she was told when she got the COVID-19 Vaccine shot she has to be a little more careful, and she might not be as protected as some people. She said she was told there have not been enough studies on the COVID-19 Vaccine. She clarified she was told that information by a person at the site where she received the COVID-19 Vaccination, saying the person was helping her with the COVID-19 Vaccination authorization form. Reported she thought she was doing OK after she received the COVID-19 Vaccine, until after last night and yesterday afternoon. She said if she continues feeling the way she is, she will see her doctor. She said her system seems off. She said she normally tries everything she knows first, like drinking a lot of water, and drinking electrolytes, and will take potassium to see if that is the issue. She said those are her own things that she does before she calls her doctor. Clarified sometimes she has numbness in her face due to not having her B-12. She said she still has a little numbness in face. She said on 05Jan2021, the numbness went across her face from the bridge of her nose down through to her mouth. She said the numbness was nothing like paralysis in her face, but her face was really hot at the same time she had the numbness. Reported she took Tylenol (clarified as (company) brand Tylenol, stating she doesn't have the UPC, Lot and Expiration Date). She said the Tylenol wasn't kicking in, so she took Ibuprofen (clarified as (company)brand Ibuprofen, and she doesn't have the Ibuprofen NDC, Lot and Expiration date). She said she took her normal medications. Outcome of events ""She clarified she had some injection site pain"" ""and the injection site was a little itchy"" and Shoulder pain were recovered on an unspecified date, ""Chills"" and ""feels shaky inside"" were not recovered, ""Joint pain"" ""Nausea"" ""Numbness facial"" were recovering, while outcome of other events was unknown."

Bell's Palsy; This is spontaneous report from a contactable Other Health Professional. This reporter reported similar events for 6 patients. This is a 6th of 6 reports. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced bell's palsy on an unspecified date with outcome of unknown. Since the use of modified RNA in COVID vaccines, the reporter aware of 6 cases of Bell's Palsy by the companies making these vaccines. Information about lot/batch number has been requested.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the event facial paralysis cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and

analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2021007605 Different patient, same drug/event.

The numbness began to intensify and I could not feel myself blinking or smiling on the left side of my face; pain and numbness to my left ear and left jaw that began to spread down my left jaw and upward across my left cheek, left eye, and left temple, and above my left eyebrow; pain and numbness to my left ear and left jaw that began to spread down my left jaw and upward across my left cheek, left eye, and left temple, and above my left eyebrow; pain and numbness to my left ear and left jaw that began to spread down my left jaw and upward across my left cheek, left eye, and left temple, and above my left eyebrow; pain and numbness to my left ear and left jaw that began to spread down my left jaw and upward across my left cheek, left eye, and left temple, and above my left eyebrow; pain and numbness to my left ear and left jaw that began to spread down my left jaw and upward across my left cheek, left eye, and left temple, and above my left eyebrow; This is a spontaneous report from a contactable nurse reported for herself. A 39-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EL0142) via an unspecified route of administration on 07Jan2021 07:00 at single dose for covid-19 immunization. Vaccine location was left deltoid. The facility type vaccine was Workplace Clinic. Medical history included food allergy at shrimp. Concomitant medications were not reported. The patient did not received any other vaccines within 4 weeks prior to the COVID vaccine. On 07Jan2021 at 07:15 AM the patient notice pain and numbness to her left ear and left jaw that began to spread down left jaw and upward across left cheek, left eye, and left temple, and above left eyebrow. The numbness began to intensify and patient could not feel herself blinking or smiling on the left side of my face. The numbness slowly began improving over the next hour in the same order that it began, but she still have mild left ear and jaw pain and mild numbness. Events outcome are recovering. No treatment was received. The action taken was not applicable.; Sender's Comments: Based on the compatible time association, the facial palsy is possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Burst blood vessel in left eye 24 hours after vaccine was given.; This is a spontaneous report from a contactable other-HCP. A 45-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) lot number not available, via an unspecified route of administration on 21Dec2020 07:45 AM at single dose for covid-19 immunization. Vaccine location was left deltoid. The patient did not received any other vaccines within 4 weeks prior to the COVID vaccine. Medical history included morbid obesity and blood pressure high. No known allergies. Patient didn't do relevant test. Concomitant medication included amlodipine (AMLODIPINE) at 5mg daily. The patient experienced burst blood vessel in left eye 24 hours after vaccine was given (eye haemorrhage) on 22Dec2020 08:30 with outcome of recovered. No treatment received. The action taken in response to the event for BNT162B2 was not applicable. Information on the lot/batch number has been requested.; Sender's Comments: Based on the available

information, the company considers that a causal relationship between the eye haemorrhage and vaccination with BNT162B2 cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer drug is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Had ruptured blood vessels x 2 spontaneously in eyes; This is a spontaneous report from a contactable nurse reported for herself. A 54-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EK5730), via an unspecified route of administration on 17Dec2020 03:00 P.M at single dose for covid-19 immunization. The facility type vaccine was: workplace clinic. Medical history included manifesting carrier BMD (Becker's muscular dystrophy). Allergies to medication: allergies rash on Sulfa. The patient did not received any other vaccines within 4 weeks prior to the COVID vaccine. Concomitant medication included pregabalin (LYRICA), duloxetine hydrochloride (DULOXETINE [DULOXETINE HYDROCHLORIDE]). The patient experienced ruptured blood vessels x 2 spontaneously in eyes (eye haemorrhage) on 18Dec2020 with outcome of recovered. No treatment received. The action taken in response to the event for BNT162B2 was not applicable.; Sender's Comments: Based on the available information, the company considers that a causal relationship between the eye haemorrhage and vaccination with BNT162B2 cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer drug is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

some congestion that just came on; her arm was really aching after the injection; she started coughing; voice was hoarse; light wheeze; soles of her feet were hurting; pressure in bilateral groin; aching all over; very tired; balance issues; This is a spontaneous report from a contactable nurse (patient). A 62-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK9231) intramuscularly in left upper arm on 05Jan2021 at single dose for covid-19 immunisation. The patient got her Covid vaccine yesterday (05Jan2021) around 11 or 11:30 am in her left upper arm. She had bilateral breast cancer and had lymph nodes removed in each arm but more removed from her Right, so she got the vaccine in the left arm. She also had some skin cancers removed, one would not heal properly on her left arm and formed a blister, and her dermatologist popped it and put a band aid on it. The vaccine was given 3 inches above it. The patient's concomitant medications were not reported. The patient experienced pressure in bilateral groin, aching all over, very tired and balance issues on 05Jan2021; light wheeze on 06Jan2021. Seriousness for these events was medically significant. The patient stated she had some congestion that just came on. She felt fine yesterday (05Jan2021) right after getting the vaccine, that at work she did notice that there was something different feeling in the left side of her groin. She was not in direct patient care. She noticed on her left side in the groin, something felt different, then yesterday evening (05Jan2021) after work she was really tired in the evening, aching all over last night, even the soles of her feet were hurting, woke up like her balance was off, she would walk one way and go another, states it is not like an orthostatic issue, that

she knows what that feels like. She stated that in her inguinal area she could feel pressure, bilaterally. Her arm was really aching after the injection. Her breathing, heard a light wheezing, was clearing her voice, and then she started coughing, voice was hoarse. The outcome of events pressure in bilateral groin, very tired and light wheeze was not recovered; of events aching all over and balance issues was recovering; of other events was unknown.; Sender's Comments: The reported events bilateral groin, aching all over, very tired, balance issues and light wheeze were possibly related to the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), due to temporal relationship. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics committees and Investigators, as appropriate.

Severe respiratory distress; This is a spontaneous report from a contactable pharmacist. A 51-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection),Lot# lot number: EL1284, intramuscular at right arm on 07Jan2021 12:00 PM, at SINGLE DOSE for COVID-19 immunization. No known allergy , no other medical history.No COVID prior vaccination. Facility where the most recent COVID-19 vaccine was administered was Nursing Home/Senior Living Facility .No any other vaccines within 4 weeks prior to the COVID vaccine. No Concomitant medications (received within 2 weeks of vaccination) . On 07Jan2021 the patient experienced Severe respiratory distress that resulted in Emergency room/department or urgent care.It was unknown if treatment was received for the event. The patient had not been tested for COVID post vaccination. The outcome of the event was unknown.; Sender's Comments: A possible causal relationship between Severe respiratory distress and BNT162B2 cannot be completely ruled out considering the temporal relationship. However, more information would allow for a full medically meaningful assessment, especially medical history, concomitant medications, concurrent illness and event details. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

she was transferred to the hospital with tachycardia, congestion, shortness of breath, and is now unresponsive; she was transferred to the hospital with tachycardia, congestion, shortness of breath, and is now unresponsive; she was transferred to the hospital with tachycardia, congestion, shortness of breath, and is now unresponsive; she was transferred to the hospital with tachycardia, congestion, shortness of breath, and is now unresponsive; This is a spontaneous report from a contactable nurse. A 95-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), Lot# EH9899 Exipration on 06Jan2021 at 15:00 at SINGLE DOSE at deltoid for COVID-19 immunization. The patient received first dose of the same vaccine BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), Lot# EH9899 Exipration date : 31Mar20221, on 16Dec2020. Medical history included : cardiac failure congestive, hypertension, cardiac murmur .There were no concomitant medications. The patient previously took cymbalta , vasotec and

zocor and experienced drug hypersensitivity. The patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine.This nurse,worker at a skilled nursing facility, reported that this patient with a history of heart failure, received her second dose of the Pfizer-BioNTech Covid-19 vaccine yesterday, 06Jan2021, at 3pm. At 7am on 07Jan2021 she was transferred to the hospital with tachycardia, congestion, shortness of breath, and is now unresponsive. Patient was stable prior to vaccination, but will now be transferred to hospice care. The nurse added the patient had the second COVID vaccine on 06Jan2021 yesterday and has now been transport to hospital due to a drastic decline after the shot. It was explained that this morning around 7 am she was transferred to the hospital. She was experiencing tachycardia, shortness of breath, and congestion. The events started this morning around 6-6:30am. The patient was admitted to the hospital. The shot was given at the facility. She received it at 3pm on 06Jan2021, First dose was on 16Dec2020.The caller relays she didn't know how aggressive the hospital will be for the patient. She was a full code when left and now a DNR and is unresponsive. The patient will be going on hospice care. The causality was reported as related. The outcome of the events was not recovered.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported tachycardia, shortness of breath, congestion, unresponsive, and the administration of the COVID 19 vaccine, BNT162B2, based on the reasonable temporal association. The patient's pre-existing medical condition of cardiac failure congestive, hypertension, cardiac murmur are confounding factors. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

patient developed acute onset of right-sided facial palsy and pain; patient developed acute onset of right-sided facial palsy and pain; Brain MRI done showing T2 hyperintensity in the brainstem and basal ganglia, suspicious for inflammation; This is a spontaneous report from a contactable physician. A 46-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), on 18Dec2020 at SINGLE DOSE for COVID-19 immunization. Medical history included psoriasis. No COVID prior vaccination. It was unknown if the patient received any other vaccines within 4 weeks prior to the COVID vaccine.No known allergies. Concomitant medications (received within 2 weeks of vaccination) included fluoxetine. days following vaccination,on 23Dec2020,the patient developed acute onset of right-sided facial palsy and pain. Brain MRI done showing T2 hyperintensity in the brainstem and basal ganglia, suspicious for inflammation. Work-up is ongoing. AE Resulted in: Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, Disability or permanent damage].It was unknown if the event was treated. The event was assessed as serious for Disabling/Incapacitating. The patient had been tested for COVID post vaccination (covid test result-Negative). The outcome of the events werenot recovered Information about lot/batch number has been requested.; Sender's Comments: A possible causal relationship between acute onset of right-sided facial palsy and pain with MRI findings suspicious for brain inflammation and BNT162B2 cannot be completely ruled out considering the temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as

well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

myositis; This is a spontaneous report from a contactable physician. A 43-year-old male patient received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number/expiration date unknown) on an unspecified date in Dec2020 reported as around the end of December, at single dose for COVID-19 immunization. Relevant medical history and concomitant medications were not reported. On an unspecified date after he received the vaccine he had right arm pain and swelling (states it was in his bicep brachial radialis in the muscle) which is the opposite arm of the injection site. He had an MRI done on an unknown date that showed myositis. He thinks could be due to the vaccine since it started two days after he received the vaccine. His pain peaked at about a week and a half and now the pain was improving and the swelling was down. He still had function in the right arm but when he strained it would hurt. His concern was that the reaction may be an autoimmune reaction and the first response was muted. He was worried the second dose may elicit a larger response. At the time of the reporting the patient was recovering from the events. Information on Lot/Batch number has been requested.; Sender's Comments: Based on the available information, the company considers that a causal relationship between the myositis and vaccination with BNT162B2 cannot be excluded. Additional information regarding onset latency, relevant medical history, concomitant medications and detailed clinical course around the event onset will aid in comprehensive assessment of the case. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics committees and Investigators, as appropriate.

Atrial fibrillation; Was not feeling well; Warm sensation in chest; This is a spontaneous report from a contactable nurse (patient). This 62-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot EJ 1685), intramuscular, on 21Dec2020 at 09:30 PM at single dose for COVID-19 immunisation. Vaccine location was left arm. The patient was vaccinated at hospital, age at vaccination was 62-years-old. The patient received also varicella zoster vaccine RGE (CHO) (SHINGRIX) on 19Nov2020. Medical history included gastrooesophageal reflux disease (GERD) and high cholesterol. Concomitant medications included omeprazole, colestyramine (QUESTRAN), and vitamins. On 22Dec2020, the patient was not feeling well intermittently starting the day after the injection with warm sensation in chest that would go away until 31Dec2020 when the warm sensation of chest would not go away. The patient was sent for EKG that showed atrial fibrillation that she is now being treated for. The events resulted in doctor or other healthcare professional office/clinic visit. The events were reported as non-serious. Outcome of the events was unknown.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported atrial fibrillation and the administration of COVID 19 vaccine, BNT162B2. More information regarding the clinical course, the patient's underlying concurrent medical condition are required for the Company to make a more meaningful causality assessment. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for

adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, Agency, as appropriate.

blood in the stool; fevers; night sweats; chills; aches; This is a spontaneous report from a contactable Physician reporting for herself. A 30-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 30Dec2020 at single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. She experienced chills and aches after 24 hours (on 31Dec2020) and experienced significant fevers that wouldn't break and cycles of chills and fevers that would last for 2 hours each cycle over the next 24 hours. She also experienced night sweats and blood in the stool and mentioned it was the first time that happened to a healthy 30 year old like her. She is asking for reports of these side effects, especially blood in the stool and for recommendations regarding taking the 2nd dose as she is still not sure on whether to take it due to hearing that the 2nd dose side effects were worse. The outcome of the events was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: Based on the information currently provided, the vaccination with BNT162B2 might play a contributory role in triggering the onset of blood in the stool. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Tested positive for COVID-19; CT showed increased infiltrates 10-15%; Dehydration/Dehydrated; Chills; Tested positive for COVID-19; Hypotensive; Achy; Severe achy cramps/Severe cramps all over body; This is a spontaneous report from a contactable nephrologist (patient himself). This 78-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EK5730), via an unknown route, on 17Dec2020 at single dose for COVID-19 immunisation. Age at vaccination was 78-year-old. The patient was diabetic and hypertensive. Additional medical history included hyperlipidaemia. No relevant concomitant medications were provided. On 18Dec2020, the patient developed severe achy cramps/severe cramps all over body. On 19Dec2020, the patient developed achy. On 20Dec2020, the patient was dehydrated and hypotensive, he had also chills. On unknown date, blood pressure was down to 76/50. His symptoms for COVID were severe achy cramps, hypotension, and dehydration. On 20Dec2020, COVID-19 test was positive. On 21Dec2020, the patient was given monoclonal antibodies. A computerized tomogram (CT) of the lungs was performed on 21Dec2020 and it was ok. A week later (Dec2020), he had a repeat CT which showed increased infiltrates of 10 to 15%. He then started on dexamethasone, apixaban (ELIQUIS) and the rest of the things. He had a repeat CT on 05Jan2021 which showed resolution of the infiltrates; most of the lesions went gone. CT results had improved significantly. The patient underwent a second COVID test a week ago which was still positive. He had a third COVID on 06Jan2021, but results were not available yet. The patient queried if he can proceed with second dose planned on 07Jan2021 or if he should wait. The clinical outcome was recovered for the event 'severe achy cramps/severe cramps all over body' on 19Dec2020, for 'dehydration/dehydrated' on 20Dec2020, for 'chills' on unknown date in Dec2020, for 'achy' on 30Dec2020, for 'hypotensive' on 20Dec2020; the outcome of the event 'CT showed increased infiltrates

10-15%' was recovering; the outcome for 'Tested positive for COVID-19' was unknown. The reporter considered the events 'achy' and 'severe achy cramps/severe cramps all over body' serious because causing disability; the events 'tested positive for COVID-19', 'dehydration/dehydrated', 'chills' and 'hypotensive' were considered medically significant. The reporter considered the events 'Tested positive for COVID-19', 'CT showed increased infiltrates 10-15%' and 'dehydrated/dehydration' unrelated to BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE).; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded. Case will be reassessed when new information is received. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Possible cellulitis; slight redness in left upper within 24 hours; severe redness and swelling and warmth of entire upper left arm and half of lower arm; severe redness and swelling and warmth of entire upper left arm and half of lower arm; Some pain; This is a spontaneous report from a contactable Physician. A 94-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EL0140) on 30Dec2020 at 12.00 pm at single dose Intramuscular on left arm for COVID-19 immunization. Relevant medical history included COVID 19 infection, on 19Jul2020, post COVID left femoral DVT oral anticoagulation, Alzheimer dementia, Osteoarthritis, Spinal Stenosis, Gait Dysfunction and Constipation. Known allergies included acetazolamide, penicillin and sulfa. Concomitant medications included apixban (ELIQUIS) 5 mg twice a day, colecalciferol (VIT D3) 1000u once a day. On 31Dec2020 at 12:00 pm patient experienced slight redness in left upper within 24 hours. The patient also experienced possible cellulitis, severe redness and swelling and warmth of entire upper left arm and half of lower arm. Some pain. No fever. It was also informed that patient underwent nasal Swab test for Coronavirus (Abbott BinaxNOW) on 05Jan2021 and on 07Jan2021 and resulted negative, for both. Treatment received for cellulitis included Cefuroxime. Outcome for the event possible cellulitis was unknown. Outcome of other reported events was recovering.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported events due to temporal association. However patient old age and other underlying conditions cannot be excluded for a contributory role The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators as appropriate.

Facial paralysis; This is a spontaneous report from a contactable Pharmacist. A 70-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EH9899, Expiration Date 30Mar2021), via intramuscular, on 17Dec2020 (at 15:35), at single dose of 0.3 mL for COVID-19 immunisation. The patient was vaccinated at hospital, age at vaccination was 70-year-old. Vaccine location was deltoid but unsure which deltoid. The patient did not have a relevant medical history and concomitant medications. Pharmacist said that after vaccination, she waited to be

monitored the standard 15 minutes at hospital and then when she got in the car and was on the way home like 20 minutes later she had brief episode of what the patient described as facial paralysis. It was like the side of her face in one area felt funny, it felt numb and it was not anywhere else on her face. It lasted the 20 minutes and then went away. The patient had recovered from the events on 17Dec2020. The pharmacist queried if the patient can proceed with the 2nd dose of the vaccine. The reporting pharmacist considered the event 'facial paralysis' as non-serious.; Sender's Comments: A possible causal relationship between acute onset of facial paralysis and BNT162B2 cannot be completely ruled out considering the temporal relationship and the known adverse event profile of the suspect vaccine. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

got home from the shot at 1145a. Fell asleep until 930pm. During sleep was told by family that i was angry, cursing and yelling in my sleep. I don't remember any of it , i felt delirious and out of co; got home from the shot at 1145a. Fell asleep until 930pm. During sleep was told by family that i was angry, cursing and yelling in my sleep. I don't remember any of it , i felt delirious and out of co; got home from the shot at 1145a. Fell asleep until 930pm. During sleep was told by family that i was angry, cursing and yelling in my sleep. I don't remember any of it , i felt delirious and out of co; got home from the shot at 1145a. Fell asleep until 930pm. During sleep was told by family that i was angry, cursing and yelling in my sleep. I don't remember any of it , i felt delirious and out of co; Left arm was extremely painful; This is a spontaneous report from a contactable Other-HCP. A 51-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number # EL1284) on 02Jan2021 at 10:00 AM at single dose via intramuscular on left arm for COVID-19 immunization. Medical history included allergy to codeine hypertension and asymptomatic HIV infection. Concomitant medications were not reported. Patient got home from the shot on 02Jan2021 at 11: 45 am. Fell asleep until 930p:m. During sleep was told by family that He was angry, cursing and yelling in his sleep. He didn't remember any of it, He felt delirious and out of control. Left arm was extremely painful. At the time of the reporting had recovered from the events without any treatment.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported event delirious cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

"lymph node swelling and lymphedema in the right forearm side and the right upper arm; lymph node swelling and lymphedema in the right forearm side and the right upper arm; cold blister on lip; significant swelling on the right side of the base of her neck near her clavicles; slightly itchy scalp; redness, swelling, tenderness at injection site; redness, swelling, tenderness at injection site; redness, swelling, tenderness at injection site; This is a spontaneous report from a contactable Registered nurse reporting for herself. A 58-years-old female patient received the first dose of BNT162B2 Pfizer-BioNTech COVID-19 Vaccine (Batch/lot number: EL0140), in Hospital, by intramuscular route in right upper arm on

23Dec2020 at 08:30, at 58-year-old of age, at single dose for COVID-19 immunization. The patient had no relevant medical history. She didn't receive any prior vaccinations within 4 weeks. There were no concomitant medications. The patient reported that it has been 2 weeks since she received the COVID-19 Vaccine now and she still has a considerable amount of lymph node swelling and lymphedema in the right forearm side and the right upper arm. The nodes on the right side of her neck around the clavicle have been quite swollen for about 2 weeks. She has the list of side effects so she was not concerned, as this was listed but now she's not sure. When she got the vaccine she had the expected redness, swelling and tenderness at injection site (onset reported as 23Dec2020). On the evening of the 24Dec2020 she had an itchy scalp but she didn't see any rash and that only lasted a short time. On 29Dec2020 the patient had a significant swelling on the right side of the base of her neck near her clavicles that wrapped around to the posterior of her neck and was assessed as medically significant. She treated it by putting ice on it in the evening. On 30Dec2020 the swelling seemed to be slightly decreased but it is still a visible lump, the nodes are firm and there is swelling around those and it has not improved since the 30Dec2020. On 30Dec2020 she noticed a little cold blister or hive on the center of her lower lip and that was resolved by 03Jan2021, she did not have fever and did not feel sick, but her main problem is the swollen lymph nodes around base of neck around clavicle and it is considerably swollen there. The patient reported that last night (06Jan2021) it looked like her right arm was swollen, she thinks she is having lymphedema on the right arm, her right forearm is half an inch circumference larger than her left arm and was measured at her work. The patient reported she is seeing her new primary care doctor on 26Jan2021 and will follow up with the doctor. The patient wanted to know if she should get the second dose scheduled for the next week or should wait until the swelling resolves. Moreover the patient asked how long do the side effects usually last (specifically systemic side effects). The events ""redness, swelling and tenderness at injection site"" and ""slightly itchy scalp"" resolved on 25Dec2020, the event ""Cold blister on lip"" resolved on 03Jan2021. The event ""Swelling on the right side of the base of her neck near her clavicles"" had not resolved yet at the time of the report. All the reported events were assessed as related to the COVID-19 Vaccine by the Primary Source Reporter (Method of assessment:Agency).; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events swelling and lymphadenopathy cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate."

kidney infection; urine turning a different color/urine was an orange color/urine was a tea color; This is a spontaneous report from a contactable Nurse reporting for herself. A 24-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 06Jan2021 at single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient stated earlier this afternoon (07Jan2021) urine turning a different color, her urine was an orange color, and this afternoon her urine was a tea color. She had no other symptoms as if she had a kidney infection. The outcome of the events was

unknown. Information on the lot/ batch number has been requested.; Sender's Comments: The causal relationship between BNT162B2 and the event kidney infection cannot be excluded as the information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

Nausea; Diarrhea; Jitteriness; foggy head or brain; she can't concentrate /she didn't pay it any attention; sleeping a lot; sick; Headache; body aches; This is a spontaneous report from a contactable nurse. A 62-years-old female patient started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EK5730), via an unspecified route of administration on 05Jan2021 08:15 at single dose for COVID-19 immunisation. Anatomical location of administration of vaccine was right deltoid. Medical history was not reported. The patient previously took omeprazole (PRILOSEC) and experienced drug hypersensitivity and lip swelling. Concomitant medication included atorvastatin (LIPITOR). The patient experienced headache on Jan2021, body aches on Jan2021, nausea on 06Jan2021, diarrhea on Jan2021, jitteriness on Jan2021, foggy head or brain on Jan2021, sleeping a lot on Jan2021, sick on Jan2021, she can't concentrate /she didn't pay it any attention on Jan2021. The outcome of headache and she can't concentrate /she didn't pay it any attention was recovering, of pain, jitteriness, foggy head or brain was not recovered, of sleeping a lot and sick was unknown. Nausea, and diarrhea recovered on 07Jan2021.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events headache, pain, nausea, diarrhea, feeling jittery, feeling abnormal, disturbance in attention and hypersomnia cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

High fever; Vomiting; Severe fatigue; Weakness; This is a spontaneous report from a contactable physician (patient himself). This 61-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EL1442), via intramuscular, on 05Jan2021 at single dose for COVID-19 immunisation. Age at vaccination was 61-year-old. Vaccine location was deltoid left. The subject did not have a relevant medical history and concomitant medications. On 06Jan2021, the patient developed high fever, vomiting, severe fatigue and weakness. He did not experience anaphylaxis. The events were considered serious as medically significant. The patient stated that side effects mentioned lasted 3 hours and he felt much better now. However, the final clinical outcome was unknown. The patient is not sure if he should get the shot again in 3 weeks since he was really sick. The reporting physician considered the events 'high fever', 'vomiting', 'severe fatigue' and 'weakness' related to BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE).; Sender's Comments: Based on temporal association, the causal

relationship between BNT162B2 and the events pyrexia, vomiting, fatigue and asthenia cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

feeling of fullness in her ear; it felt like fluid in her right ear; Hearing loss in right ear; Soreness in the left arm; This is a spontaneous report from a contactable Other-HCP. A 34-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number # EH9899) 16Dec2020 at 07:40AM in the left arm at single dose via intramuscular for COVID-19 immunization. Medical history included seasonal allergy. Concomitant medications included fluticasone propionate for seasonal allergy. The day after vaccination she noticed soreness of the left arm. Then two days later she noticed hearing loss secondary to a feeling of fullness in her ear; it felt like fluid in her right ear which has improved and she states it was not serious after the first dose. Patient received the second dose of vaccine on 04Jan2021 at 08:00AM in the left arm. That night she experienced myalgia, fever, chills, back pain, and started with a constant ringing in her right ear and the hearing loss that worsened from before (reported under AER 2021012152. All of these effects have resolved except the hearing loss and ringing in her ear. Additionally she went to see an ENT doctor and get a hearing test. The Hearing test showed moderate hearing loss and speech clarity of 96% in her left ear compared to 52% in the right ear. They don't know if it is permanent. She was currently being treated with 80mg of Prednisone daily by mouth and getting Dexamethasone injections to her middle eardrum. Patient informed that on 17Dec2020 she was tested for COVID 19 with the PCR test due to an exposure at work. The result was negative. The patient recovered from soreness in the left arm on 19Dec2020. The patient had not yet recovered from deafness.; Sender's Comments: Based on temporal association, the causal relationship between BNT162B2 and the events ear congestion and hearing loss unilateral cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

constant ringing in right ear; Myalgia; Fever; Chills; back pain; Inappropriate schedule of vaccine administered; hearing loss that worsened from before; hearing loss that worsened from before; This is a spontaneous report from a contactable physician (patient). This 34-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot EH9899), via an unspecified route of administration, on 04Jan2021 at 08:00AM at single dose for COVID-19 immunisation. The first dose was received on 16Dec2020 at 7:40 AM at single dose. Vaccine location was in the left arm. The patient was vaccinated at hospital, age at vaccination was 34-years-old. No other vaccine was received in four weeks. Medical history was none. Concomitant medications included ongoing fluticasone proprionate

(FLONASE) for seasonal allergy taking for two years. On 17Dec2020, COVID-19 PCR test was negative. On 04Jan2021 at night, she experienced myalgia, fever, chills, back pain and started with a constant ringing in her right ear and the hearing loss that worsened from before (started on 18Dec2020 after first dose, see AER # 2021012126). Start date of constant ringing in right ear was 05Jan2021. The events resulted in Physician Office visit. Hearing loss in right ear worsened and constant ringing in right ear were reported serious as medically significant while the other events were reported as non-serious. She went to see an ENT doctor and get a hearing test. The hearing test showed moderate hearing loss and speech clarity of 96% in her left ear compared to 52% in the right ear. They don't know if it is permanent. She is currently being treated with 80mg of Prednisone daily by mouth and getting dexamethasone injections to her middle eardrum. All of these effects have resolved except the hearing loss and ringing in her ear. All the events were considered related to the vaccine per reporter.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

fever of 103.7; Cough; body aches; Joint pain; chills; This is a spontaneous report from a contactable Nurse reporting for herself. A 54-year-old female patient received first dose of intramuscular BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 06Jan2021 at single dose in left deltoid for COVID-19 immunisation at the age of 54-year-old. Lot number was EL1284. Medical history included Asthma since 1991 and ongoing, high blood pressure since 2020 (6 months before the report) and ongoing. Concomitant medications were unknown. On 07Jan2021, the patient experienced fever of 103.7 at 1:30PM, chills at 9:00AM, body aches at 11:00AM, Joint pain at 09:00AM, cough at 1:00PM; the events were considered medically significant. The patient was not treated for the events. On 13Nov2020, test showed she had COVID-19. On 07Jan2021, body temperature was 103.7 Fahrenheit. The patient did not recover from the events. The nurse considered the events were related to suspect vaccine.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

"Hypokalemia; Hypomagnesemia; Hypocalcemia; Hemoglobin dropped little bit; Tetany; Muscle cramps; This is a spontaneous report from a contactable healthcare professional, a physician assistant. A 50-year-old female patient received the first dose of the BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot Number: UNKNOWN), via an unspecified route of administration on 18Dec2020 (at the age of 50-years-old) as a single dose for COVID-19 immunization. Medical history included tachycardia, tension headache, and glucose tolerance impaired. Concomitant medications included rosuvastatin calcium (CRESTOR), gabapentin (MANUFACTURER UNKNOWN), and metoprolol (MANUFACTURER

UNKNOWN). On 18Dec2020, the patient experienced hypokalemia, hypomagnesemia, hypocalcemia, tetany, muscle cramps, and hemoglobin dropped little bit. The clinical course was as follows: The patient received the vaccine and about 30 minutes later she started to ""feel bad"". She went to the urgent care and about an hour after they took her to the emergency room (also reported as hospital). She had a complete blood count, complete metabolic panel, and magnesium level done on the 18th, 21th, 23rd, 26th, 28th, 30th of Dec2020 and then again on 04Jan2021. On 18Dec2020, her initial lab test showed potassium: 2.6, hemoglobin: 10.2, magnesium: 1.2, and calcium: 5.7. The physician assistant reported that a potassium of 2.6 was critically low and a hemoglobin was 10.2 was about normal for the patient. She received oral medications of potassium 20 mEq twice a day and calcium and magnesium supplements once a day. On 04Jan2021, lab data showed: potassium: 4.2, magnesium: 2.1, calcium: 9.5 and hemoglobin: 14.5. Per the reporting physician assistant, the above levels went back to normal but stated she had to be supplemented to get back to that point. The clinical outcomes of the hypokalemia, hypomagnesemia, hypocalcemia, and hemoglobin dropped little bit were recovered on 04Jan2021; while that of the tetany and muscle cramps, were unknown. The physician assistant assessed the events as related to the suspect vaccine. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

patient felt tingling in their neck, arms and hand and then few days later it went to their feet; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number and Expiration Date: unknown), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. On an unspecified date, the patient felt tingling in their neck, arms and hand and then few days later it went to their feet (medically significant). The clinical outcome of the event was unknown. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 MRNA VACCINE, were not provided and will be requested during follow up.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

Bell's palsy; Flu like symptoms; This is a spontaneous report from a non-contactable consumer reported that a female patient of an unspecified age received bnt162b2, via an unspecified route of administration on an unspecified date at a single dose for COVID-19 vaccination. The patient's medical history and concomitant medications were not reported. It was reported that the patient got Bell's palsy four days after the vaccine and had flu-like symptoms for two weeks. Added that patient is completely

symptom free at the time of report. The outcome of the events was recovered. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

"Got very hot and clammy but at the same time had the goosebumps; Got very hot and clammy but at the same time had the goosebumps; Got very hot and clammy but at the same time had the goosebumps; My whole body was as if I was sun burnt; My heart started to race; This is a spontaneous report from a contactable consumer (patient). A 45-year-old female patient received BNT162B2, (Pfizer COVID Vaccine, lot number: EK9231, expiry date: Apr2021) intramuscular on an unspecified date at single dose on right arm for COVID-19 immunisation. Medical history included migraine from an unknown date and unknown if ongoing. Concomitant medication included nortriptyline for migraine, botulinum toxin type a (BOTOX) for migraine and birth control medication. The patient stated that, ""I was wondering if this was a reaction to the vaccination I had today. So I ended up 3 hours after I received the vaccine, I got very hot and clammy but at the same time had the goosebumps and then my whole body was as if I was sun burnt and my heart started to race. And then my whole body was red as if I had a sunburn. Actually I went to the ER today and they just did lab work because of the way I was feeling. All they gave me in the emergency room is IV fluids."" Therapeutic measures taken as a result of the events included IV fluids. The outcome of the events was unknown."

died; This is a spontaneous report from a non-contactable consumer via a Pfizer-sponsored program. A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, via an unspecified route of administration on an unspecified date at single dose for covid-19 immunisation. The patient medical history and concomitant medications were not reported. It was reported the patient was a doctor, died after the vaccine with no apparent disease. It was not reported if an autopsy was performed. No follow-up attempts are possible. Information about lot/batch number cannot be obtained.; Reported Cause(s) of Death: Unknown cause of death

COVID-19 positive and admitted to hospital 6 days post-vaccination

Received first dose Moderna COVID vaccine on 12/28/2020; on that same day 12/28 he noticed a dry cough; on 1/1/2021 he reported fever, chills, body aches, Headache, sinus congestion. On 1/1/2021 he tested positive for COVID-19, he reported being with a family member on Christmas who had COVID symptoms. On 1/11/2021 he required hospitalization for COVID-19 pneumonia

on 1/8/2021 17:30 patient taken to ER, cerebellar hemorrhage, stroke, aneurysm

Following the first COVID vaccine dose on Dec/18/2020, I had headaches that started on the third day and ended on the tenth day. The headaches were usually light, unilateral, and alternating from one side to the other. I was usually functional except on the fourth and seventh days where the headaches were moderate to severe, and I took naps to help with the headaches for those two days. I have never had an issue with headaches before, and these symptoms were a new experience for me. I did not take any medications as treatment for the headaches. Following the second COVID vaccine dose on January/7/2021, I felt fatigue and generalized muscle aches within six to twelve hours, and these symptoms lasted for two days. On January/10/2021, when I woke up that morning I again felt light, unilateral, and alternating headaches. In addition, I noticed that I was unable to move the left side of my

face. I felt moderate tingling sensations associated with the distribution of the paralysis. When I looked in the mirror, I could quite noticeably see asymmetry in my face. I immediately went to the emergency department at the hospital where my primary care doctor is located. I was kept in the hospital into the next day for observation. After evaluation by a neurology team and an MRI, I was provided with the diagnosis of Bells Palsy. I have never previously been diagnosed with Bells Palsy, and I have never previously had a hospital stay before. The doctors prescribed medications which I am currently taking. As of today January/12/2021, the symptoms have had some improvement, but the symptoms still continue.

Beginning at 6:30 am on 1/8, two days following vaccination, the individual was driving to work and began to experience nausea while at a traffic light. He pulled over and threw up. Once he got to work he vomited again. He drove to another facility for work and then threw up 3 or 4 more times. He began experiencing hot flashes at this time. He went to the hospital and was seen in the emergency room. He threw up several more times in the ER and stated that his heart was racing and that he had diarrhea. The emergency room gave him medications for the nausea and he stayed there for 2 or 3 hours. He began to feel better and was discharged to home.

Immediately developed intense burning that progressed over the next 30 minutes and continued to burn for 3 days. The next day progressive extreme fatigue last 4 days. felt like it was going to pass out. full on body pain, dizzy and lightheaded. need assistance to get to the walk, intense headache.

Very large, reddened, tender area at injection site (like the size of an angry red egg), and fever of 103.2.

GIVEN ON 12/23. SORENESS FELT ON LEFT ARM SITE THE NEXT DAY, WITH DECREASED MOBILITY AND STRENGTH DUE TO SEVERE SORENESS AND PAIN. PAIN PROGRESSIVELY LESSENED BUT THE SORENESS STILL VERY APPARENT. ON 1/5, SPOKE TO PRIMARY MD, XRAY ON LEFT SHOULDER DONE ON 1/6. ON 1/7, STIFFNESS WITH SEVERE PAIN UPON MOVEMENT NOTED ESP IN THE MORNING. ULTRASOUND WAS DONE ON 1/8, NOTED BICEPS TENOSYNOVITIS. ORTHOPEDIC SURGEON SEEN ON 1/11, W DX OF ADHESIVE CAPSULITIS, SUGGESTED FOR PT FOR NOW, AND OFF WORK, AND TO BE FOLLOWED UP ON 2/1 BY SAME ORTHO SURGEON. WILL NOT OFFER CORTISONE SHOT FOR NOW AS IT MAY COMPROMISED OR WEAKEN IMMUNE RESPONSE, IN WHICH MY SECOND COVID SHOT DUE ON THE 15TH OF JANUARY. FIRST APPT FOR PT ON 1/15

Sudden hearing loss right ear accompanied by tinnitus

Sudden hearing loss right arm accompanied by tinnitus

Patient presented on the morning of 1/10/2021 with swollen lips and hives. Vaccination took place on Wednesday January 6th, 2021.

Patient had mild bilateral knee and hip pain 1 month ago, then she received her 1st dose of COVID vaccine on 12/14/20. Her joint pain worsened then on 1/4/21 she received her 2nd dose of COIVD vaccine on 1/4/21 and then her pain increased in spread up to her shoulders. She was seen at immediate care on 1/11/21 because her joint pain had worsened throughout and her shoulder pain was

making it difficult to raise her arms above the level of her shoulders. Her pain was made worse w/ movement.

Woke up on 1/6/2021 with hot flashes, palpitations, dizziness and heart racing. Went to urgent care and they did an EKG which showed A-Fib, so I was sent to the ER and from there, I was transferred to an ICU at a different facility . I stayed until 1/8/2021. No cause was found and no history of A-Fib or family history.

immediate tingling of lips, followed by fullness of posterior oropharynx, hoarseness and pruritus

"Fever (103-104 oF) and 4""x1"" red, swelling area around site of injection. Pt states she received an IV."

Acute approximate respiratory failure secondary to acute COPD

first day after shot, nausea, body aches, 2nd day Sunday headache, Monday 5 am woke up itching, then 9 am hives everywhere, trouble breathing, anaphylaxis, went to ER, got epi X 2, solumedrol, benadryl, pepcid, then still with hives, tachycardia, dyspnea, iv fluids were influsing and epi drip started, went to ICU

Back pain, bilateral PE and DVT

"Patient states that she received her second vaccination and in the hours after she had flu-like symptoms. Then over the next few days, she started to notice tingling and a ""prickly"" sensation in various areas. This progressed to symmetric BLE weakness which started in her feet and had reached to just above her knees bilaterally time and she arrived. The weakness had progressed to her hips. She also noticed weakness in her arms and they are easily fatigued. She is able to walk but it takes much effort."

coughing, flushing, cyanosis, diaphoresis

Within 3 minutes of receiving vaccine felt flush and throat swelling, responded to Epi Pen and Benadryl p.o. EMS took him to ED where he remained several hours receiving 1 liter NS 125 mg solumedrol IV, discharge with 4 days of prednisone 40 mg daily and a prescription for an Epi Pen. As of 1.12 he is totally okay with no after effects.

First Day after the injection I had a headache and nausea the entire day into the next day. The second day I still had the headache and the nausea. I work overnights. When I awoke in the afternoon, my throat was closing up. It was hard to swallow and I struggled to breath. I immediately drank liquid Benadryl and called my doctor in the morning.

Patient presents to the Emergency Department who was doing well up until she received COVID-19 vaccine at 1150. 15 minutes later patient started to experience throat tightening and tongue swelling. She was administered Epipen at 1217 by staff at vaccination clinic. EMS was called and prior to arrival at ER tongue swelling had subsided.

-0715 vaccine administered. -0735 started to feel dizzy/off and right side of tongue felt like it was mildly swelling and itchy. -0735 asked to have blood pressure taken as know when I am having anaphylaxis my

blood pressure escalates. -0740 took blood pressure and it was 141/86 in right arm. Normal is 110s/60s-70s. No anxiety feelings. -0740 throat started to have increased mucous production. Had the tickle and tightness in throat. Asked and received 25mg Benadryl with cup of water. -0742 started clearing throat frequently and slight cough. Knew it was anaphylaxis and told the team I need to go to the ER. Asked for additional 25mg Benadryl. Also took 20mg Famotidine and 2 puffs Albuterol inhaler--this is my prescribed anaphylaxis routine. Had Epipens on standby. -0743 put on O2 saturation monitor and watched O2 drop into 90-92 range. Asked for epipen on standby as I know when I need to start it. Didn't want to take that when I knew I was about to get it in the ER and knowing self hadn't progressed that far. Felt chest tightness and shortness of breath. Voice started becoming hoarse. -0800 EMS arrived (delay as team didn't know if they were supposed to call 911 or a Code--they chose EMS even though in hospital). Then staff at COVID vaccine clinic kept emphasizing need to go in ambulance while EMS and self fought to go through hospital (much quicker route). Finally cleared to go through hospital to ER. To get some air via breathing in had to sit up leaning forward. Voice completely hoarse by this time. -About 0817 arrived to ER bay. At this time, frequently coughing and cough started to sound stridorous. Difficulty getting breaths in. Had chest pain near heart. Greeted by MD, 2 RNS, and technician. -0819 received IM epinephrine. Attached to 5 lead EKG monitoring and O2 monitoring. Blood pressure done again. Higher than previous. -About 0821 had working IV (previous two attempts failed as veins were constricting). Given IV Solumderol. Started bolus of 1L Normal Saline. -Not sure how long after by cough subsided, increased mucous production subsided, as well as hoarseness decreased. -Held for observation for 2hours (would be longer if not resolved). - Discharged around 1015. At this time, hoarseness almost all gone. Minimal throat clearing. Cough resolved. -Prescribed epipen inhalers (mine expired) and Prednisone. Prednisone is PRN for mild breathing difficulties if it starts again tomorrow 1/13/21. -At 1400 took 50mg Benadryl and 20mg Famotidine as previously prescribed for anaphylaxis maintenance. Will continue this as previously prescribed every 6hours until symptoms stay resolved. - Made follow up appointment with Primary Care Physician per protocol

Immediately after she felt faint, heart rate 121, felt faint again bp 62/33. Was taken to the ER, within a half hour, she fully recovered. Vitals went back to normal.

Hospice Resident received first Covid 19 vaccine dose on 1/6/21. 1/7/21 resident had decreased appetite noted in am but ate 100% of meal at dinner. 1/9/21 resident had decreased appetite with emesis x 2, loose BM x 2. Call placed to hospice. 1/10/21 5:44 am resident able to take HS meds, ingest 2 cups of shake. No emesis or loose stool noted. 12PM nurse noted resident not eating meals but ingesting milkshake and medications without any problems. Hospice contacted for change in condition. 1:00 pm hospice ordered Phenergan 12.5 mg Q 6 hrs PRN. Labs to be drawn 1/11/21. Hospice notified POA. 1/11/21 12:24am Resident had blood in stool. Resident denies any pain, on 2L of O2 for comfort.

Severely dizzy, left hand totally numb but painful, cold to touch. Felt better before she got to ER.

Patient vaccinated on 12/28. Approximately one day later, develops cough and on azithromycin x 1 week. On 1/3, patient develops left-sided weakness and aphasia. Taken to the hospital, tested COVID+, required intubation -- acute hypoxic respiratory failure secondary to COVID - on H&P. Patient died on 1/4/21 at 7:20am.

Attempting to confirm which COVID 19 vaccine was given (Moderna or Pfizer). They did not send the record when they sent the patient to General ER the next am. Did not answer the phone.

Started to feel lightheaded, weak, faint like I was going to pass out, heart rate increased, confusion, trouble speaking, brought to the ED, throat started to swell and started having thick spit and clearing my throat excessively. Diagnosed as anaphylaxis.

within 1 hr post-vaccine on 1/7 I had a mild headache that resolved with Tylenol. At about 12 hours post-vaccine I developed nausea, fever (100.4) and chills and secondary to this had poor sleep. The next day I took scheduled alternating Tylenol & ibuprofen during the day and then overnight 1 episode of chills that woke me up. no events Saturday or Sunday. Then Monday 1/11 in the early morning I started to develop a rash on my b/l elbow and right foot 3rd toe. I applied mometasone topical cream to these locations. while at work the rash extended down both forearms then by 5pm it was on both hips and extending along both legs. I applied Benadryl cream to the most irritated sites and took PO Benadryl 50mg at bedtime and again at 1am when the itching woke me up. I repeated Benadryl 25mg at 8am. The rash seems to be getting better on the arms but then by noon I had a new breakout on my neck and face. I took Benadryl 50mg at 1pm. The rash continued to have a rapid progression over the next hour and resulted in angioedema with my throat swelling, lips puffed and numb and eye swelling. I was injected with an epi pen and sent to the ED where I received PO prednisone, famotidine, and Benadryl. The face/neck rash then greatly improved and I was sent home on prednisone 40mg daily for 3 days.

Blurred vision, difficulty breathing (pale skin/blue lips), profuse sweating, muscle fatigue, headache. This lasted about 15 minutes. Until severity went down. Followed by 20 minutes of profuse sweating and headache. I thought I was going to die

Sudden cardiac death

"COVID-19 PCR test/he was positive per the PCR test; COVID-19 PCR test/he was positive per the PCR test; Sweating; Fever; running to bathroom with urination every 15 minutes with a large amount of urine; running to bathroom with urination every 15 minutes with a large amount of urine; Heart pounding; tired and fatigue; Weight loss; Chills; pain all over the body; Sluggishness; This is a spontaneous report from a contactable consumer. A 63-years-old male patient received his first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EH9899, expiry date was unknown), via an unspecified route of administration on the left arm on 21Dec2020 14:40, at a single dose for Covid 19. The patient's medical history and concomitant medications were not reported. The patient has no prior vaccinations -within 4 weeks. The patient is an EEG technician. On 22Dec2020, the patient reported the next day he started to feel sluggish, chills, tired/fatigue, pain all over his body, patient mentioned he has lost weight everyday since he got the shot from 153 pounds to 142 pounds; then on Wednesday evening 23Dec2020, it was a nightmare, he got sweating; fever with a high of 101.4 Fahrenheit; he was running to bathroom with urination every 15 minutes with a large amount of urine; and he was so tired and fatigued. Added when he was getting up all that night he was having night sweats up to five times a night and chills; and his heart was pounding. The urination, heart pounding resolved the next day. All of these events have improved at the time of report (now) or gone away but

he is still sweating once at night for the last two days and he is tired and fatigued. He stated that he is scheduled for the second dose on 11Jan2021 and he is concerned if he should take the vaccine. He mentioned that he was tested for COVID 19 on 18Dec2020 and the result was inconclusive. He went again 23Dec2020 they called him on 25Dec2020 and informed he was positive per the PCR test. He treated himself with 500mg acetaminophen (UPC 0904672059; lot OBE2896 and expiration Oct2021) and azithromycin Z-Pack (NDC 65862-641-69; Lot ZYSA20012-A; and expiration date Mar2022). The sample of the product is not available to be returned. Predisposing factor was that the patient's wife was at home and was sick too at the same time. She was tested Sunday with no results yet. The outcome of the events of fever recovered on 28Dec2020, sluggishness recovered on 29Dec2020, pain all over the body was recovered on 02Jan2021; running to the bathroom with urination every 15 minutes with a large amount of urine and heart pounding were recovered on 24Dec2020, weight loss was not recovered, and for other events was recovering.; Sender's Comments: Based on the mechanism of action of BNT162B2 vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine was given (4 days in this case). However, a causal relationship between event ""COVID-19 PCR test/he was positive per the PCR test"" (coded to Drug ineffective / SARS-CoV-2 test positive) and BNT162B2 vaccine cannot be completely excluded"

Tested positive to COVID; Tested positive to COVID; This is a spontaneous report from a contactable nurse, the patient. A 41-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 23Dec2020 as a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. On 02Jan2021, the patient tested positive to Covid. The outcome of the event, tested positive to Covid, was unknown. The lot number for the vaccine, BNT162B2, was not provided and will be requested during follow up.

neuropathy; pain; nausea; fatigue; bone, muscle, stomach pain; bone, muscle, stomach pain; bone, muscle, stomach pain; flare; increase in joint pain from his baseline; This is a spontaneous report from a Pfizer sponsored program Accredo Xeljanz Program. A contactable nurse and contactable consumer (patient) reported that a 56-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 18Dec2020 at a single dose for COVID-19 immunization and tofacitinib citrate (XELJANZ XR), orally from 02Oct2020 at 11 mg, daily for rheumatoid arthritis. The patient's medical history and concomitant medications were not reported. On 19Dec2020, the patient experienced neuropathy, pain, nausea, fatigue, bone, muscle, stomach pain and flare. In Dec2020, the patient experienced increase in joint pain from his baseline. The physician was aware. The patient was placed on unspecified steroids for the events, neuropathy, pain, nausea, fatigue, bone, muscle, stomach pain and flare which minimized symptoms. While weaning off steroids, the severity of symptoms returned. The patient was instructed by the doctor to stop taking tofacitinib citrate which was stopped on 29Dec2020. The action taken in response to the events for BNT162B2 was not applicable and for tofacitinib citrate was permanently withdrawn on 29Dec2020. The patient reported slight improvement after stopping tofacitinib citrate. The outcome of neuropathy, pain, nausea, fatigue, bone, muscle, stomach pain and flare was recovering and of increase in joint pain from his baseline was

unknown. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.; Sender's Comments: Based on the information available, the reported events are most likely due to patient underlying contributory factors and unlikely that it is related to the suspect product. However due to temporal association with the vaccine, a possible contributory role of vaccine cannot be ruled out. Case will be reevaluated based on additional information during the follow-up. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators as appropriate.

I developed Covid -19 (positive PCR) on 02Jan2021 after respecting quarantine, mask wearing, and was not onsite at work; I developed Covid -19 (positive PCR) on 02Jan2021 after respecting quarantine, mask wearing, and was not onsite at work; This is a spontaneous report from a contactable pharmacist. A 25-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) lot number: EK5130, via an unspecified route of administration at left arm from 23Dec2020 16:30 to 23Dec2020 16:30 at a single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. The patient developed Covid-19 (positive polymerase chain reaction (PRC)) on 02Jan2021, after respecting quarantine, mask wearing, and was not onsite at work. The patient did not received treatment for the adverse events. The outcome of the events was recovering.; Sender's Comments: A causal association between reported event and suspect BNT162B2 cannot be excluded.

she received her first dose of COVID vaccine on 18Dec and a week later contracted COVID; she received her first dose of COVID vaccine on 18Dec and a week later contracted COVID; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs) from a contactable registered nurse (patient). This 67-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) at single dose on 18Dec2020 for COVID-19 immunization. Medical history and concomitant medication were not reported. Patient stated she received her first dose of COVID vaccine on 18Dec and a week later contracted COVID (in Dec2020) after receiving COVID vaccine. She just wanted to find out the answer to some medical questions. She had questions about antibodies and whether or not she should take the second dose. She stated her second dose was scheduled in two days, on Friday. She said after being positive on 28Dec2020 for COVID-19 virus test, she received the medication Bamlanivumab 700 mg intravenous passive antibodies therapy to lessen the COVID symptoms and to keep her out of the hospital, which it did. The outcome of events was unknown. Information about lot and batch number was requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 cannot be completely excluded. However, it is unlikely that the patient would have fully developed immunity due to the very short time lag between the first vaccine dose and the event onset.

COVID Rapid Test and COVID-19 PCR test positive/ symptomatic/ fever/ not feeling well; COVID Rapid Test and COVID-19 PCR test positive/ symptomatic/ fever/ not feeling well; This is a spontaneous report from a Pfizer-sponsored Program Pfizer First Connect. A contactable nurse reported for a male patient (husband) with unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730) via IM injection left deltoid on 19Dec2020 at single dose for COVID Prevention.

Medical history and concomitant medications were none. The patient did not receive any other vaccines on the same day as the COVID vaccine. The patient was a healthcare professional. The vaccine was not specifically prescribed to the patient, but rather was given to him via his workplace policy, although it was not mandatory. The patient received 1st dose on 19Dec2020, and he had exposure to the virus at work, and on 01Jan2021 he woke up with a fever and was not feeling well and tested positive for COVID-19. Currently he is still symptomatic. The reporter is inquiring about how to follow up with the second dose for the patient, as the patient is due for his second dose on 09Jan2021. It was reported that it had mostly been a low grade fever. The patient had both COVID Rapid Test and COVID-19 PCR test performed on 01Jan2021, and both were positive. The outcome of event was unknown. The reporter was unsure of seriousness for the patient's positive COVID tests, so far it had not been terrible, but he was still symptomatic, so it was hard to say seriousness at this time. Relatedness of vaccine to event fever and positive COVID test both rapid and PCR from the reporter was unrelated.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 cannot be completely excluded. However, it is unlikely that the patient would have fully developed immunity due to the very short time lag between the first vaccine dose and the event onset.

"got the covid 19 vaccine on 29Dec2020 and tested positive for covid on 05Jan2021; got the covid 19 vaccine on 29Dec2020 and tested positive for covid on 05Jan2021; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age (reported as ""Age-48, Unit-Unknown"") received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 29Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient stated she got the covid 19 vaccine on 29Dec2020 and tested positive for covid on 05Jan2021. She wanted to know what to do about the second dose of the vaccine. Information about Lot/batch number has been requested."

"I ended up testing positive on Monday 04Jan2021; I ended up testing positive on Monday 04Jan2021; This is a spontaneous report from a contactable Other Health Professional (patient). A male patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection) lot number was not reported, via an unspecified route of administration on 30Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Family history included patient was ""99.9% sure that his daughter at day care had direct contact (COVID-19)"". It was reported that the patient received first dose on 30Dec2020, and that same Wednesday morning 99.9% sure that his daughter at day care had direct contact (COVID-19). He ended up testing positive on Monday 04Jan2021 with outcome of unknown, and was scheduled for second dose on 04Jan2021. He asked for specific recommendation for his weird situation. Information on Lot/Batch has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of suspected LOE and SARS-CoV-2 test positive due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available."

anaphylactic reaction; arm was really sore; tiredness; dizzy; This is a spontaneous report from a contactable other health professional (patient). A 53-year-old female patient received bnt162b2 (Pfizer-biontech covid-19 vaccine), via an unspecified route of administration on 31Dec2020 at single dose for covid-19 immunization. Medical history included shellfish allergy. The patient's concomitant medications were not reported. The patient experienced anaphylactic reaction on an unspecified date, dizzy on 31Dec2020, arm was really sore on an unspecified date, tiredness on an unspecified date. Event details: She was dizzy that day especially with changing positions, she didn't need to go to the doctor or anything. It wasn't severe. She was just a little dizzy. It's probably just the vaccine and it did go away. Her arm was really sore and went away after a few days. the tiredness, it wasn't a big deal. She did feel better about. it wasn't a serious anaphylactic reaction. It didn't happen right away. She had arm soreness. it wasn't immediate. She usually didn't have. It was really weird. She thought she was well hydrated. The outcome of event was really sore was resolved, outcome of other events was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the anaphylactic reaction and other reported events due to temporal relationship. There is very limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

she tested positive for COVID-19 after receiving the first dose of the Pfizer-Biontech COVID-19 vaccine.; she tested positive for COVID-19 after receiving the first dose of the Pfizer-Biontech COVID-19 vaccine.; This is a spontaneous report from a contactable physician. A 41-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EH9899) intramuscular in left arm on 26Dec2020 14:30 at a single dose for COVID-19 immunization.The patient's medical history and concomitant medications were not reported. The physician received her first dose of the COVID vaccine on 26Dec2020 and on 02Jan2021, tested positive for COVID. She actually tested negative 2 days before testing positive (26Dec2020). The outcome of the event was recovered on an unknown date. According to the physician, the event was unrelated to the vaccine as her nanny and her son was also tested positive.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported tested positive for COVID, which is considered ineffective of BNT162B2, and the administration of BNT162B2.

Tested positive for COVID; Tested positive for COVID; This is a spontaneous report received from a contactable Registered Nurse (patient) via a Pfizer sponsored program IBCC (Inbound Call Center for HCPs). A female patient of an unspecified age received BNT162B2, via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient experienced tested positive for COVID on an unspecified date with outcome of unknown. The patient just received the COVID vaccine,

and also tested positive for COVID. The patient underwent lab tests and procedures which included COVID test: positive. Information on the lot/batch number has been requested.

has COVID now and was pretty ill and in their ICU, positive COVID-19 test; has COVID now and was pretty ill and in their ICU, positive COVID-19 test; This is a spontaneous report from a contactable pharmacist. A 55-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), on unspecified date in Dec2020 at SINGLE DOSE for COVID-19 immunization. The patient developed positive COVID-19 test with symptoms on unknown date. The clinical course was as follows: the patient received the first dose of the vaccine 2 weeks ago and has COVID now and was pretty ill and in their ICU. Laboratory data included: SARS-CoV-2 test (unknown date): positive. The pharmacist was wondering if the participants in the trials received their second dose if they tested positive before the second dose and if there is any data on when to give the second dose of the vaccine for patients that test positive before the second dose. The outcome of the events was unknown. Information on lot/batch number has been requested.; Sender's Comments: No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the positive COVID likely represents a pre-existing infection prior to vaccine use. Further information is needed for full medical assessment.

"Anaphylactic reaction; Tongue was swelling; Difficulty breathing; This is a spontaneous report from a contactable Pharmacist. A 55-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection), at SINGLE DOSE for COVID-19 immunization. The patient experienced ""Tongue was swelling, Difficulty breathing, and an Anaphylactic reaction"".No other details provided. The outcome of the events was unknown Information on lot/batch number has been requested.; Sender's Comments: A possible causal relationship between acute onset of Anaphylactic reactions presented as Tongue swelling/Difficulty breathing and BNT162B2 cannot be completely ruled out considering the temporal relationship and the known adverse event profile of the suspect vaccine. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

Positive COVID-19 rapid test; Positive COVID-19 rapid test; Positive COVID-19 rapid test; Patient got sick; 2 weeks of on and off fever and unproductive cough; Patient got sick; 2 weeks of on and off fever and unproductive cough; Patient got sick; 2 weeks of on and off fever and unproductive cough; Lost sense of taste and smell; Lost sense of taste and smell; sore throat; This is a spontaneous report from a contactable nurse (patient). A 50-year-old male patient received the 1st dose of bnt162b2 (BNT162B2), via an unspecified route of administration, on 16Dec2020, at single dose, for COVID-19 immunisation. Medical history and concomitant medications were none. On 17Dec2020 patient got sick; 2 weeks of on and off fever and unproductive cough. In Dec2020 the patient also experienced lost sense of taste and smell. On 20Dec2020 the patient underwent COVID-19 rapid POC test and was found positive. The events required emergency room visit. Therapeutic measures were taken as a result of the events and included treatment with Tylenol 650 every 4 hours. The events recovered on unspecified date except unproductive cough and sore throat that were recovering. The information on the lot/batch number has

been requested.; Sender's Comments: The association between the event lack of effect (COVID-19 rapid POC test) with BNT162b2 can not be completely excluded.

Covid; Covid; This is a spontaneous report from a contactable Other Healthcare Professional (HCP). A female patient of unknown age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on an unknown date at single dose for COVID-19 immunisation. Medical history and concomitant medications were unknown. The patient was scheduled for her second dose of vaccine tomorrow (08Jan2021) but she was diagnosed with Covid on 07Jan2021. Outcome was unknown. Information on the lot/ batch number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

Drug ineffective; tested positive for COVID-19; This is a spontaneous report from a contactable pharmacist reporting for his/her mother-in-law. A 99-years-old female patient in good health received the first dose of BNT162B2 Pfizer-BioNTech COVID-19 Vaccine, via an unspecified route of administration on an unspecified date (presumably on 02Jan2021 - to be confirmed) at single dose for COVID-19 immunization. The patient's medical history was not reported. Concomitant medication included monoclonal antibody bamlanivimab on an unknown date. On 06Jan2021 the patient experienced tested positive for COVID-19. It was reported that the patient is scheduled to have her 2nd dose on 23Jan2021. The reporter asked if the patient should wait 90 days before taking the second dose. Information on the lot/batch number has been requested.; Sender's Comments: A causal association between event and suspect BNT162B2 cannot be excluded

"positive with covid; positive with covid; sinus strainagned at the back of the throat.; sinus strainagned at the back of the throat.; This is a spontaneous report from a contactable nurse. A female patient of an unspecified age started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# unknown), via an unspecified route of administration on an unspecified date single dose for COVID-19 immunisation. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient experienced positive with COVID on an unspecified date, sinus strainagned at the back of the throat on an unspecified date. The outcome of the events was unknown. Information on the Batch/Lot number has been requested.; Sender's Comments: A causal association between reported ""positive with covid"" and suspect BNT162B2 cannot be excluded."

received her 1st COVID vaccine shot 22Dec2020, however she got diagnosed with COVID; received her 1st COVID vaccine shot 22Dec2020, however she got diagnosed with COVID / pneumonia; rash; This is a spontaneous report from a contactable consumer (patient). This 77-years-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 22Dec2020 at single dose for COVID-19 immunisation. Medical history and concomitant medications were unknown. After the first dose, the patient got diagnosed with COVID. She does not want to waste a second dose if it will not be useful. Everyone on her department has had

COVID, and have been told to wait 3 months before getting their second dose. Caller had a 'rash' after her 1st dose of the COVID vaccine. The patient is now recuperating from the pneumonia. Outcome of pneumonia was recovering while outcome of the other events was unknown. Information on the Lot/Batch Number has been requested.

headaches on both sides of his head; This is a spontaneous report from a contactable Physician reporting for himself. A 53-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) at 0.3ml single dose on 30Dec2020 in the left deltoid for COVID-19 immunisation at the age of 53-year-old. Lot number was EK9231, expiration date 30Apr2021. Medical history and concomitant medications were unknown. On 31Dec2020, headaches on both sides of his head; the event was considered medically significant. The patient received TYLENOL for the event. The patient did not recover from the event. The physician considered the event was related to suspect vaccine. Information on the lot/batch number has been requested.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

Received the first dose of Pfizer COVID Vaccine and then tested positive after receiving it; Received the first dose of Pfizer COVID Vaccine and then tested positive after receiving it; This is a spontaneous report from a Pfizer-sponsored program. A contactable consumer (patient) reported that a male patient of an unspecified age received the first dose of bnt162b2 (lot no. and expiry date were unknown), via an unspecified route of administration on an unspecified date at single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the first dose of Pfizer COVID Vaccine and then tested positive after receiving it. He says it has been 14 days after he tested positive and he is wondering about getting his second dose. The outcome of the event was unknown. Information on the Lot/batch number has been requested.

increased respiratory infection; Allergic reaction; Yeast infection; Non-diagnosed allergic conjunctivitis; seasonal allergies; This is a spontaneous report from a Pfizer-sponsored program, IBCC (Inbound Call Center for HCPs), from a contactable nurse (patient) reported for herself. A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 22Dec2020 at a single dose for COVID-19 immunization. Medical history and concomitant medications were not reported. The patient was having an allergic reaction and had a yeast infection. She was supposed to get the next dose soon (on 12Jan2021) but she was worried about getting the second dose. The patient stated so she had some increased (incomplete sentence).The patient stated she had a non-diagnosed allergic conjunctivitis followed by a yeast infection, followed by increased respiratory infection and she did make a report of the seasonal allergies that I did not used to get at this time of year. So, she did not report the conjunctivitis because it was not diagnosed and did not report the yeast infection because she handled it herself. The outcome of events was unknown. Information about Lot/Batch number is requested.; Sender's Comments: Based solely on a compatible

temporal association causality between reported events and BNT162B2 vaccine cannot be excluded. The case will be reevaluated should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

On 1/5/2020, I, the patient woke up at 3:30 with sharp boring epigastric pain. Progressed to include nausea. On evaluation in the ED was diagnosed with acute pancreatitis. Prior hx includes 2 episodes with hospitalization for gallstone pancreatitis in 2016. Subsequently had laparoscopic cholecystectomy in 2016. Last alcoholic beverage prior to 2020 ED presentation was 3 weeks prior. No tobacco or drug use.

The patient presented to hospital on 1/6/2021 with a primary complaint of Fatigue (pt had covid vaccine yesterday. Now displaying increased weakness, blood in urine, increased confusion and urinated on herself today. Fever of 101.9) 79-year-old female presents to the emergency room with fatigue. The patient states yesterday she had the Moderna COVID-19 The patient states today she had a temperature 101.8¦ prior to arrival. Her son noted that she was having episodes of urinary frequency and also that she was profoundly weak and fatigued. They denied falling or hitting her head. The patient also states she been having nausea vomiting with diarrhea.

Vaccine was given on 12/23/20 on 01/07.21 went to get a routine physical and received an emergency call that my pallet blood count was around 10K instead of 150k. Was instructed to go to the ER asap. However didn't received the message until the next morning at 6:30am. Was checked into the E.R. , given sterioids, pallets, hemogolibin. Stayed overnight in the hospital was able to leaved the next day around 1pm with pallets at 47k.

swelling at the injection site, pain, headache, feeling like numb, change in the taste, fever the 1st day x2, body ache, lower back pain.

Three hours after receiving COVID 19 vaccination, Patient oxygen level decreased to a critical level and went into cardiac arrest. Staff performed full code but was unable to bring back patient from cardiac arrest.

2230 feeling of unease, body aches, site arm tingling, general mild aches 0220 awoke from sleep choking, having difficulty breathing, felt very SOB, worse with exertion or trying to speak, great difficulty swallowing and speaking even in brief words. Took 50mg of Benadryl PO and went to the ED, about a 15 minute car ride. Had tingling and numbness of the tongue and back of throat by arrival but still able to breath with focus. Exertion of just walking into the ED greatly increased the SOB. Was triaged, Benadryl starting to help, was able to speak a little better, 3-4 words without too much SOB caused. Was walked to a room, SOB milder with that exertion. Seen by Dr. Given IV Sol-u-Medrol and 50mg Benadryl. Was observed on cardiac monitor/Q15VS for a few hours and discharged home around 5:30. Given Rx of Prednisone 20mg -3tabs x2 days, 2tabs x5 days all once a days and told to take 50mg of Benadryl Q4H for the next 24 hours at least and to return prn. I did need to stay on Benadryl, as the Sol-u-Medrol wore off some of the swelling in thr throat did return but not severe, Benadryl did help, along with taking my

Asthmnex I already had. I also continued my normal HS antihistamines. I had SOB on exertion, progressively better from the 6th-10th with it mostly resolved to yesterday. Body aches have continued but also progressively better. Yeasterday1/12/21 the Rx of prednisone was completed and I did have some mild swelling /tingling in the throat/face/mouth return in the evening, took Benadryl 50mg again and inhaler used. I have an appointment today to seek further care at my primary doctor's office. Asthmnax used again this morning as well, only mild tightness in the throat currently with mild body aches this whole time.

Systemic: Fever-Severe, Systemic: hypotension, dyspnea-Severe; symptoms lasted 1 day

Patient day after vaccination had fever, chills, headache and malaise but recovered the next day. starting four days after vaccination started to have left neck swelling . Of note day prior vaccination had left wisdom teeth removal and maxillary root canal. 1 week after vaccination and 8 days after oral procedures worsening left neck swelling, trouble swallowing's and change voice found resulting left neck 3x2cm necrotic neck abscess and significant neck inflammation. Patient was seen by ENT and started on IV Unysan and admitted for airway monitoring due to swelling with improvement over next 48 hours.

12/23/2020-RECEIVED VACCINE AT 9:52 AM. REPORTS NOT FEELING WELL IN THE AFTERNOON, LIGHTHEADED AND DIZZY, THROBBING HEADACHE. CRAMPING/ACHING IN BACK OF CALVES. 12/24/2020 CONTINUED WITH DIZZINESS, THROBBING HEADACHE, BLOOD PRESSURE ELEVATED, CHEST PRESSURE 8:00 PM REPORTED FEELING THAT SHE WAS GOING TO DIE, WENT TO LAKE CITY MEDICAL CENTER- BLOOD PRESSURE ON ARRIVAL 184/101 HR. 117. GIVEN NITRO AND MEDICATIONS. ADMITTED, DISCHARGED 48 HOURS LATER ON 12/26/2020. DISCHARGED ON BLOOD PRESSURE MEDICATION 12/27/2020-LESS THAN 24 HOURS AFTER BEING DISCHARGED SHE WAS READMITTED TO MEDICAL CENTER WITH SAME SYMPTOMS. 36 HOURS AFTER ADMISSION, TRANSFERRED TO MEDICAL CENTER. FOR CARDIC WORKUP AND HIGHER LEVEL OF CARE.

Became dizzy, headache, felt like she was going to faint, rigors and a temperature of 101.5. Next morning she had upset stomach, feeling dizzy, thought she was going to faint and a headache.

Had Covid Vaccine AM of 1.8.2021. Woke up with Nausea, Vomiting X 4, Chills the following AM. Presented to ED. Found to be hypotensive during ER. Nausea Vomiting resolved. Tx with fluid replacement and dismissed home instructed to monitor BP. B/P dropped again at home returned and admitted to hospital.

Site: Pain at Injection Site-Medium, Systemic: Generalized Body Aches -Severe, Systemic: Headache-Severe, Systemic: Severe drop in blood pressure, pulse, and o-sat-Severe

Patient reported symptoms started ~15 mins s/p dose. Symptoms reported LUE and LLE numbness/tingling, and notable tachycardia

NauseaVomiting, HYPERtension, Tachycardia, throat swelling Narrative: Went home after vaccine and starting vomiting, throat swelling. HR and BP elevated Went to ER was given beta blockers, in hospital for observation.

"Patient received vaccine on 1/8/2021. On 1/9/2021 I checked on patient via phone for symptoms or problems and he reported none but mild soreness at injection site. On 1/10/2021 family friend called me to tell me that patient had expired at about 8:00 pm. Patient reportedly complained of ""pain"" unspecific and collapsed at home. Hospital reportedly told family that it appeared to be a ""heart attack""."

I was being monitored for 15 mins since I was allergic to tree nuts stayed 20 mins. I started feeling dizzy and exp nausea lasted 20 sec. After about 12 hrs later I woke up had difficult swallowing felt like something in my throat. I went to ER received a dose pack, Benadryl and steroid injection.

Jan 1st, patient had a seizure after breakfast. Temperature was 98.5 Pulse 95. B.P. 160/70 Two hours later another seizure at the home, with emesis, Sent to hospital at 2pm. Focal Status elepticus. Seizure activity along with continuous persistent activity with emesis throughout the 12 hour time in the ED. Seizure during the CT scan.

severe stabbing-shooting lower back pain; severe stabbing-shooting lower back pain that radiated to both legs; Pricking, pins and needles sensations in the hands and feet; numbness; weakness to both legs but mostly the right leg; Coordination problems, unsteadiness; Coordination problems, unsteadiness; This is a spontaneous report from a contactable nurse (patient). A 39-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL0140), intramuscular on 20Dec2020 08:00 at single dose at left arm for covid-19 immunization. Medical history included hypertension from an unknown date and unknown if ongoing. The patient's concomitant medications in two weeks included multivitamins. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. No known allergies to medications, food, or other products. On 22Dec2020 at approximately 19:15, the patient experienced sudden onset of severe stabbing-shooting lower back pain that radiated to both legs. Pricking, pins and needles sensations in the hands and feet. Coordination problems, unsteadiness, numbness, and weakness to both legs but mostly the right leg. The patient underwent lab tests and procedures post-vaccination which included nasal swab for covid test: negative on 30Dec2020 (Antigen Test). Adverse events resulted in doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care, disability or permanent damage. Patient received pain medication, steroid dose pack, MRI (pending), and physical therapy (pending) as treatment. Outcome of all events was not recovered.; Sender's Comments: Based on the compatible temporal association, a contributory role of vaccination with BNT162B2 in the onset of the events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

high blood pressure within 15 min post vaccination. BP 180/94/BP rose to 202/110; This is a spontaneous report from a contactable nurse. An adult female (age:18-64 Years) patient (pregnant: No) received first dose of BNT162B2 (Pfizer), intramuscularly in left arm on 05Jan2021 10:30 at single dose for COVID-19 immunization. The patient's medical history was not reported. The patient was received

other concomitant drugs. The patient experienced high blood pressure within 15 min post vaccination. BP (blood pressure) 180/94 rose to 202/110 on 05Jan2021 10:45. The event resulted in doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. The events were reported as non-serious. Recipient experienced high blood pressure within 15 min post vaccination. Went to hospital where her pressure was 202/110, vaccine given on 05Jan2021 at 10:30 am, by 10:45 am BP was 180/94, recipient refused hospitalization. Sister took her home but made her go to the hospital where her BP rose to 202/110. IV (intravenous) steroids given. The outcome of event was resolved in Jan2021. The patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. The medications the patient received within 2 weeks of vaccination: Protein drink. Unknown whether was the patient diagnosed with COVID-19 prior to vaccination. Unknown whether the patient been tested for COVID-19 Since the vaccination. Unknown allergies to medications, food, or other products. Information on the lot/batch number has been requested.; Sender's Comments: Based on temporal association, a possible contributory role of BNT162B2 cannot be excluded for reported event hypertension. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

First dose on 16Dec2020, second dose on 05Jan2021; Tinnitus; constant ringing in ears; louder this time; This is a spontaneous report from a contactable nurse (patient). A 51-year-old female patient (no pregnancy) received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), with first dose (lot number: EH9899) on 16Dec2020 via intramuscular route, with second dose (lot number: EK4176) on 05Jan2021 via an unspecified route of administration, both at single dose for covid-19 immunization. Medical history included allergies: penicillin. Concomitant medication included famotidine, ibuprofen (DUEXIS), iron (IRON) and multivitamins, all received within two weeks of vaccination. On 17Dec2020, the patient experienced tinnitus, constant ringing in ears that started 24 hours after first vaccine, lasted about 2-3 days and went away. Ringing in ears started again and is louder this time on 06Jan2021. Facility where the most recent COVID-19 vaccine was administered was in hospital. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. No treatment received for the adverse event. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. The event was identified as serious and resulted in disability or permanent damage. The outcome of event tinnitus was not recovered. The outcome of the other event was unknown.; Sender's Comments: Based on the compatible temporal association with positive rechallenge result, the Company considers the event tinnitus is possibly related to vaccination with BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Injection site was red and a little swollen the next day and has become increasingly larger. Today (3 days later) the injection site is red, warm, swollen, and about the size of a grapefruit.; Injection site was red and a little swollen the next day and has become increasingly larger. Today (3 days later) the injection site is red, warm, swollen, and about the size of a grapefruit.; Injection site was red and a little swollen the next day and has become increasingly larger. Today (3 days later) the injection site is red, warm, swollen, and about the size of a grapefruit.; This is a spontaneous report from a contactable other HCP. A 39-yearsold female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EL1284), intramuscular in left arm on 04Jan2021 14:00 at a single dose for COVID-19 immunization. Medical history included COVID-19 prior to vaccination. Concomitant medication included desvenlafaxine succinate (PRISTIQ), fluoxetine (FLUOXETINE), bupropion hydrochloride, naltrexone hydrochloride (CONTRAVE), hydrochlorothiazide (HYDROCHLOROTHIAZIDE), etonogestrel (NEXPLANON) , ergocalciferol (VITAMIN D [ERGOCALCIFEROL]), cyanocobalamin (VIT B12), and iron. On 05Jan2021, the patient experienced injection site was red and a little swollen and has become increasingly larger. 3 days later, on 08Jan2021, the injection site was red, warm, swollen, and about the size of a grapefruit. The outcome of the event was not recovered. Treatment included over the counter medications and ice. The patient was not tested for COVID-19 post vaccination.; Sender's Comments: Based on the information currently provided, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the reported injection site reactions. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"dizzy; felt like I was going to pass out; shaky; ringing in ears; This is a spontaneous report from a contactable nurse (patient herself). A 63-year-old non-pregnant female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: unknown), via intramuscular route of administration on the left arm on 30Dec2020 17:00 at a single dose for COVID-19 immunization at hospital facility. The patient had no relevant medical history and no known allergies. The patient's concomitant medications were not reported. The patient did not receive any other vaccines within 4 weeks, or any other medications within 2 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient reported ""almost immediately, dizzy, felt like I was going to pass out, shaky, and ringing in ears"" on 30Dec2020 17:00. Events were reported as non-serious but resulted in visit to the Emergency room/department or urgent care. Ondansetron (ZOFRAN) was given as treatment for nausea and meclizine. The outcome of the events was not recovered. Since the vaccination, the patient had not been tested for COVID-19. Information on the lot/batch number has been requested.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported ""dizzy, felt like I was going to pass out, shaky, and ringing in ears"" and the administration of COVID 19 vaccine, BNT162B2, based on the plausible temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate."

felt flushed; BP elevated 226/97; dull occipital headache/dull headache; This is a spontaneous report from a contactable other HCP (patient). A 64-year-old female patient received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EL1284; expiration date not provided) via an unspecified route of administration (vaccination location: left arm) on 06Jan2021 09:30 at SINGLE DOSE for COVID-19 immunisation. Medical history was reported as 'none'. It was also reported that patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine, and prior to vaccination, the patient was not diagnosed with COVID. The patient has no allergies to medications, food, or other products (no known allergies). The patient's concomitant medications were not reported. The patient previously took bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EH9899; expiration date not provided), via an unspecified route of administration (vaccination location: left arm) on 18Dec2020 18:00 at SINGLE DOSE for COVID-19 immunisation. It was reported that patient received second dose of Pfizer Covid vaccine on 06Jan2021 at 09:30 am. One hour after the 2nd dose (10:30 am), patient experienced dull occipital headache. Patient took paracetamol (TYLENOL). At 10:45 am, patient felt flushed. The nurse took patient's vital signs and noted no fever, normal heart rate and respiratory rate. BP elevated 226/97 (reported at 10:30, no unit provided; normal BP: 130's/80's). At 12:45, patient was taken to ED. CT scan and lab work were reported as all normal. BP continues to be elevated. Amlodipine (NORVASC) 10 mg was given at 17:00. BP slowly came down. Twenty-four hours later, BP was normal at 137/72 (no unit provided). No additional medication taken. It was reported that patient continues to have dull headache. No arm soreness or other symptoms. It was also reported that since the vaccination, the patient has not been tested for COVID-19. Outcome of the events 'BP elevated 226/97' and 'felt flushed' was recovering, outcome of the event 'dull occipital headache/dull headache' was not recovered.; Sender's Comments: Based on the compatible temporal association and in absence of strong confounding factors, the Company considers the reported event blood pressure increased is possibly related to vaccination with BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"rash/getting this rash on my face and everywhere/rash and it is breaking out her face and now it is all over; a lot of muscle pain; could not sleep; This is a spontaneous report from a contactable consumer (patient). A 27-year-old female patient received first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular in left deltoid on 24Dec2020 09:30 at single dose for preventative. Medical history included none. There were no concomitant medications. The patient previously took influenza vaccine (FLU) for immunization and experienced sick (Flu shot if it contains egg she gets really sick). Patient reported experiencing a rash 2 weeks on 06Jan2021 after getting her first dose of the vaccine. Caller stated ''I'm concerned because I'm getting this rash on my face and everywhere and I'm due for my booster on 13Jan2021.'" Caller questioned if others had reported this. She had a lot of muscle pain on 24Dec2020 and could not sleep from the pain in Dec2020. Reports the pain is gone now and lasted till 28Dec2020. She has a rash and it is breaking out her face and now it is all over. States nothing has changed and the vaccine was the only new thing. States the rash started two weeks since she got the vaccine. Vaccination facility type was Hospital. Vaccine administered at military facility was No.

Additional Vaccines Administered on Same Date of the Pfizer Suspect was none. AE not require a visit to emergency room. Therapeutic measures were taken as a result of rash/getting this rash on my face and everywhere/rash and it is breaking out her face and now it is all over (Doctor ordered steroids for her today she is a CNA). The outcome of the event a lot of muscle pain was recovered on 28Dec2020. The outcome of the event rash/getting this rash on my face and everywhere/rash and it is breaking out her face and now it is all over was not recovered. The outcome of the event could not sleep was unknown. Information about lot/batch has been requested."

"passed out; blood pressure was lowered; blood sugar high; weakened; feeling tired and her legs are heavy; feeling tired and her legs are heavy; This is a spontaneous report from a contactable consumer (Patient's Mother). A 23-years-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 04Jan2021 Monday at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient experienced passed out 12 hours post injection (Jan2021). She specified that her daughter was therefore brought to hospital by ambulance. She continued explaining that her blood pressure was lowered, her blood sugar high and that she was weakened (Jan2021). On 08Jan2021, ""day 4"", she said that her daughter had been feeling tired and her legs are heavy (Jan2021). The event outcome was unknown. She then asked if those side effects were experienced after the vaccine. It was not reported as serious. Information on the batch number has been requested."

left side will blur; Left side of face was sagging/ water leaking out of mouth/Progressive weakness on left side of face/ Swelling on lower left mandible/ diagnosed with Bell's Palsy.; Eye tearing; This is a spontaneous report from a contactable nurse who reported for himself. A 61-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Batch/lot number: EK5780) in left arm on 26Dec2020 at 08:30 at single dose for covid-19 immunisation (worked in surgical ICU and was over 61 years old). Medical history included Pre-diabetic. Family history included: mother died; mother's side had colon cancer and grandparents and uncles had cardiovascular diseases.Concomitant medication included exenatide (BYDUREON), amlodipine besilate (NORVASC), omeprazole (PROTONIX), hydrochlorothiazide, lisinopril and pneumococcal vaccine on 08Dec2020 and tetanus vaccine on 08Dec2020. It was reported that on 31Dec2020 at 07:30, the patient had eye tearing and water leaking out of mouth, left side of face was sagging, swelling on lower left mandible (eye tearing was first, as reported); on 31Dec2020 he also experienced progressive weakness on left side of face; on 02Jan2021 the patient was diagnosed with Bell's Palsy. Then on an unknown date, left side will blur occurred. All events required emergency room visit and physician office visit. Diagnosis of Bell's Palsy and event eye tearing were serious per disability; left side will blur was non serious. Patient described the events as follows: on 31Dec2020 he was brushing teeth and noticed the water was going everywhere. Left side of face was sagging, noticed some swelling and thought it was from a bug bite. He wasn't sure if it was a stroke or not. In the morning of 01Jan2021 noticed it was progressively causing a problem. Days before noticed tearing of left eye (as reported). On 31Dec2020 before midnight, something felt wrong. He saw four cases on clinical trial with similar side effects (he clarified he had no patient information for the four patients mentioned with similar side effects from Pfizer Clinical trial. He saw this information from a article; stated four from Pfizer and Moderna). In the morning of 02Jan202, he went to Emergency Room

(ER) and was diagnosed with Bells Palsy. He was given prednisone 20mg to take 3 times by mouth every day for 5 days, tetracycline 100mg, at 1 capsule by mouth twice a day for 10 days and methylprednisolone (SOLU MEDROL; Lot: 9945776;Exp: Nov2021) 4mg dose pack, started with 6 tablets first day. It was told by doctor it might cause tick problems. He was waiting for results. On 04Jan2021 went to family doctor and more blood work was taken. Because he was taking prednisone, noticed his sugar was up a little bit (date unspecified). It was prescribed Glitizide extended release, 2.5mg one tablet twice a day with breakfast. Patient was checking sugar every 6 hours. It was also prescribed Acyclovir 400mg one tablet orally five times per day for 10 days. 08Jan2021 is last day of prednisone 5 day dose and will follow up with methylprednisolone tablets. Patient had an appointment with a neurologist on 13Jan2021. Patient was still having symptoms. It was really hard for him. Not hard to swallow. Face was still drooping. Eyes were still tearing. Could not work with eyes tearing all of the time. Needed to be alert. When driving, had to focus on the right side because his left side will blur. He had to chew only on the right side because food will be left behind in between his cheeks and gums. If he drank through a straw, he had to cover the left side of his lips so he was able to suck out fluids. He thought symptoms were progressively getting worse, he didn't see much improvement. He clarified swelling was on lower part of mandible on left side. It was slightly bigger than right. When looking at face, the lines on his forehead on the left side were down. If he smiled he cannot raise his left eye brow, when before the COVID-19 vaccine he could. Noticed left side of nose was lower than the right. Cannot raise left side of lips. Outcome of the event Eyes tearing and Bell's Palsy was not recovered; outcome of the other event was unknown. Information on the batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of Bell's palsy, Lacrimation increased and vision blurred due to temporal relationship. However, the Bell's palsy may likely possibly represent concurrent medical condition in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including head CT/MRI and viral serologies, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Bell's Palsy; This is a spontaneous report from a contactable nurse. A 33-year-old male patient received his first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. The reporter reported a patient developed Bell's Palsy after receiving the first dose of the vaccine. This patient was a physician, the reporter stated that the patient was scheduled to receive the second dose on Monday (unspecified date) and questioned if he should or should not get the second dose. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on temporal association, the causal relationship between bnt162b2 and the event facial paralysis cannot be excluded. The information available in this report is limited and does not allow a medically meaningful

assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

hearing loss; ringing and pulsating in her ears; Chills; Headache; This is a spontaneous report from a contactable consumer (patient). A 36-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK9231), via an unspecified route of administration in in the left arm on 04Jan2021 at single dose for covid-19 immunization. Medical history included ongoing acid reflux. The patient had no concomitant medications. The patient previous received the flu shot. The patient experienced hearing loss, ringing and pulsating in her ears on 05Jan2021, headache on 04Jan2021, chills on 05Jan2021. Treatment was none. She had the vaccine on Monday at work and some of the symptoms that she has had have not resolved. She was having ringing in her ears and hearing loss. Went to see them and had her ears looked at. Everything was normal. Got the vaccine on 04Jan2021. Ringing in ears and hearing loss: Had been very consistent with no improvement. If anything, it had worsened. She was going to re-contact her doctor. She was also going to ask, should she go on Prednisone or something. She was worried she was going to lose her hearing. Her doctor said that a hearing test may need to be done. History: Takes one medication that she has been taking for years. She has never had an adverse event to any vaccine before. She got the flu shot every year. She was expecting the chills and headache, but they resolved fast. The next vaccine was 25Jan2021, the patient was asked whether she should get the second dose. The outcome of events for hearing loss, ringing and pulsating in her ears was not resolved, for headache and chills was resolved on 06Jan2021.

she was dying as her blood pressure dropped to 70/40 and to come for a last visit; This is a spontaneous report from a contactable consumer. A 100-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 02Jan2021 at single dose for COVID-19 immunization. Medical history included COVID in Dec2020, urinary tract infection (UTI), dehydration and Covid sickness (vomiting) (was treated earlier in month for UTI and dehydration from the Covid sickness (vomiting)). Known allergies: no. The patient's concomitant medications were not reported. After testing positive in mid December to COVID and being declared Covid free on 30Dec by the nursing staff and in good health, with normal vitals and oxygen levels, the patient was given a vaccination on 02Jan2021. In the early evening the patient's blood pressure dropped to 70/40 and the reporter was told to come for a last visit. The patient was sleeping comfortably. She did not wake up when spoke with her. No one expected her to make it through the night. The next morning she work up, ate breakfast, watched TV, got IVs and oxygen and her vitals improved significantly. Lab tests and procedures included blood pressure: 70/40 on 02Jan2021, oxygen levels: normal, COVID test: positive in Dec2020 (testing positive in mid December to COVID and being declare Covid free on 30Dec), vitals: normal; improved significantly. Facility where the most recent COVID-19 vaccine was administered: Nursing Home/Senior Living Facility. If the patient received any other vaccines within 4 weeks prior to the COVID vaccine: No. Prior to vaccination, was the patient diagnosed with COVID-19: Yes. Since the vaccination, has the patient been tested for COVID-19: No. AE resulted in: Life threatening illness

(immediate risk of death from the event). Serious: Yes. Seriousness criteria-Results in death: No. Seriousness criteria-Life threatening: Yes. Seriousness criteria-Caused/prolonged hospitalization: No. Seriousness criteria-Disabling/Incapacitating: No. Seriousness criteria-Congenital anomaly/birth defect: No. Information about lot/batch number has been requested.

dizzy; itchy throat; coughing; swollen throat; This is a spontaneous report from a contactable pharmacist. A 21-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL0142, NDC number: 59267-1000-1; Expiry Date: Mar2021), via an unspecified route of administration on 07Jan2021 11:20 at 0.3 mL, single at left arm for vaccination. Medical history included Cushing's disease (recovering), bipolar disorder from an unknown date and unknown if ongoing. Concomitant medication included lamotrigine (LAMICTAL) for bipolar disorder. On 07Jan2021, looked like after receiving the vaccine about 30 minutes later patient was standing and felt like dizzy. About 15 or 20 more minutes, or 45-50 minutes after received injection, she felt like itchy throat, then itchy throat triggered coughing, then she felt like swollen throat. For the treatment on scene patient was administered 50mg of diphenhydramine hydrochloride (BENADRYL) and when she complained of swollen throat was administered epinephrine (EPI-PEN) 0.3mg injection to right thigh. Then they called EMS who transported her to the hospital where she was admitted to the hospital. Outcome of events was unknown. This report was considered as serious per caused/prolonged hospitalization. Causality: Cannot jump to that conclusion.; Sender's Comments: Based on temporal association, the causal relationship between bnt162b2 and the events dizziness, throat irritation, cough and pharyngeal swelling cannot be excluded. The information available in this report is limited and does not allow a medically meaningful assessment. This case will be reassessed once additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees, and Investigators, as appropriate.

horrible body aches; Nausea; head fogginess; felt like a lump and couldn't move; not wanting to eat; This is a spontaneous report from a contactable nurse (patient). A 63-year-old female patient received BNT162B2 (Batch/lot number: E10140) first dose on 28Dec2020 11:15AM in the right arm at single dose since she is front line health care worker. Medical history included pain. Medical history included tramadol for pain. No Prior Vaccinations (within 4 weeks). Family Medical History Relevant to AE was none. She received the vaccine 28Dec2020 and it flattened her for two days. Her primary care provided has advised her not to take the next dose. Within 45 minutes she noticed nausea. She was eating lunch and she felt like everything was coming up and she forced herself not to vomit. The she noticed horrible body aches; head was foggy; she felt like a lump and couldn't move;. The body aches hurt in her arms, legs, hips, and back. Adds she was out of work for two days. She could feel it working as the symptoms would peak and then drop. She did go back to work but shouldn't have as she continued to feel nauseous and not wanting to eat. All of these symptoms have now resolved. Vaccination Facility Type was nursing home. No Vaccine Administered at Military Facility. Facility Name: Nursing Home. History of all previous immunization with the Pfizer vaccine considered as suspect was none. Additional Vaccines

Administered on Same Date of the Pfizer Suspect was none. Event not resulted in Physician office or ER. The outcome of the event nausea was recovered on 02Jan2021. The outcome of event not wanting to eat recovered on 03Jan2021. The outcome of other events was recovered on 01Jan2021. The seriousness criteria for event horrible body aches was reported as medical significant.; Sender's Comments: The patient had medical history included pain. A possible contribution role of the first dose of BNT162B2 to the horrible body aches cannot be excluded. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

patient passed away after receiving the Covid vaccine; This is a spontaneous report from a contactable nurse. An 81-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), intramuscular into the right arm on 07Jan2021 at 0.3 mL, single for covid-19 immunization. There was no medical history and no concomitant medications. On 08Jan2021, the patient passed away after receiving the COVID vaccine. The patient died on 08Jan2021. An autopsy was not performed. Investigations indicate that unspecified labs were done, but nothing two weeks prior; no further details were provided. The patient received the first dose the day prior. The reporting nurse discussed it with the medical director, and he thought that he potentially passed away from the COVID vaccine. The relatedness of the event to the suspect vaccine was reported as related by the reporting nurse per The Agency. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up .; Sender's Comments: Based on the limited information available, it is medically not possible to make meaningful causality assessment, it is unlikely the vaccine could have contributed to the death of the patient based on the known safety profile. However case will be reevaluated when additional information is received during the follow-up The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Stated that the patient passed away after receiving the Covid vaccine

Patient received her vaccination on 1/12/21 administered by pharmacy*+. She expired on 1/12/21 an approximately 7:30pm. Resident did not have any adverse reactions and was a hospice patient.

"Patient was found ""acting abnormal"" on 1/9/2021 at 1215. VS HR 20-30's. EMS activated. EMS arrived and patient was found pulseless in PEA/ asystole, CPR and ACLS initiated and then transported to the MC. Unsuccessful resuscitation and expired on 1/09/2021 at 1348. Clinical impression Cardiopulmonary arrest."

"5 days after administration- heavy uterine bleeding; constipation; severe knee/shoulder joint pain; light sensitivity; dizziness/ light headedness; thigh numbness; pain when prodded on either sides of thighs; harsh headache; This is a spontaneous report from a contactable Other healthcare professional

(patient). A 21-year-old female patient received BNT162B2 first dose on 31Dec2020 03:15 PM intramuscularly on left arm at single dose for COVID-19 immunization. Medical history included Depression, Anxiety, Factor V Leiden, Known allergies to Penicillin and Onion sensitivity. Patient is not pregnant. No other vaccine in four weeks. Concomitant medications in two weeks included unspecified medications. ""5 days after administration"" (also reported as 01Jan2021)- heavy uterine bleeding (resulting with trip to ER), constipation, severe knee/ shoulder joint pain, light sensitivity, dizziness/ light headedness, thigh numbness, pain when prodded on either sides of thighs, harsh headache. No treatment received for the events. Events resulted in ER and physician office visit. No covid prior vaccination. No covid tested post vaccination. The outcome of the events was not recovered. The seriousness was reported as no. Information on the lot/batch number has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported uterine bleeding cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

thrombopenia; pulmonary embolism; neutropenia fever; This is a spontaneous report from a Pfizer-sponsored program . A contactable consumer reported for a patient that received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced thrombopenia, pulmonary embolism and neutropenia fever on an unspecified date. The clinical outcome of thrombopenia, pulmonary embolism and neutropenia fever was fatal. The patient died on an unspecified date. It was unknown if an autopsy was performed. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.; Reported Cause(s) of Death: thrombopenia; pulmonary embolism; neutropenia fever

"Began to start having bulbar reaction with clearing of throat and tightness of chest; Began to start having bulbar reaction with clearing of throat and tightness of chest; Numb bottom lip progressed to both lips with swelling, then tip of tongue and progressed to tongue with numbing /swelling sensation; Numb bottom lip progressed to both lips with swelling, then tip of tongue and progressed to tongue with numbing /swelling sensation; Numb bottom lip progressed to both lips with swelling, then tip of tongue and progressed to tongue with numbing /swelling sensation; This is a spontaneous report from a contactable Other-HCP (patient herself). This 48-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EL0142), via an unknown route, on 07Jan2021 at 14:15 at single dose for COVID-19 immunisation. Vaccine location was left arm. The patient was vaccinated at hospital, age at vaccination was 48-year-old. The patient was not pregnant. No other vaccine was received in four weeks.Relevant medical history included COVID 19 complications (prior to vaccination). The patient has allergy to contrast dye, sulfa and molds. Relevant concomitant medications included nebivolol hydrochloride (BYSTOLIC), topiramate (TOPAMAX), atorvastatin (LIPITOR), ascorbic acid, betacarotene, biotin, calcium, chromium, copper, folic acid, iodine, iron, lycopene, magnesium, manganese, nicotinamide, pantothenic acid, phytomenadione, pyridoxine hydrochloride, retinol,

riboflavin, selenium, vitamin b1 nos, vitamin b12 nos, vitamin d nos, vitamin e nos, xantofyl, zinc (CENTRUM WOMEN), and acetylsalicylic acid (ASA). After vaccination, within 5 min she started with numb bottom lip progressed to both lips with swelling, then tip of tongue and progressed to tongue with numbing /swelling sensation. Began to start having bulbar reaction with clearing of throat and tightness of chest. She was given diphenhydramine hydrochloride (BENADRYL) total 50 mg, famotidine (PEPCID) 20 mg, dexamethasone (DECADRON) 4 mg and racemic epinephrine. The events required visit at emergency room/department and urgent care. However, the events were reported as non-serious by the reporter. Post-vaccination COVID test was not performed. The patient had not recovered from the events.; Sender's Comments: The reported ""numb bottom lip progressed to both lips with swelling, then tip of tongue and progressed to tongue with numbing /swelling sensation"", ""bulbar reaction with clearing of throat and tightness of chest"" developed within 5 min administration of BNT162B2, is likely an allergic reaction to BNT162B2, and considered related. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate."

My b/p shot up as well 180/107; My heart started racing....noted at 133/I had strong heart palpitations; Feeling of lightheadedness; This is a spontaneous report from a contactable nurse reporting for herself. A 50-years-old female patient received the first dose of BNT162B2 Pfizer-BioNTech COVID-19 Vaccine, via an unspecified route of administration in the right arm on 29Dec2020 at 12:15 pm, at 50-years of age, at single dose for COVID-19 immunization. The patient received the vaccine in Hospital and didn't receive any other vaccine in the previous four weeks. Medical history included hypertension from an unknown date (controlled) and no known allergy. Concomitant medication included amlodipine besilate 10 mg (NORVASC). The patient reported that, on 29Dec2020, within 6 minutes after receiving the vaccine dose, her heart started racing, it was noted at 133, her blood pressure shot up as well to 180/107, she had strong heart palpitations with feeling of lightheadedness. Prior to the vaccine the patient was at work, feeling well and taking care of her patients. Emergency Room visit and Physician Office visit were required, moreover fluids and potassium were administered to the patient as a result of the events. She reported she spent 8 hours in the ER. The events were reported as non-serious but they were assessed as important medical events by the Company. At the time of the report the reported events were resolving. Information about Lot/Batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Hypertensive crisis, Palpitations, and Lightheadedness cannot be excluded. The case will be reassessed if additional information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"Heart attack; This is a spontaneous report from a contactable consumer. An 82-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: and Expiration Date: Unknown), via an unspecified route of administration in the left arm on 05Jan2021 at 13:00 at a single dose for COVID-19 immunization; administered in doctor's office/urgent care. The patient's medical history and concomitant medications were not reported. It was unknown if the patient received any other vaccines within four weeks prior to the COVID vaccine. Prior to the vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. On 05Jan2021, the patient experienced heart attack; which resulted in death and was assessed as medically significant. The patient also experienced the associated symptoms of cold sweats, chest pain, shortness of breath. Therapeutic measures were taken as a result of heart attack, which included ""life saving measures"" by the paramedics performed upon arrival with no success. The clinical outcome of the event, heart attack, was fatal. The patient died on 05Jan2021 due to heart attack; as ruled by the paramedics. It was unknown if an autopsy was performed. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 MRNA VACCINE, were not provided and will be requested during follow up.; Reported Cause(s) of Death: Heart attack"

"Cardiac Arrest; Patient was found pulseless and breathless 20 minutes following the vaccine administration.; Patient was found pulseless and breathless 20 minutes following the vaccine administration.; This is a spontaneous report from a contactable other healthcare professional (HCP). A 66-year-old female patient (pregnant at the time of vaccination: no) received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL1284) via intramuscular at left arm on 11Jan2021 12:15 PM at single dose for COVID-19 immunization. Medical history included diastolic CHF, spinal stenosis, morbid obesity, epilepsy, pulmonary hypertension and COVID-19 (Prior to vaccination, the patient was diagnosed with COVID-19). The patient received medication within 2 weeks of vaccination included amiodarone, melatonin, venlafaxine hydrochloride (EFFEXOR), ibuprofen, aripiprazole (ABILIFY), lisinopril, cranberry capsules, diltiazem, paracetamol (TYLENOL), famotidine, furosemide (LASIX [FUROSEMIDE]), ipratropium bromide, salbutamol sulfate (IPRATROPIUM/ALBUTEROL), buspirone, senna alexandrina leaf (SENNA [SENNA ALEXANDRINA LEAF]), polyethylene glycol 3350 and morphine. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Patient used took Penicillin, propranolol, quetiapine, topiramate, Lamictal and had allergy to them. Patient used took the first dose of BNT162B2 (lot number: EJ1685) via intramuscular at right arm on 21Dec2020 12:00 PM at single dose for COVID-19 immunization. Since the vaccination, the patient been tested for COVID-19 (Sars-cov-2 PCR) via nasal swab on 06Jan2021, covid test result was negative. Patient was found pulseless and breathless 20 minutes following the vaccine administration (11Jan2021 12:30 AM). MD found no signs of anaphylaxis. Patient died on 11Jan2021 12:30 AM because of cardiac arrest. No treatment received for the events. Outcome of pulseless and breathless was unknown. the autopsy was performed, and autopsy remarks was unknown. Autopsy-determined cause of death was unknown. It was reported as non-serious, not results in death, Life threatening, caused/prolonged hospitalization, disabling/Incapacitating nor congenital anomaly/birth defect.; Sender's Comments: Based on the available information this patient had multiple underlying medical conditions including morbid obesity, diastolic CHF, epilepsy, pulmonary hypertension and COVID-19 diagnosed prior to vaccination. All these conditions more likely contributed to patients cardiac

arrest resulting in death. However, based on a close temporal association (""Patient was found pulseless and breathless 20 minutes following the second dose of BNT162B2 vaccine administration, contributory role of BNT162B2 vaccine to the onset of reported events cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: Cardiac arrest; Autopsy-determined Cause(s) of Death: autopsy remarks was unknown. Autopsy-determined cause of death was unknown"

Patient admitted for a fib; This is a spontaneous report from a contactable consumer. A female patient in her 70s received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection) lot number was unknown, via an unspecified route of administration on 05Jan2021 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that the patient received vaccine on Tuesday, 05Jan2021. On Thursday, 07Jan2021, patient did not feel good-pulse and blood pressure. It was mentioned that the patient admitted for a fib. Two days after receiving Pfizer-BioNTech Covid 19 vaccine, the woman patient in her 70s was admitted for a fib. Information about lot/batch number has been requested.

Vaccine administered at 08:16--08:25 patient c/o feeling unwell and dizzy 87, 143/84, 18, 100%; 08:28: Pt c/o dizzy & chest tightness, appeared pale, monitoring; 08:34: Pt c/o increased chest tightness 130, 144/81, 22, 100% monitoring 08:36: Epinephrine .3mg given IM to R thigh, pt. reported flushing, pounding heart, 911 called; 08:40: Pt flushed.

5 days after Moderna vaccine, developed severe abd pain, mid epigastrium. No Nausea or vomiting. No fever. Mild diarrhea. after 48 hrs with no improvement went to ED

At first I has some injection site pain and soreness nothing too bad. But around 01:30 I awoke with a really high fever. My fever was 102.8 when I first woke up. I was very nauseous and my fever felt worse. My thermometer would not read any more until my temp came down. I can only guess how high it got but at least 103 degrees. I took Advil Liquid Gells and then my fever broke. I was actually scare for my life. In March I actually caught coronavirus and developed anti bodies for Covid. I can only guess my body was fighting for it's life.

positive COVID-19 test with symptoms; positive COVID-19 test with symptoms; After the shot i have headache, sorethroat, cough and cold till this date; After the shot i have headache, sorethroat, cough and cold till this date; After the shot i have headache, sorethroat, cough and cold till this date; After the shot i have headache, sorethroat, cough and cold till this date; A 48-years-old non-pregnant female patient, receivedBNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration, in left arm, on 18Dec2020 (at the age of 41 years-old) as a single dose for COVID-19 immunization. The vaccination was administered at a pharmacy/drug store. Medical history was not reported. Concomitant medication included sertraline hydrochloride (SERTRALINE HYDROCHLORIDE). The patient had not received any other vaccines within four weeks prior to the vaccination nor received

any other medications withing 2 weeks prior. It was reported that the patient had been tested for COVID-19 prior to vaccination and was negative. On 18Dec2020, the patient experienced itchy sore eyes one hour after vaccination, sore and itchy arm for 5 days, headache, swollen sore throat, tiredness all 5 days after. The patient was not hospitalized nor received treatment for the events. The clinical outcome of the events of Itchy, sore eyes 1 hour after, sore and itchy arm for 5 days, headache, swollen sore throat, tiredness all 5 days after, was not recovered., the outcome of the COVID-19 positive was unknown. It was reported that the patient tested positive for COVID-19 via nasal swab, post vaccination on 31Dec2020. No follow-up attempts possible. No further information expected. Lot/batch number was not provided and unable to obtain

tested positive for Covid; tested positive for Covid; This is a spontaneous report from a contactable consumer. A 7-decade-old female patient (in her 60s) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 23Dec2020 at a single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. A pharmacy student received this drug information question in which a female patient in her 60s received the first Covid vaccine on 23Dec2020 and tested positive for Covid on 04Jan2021. Could the patient receive antibody treatment? Could she get the second vaccine and when? The outcome of the events was unknown. Information about Lot/Batch number has been requested.

Caller is a respiratory therapist who reports that he tested positive for covid after receiving the first dose of the vaccine on 17Dec; Caller is a respiratory therapist who reports that he tested positive for covid after receiving the first dose of the vaccine on 17Dec; This is a spontaneous report from a contactable consumer (patient) reported that a 32-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EH9899), via an unspecified route of administration from on 17Dec2020 at single dose (once by injection in the right arm/bicep) for COVID-19 immunization (Healthcare worker). There were no medical history and concomitant medications reported. The patient/caller is a respiratory therapist who reported that he tested positive for covid after receiving the first dose of the vaccine on 17Dec2020. He called to ask if he can get the second dose. He also wanted to ask if people experienced side effects or what side effects people experience after the second dose. He tested positive for Covid-19 on 21Dec2020, after receiving the first dose of the vaccine. He said it had been 14 days since he tested positive for COVID and he is if he can get the second dose. He says he is actually on his way to get the second dose right now, and thought he should call. The outcome of the event was unknown.

hypertension like 190/90; I had tachycardia to 165; Flushing; This is a spontaneous report from a contactable consumer (patient). A 22-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) lot number: EK9231, intramuscular on 06Jan2021 at single dose for COVID-19 immunization. Medical history included migraine. Concomitant medication included cyproheptadine for migraine, unspecified multivitamins; and diphenhydramine (BENADRYL) and famotidine as pre-medications. The patient previously received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 17Dec2020 for COVID-19 immunization, and experienced dizziness, palpitations, tingling in face and legs, myalgia, nausea, headache, fatigue. It was reported that patient got the second dose and had tachycardia to 165 and hypertension like 190/90 and had some flushing

(event onset: 06Jan2021). Patient was no longer tachycardiac or hypertensive; lasted for about 30-40 minutes. Outcome of the events tachycardia and hypertension was recovered on 06Jan2021. Outcome of the event flushing was unknown.

Actual event and cause of death were unknown; This is a spontaneous report from a non-contactable consumer. A 90-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 06Jan2021 at single dose for COVID Prevention. The relevant medical history included aortic valve replacement from Nov2019. Concomitant medications were not reported. The consumer stated that she was taking the reporting responsibilities to report that a friend of hers, informed that the patient passed away on Friday, and had received the COVID vaccine on Wednesday. The consumer stated that it was unknown to her at this time, if the friend had called to complete a report herself, regarding the incident. Their conversation was very brief. The patient was 90 years old, and it was her friend's mother that was the patient. Actual event and cause of death were unknown. The patient had her vaccine on Wednesday 06Jan2021, and then the patient collapsed in front of the reporter at Friday night on 08Jan2021 and passed away that same day. The autopsy was unknown. The outcome of the event was fatal. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Reported Cause(s) of Death: Actual event and cause of death were unknown

episodes of severe dyspnea and lightheadedness over the past couple of weeks; episodes of severe dyspnea and lightheadedness over the past couple of weeks; ventricular tachycardia with a rate of 270; severe right ventricular dilatation and dysfunction with inflammation and fibrosis throughout the RV and septum, but minimal LV involvement.; severe right ventricular dilatation and dysfunction with inflammation and fibrosis throughout the RV and septum, but minimal LV involvement.; severe right ventricular dilatation and dysfunction with inflammation and fibrosis throughout the RV and septum, but minimal LV involvement.; This is a spontaneous report from a contactable physician (patient). A 4-decade-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via unspecified route of administration on 18Dec2020 at single dose for COVID-19 immunization. Patient medical history and concomitant medications were not reported. Patient reported that on 18Dec2020, she received the first dose of Pfizer / BioNTech vaccine. On 30Dec2020 (Wednesday), she was diagnosed of ventricular tachycardia with a rate of 270, severe right ventricular dilatation and dysfunction with inflammation and fibrosis throughout the RV and septum, but minimal LV involvement. On 30Dec2020, EKG showing RBBB with PR 234 (in presence of normal EKG and ECHO from Dec2016), and positive troponin 0.07 that has remained stable in the following week. On unspecified date in Jan2021, the patient had been having episodes of severe dyspnea and lightheadedness over the past couple of weeks, but it had been sporadic - it became significantly worse in the last 2 weeks, which is why patient sought out an electrophysiologist (and purchased at-home EKG monitor on which she saw the VT). Patient do not know the cause at all. She was tested for SARS-CoV-2 antibody yesterday (unspecified date in Jan2021), which was negative. Patient was also trying to determine if she should get the second dose or not. She will have cardiac PET scan next week, which hopefully further elucidate causes. Outcome of the events dyspnea and lightheadedness was not recovered; while outcome of other events was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: Based on the available

information, a causal relationship between reported events and BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

My right leg from the knee down was purple and they thought I have a blood clot; My right leg from the knee down was purple and they thought I have a blood clot; This is a spontaneous report from a non-contactable consumer (patient). A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. Three days after vaccination the patient felt very sick and he/she was so bad that he/she thought he/she might die with outcome of recovered after one week. The patient reported also that on unknown date his/her right leg from the knee down was purple and they thought he/she have a blood clot, due to which the patient was hospitalized for 14 days. The patient ended in the hospital because his/her right leg from the knee down was purple and they thought he/she have a blood clot but they did an ultrasound that was not the case but they put he/she on antibiotic. The patient was still taking them but his/her leg has got better. No follow-up attempts are possible. Information about lot/batch number cannot be obtained. No further information is expected.

Covid symptoms began 2-3 days after shot. Presented to ER day 11 day after positive with extreme dyspnea O2 Sat at 88% Chest xray opacities throughout the bilateral hemithoracies would suggest multifocal infiltrate Admitted on high flow oxygen reduced to 6 liters currently D-dimer is >35.20

Patient is a 99yr old female who got a covid vaccine in the afternoon of 1/10/21 and woke up in the morning of 1/11/21 with altered mental status, weakness, and dysarthria. She was taken from her assisted living facility to the hospital and MRI showed a small stroke in the right medial thalamus. She was also found to have new onset atrial fibrillation. She was treated appropriately for both conditions and discharged to a skilled nursing facility on 1/13/21.

Pt was accompanied by daughter, who drove pt to clinic. Pt was correctly identified, screened, given vaccine, monitored for appropriate time. Pt left clinic as passenger of vehicle and was being driven by daughter. Pt started complainingg of Shortness of breath and not feeling right.. Daughter brought pt to local emergency room, Pt was later transferred to higher care hospital. Information regarding symptoms and further medical care was relayed to clinic by family member.

Patient received vaccine in afternoon of 12/28. She works in ER as housekeeper 7pm-7am. The day she received the vaccine she became ill with fever chills and nausea and left work at 2am. On 12/31 she developed hemianopia. She went to ER and they did CT scan. She was told it was complex migraine. She left and came Home. On 1/1/21 her vision was back to normal. On 1/3 she suffered bilateral cerebellum ischemic stroke. She is currently in medical center. In Trauma.

Patient experienced a syncopal episode post vaccination, accompanied by feeling hot and tachycardic. Prior to the syncope, she reported hyperventilating. She remained unresponsive for about 10 minutes and was brought to the ED. There she became responsive, and reported chest pain and had sinus tachycardia episodes. She also had lower extremity weakness. This has improved per the latest neurology notes. She also had a negative EEG. Unsure if this is an allergic reaction or if the syncope was due to hyperventilation. Patient is currently on day 3 of hospitalization.

Systemic: Headache, Systemic: Eyes dilated and difficulty remembering information; symptoms lasted 2 days

I was short of breath and went to emergency room on 1/5/2021. I was diagnosed with bilateral pulmonary embolisms. I was Covid negative and had no other symptoms.

2 Hours after the injection, my arm hurt so bad I could not raise it laterally. This continued for 3 days. After that I felt tired and achy until Jan 4th, I had chills and whole body aches. I came home from work, took the next day off. Feeling better, I worked 3 more days and developed the worst headache of my life. I consulted my PCP and went to the emergency room. I was diagnosed with viral meningitis and admitted to the hospital for 3 days. .

Staff walked into resident's room around 10:00am and noted resident's left side of his face was flaccid. Nurse was called and upon assessment resident noted to have an unequal hand grasp with left worse. He was able to talk but was mumbled and hard to understand. Physician, hospice, and family were notified. Resident had a stroke at 10:06 am on 1/8/2020. He lost all ability to use his left side. Resident passed away on 1/11/2020.

Patient received COVID-19 Vaccine at 0956 and reported symptoms of itchy face and chest pressure at approximately 1008 during observation period. Pt vital signs were 133/86, HR 130 and oxygen saturation 100% on room air. Pt reported worsening symptoms of chest pressure and itchiness to face. Provider instructed Epi Pen be given and pt to be transported to ED for further evaluation. EKG obtained and showed sinus tachycardia. Nonrebreather oxygen mask applied with 2L/min and oxygen saturation remained at 100%. Pt was transported via ambulance to at 1038 and pt reported feeling improved symptoms prior to leaving the clinic at approximately 1034. Pt stable at time of transfer.

Employee was awaken at 5:30 am on 1/13/2021 by chills and a feverish feeling. She then became nauseous and faint. She passed out and was noted by her mother who is a RN to have a seizure. She remained out for several minutes and then aroused. She has remained groggy the rest of today but has improved. She has a history of non-epileptic seizures since she was 14 and has been on medications for this. Employee stated she has not has any seizure activity in over a year. She did not see medical attention due to recovering quickly from this.

The patient passed away today, 1/13/2021. She was a hospice patient. She showed no adverse effects after receiving the vaccine on 1/12/2021. This morning she woke up as normal and during her morning shower she had a bowel movement, went limp and was non-responsive. The patient passed away at 7:45 am.

The morning following COVID-19 vaccination, patient's right shoulder had swelling, generalized weakness and myalgia. Hospitalized for 2 days, received intravenous fluids and bedrest, and acetaminophen. He was prostrate for 2 days.

numbness to forearm then to lower leg that then took on a dermatomal pattern, brain fog w word finding issues that progressively worsened, LLE weakness. ct brain neg. MRI/MRA head and neck neg. labs neg. MRI of c spine t spine l spine s spine neg. emg and eeg neg. discharged from hospital. symptoms fluctuating. slowly improving.

Presented to MD'S office on 01/05/2021 with cough, HA, fever 101.9, chills, and fatigue. Returned on 01/07/2021 with no improvement. Returned on 01/11/2021 with fatigue, elevated temp 101.2, SOB, 02 Sat at 90%, Rocephin 1G IM administered, CXR revealed pneumonia. MD received call from patients husband stating worsening 02 Sat levels at 81-82%. Was transferred to hospital and admitted with pneumonia..

This person was found to be deceased on routine rounds during the night, 3am. No symptoms of reaction noted post vaccine. No injection site reaction. No reports of any allergic reaction.

Resident began having fever on 1/11/21 @0600. VS= T-102 B/P- 100/57 P- 112 RR- 24 O2 Sat 92% on RA. MD called. Rapid COVID Test was negative. CBC,CMP, U/A were ordered as well as CXR. Resident's condition declined. At 3:00pm resident started having respiratory distress and hypoxia O2 Sat 89%. Supplemental O2/mask @ 5LPM. Neb TX, EKG, and Rocephin 1 GM ordered. Condition worsened. Resident sent to nearest ER for evaluation. Later in the evening the staff AT Medical Center called to inform staff that resident had expired @ 2230 as a result of Respiratory Failure and Sepsis.

about 14 hours after vaccination I experienced what appeared to be a severe case of Cytokine storm. I had a moderate case of COVID in May 2020 and had positive IgG AB in August. The symptoms started with heavy shaking chills, lasting 1 1/2 hours , fever and most concerning sustained tachycardia with heart rate of 180' to 200' over hours, which then destabilized into runs of Vtach and complex ventricular dysrythmia, low BP, profound weaklness, head aches and joint and muscle pains (similar to the experienced COVID symptoms)

"Patient received vaccine at 0939. 30 minute wait period related to history of previous anaphylactic reaction. 10:05 patient walked from observation area to vaccinator and reported that her ""chest was burning"" and ""feels like it is getting tighter to breathe. Pt had change in voice. Patient moved to chair and started on oxygen 1.5 L/m per nasal cannula. MD came to room to assess patient. ED arrived and checked patient B/P. Patient transferred by cart to ED."

Patient began having cramping of her upper extremities and subsequent swelling of her face and neck and also shortness of breath, chest pressure and flushed appearance. She denies any tongue or throat swelling. She is also complaining of bilateral arm pain. The initial reaction treatment was started in the conference room and then the patient was transferred to the emergency room. She continued to has arm and chest pain in the emergency room. She had muscle tension/rigidity in the upper extremity which caused significant pain. She also developed a nonspecific rash on the chest and abdomen that

persisted for through out he hospital stay. Treatment was started with epinephrine 0.5 mg IM x2 and diphenhydramine 50 mg IM x1, prior to transfer to emergency room. In the emergency room treatment was dexamethasone 10mg IV x 1, famotidine 20mg IV x1, Ketorolac 30mg IV x 1, lorazepam, 1mg IV x 2, morphine 4mg IV x 2, 1000ml Saline Solution. As an inpatient the treatment included scheduled acetaminophen 500mg TID, as need morphine for pain after treatment with fentanyl, scheduled diphenhydramine 25mg IV q8 and compazine 5mg IV for nausea, cyclobenzapine 10mg as need for muscle spasms, dexamethasone as a scheduled dose started at 4 mg BID and tapered to 2 mg BID, Naproxen 500mg BID and Norco 7.5/325 as need for pain. with famotidine 20mg BID .

Note: I am currently breastfeeding. Had body aches; chills; fever of 102.6; headache; nausea; cough; shortness of breath - I went to ER and that is where I received COVID positive test and positive tests for COVID Pneumonia and Microplasm Pneumonia as well. Stayed overnight in ER observation - 2 am to 8 am . Went home next morning and was quarantined approximately 8 days. Body aches and a cough had started two days prior to injection. IV antibiotics at the hospital and oral antibiotics at home. Received nebulizer breathing treatments. Pain meds and anti-inflammatory medication.

Onset of tachycardia was 8:30pm on 1/12/21 with a noted HR of 164 and SR. Went to ER and had HR of 171 upon arriving to triage window. EKG said Sinus Tachycardia. Admitted to observation station with telemetry to monitor HR. HR normalized around 100 when up and walking at 10:45am on 1/13/21.

I received my covid vaccine on 12/29/2020 at 4:42pm. In 10 minutes after the shot, I went into anaphylactic shock, I broke out in hives, and my throat was closing

Pt reported chest tightness and throat tightness following vaccination. Time course following vaccination unknown.

little bit of a reaction light headed after 5 minutes. vitals were low, so observed for 30 minutes after being light headed. Patient was found unresponsive and pronounced dead later that day.

Death occurred 3 days after vaccine receipt; attributed to complications of her chronic advanced dementia with aspiration at age 87. No evidence of acute vaccine reaction.

No adverse effects from vaccination seen on 1/2/21. On 1/6/21 resident was seen by Dr and her baclofen pump was refilled with 20 ml Baclofen 4,000mcg/ml. ITB Rate increased by 6% to 455.5 mcg/day simple continuous rate over 3 days. On 1/8/21 at 0615 resident was shaking, lower extremities mottled, Sa02 70%, pulse 45. Oxygen started at 2 L/m per NC. At 0715 her primary physician was notified as well as her daughter. Oxygen increased to 4 L/min, sats at 83%. SOA noted, reported all over pain. At 0850 when they attempted to reposition the resident, she was not responsive. Licensed nurse assessed her and no heartbeat heard or pulse found.

I had a mild headache the evening of the shot, I had a headache the next two days that was relieved by Advil. I had a very sore arm at the injection site Friday and Saturday after the shot was given. The arm pain was gone Sunday morning. I was very tired on Saturday especially and slept through the morning and early afternoon on and off until about 3:00 pm. On Friday during the day, I noticed my right ear

starting to feel unusual and uncomfortable. On Saturday, the ear issue continued, I felt like I had some hearing loss and a constant buzzing and ear fullness feeling. On Sunday, the ear issued continued with the hearing loss, buzzing and fullness and has through today and hasn't stopped. I tried some nasal decongestant on Sunday afternoon, but it didn't have any effect. I made an appointment with the ENT doctor on Monday morning for Tuesday. I had a hearing test on Tuesday and saw the ENT doctor on Wednesday. He prescribed prednisone and ordered an MRI. I will be starting the prednisone later today (Wednesday) when the pharmacy has the prescription ready.

54 y/o M with PMH of HTN, HLD, Alcoholic Cirrhosis, Aortic Valve Stenosis, and angina BIBA as a Medical Alert for cardiac arrest noted PTA. Per EMS, the patient called because he was having constant, diffuse abdominal pain x 1 day that radiated to his chest. On scene, the patient had a witnessed arrest with EMS starting CPR. He was given 3 rounds of epi without ROSC. Pt had no associated shockable rhythm. Of note, pt's wife, had noted pt had received covid vaccine the prior day.

A few minutes after the vaccine, she had mild tongue swelling. It only lasted a few minutes, and then she felt fine. However, her BP went up. I'm not sure how high. she then has a short run of asymptomatic V tach. Taken to hospital observed overnight. No further events or problems.

She got the vaccine on Dec 23, and then on Jan 4 she had a mild stroke with left sided arm and face weakness. She did recover fully. She already has known CAD and risk factors for CVD. It is possible, but by no means certain, that the vaccine was an indirect cause of the event. Since the vaccine provoked an immune response, as it was supposed to, it is possible that this inflammation may have set up a metabolic predisposition that may have contributed to the event, which was 12 days later.

New onset altered mental status after fall. Per son, she was found in bed, unresponsive at around 12:15 AM on 1/10 by her husband. Brought to the emergency room and admitted, Began treatment for UTI w/ CTX. Discharged 1/11/21 with f/u appointments

Resident received 1st dose on 1/4/2021. On 1/6/2021 resident having SOB, increased weakness with O2 sats at 91% RA. On 8th resident sustained a fall, O2 sats 88-92, dizzy, weakness. Rapid COVID test performed with negative results. Evening of 8th resident was lethargic and diaphoretic with fever of 99.9. Resident transferred to ER, on 5lt of oxygen. Resident returned from the ER on 1/9/2021 with new diagnosis of Leukemia and orders for hospice. Continued with fever, crackles and N/V and loss of appetite from the 9th and 10th of January. Resident expired at 820am on 1/11/2021.

I had a headache at the top of my head, and a tingling sensation down my left leg from my buttocks to my calf. The tingling lasted until the next morning then went away. On 1/3/2021 I experienced a strong headache followed by facial numbness and tingling. This lasted for an hour or so and slowly subsided. The headache lingered for 3 days.

Headache; migraine; tenderness at injection site; Ten hours after injection he had shaking, sweats, hot and cold flashes, and augmentation of myalgias; Ten hours after injection he had shaking, sweats, hot and cold flashes, and augmentation of myalgias; Ten hours after injection he had shaking, sweats, hot and cold flashes, and augmentation of myalgias; Ten hours after injection he had shaking, sweats, hot

and cold flashes, and augmentation of myalgias; Ten hours after injection he had shaking, sweats, hot and cold flashes, and augmentation of myalgias; Fatigue; This is a spontaneous report from a contactable physician (patient). A 53-year-old male patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK9231), via an unspecified route of administration on right deltoid on 05Jan2021 07:45 at single dose for covid-19 immunization. Family history included migraine (other family members). Medical history included mild blood pressure and kidney stones, reactive airway disease. Concomitant medication included colecalciferol (VITAMIN D), potassium, allopurinol and hydrochlorothiazide/valsartan for mild blood pressure and kidney stones, fluticasone propionate, salmeterol xinafoate (ADVAIR) for reactive airway disease, atorvastatin, and multivitamins. The patient previously took fluticasone propionate, salmeterol xinafoate (ADVAIR) and experienced dry mouth and lost sense of taste. The patient also previously took Tdap booster on Aug2020, Shingrix on 10Aug2020, and influenza on 12Oct2020; all for immunization; and tetanus injections for immunization and experienced localized tenderness. The patient had the first dose of BNT162B2 (lot number: EH9899) for COVID-19 immunization on 15Dec2020 and experienced localized tenderness at injection point. The received his second dose of COVID vaccine on 05Jan2021. With the first dose he had increased localized tenderness at injection site on 15Dec2020, and he rated it mild to moderate. He would say it was 80% resolved in 24 hours. It had completely resolved in 36 hours. He would say that he has recovered completely form the localized tenderness with the first dose. Then he noted his second dose was yesterday, in the context of not having much sleep the night before. The actual injection was uncommonly eerily painless. The other folks in his department had similar experience. Maybe it was the nurse who gave the injection. Maybe it was because it was the same area and sensitivity was decreased. They had to check the Band-Aid to make sure blood was there. The administration was painless. He was relieved when the arm started getting sore to know he actually received it. He had increased arm tenderness at injection site which he rated as moderate which has now resolved. It got to moderate where lifting the arm up was sore. He definitely knew that he had been vaccinated. He got the vaccine at 7:45AM and now it is 16 to 17 hours later and he would say the pain is mild now. It did persist. The first vaccine hurt a little more. He expects this to go away. Ten hours after injection he had shaking, sweats, hot and cold flashes, and augmentation of myalgias. He had unrelenting headache over night that was moderate to severe. He said it kept him awake. It was exacerbated by lying down. Sitting up helped him. It became a migraine which is something he doesn't often experience. Migraines are pretty rare for him. He took 800mg of Advil at 6AM that helped for headache and migraine. The weight of the patient was 250 to 255 pounds. Shaking, sweats, hot and cold flashes, and augmentation of myalgias have resolved. Everything has resolved except for a little headache. In the background he literally had one or two hours of sleep. He thinks that likely precipitated a migraine was increased. Last night he slept literally an hour. He took 800mg of Advil and fell asleep. He is operating on 2 hours of sleep in 48 hours. Most of the stuff is gone except a little headache and expected fatigue. Headache Seriousness Criteria: he would say that it was relatively disabling. He would not have been able to carry on. He wouldn't have been able to operate last night. It would have interfered. It was dissimilar to others. He gets rare migraines. Everything was amplified with a migraine. He certainly felt that. It was fair to say the vaccine precipitated the migraine that was mild or severe. He doesn't want to falsely attribute these things to the vaccine. Causality Headache: precipitated by the vaccine. In the context that he had not slept the night before. He had a nasopharyngeal COVID test and it was negative. He has been in a COVID study

where they are looking at combination. They developed a saliva test at (Name). There is a combination of saliva oropharyngeal and immunoglobins. He has been negative multiple times. The outcome of the events headache and fatigue was not recovered and recovered for the rest of the events.; Sender's Comments: A causal association between BNT162B2 and the reported event headache cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

A PCR test was done and received results Monday (4th) as positive; A PCR test was done and received results Monday (4th) as positive; Had some scratchy throat late friday night; Saturday called out sick to work as the cough started; Saturday called out sick to work as the cough started.; Lost taste and smell monday; Lost taste and smell monday; Running fever; fatigue; This is a spontaneous report from a contactable Pharmacist (the patient). A 52-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number EJ1686, expiration date unknown) via an unspecified route of administration on 28Dec2020 at 12:00 PM (at the age of 52-years-old) via an unspecified route of administration at an unspecified dose in the right arm for COVID-19 vaccination. Medical history included hypertension, high blood cholesterol from unknown dates. Allergy information was not provided. Prior to the vaccination, the patient was not diagnosed with COVID-19. The patient was administered the vaccine at a Nursing Home/Senior Living Facility. Concomitant medication included hydrochlorothiazide, valsartan (VALSARTAN/HYDROCHLOROTHIAZIDE), atorvastatin (LIPITOR), fenofibric acid (FENOFIBRIC ACID), amlodipine besilate (NORVASC). The patient did not receive any other vaccines within four weeks prior to the vaccination. The patient received the vaccine on Monday 28Dec2020. A PCR test for COVID was done on Tuesday and a rapid test on Wednesday both of which were negative. The patient experienced some scratchy throat late Friday night on Saturday, 02Jan2021 the patient called out sick to work as a cough had started. A PCR test was done on 02Jan2021 and he received results Monday (4th) as positive. The patient continued to say that the cough had subsided, as he took Delsym. He lost taste and smell on Monday. He reports running a fever that varies from 99-101.5. He took Tylenol and Motrin to control the fever. In addition he has experienced fatigue. It was also reported, in contradiction of the above reported chronology of events, that the onset date of events was 25Dec2020 (CONFIRMATION PENDING for onset date of events relative to vaccine administration). The patient experiences of COVID 19 positive test, scratchy throat, sickness, cough, loss of test and smell, fever and fatigue resulted in a physician office visit (date not specified). The patient underwent lab tests that includes a PCR test on 29Dec2020 which was negative, a rapid test on 30Dec2020 which was negative and a PCR test on 02Jan2021 which was positive. Treatment for the events was reported as Motrin and Tylenol for fever and Delsym. for cough. The clinical outcome of COVID 19 positive test, scratchy throat, sickness, cough, loss of test and smell, fever and fatigue was reported as not recovered.; Sender's Comments: The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 28Dec2020, and COVID-19 PCR test positive on 02Jan2021. No effect of the suspect vaccine could be reasonably achieved to protect from the targeted

infection/disease due to the very short time lag. Instead, the positive COVID likely represents the pre-existing infection prior to vaccine use. Further information is needed for full medical assessment.

"he tested positive for COVID-19 / (probably infected by a family member); runny nose; dry cough; flu-like symptoms; he tested positive for COVID-19 / (probably infected by a family member); he tested positive for COVID-19 / (probably infected by a family member); This is a spontaneous report from a contactable consumer (patient). A 40-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 17Dec2020 at single dose for COVID-19 immunisation. The relevant medical history and concomitant medications were not reported. The patient stated that the next dose is scheduled for the time of the report, however he tested positive for COVID-19 on 05Jan2021 (probably infected by a family member). Representatives at the administration site are not sure if he should get the second dose. The patient reported minor symptoms ""flu-like symptoms, runny nose, dry cough, no major symptoms"". The outcome of the events was unknown. Information on the lot/batch number has been requested."

diagnosed with covid 30Dec2020; diagnosed with covid 30dec2020; This is a spontaneous report from a contactable nurse (patient). A 27-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number EK5730), via an unspecified route of administration in right deltoid on 21Dec2020 13:45 at single dose for Vaccination. There were no medical history and concomitant medications. The patient was diagnosed with covid on 30Dec2020 with outcome of recovering. The patient underwent lab tests and procedures which included COVID test: positive on 30Dec2020. The patient received the first dose of the covid vaccine on 21Dec2020, and was diagnosed with covid on 30Dec2020. The patient had COVID test on 30Dec2020 and received positive result of COVID test on 31Dec2020. He was scheduled for the second dose between 08Jan2021 and 11Jan2021. He asked if he should continue to get the second dose as scheduled in relation to the diagnosis of COVID. COVID: the patient still had chest congestion, but no fever without medication, no cough anymore. He was having cough, fever, loss of taste and smell, fatigue and malaise. Reporter seriousness for COVID: Not serious. Relatedness of drug to reaction/event: Reaction assessed: COVID, Source of assessment: Primary Source Reporter, Method of assessment: Global Introspection, Drug result: Unrelated. Verbatim event relatedness: Pfizer COVID-19 Vaccine: COVID-Unrelated.; Sender's Comments: The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 21Dec2020, and was diagnosed with COVID-19 on 30Dec2020. No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the diagnosed COVID-19 likely represents the pre-existing infection prior to vaccine use, and unrelated to BNT162B2.

she got Covid; she got Covid; This is a spontaneous report from a contactable physician. A female patient (Patient Age: 18; Unit: Unspecified) received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date t a single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The nurse that her first Pfizer Covid 19 vaccine and a couple of days later developed symptoms of Covid and tested positive. Stated that she recovered and had no symptoms. Information on Lot/Batch number has been requested.; Sender's Comments: The

reported symptoms of Covid with tested positive after COVID-19 immunization is considered ineffective of BNT162B2, and the Company cannot completely exclude the possible causality between the reported event and BNT162B2 administration.

covid test result=Positive; covid test result=Positive; This is a spontaneous report from a contactable other healthcare professional (other HCP reporting for himself). A 39-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE Solution for injection, batch/lot no. and expiry date unknown), via an unspecified route of administration on 16Dec2020 12:45 (1st dose) at a single dose on his left arm for COVID-19 immunization. The patient medical history was not reported. Concomitant medication included hydrochlorothiazide, losartan potassium (HYZAAR), omeprazole, and ibuprofen; all on unspecified dates for unspecified indications. The patient previously took amoxicillin and experienced allergies. Patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine, he was also not diagnosed with COVID-19 prior to vaccination. However, since the medication, the patient has been tested positive for COVID-19. Patient had his nasal swab on 22Dec2020, and it turned out positive (COVID test result=positive). Outcome of the event drug ineffective and COVID-19 virus test positive was unknown. Facility where the most recent COVID-19 vaccine was administered at the hospital. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 cannot be completely excluded. However, it is unlikely that the patient would have fully developed immunity due to the very short time lag between the first vaccine dose and the event onset.

covid test result=Positive; covid test result=Positive; nasal congestion; sneezing runny nose; sneezing runny nose; sinus pressure; dry cough; This is a spontaneous report from a contactable Nurse (patient herself). This 37-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EL0140), via an unknown route, on 19Dec2020 at 16:15 at single dose for COVID-19 immunisation. Vaccine location was arm left. The patient was not pregnant. The patient was vaccinated at hospital, age at vaccination was 37-year-old. No other vaccine was received in four weeks. No relevant medical history was provided. Relevant concomitant medications included amoxicillin sodium, clavulanate potassium (AUGMENTIN, formulation: tablet) at dose of 875 mg twice daily from an unknown. Pre-vaccination COVID test was not performed. On 25Dec2020 at 20:00, the patient complained of nasal congestion, sneezing runny nose, sinus pressure, and cough. On 28Dec2020, COVID test Nasal Swab (SOFIA SARS ANTIGEN FIA/QUIDEL) was performed and resulted positive. She was given oral azithromycin 500 mg 1 tab Daily and oral benzonatate (TESSALON PERLES) 1 Capsule three times a day (TID). The symptoms of nasal congestion, sneezing runny nose, sinus pressure, and cough were improving. The outcome of 'COVID test result=Positive' was unknown.; Sender's Comments: The efficacy of a drug varies from patient to patient and can be affected by different factors; however, a contributory role of the suspect product BNT162B2 to the reported drug ineffective and SARS-CoV-2 test positive cannot be ruled out.

two staff members who tested positive for covid after receiving the first dose.; two staff members who tested positive for covid after receiving the first dose.; This is a spontaneous report from a Pfizer-sponsored program from a contactable pharmacist reported similar events for 2 patients. This is a first of two reports. A staff member of unknown age and gender received the first dose of BNT162B2 Pfizer-

BioNTech COVID-19 Vaccine, via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medication were unknown. The reporter stated that have a staff member took the first shot and afterward got a positive COVID test. He is asking about the recommendation regarding taking the second shot. The reporter explained he is the immunizer and 2.5 weeks ago he gave the employ at the facility the first does of the vaccine. He has very little information to provide on this event. He called to go over the procedure for administering the second dose and that is when in was inform. Information on the lot/batch number has been requested.; Sender's Comments: The efficacy of a drug varies from patient to patient and can be affected by different factors; however, a contributory role of the suspect product BNT162B2 to the reported drug ineffective and SARS-CoV-2 test positive cannot be ruled out.,Linked Report(s) : US-PFIZER INC-2021011912 Same reporter/ drug/ event for different patients.

received first dose of the vaccine on 19Dec and tested positive on 30Dec; received first dose of the vaccine on 19Dec and tested positive on 30Dec; This is a spontaneous report from a contactable nurse reported for herself. A female patient on unknown age received the first dose of BNT162B2 Pfizer-BioNTech COVID-19 Vaccine, via an unspecified route of administration on 19Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medication were not provided. On 30Dec2020 the patient experienced tested positive for COVID-19. It was reported that the patient is scheduled to have her 2nd dose on 09Jan2021however she's been getting roundabout information on what to do in her case. Information on the lot/batch number has been requested.; Sender's Comments: The efficacy of a drug varies from patient to patient and can be affected by different factors; however, a contributory role of the suspect product BNT162B2 to the reported drug ineffective and SARS-CoV-2 test positive cannot be ruled out.

She tested positive to COVID on 29DEC2020; She tested positive to COVID on 29DEC2020; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received first dose of bnt162b2 (BNT162B2, lot no. and expiry date were unknown), via an unspecified route of administration on 21Dec2020 at single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient was tested positive to COVID on 29Dec2020. She received the 1st dose of the vaccine on 21Dec2020. She is due for the 2nd dose on 11Jan2020. They asked if she should still receive the 2nd dose. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the positive COVID likely represents the pre-existing infection prior to vaccine use. Further information like confirmative COVID 19 Nucleic acid/ PCR test together with any associated symptoms are needed for full medical assessment.

"got the covid 19 vaccine on 21Dec2020 and tested positive for covid on 24Dec2020; got the covid 19 vaccine on 21Dec2020 and tested positive for covid on 24Dec2020; This is a spontaneous report from a contactable Nurse (patient) from a Pfizer-sponsored program Pfizer First Connect. A 36-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot number: EK5730), via intramuscular in left deltoid on 21Dec2020 10:00 at 0.3 ml, single for precaution as front line healthcare worker in hospital which is not a military facility. Medical history included nonsmoker.

She did not provide causality but stated that she probably already had COVID when she got the vaccine. It was unknown if the patient had SARS-CoV2 antibodies at diagnosis as she had never been tested. Other history was none. The patient did not have a history of hypertension, diabetes, heart disease, lung disease, liver disease, kidney disease, cancer, immunosuppressive disorder, obesity. There was not any pre-existing diseases worsened during the SARS-CoV2 infection. The patient hadn't been treated with immunomodulating or immunosuppressing medications or received any other vaccines around the time of COVID-19 vaccination. Concomitant medication included bupropion hydrochloride (WELLBUTRIN SR), sertraline hydrochloride (ZOLOFT), amfetamine aspartate, amfetamine sulfate, dexamfetamine saccharate, dexamfetamine sulfate (ADDERALL). Prior Vaccinations (within 4 weeks) were none. AE following prior vaccinations were none. There was no additional vaccines administered on Same Date (21Dec2020) of the Pfizer bnt162b2. The patient got the covid 19 vaccine on 21Dec2020 and tested positive for covid on 24Dec2020. The patient wanted guidance on receiving the 2nd dose of the vaccine. The reporter considered event was non-serious. The patient received the first dose of the vaccine on 21Dec2020, and after that on 24Dec2020, she tested positive for COVID . She was supposed to be revaccinated on 07Jan2021. She would like to know if she should she get this or does she need to be revaccinated. There is no prescriber. She received it through her work. She received the first dose on 21Dec2020, and assumed she was positive when she got it. She just had cough and muscle aches and a headache. Her dad was hospitalized. Hers was not that serious. She had not completely recovered yet. Her smell had not come back yet and she was just tired still. She said the headache was prior to getting vaccine. She did not provide causality but stated that she probably already had COVID when she got the vaccine. The cough occurred on 25Dec2020, muscle aches on 22Dec2020 at 08:00. There was no emergency room of or physician's office required for the events. The patient was not hospitalized or admitted to an ICU. Nasal swab test done. Imaging for COVID-Pneumonia, other radiological investigations, hematology, clinical chemistry, inflammatory markers, urinalysis, evidence of hypoxemia, other relevant test were none. The patient did not display clinical signs at rest indicative of severe systemic illness. The patient did not require supplemental oxygen (including high flow or ECMO) or receive mechanical ventilation. The patient did not receive any additional therapies for COVID-19. The event did not require the initiation of new medication or other treatment or procedure. She did start taking extra vitamins on her own. The patient was recovered with some lasting effects such as not being able to smell and is tired still.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported COVID with symptoms and the administration of COVID 19 vaccine, bnt162b2. However, as the reporter claimed ""she probably already had COVID when she got the vaccine"", this may provide an alternative explanation."

had the first dose of the COVID-19 vaccine last 24Dec2020 and the second dose is scheduled on 14Jan2021/tested positive for COVID-19; had the first dose of the COVID-19 vaccine last 24Dec2020 and the second dose is scheduled on 14Jan2021/tested positive for COVID-19; This is a spontaneous report from a contactable Nurse (patient). A male patient of an unspecified age received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date: unknown), via an unspecified route of administration on 24Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient had the first dose of the COVID-19 vaccine last 24Dec2020 and the second dose is scheduled on 14Jan2021. However, last 04Jan2021, the patient

tested positive for COVID-19. The patient was looking for recommendations on when he/she can take the COVID-19 vaccine. The patient underwent lab tests and procedures which included COVID-19 test: positive on 04Jan2021. The outcome of the event was unknown. Information on the Batch/Lot number has been requested.

Received the vaccine on 23Dec2020. She tested positive for COVID on 31Dec2020.; Received the vaccine on 23Dec2020. She tested positive for COVID on 31Dec2020.; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A contactable other healthcare professional (patient herself) reported that a 37-year-old female patient received bnt162b2 (BNT162B2 also reported as PFIZER-BIONTECH COVID-19 VACCINE, lot EH9899), via an unspecified route of administration in the left arm 23Dec2020 at single dose, for Covid-19 immunization. Medical history included migraine (takes a migraine medication). Her height was 168cm, weight of 72.5kg. There were no concomitant medications. Received the vaccine on 23Dec2020. She tested positive for COVID on 31Dec2020. Then she had another test and was negative for COVID on 03Jan2021 and was also negative for another test on 05Jan2021. She was wondering if this was like a super vaccine and knocked it out or if there was an error with the test. She acknowledged that there was a lag time for the second dose of 21 days. She was wondering if there was a grace period for that since she cannot be cleared for work. She was also wondering what to do before her second dose of the vaccine. The outcome of event was unknown.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported positive Sars-Cov-2 test, which is considered ineffective of BNT162B2, and the administration of BNT162B2.

she tested positive for the Covid-19; she tested positive for the Covid-19; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot no. and expiry date were unknown), via an unspecified route of administration on 17Dec2020 at single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the Covid-19 vaccine on 17Dec2020. She said that she tested positive for the Covid-19 after that (unspecified date) and she is due to get her second dose of the vaccine today 07Jan2021. She said that she is wondering if she needs to get the second dose. The outcome of the event was unknown. Information about Batch/Lot number has been requested.; Sender's Comments: Based on available information, a possible contributory role of BNT162B2 cannot be completely excluded for reported event.

tested positive for COVID; tested positive for COVID; This is a spontaneous report from a non-contactable nurse (patient) and a contactable consumer. A 43-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 23Dec2020 at single dose for COVID Prevention because of occupation. The patient's medical history and concomitant medications were not reported. The patient experienced tested positive for COVID on 02Jan2021 with outcome of unknown. The patient underwent lab tests and procedures which included COVID test: positive on 02Jan2021. The patient got the first dose of the COVID vaccine, and then tested positive for COVID afterward. The patient was inquiring about if there are any recommendations for getting the second dose, if the person tested positive for COVID after getting the first dose. The patient

did not provide prescriber information. The patient should come off of quarantine on 15Jan2021. It was unknow if the patient received any other vaccines on the same day as the COVID vaccine and if there were any concomitant medications, history or investigations other than the COVID test. The type of COVID test the patient received was unknown, just that she got the positive result on 02Jan2021. Information on the lot/batch number has been requested.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

He is losing some taste/but reduced by 30-40%; received first dose of vaccine 21DEC2020 and SARS-Cov-2 positive/Nasal swab COVID positive; received first dose of vaccine 21DEC2020 and SARS-Cov-2 positive/Nasal swab COVID positive; Sniffles; This is a spontaneous report received from Pfizer sponsored program Pfizer First Connect via a contactable other HCP (parent) reported for the patient (son). A 22-years-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot: EK5730) intramuscularly in left arm on 21Dec2020 (15:00-16:00) at single dose for COVID-19 immunisation. There was no medical history. There were no concomitant medications. The patient received first dose of vaccine 21Dec2020 and SARS-Cov-2 positive 06Jan2021 13:00. The patient got COVID vaccine 21Dec2020, and was scheduled to get second dose on 11Jan2021. He had a sniffle the other day on 05Jan2021 night time and tested positive for COVID on 06Jan2021, so reporter wanted to know if he should still get second dose. His symptoms are stable. He is quarantining. He is on his way to do a PCR now. Reporter read somewhere people could have false positive in nasal. He is losing some taste from 07Jan2021 (01:00 - 02:00). Most things he can taste. Some he cannot. It is not completely gone but reduced by 30-40%. He did a mouthwash with a sting and is not feeling that sting anymore. He said last night, same thing. He did a mouth wash and did not really taste much. It is not as prevalent as it was before. The patient underwent lab tests and procedures which included SARS-CoV-2 test: positive on 06Jan2021, positive COVID test 06Jan2021, 13:00, Nasal swab COVID. Event outcome of sniffles was recovering, while for other events was unknown.; Sender's Comments: The efficacy of a drug varies from one patient to another and can be affected by different factors; however, a contributory role of the suspect drug BNT162B2 to the reported event ___ cannot be ruled out. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

woke up in the middle of the night; lower legs felt kind of numb and tingly; weak; nausea; anaphylactic reaction; hot flash started on my head, went over my body; dizzy/lightheaded; blurred vision; chest became very tight/chest tightness; throat felt like there was a lump in it; coughing; irritated throat; heart rate was in the 140s; sinus tachycardia; lower legs felt kind of numb and tingly; chills; fever; body aches; diarrhea; This is a spontaneous report from a contactable nurse. A 26-year-old female patient

started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EH9899) via an unspecified route of administration on 29Dec2020 07:30 at single dose for COVID-19 immunisation. The patient medical history was not reported. The patient's concomitant medications were not reported. The patient experienced anaphylactic reaction, hot flash started on my head, went over my body, dizzy, lightheaded, blurred vision, chest became very tight/chest tightness, throat felt like there was a lump in it, coughing, irritated throat, heart rate was in the 140s, sinus tachycardia, fever, chills, body aches, diarrhea, lower legs felt kind of numb and tingly, weak, all on 29Dec2020 and , woke up in the middle of the night on an unspecified date. She reported severe reaction to Pfizer COVID-19 Vaccine onset 8 minutes after being administered that first dose. She asked for information regarding her severe reaction related to the product. This event started with a hot flash that started in her head and went all the way through her body; became really lightheaded; dizzy; her chest became really tight; felt like there was a lump in her throat closing her throat up. They took her to the emergency room where she was treated and kept for a couple of hours, but was not admitted to the hospital in response to this event. While in the hospital she received IV fluids; steroids clarified as Prednisone; Benadryl; Pepcid; and was sent home. On 30Dec2020 afternoon she ended up with the same type of severe reaction: her chest felt tight, she felt her throat closing and itching; she started coughing. She went back to the emergency room in response to the severe reaction. The emergency room thinks it was the same thing again as on 29Dec2020; she again was not admitted to the hospital in response to this event, but was treated and kept for a couple of hours; while in emergency room they again gave her IV fluids; steroids clarified as Prednisone; Benadryl, and because her heart rate was like in the 140s also gave her Ativan to help bring her heart rate down. The anaphylactic aspect of the severe reaction is not ongoing any longer. She then developed fever; body aches; nausea; diarrhea; all the kind of what you would call normal side effects. She reported that on 03Jan2021 morning she woke super dizzy, lightheaded and her vision was blurred. In response to those events she went to her Primary Care Physician on 04Jan2021. The Primary Care Physician told patient to just ride it out for a little bit to see what happens; so that is what the patient has been doing. The dizziness and blurred vision have improved over the last couple of days; but last night she was up all night because she felt a numbness in her lower legs; she can still walk, it is not painful; it's just a weird numbness, tingling kind of feeling. Severe reaction events reported as improved, but ongoing. The patient underwent lab tests and procedures which included electrocardiogram: sinus tachycardia on 30Dec2020, heart rate: was in the 140s on 29Dec2020. The outcome of anaphylactic reaction was recovering, of hot flash started on my head, went over my body, dizzy/lightheaded, blurred vision, chest became very tight/chest tightness, throat felt like there was a lump in it, coughing, irritated throat, heart rate was in the 140s, sinus tachycardia, fever, chills, body aches, diarrhea, woke up in the middle of the night, lower legs felt kind of numb and tingly, weak was unknown. Caller explained she will not receive the second dose.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset anaphylactic reactions cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

an employee who received the first dose of the Covid 19 vaccine, has tested positive for Covid 19 today; an employee who received the first dose of the Covid 19 vaccine, has tested positive for Covid 19 today; This is a spontaneous report from a contactable other HCP and a nurse. A female patient of an unspecified age received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient employee who received the first dose of the COVID 19 vaccine, has tested positive for COVID 19 today, 07Jan2021. The outcome of the event was unknown. The reporter would like to know if the patient can get the second COVID-19 vaccine. Information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of BNT162B2 cannot be completely excluded for reported event.

Tested positive for COVID after receiving the first dose of the vaccine; Tested positive for COVID after receiving the first dose of the vaccine; This is a spontaneous report from a contactable other healthcare professional (patient). A 26-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EJ-685, expiration date: Mar2021), via an unspecified route of administration in the right arm on 21Dec2020 at a single dose for COVID-19 immunization. There were no medical history and concomitant medications. The patient tested positive for COVID on 26Dec2020. Now, she is wanting to know if she should still get the second dose. Outcome of the events was unknown.; Sender's Comments: The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 21Dec2020, and COVID-19 test positive on 26Dec2020. No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the positive COVID likely represents the pre-existing infection prior to vaccine use. Further information is needed for full medical assessment.

tested positive/had the COVID infection/cough; tested positive/had the COVID infection/cough; PFIZER-BIONTECH COVID-19 VACCINE at 1.3 mL; This is a spontaneous report from a contactable nurse (patient). A 39-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiration date were not reported), via an unspecified route of administration on 19Dec2020 at 1.3 mL, single for COVID-19 immunization. There were no medical history and concomitant medications. She received the first COVID-19 vaccine dose on 19Dec2020 then she tested positive on 22Dec2020. She got the first dose of the COVID vaccine and now she had the COVID infection. She was wondering if she should continue to get the second dose. She was also wondering if it will affect whether or not she gets the second dose. She couldn't find information online about what to do. Before she got the vaccine, she did take a test on an unspecified date to make sure she was negative, and she was. She had a cough at the end of the call. Outcome of the events was unknown. Information on lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of COVID-19 and suspected LOE due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this

report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Idiopathic trigeminal neuralgia; This is a spontaneous report from a contactable nurse (patient). A 34-year-old female patient started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EL0140), intramuscular (right deltoid) first dose on 21Dec2020 at single dose for Covid-19 immunization. The patient's medical history included multiple sclerosis from 2015 (Diagnosed 5 year) and ear infection from 03Dec2020 prior to vaccination, she was seen in urgent care with an ear infection, states it was super painful and lasted about 7-10 days treated it with drops.. There were no concomitant medications. The patient requested guidance on whether or not she should get the second dose of the covid vaccine after being diagnosed with Trigeminal Neuralgia following the first dose. The patient stated that she received the first done on 21Dec2020 and on 27Dec2020 was diagnosed with Idiopathic trigeminal neuralgia. The patient was unclear if the vaccine played a part in the diagnosis and wonders if there is any data available about this as an adverse event as she read that Bells Palsy was reported and this was similar. The patient need guidance on whether to get second dose of the Covid vaccine scheduled for on Monday. Wondering if getting the second dose would be risking it flaring up, states she was now on anticonvulsant medication and gabapentin and they have increased the anticonvulsant medication. The patient experienced idiopathic trigeminal neuralgia (trigeminal neuralgia) (non-serious) on 27Dec2020 with outcome of not recovered. The action taken in response to the event(s) for bnt162b2 was not applicable. The outcome of the event was not recovered.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported event of Trigeminal Neuralgia due to temporal relationship. However, the event may possibly represent concurrent medical condition in this patient with medical history of multiple sclerosis. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including head CT/MRI and viral serologies, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

rash developed on 50% of her body; vomiting; nausea; headache; severe muscle aches; This is a spontaneous report from a contactable nurse reported for herself. This 39-year-old female patient received the 1st dose of BNT162B2 (Pfizer-BioNTech COVID-19 vaccine) via Intramuscular at left arm on 16Dec2020 at 01:00 PM at single dose (lot number: EK5730) for COVID-19 immunisation. Medical history was unknown. Concomitant medications included bupropion hydrochloride (WELLBUTRIN), zolpidem tartrate (AMBIEN) and vitamins. The patient previously took dicycloverine hydrochloride (BENTYL), amlodipine and azithromycin (ZITHROMAX), all experiencing allergies. The patient experienced rash developed on 50% of her body, vomiting, nausea, headache, severe muscle aches 24

hours post vaccination on 17Dec2020 10:45 AM. The patient was treated with Benadryl, Tylenol, IM Solumedrol. The patient had Covid test post vaccination by Nasal Swab on 28Dec2020 and on 04Jan2021, both with negative results. The patient was not pregnant at the time of vaccination. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Outcome of all events was recovered.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the rash and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

COVID-19 virus test positive; COVID-19 virus test positive; Headache; Sinus congestion; This is a spontaneous report from a contactable consumer reported for himself. A 61-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EN9899 and expiration date unknown), via intramuscular on left arm on 22Dec2020 at single dose for COVID-19 prophylaxis. The patient medical history reported as none. Concomitant medications reported as none. The patient is a radiology technician that reported that he got the Pfizer vaccine on the 22Dec2020. He said that he got a positive Covid test on 04Jan2021. The patient had the Covid symptoms as of last Monday night on 04Jan2021. He stated that he developed a headaches and sinus congestion on the 04Jan2021. Stated that he has not had a fever. He said that there was no adverse reaction from the vaccine itself. He said that he was due for the second dose on the 11Jan2021 and he is currently quarantined so he will not be getting the second dose. The outcome of the events was unknown.

two staff members who tested positive for covid after receiving the first dose.; two staff members who tested positive for covid after receiving the first dose.; This is a spontaneous report from the Pfizer Sponsored Program called 'Pfizer First Connect' received by a contactable pharmacist. This pharmacist reported similar events for 2 staff members. This is 2nd of 2 reports. A patient (demographics unknown) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unknown route, in Dec2020 at single dose for COVID-19 immunisation. No relevant medical history and concomitant medications were provided. On unknown date, after first shot of vaccine, COVID test resulted positive. The reporting pharmacist is asking about the recommendation regarding taking the second shot. The outcome of the event was unknown. Information about Batch/Lot number has been requested.; Sender's Comments: A causal association between reported event and suspect BNT162B2 cannot be excluded. ,Linked Report(s) : US-PFIZER INC-2021010495 Same reporter/ drug/ event for different patients.

positive COVID-19 test with symptoms; positive COVID-19 test with symptoms; The patient had MS and was immune compromised; The patient had MS and was immune compromised; This is a spontaneous

report from a contactable consumer (patient). This female consumer of unspecified age received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 04Jan2021, for COVID-19 immunization. She had MS and was immune compromised. Concomitant medications were not reported. On 07Jan2021 the patient woke up with headache, runny nose, groggy and muscle aches. She went to pharmacy and got a rapid COVID test that resulted positive. She was asking if the 1st dose could have caused her to be positive on the test. Events outcome was unknown. Information on the batch/lot number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

tested COVID Positive; tested COVID Positive; This is a spontaneous report from a contactable nurse. A female patient of an unspecified age received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 22Dec2020 at single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient experienced tested COVID positive on 01Jan2021. She still has a few symptoms and is scheduled for the 2nd dose on 12Jan2020 or 13Jan2020. She was asking if there were any recommendations on the scheduling of the vaccine for her. The outcome of event was unknown. information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient cannot be completely excluded.

severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath.; severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath.; severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath.; severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath.; severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath.; severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath; severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath; This is a spontaneous report from a contactable nurse (reporting for herself). A 41-year-old non-pregnant female patient received two doses of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), both via an unspecified route of administration in the left arm, the first dose on 16Dec2020 09:00 (lot number: EH9899) and the second dose on 08Jan2021 07:15 (lot number: EL0140), both at a single dose for COVID-19 immunization. Medical history included ongoing anxiety, from an unspecified date. The patient had no known allergies. Concomitant medication included escitalopram oxalate (LEXAPRO), acetaminophen (MANUFACTURER UNKNOWN), naproxen sodium (MANUFACTURER UNKNOWN), ibuprofen (MANUFACTURER UNKNOWN). The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, has not been tested for COVID-19. On 09Jan2021 at 01:30 AM, the patient experienced severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath, all of which were reported as being life-threatening. The patient went to the

Emergency room due to the events. Therapeutic measures were taken as a result of the events and included: methylprednisolone sodium succinate (SOLUMEDROL) 125 mg, famotidine (MANUFACTURER UNKNOWN) 20 mg and diphenhydramine hydrochloride (BENADRYL) 50 mg. The clinical outcome of severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath was recovering.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset severe angioedema, hives, tachycardia, hypertension, pruritus, chest tightness and shortness of breath cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

the person who took the 1st dose of the vaccine and still tested positive; the person who took the 1st dose of the vaccine and still tested positive; This is a spontaneous report from a Pfizer sponsored program Pfizer First Connect. A non-contactable consumer reported that a patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via unspecified route of administration on unspecified date at single dose for COVID-19 immunization. Patient medical history and concomitant medications were not reported. ~The patient took the 1st dose of the vaccine and still tested positive on unspecified date. They would like to know if the patient still needs to take the 2nd dose of the vaccine or not. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

Received 2nd vaccination in series on 11 JAN 21. By next morning started to experience some muscle and joint symptoms. By afternoon of 12 JAN 21 experienced sudden onset loss of bladder control for first time in his life, followed a few hours later by blurry vision, vertigo, motion sickness, emesis and cold sweats that drenched his clothes. Taken to ER by paramedics, and admitted for further observation and evaluation for underlying neurologic vs. cardiogenic problems. Given positional treatments by PT for possible otoliths. Feels much improved on afternoon of 13 JAN 21, but symptoms not fully resolved. Will likely be discharged from hospital on 14 JAN 21 if problems continue to resolve.

Admission Note: ? Weakness - Generalized á á Patient reports feeling weak prior to dialysis, but demanded clinic to perform dialysis. Had full tx done and brought to ER. Reports still feels weak after dialysis. á 84 year old male comes in today after completing dialysis for evaluation of generalized weakness x 5 days. He has also lost his voice. He tells me he received his COVID vaccine yesterday, but he is concerned he may have COVID. He denies any fevers, cough, sore throat, NVD, abd pain. Transfer Note: HOSPITAL COURSE: Patient is a 84 y.o. male who presented with shaking chills and was found to have Gram-negative rods in the blood. The source of infection was unclear. Initially it was thought that it could possibly be cholecystitis but imaging was negative for that. There was concern that it could be UTI but the patient is on dialysis and is an uric and therefore no urinalysis could be got. Early this morning when I saw the patient the patient did have significant pain and tenderness in the right knee and is not able to put weight on that. I.e. Consulted Dr. Today with per lumbar from Orthopedics who said that it would be in the best interest of the patient for him to be transferred to hospital where he could decide on aspiration and or washout of the right knee. á Transfer center has been called and we are trying to

finalize a transfer of the patient hospital at this point of time á Please see problem list listed below. á REASON FOR ADMISSION/ ADMISSION DIAGNOSES á Sepsis cause unclear

History of Present Illness: á Patient is a 80 y.o. male who presents with chest pain. Patient reported that he 1st had the chest pain approximately 2 weeks ago when he woke from sleep. At that time patient pain lasted about 5 minutes or so and resolved when he got out of bed. He did well for the rest of the day up until yesterday. Patient reported that yesterday morning he woke up with the pain at the lasted about 30 minutes or so. Patient also had associated burping felt that it is likely GI in nature. The pain was located mainly in the left side of the chest without any radiation. No diaphoresis. No shortness of breath or palpitation. No radiation for the pain. Since yesterday morning he had another 3 episodes of pain the last after dinner tonight. Patient reported that this pain was located more on the left side of the chest, likely lasted about 10 minutes or so. There was no exertional component to the pain. No known history of heart disease. Due to rather recurrent nature of the pain patient was brought to the hospital by his son who is a cardiologist to be evaluated. No fever or chills. No cough . Patient reported that he got vaccination for COVID 2 days ago-of a concern that this may be a side effect of the vaccine. No dizziness lightheadedness. Patient with history of GI bleed in the past at that time patient was on NSAIDs. Patient with burping associated with the pain

Chief Complaint Patient presents with ? Generalized Body Aches á á Pt presents via EMS c/o DOE, dry non-productive cough, subjective fevers Tmax 101.9, decreased appetite, aches since testing + for COVID on 1/5. á Patient is a 50 year old male with PMH of Crohns/MS on fingolimod presenting to the Hospital for fevers, shortness of breath and weakness. Patient received COVID vaccine on 12/29. Patient had initial left arm discomfort though has had worsening weakness, cough, shortness of breath and fevers since that time. Patient tested positive for COVID19 on Patient has shortness of breath with exertion that is relieved by rest. Patient denies N/V/D. Patient has taken tylenol at home to attempt to alleviate symptoms.

Chief Complaint Patient presents with ? Vomiting á á pt reports dry heaving and nausea that started an hour ago á Patient is an 68 y.o. year old male with PMHx significant for HTN, BPH, who presents to the ED today with nausea and dry heaving for one hour PTA. States that he was at work as a courier when he had onset of sensation of room spinning, nausea, and dry heaving. Also having tinnitus which he thinks is b/l. This happened once about two weeks ago and resolved spontaneously overnight when he was asleep. No preceding illnesses, medication changes, or other associated symptoms. Vertigo has no clear exacerbating or relieving factors. Has not yet taken anything for symptoms. á The patient denies fevers, chills, headaches, syncope, chest pain, shortness of breath, rhinorrhea, sore throat, cough, abdominal pain, changes in usual bowel movements, changes with urination, back pain, pain anywhere else in body. The patient has no sick contacts, recent travel history.

HOSPITAL COURSE: Patient is a 50 y.o. female with a history of anxiety and migraine headaches who presented to hospital with cough and diarrhea. The patient had felt the symptoms on 12/31/2020 and eventually went to have a COVID test on 1/1/2021. She was subsequently positive but due to dehydration and diarrhea she came to the emergency department where she was admitted for

remdesivir and dexamethasone. She was able to be weaned off any supplemental oxygen. Her diarrhea resolved. She is feeling well and will be discharged home in good condition.

None stated.

Peripheral neuropathy

Pt experienced 103.7 fever and muscle spasms. Hospitalized.

Numbness tingling in feet, toes progressed to waist. ER Sunday hosp, pt was admitted inpatient, diagnosis transverse myelitis.

Systemic: Dizzy, hyperventolation-Medium

Began with tingling/itching to tongue and roof of mouth approx 15 minutes after administration, progressed to tingling of lips, was sent to the ED for observation. Within 20-30 minutes developed cough, throat tightness, difficulty swallowing, breathing, vomiting, shortness of breath. Noted to have uvular swelling and wheezing on examination. Given Benadryl, Pepcid, Solumedrol, Zofran, Albuterol MDI, Epi IM. within a few minutes symptoms returned and were worse where I felt like I could not breathe, throat was closing, could not talk. Noted to be pale, HR in 140?s. Given second dose of epi IM and symptoms improved. Was transferred to Obs Unit., within 2 hours (approx 6 hours after administration), developed SOB, throat tightness, cough, vomiting, difficulty breathing. Again noted to have swelling of uvula, wheezing on exam. Given Solumedrol, Benadryl, SQ epi, Albuterol, Racemic Epi nebulizer. Was transferred to ICU, all meds held except Pepcid. Day #2 ~10 am (25 hours from administration) developed throat tightness, diffuse red rash to arms, difficulty breathing, vomiting. Again noted to have uvular swelling and wheezing. Given Solumedrol, Benadryl, Pepcid, Albuterol MDI, Racemic Epi neb. Solumedrol started q12hour dosing. Strange feeling/fullness in throat continued all day, got additional racemic Epi neb that night with improvement of symptoms. Following morning (day#2 after vaccine) noted to have diffuse red rash to chest and face, spread to arms, then began coughing. Given Solumedrol, Pepcid, Benadryl, Advair, Racemic Epi nebulizer. Solumedrol changed to q8 dosing. Approx 4 hrs later nurse noted rash worse on face, associated with itching, throat tightness. Given additional Benadryl, Racemic Epi neb with improvement. Rash continued that night with throat tightness, got additional Benadryl and Racemic Neb that night (total of 3 Racemic nebulizer on Day#2 post vaccine). Transferred to telemetry floor. Day#3 post vaccine rash improved, but still present to chest and face. Throat fullness present, especially after drinking. Am still hospitalized while writing this report

Initial pain in back of head and extreme headache. Some vomiting. At emergency, went into coma and was intubated. Hole drilled in skull to relieve pressure. MRI taken. Lot of bleeding in brain - anuerism lead to death approximately 14 hours after initial symptoms.

Systemic: Anaphylaxis-Medium; symptoms lasted 1 day

Unprovoked seizure (clonic tonic) 13 days later, requiring hospitalization and testing

Pt collapsed at home approx 5:30 pm and died

On day due for 2nd dose, Patient was found unresponsive at work in the hospital. Patient pupils were fixed and dilated. Full ACLS was initiated for 55 minutes with multiple rounds of bicarb, calcium chloride, magnesium, and epinephrine. Patient was intubated. Patient continued into V. Fib arrest and was shocked multiple times.

Systemic: reported by staff patient expired under suspicious circumstnces after receiving vaccine. Patient was on hospice, reported not expected to pass this soon; symptoms lasted 0 days

Extreme lockjaw unable to barely talk or chew

Day 7 post vaccine, woke with vertigo, nausea and double vision prior to my alarm going off at 5:30am, told my husband that I did not feel right and it felt like something was wrong with me. I asked him to send a message to work that I was not feeling well and would not be in. I was not able to see my phone clearly as I had double vision. I went back to sleep to try to get relief, woke up and called out to husband for help and he said I was just making groaning noises but I know in my head I was saying please help me as I could not move my right side and I was not sleeping or having a dream. At approximately 9:30am my husband kept telling me someone was trying to text me and needed a response. I tried to get up and still could not move my right side. He helped me sit up and I could not use my right arm and hand. He helped me get some clothes on and took me to the ED. When we arrived I still could not use my right hand and my arm still felt weak. The weakness resolved within a couple of hours and I got the strength back in my hand. I did have some concern that my TIA type symptoms could possibly be related to vaccine but it was just a thought until I received my second dose. 3 hours post vaccine my face became numb and tingly. It remained that way until I went to sleep. This is why I am reporting this incident.

Per patient report on follow-up: admitted to hospital following initial vaccine on 12/29 with N/V and severe HA. Patient placed on Morphine for pain, now resolved. Admission occurred outside of hospital system providing initial vaccine.

Patient reports no symptoms until 1/8/21 at which time a rash developed along with fatigue and fevers. Patient was seen in ED 1/8 and 1/11/21. Was admitted 1/11/21 with Concern for STevens Johnson and sepsis. Patient subsequently developed full body macular rash and mucosal lesions. Fevers to 102-104.

Reported redness, swelling and pain at injection site, diarrhea and light headedness1/5/21. Evaluated in ED and hospitalized for neurological symptoms that started 1/8/21.

vaccinated at Hospital on 1/12/2021. According to patients father she developed stomach pains, constant vomiting, sweating which started at approx. 4am. She arrived at Medical center at approx. 7:20 stating she had been vomiting since 4am. Attempted PO fluids while in ED. Uncontrolled nausea persisted despite medication. Admitted to Hospital for observation for uncontrolled nausea. IV fluids given

Developed pulmonary embolism in right lung one week after vaccination. Sharp pain on right side when breathing. Treated with IV Apixaban while inpatient for 2 days, oral Apixaban 5 mg, 2 tabs twice daily 1/5/21-1/11/21, then one 5 mg tab twice a day. Pain has subsided as of 1/14/21.

No adverse reactions observed after administration of medication. Patient starting complaining of shortness of breath around 0500 the following morning. SP02 checked in the 80s. Patient expired 01/09/2021;

altered mental status, hypoxic, fever 39.3, agitated

a positive Covid test after receiving their first dose; a positive Covid test after receiving their first dose; The initial case was missing the following minimum criteria: No adverse effect. Upon receipt of follow-up information on 06Jan2021, this case now contains all required information to be considered valid. This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A contactable other healthcare professional (student pharmacist) and a contactable pharmacist reported that a patient of unspecified age and gender received BNT162B2 (PFIZER BIONTECH COVID-19 VACCINE, lot number unknown), via an unspecified route of administration, on an unspecified date, at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Reporter that works at a hospital pharmacy called about a patient that received their first dosage of COVID-19 vaccine who had a positive COVID test on an unspecified date after receiving their first dose of the vaccine. They wanted to know hoe to proceed and if they needed the second dose. The outcome of the event was unknown. Information on the lot/batch number has been requested.

covid a week after the1st dose of the vaccine. When to get the 2nd dose?/tested positive for COVID; covid a week after the1st dose of the vaccine. When to get the 2nd dose?/tested positive for COVID; body aches; fever; Headache; This is a spontaneous report from a contactable physician. A 31-year-old female patient (healthcare worker) received the 1st dose of bnt162b2 (BNT162B2) at single dose in Dec2020 (9 days before 07Jan2021) for Covid-19 immunisation. The patient medical history and concomitant medications were not reported. The patient received the 1st dose of the COVID vaccine 9 days before 07Jan2021 and got a headache afterward in Dec2020. After 6 days, in Jan2021 the patient had a worse headache, body aches, and fever. She was swabbed for COVID on 06Jan2021 and tested positive. The reporter wanted to know what to do about the 2nd dose. The outcome of events was unknown. A product complaint was filed. information about lot and batch number was requested.

tested positive for covid/headache, ever, cough, diarrhea; tested positive for covid/headache, ever, cough, diarrhea; This is a spontaneous report from a contactable consumer (patient) via a Pfizer Sponsored Program IBCC (Inbound Call Center for HCPs). A 47-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK5730, expiration date: 20Mar2021), via an unspecified route of administration on 19Dec2020 16:15 at left arm, at single dose for covid-19 immunization. Medical history included hysterectomy in 2010, pulmonary Embolism in 2010, gallbladder removed on an unknown date. There were no concomitant medications. The patient received 1st dose 19Dec2020, she was supposed to get her second dose, but tested positive for covid. She thought she had side effects after vaccine, she began with a headache, fever a week later and

thought they were from the vaccine, but then her sister-in-law was positive for COVID, her sister-in-law passed away from covid virus. Then the patient, her mom, and husband tested positive for COVID. She tested positive for COVID on 27Dec2020. She developed symptoms of COVID on 27Dec2020. It was exactly one week after receiving the first dose. It was also reported that she got tested on the 30th (as reported) and received results on 31Dec2020 that she was positive. After she got sick she has taken Mucinex. Day eleven, she is doing ok, but has a little cough. No more fever. Sometimes she has diarrhea but today no diarrhea. The patient asked if she can get her second dose of the covid vaccine on day 24. The outcome of the events was recovering.

arm is red, warm, and itchy; arm is red, warm, and itchy; arm is red, warm, and itchy; Chest tightness; bitter taste in her mouth; funny feeling; arm was hurting; swelling; patient thinks the vaccine was given to her subcutaneously instead of intramuscularly; This is a spontaneous report from a contactable nurse (reporting for herself). A 43-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot number: EK9231), subcutaneously in the left arm on 05Jan2021 15:00 at 0.3 mL, single for COVID-19 immunization. The patient's medical history was not reported. Concomitant medication included an unspecified multivitamin, taken at one tablet daily by mouth for supplementation therapy. The patient previously took the flu vaccine (MANUFACTURER UNKNOWN) in 2016 for immunization and experienced chest tightness, which she took diphenhydramine hydrochloride (BENADRYL). The patient experienced arm is red, warm, and itchy on 05Jan2021, which was reported as being medically significant. On 05Jan2021, the patient experienced chest tightness, bitter taste in her mouth, funny feeling, arm was hurting, swelling and patient thinks the vaccine was given to her subcutaneously instead of intramuscularly. On 06Jan2021, the patient experienced arm is red, warm, and itchy was reported as worsened. The outcome of arm is red, warm, and itchy, chest tightness and arm is red, warm, and itchy was reported as worsened was not recovered and of bitter taste in her mouth, funny feeling, arm was hurting, swelling and patient thinks the vaccine was given to her subcutaneously instead of intramuscularly was unknown. The reporter assessed the relatedness to the event, arm is red, warm, and itchy to the Covid-19 Vaccine as related; Sender's Comments: Based on the time association, the possible contribution of suspect BNT162B2 to the events pruritus, erythema and feeling hot cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

The patient had an ongoing medical history of Crohn's disease/Concomitant medication included vedolizumab (ENTYVIO) for Crohn's disease; shortness of breath; difficulty swallowing; fever; headache; nausea; she was feeling as if her throat was closing; Chest tightness; This is a spontaneous report from a contactable physician reporting for a patient. A 34-year-old female patient received the first dose of BNT162B2 (COIVD-19 Vaccine) , via an unspecified route of administration on 03Jan2021 at single dose for covid-19 immunisation. Medical history included Crohn's disease from an unknown date and unknown if ongoing, COVID-19 in 2020 to an unknown date and unknown if ongoing. Concomitant medication included vedolizumab (ENTYVIO) for Crohn's disease. The reporter is a physician who is

reporting and AE for a patient who received the vaccine and subsequently developed symptoms including short of breath, fever, headache, nausea, difficulty swallowing with seriousness criteria of Medically significant on 03Jan2021. The patient self-medicated with benadryl and symptoms resolved briefly but then went to urgent care with re-occurring symptoms and was prescribed prednisone. Caller states the patient's symptoms have resolved. She is calling to get more information to determine if the patient should receive the second dose. The reporter further stated that she has a patient who received her first shot, clarified as the COVID-19 Vaccine. About an hour and 45 minutes later, the patient had shortness of breath and then later had a fever, headache and nausea. It was later that night when the patient had a fever. The patient had difficulty swallowing which worsen; she was feeling as if her throat was closing. The patient is a nurse, so she self medicated with Benadryl. After taking the Benadryl, the patient was better in the early morning. When the doctor's office opened, the patient called and was having similar symptoms, clarified as all the symptoms mentioned above. The patient went to the urgent care where she received more Benadryl and was started on prednisone. Caller did not know the dose of prednisone the patient had received. After that, the patient started feeling better. The patient's second dose of the COVID19 Vaccine is due around 24 to 26Jan2021. The patient has not called the doctor/caller back. The caller assumes that the patient has recovered but could not be certain. Caller added that the patient also experienced chest tightness when she was having shortness of breath. The patient's fever was 101 on 03Jan2021. The patient was not drooling with her difficulty swallowing. Caller stated that the patient had a positive COVID test earlier, she thinks it was maybe 3 to 4 months ago (in 2020). The patient has not received another COVID test since she received the first dose of the COVID-19 vaccine to the caller's knowledge. Reporting physician is an internal medicine physician. Therapeutic measures were taken as a result of the events. The outcome of the events was unknown. Information on the Batch/Lot number has been requested.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported short of breath, fever, headache, nausea, difficulty swallowing, throat closing, chest tightness, and the administration of COVID 19 vaccine, BNT162B2, based on the plausible temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

headache; injection site is itchy and swelled up; injection site is itchy and swelled up; But this one turned red; can't lift her arm it's heavy and painful; can't lift her arm it's heavy and painful; shortness of breath; palpitation; Dizziness, lightheaded/ feeling dizzy; Uneasiness; hands are so cold; nauseous; This is spontaneous report from a contactable nurse reported for herself. This 42-year-old female patient (No pregnant) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via Intramuscular on Left arm on 29Dec2020 17:00 PM on left arm at single dose (Lot # EL1284) for COVID-19 immunisation. Medical history included None. No Allergies to medications, food, or other products. Concomitant medications included ascorbic acid, bioflavonoids nos, hesperidin, malpighia glabra, rosa canina, rutoside (VITAMIN C), collagen, colecalciferol (VITAMIN D), cynara cardunculus, malus spp. vinegar extract, taraxacum officinale (APPLE CIDER). No other vaccine in four weeks. The patient experienced Dizziness, lightheaded, palpitation, uneasyness, shortness of breath on 29Dec2020 17:15 pm. Then when the patient drove home, she felt so uneasy and hands are so cold, nauseous and feeling

dizzy on 29Dec2020 17:15 pm. Felt the same way in the house for a good 2 hours after the vaccination. Drank water and didn't sleep right away. Tried to monitor herself. After that day the patient felt better but with bouts of headache and dizziness every now and then. The injection site was itchy and swelled up. But it went down if didn't scratch it. The patient didn't have allergies to any medications. But this one turned red. And the next day after the vaccination (30Dec2020) the patient can't lift her arm it's heavy and painful. Then pain went away. But now it was the itchiness in the site that bothered her. But the patient didn't scratch it. So it didn't swell up as much. Prior to vaccination, was the patient did not diagnose with COVID-19. Lab data on 07Jan2021 Nasal Swab post vaccination for Covid 19: result was pending. No treatments received for the events. Outcome of the events Dizziness, lightheaded/ feeling dizzy, palpitation, Uneasiness, shortness of breath, hands are so cold, nauseous was recovering. Outcome of the event pain in arm was recovered. Outcome of other events was unknown.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the dizziness, lightheaded, palpitation, shortness of breath and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including chest x-ray, EKG and chemistry panel, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

trouble breathing; She had bad pain in her chest; Her oxygen saturation dropped to 92 and it is usually 98 or 100; not been feeling well; A fast heartbeat 5-10 minutes after initial dose; This is a spontaneous report from a contactable healthcare professional (dental assistant) reporting for self. This female patient with unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 22Dec2020 at single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. The patient previously had reactions with the flu shot in the past for immunisation and she only was able to take the vegan version of the flu shot due to the egg content in the regular version of the flu shot. She also stated not being able to take the flu shot in the arm, leg, hip etc. Patient stated she was scheduled to take her second dose of vaccine tomorrow. She received the first dose on 22Dec2020. She stated she was in the ER on Monday for 5 hours because she was unable to see her primary care physician because his office was filled with patients with Covid and they could not provide her with guidance. She stated after receiving the first dose of vaccine she had not been feeling well ever since. Stated she had had trouble breathing and this took her by surprise. She had bad pain in her chest and a fast heartbeat 5-10 minutes after initial dose (on 22Dec2020). Her oxygen saturation dropped to 92 and it was usually 98 or 100. She stated something inhibited her ability to breathe and this scared her because she was healthy prior to the vaccine and never been in hospital and wasn't born in the hospital. She stated the condition she was diagnosed with will take 6-12 months for her to recover from and go back to normal. She stated during her ER room visit there were a lot of tests done. She would like to know if she should receive the second dose of the vaccine. The outcome of events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on available

information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the dyspnea, chest pain, oxygen saturation decreased and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics including chest x-ray, arterial blood gas and pulmonary function tests, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

On 1/12/20 resident woke up and was not able to stand in the E-Z stand. E-Z lift was needed. In addition he needed assistance with eating. At that time VS were stable, equal hand grasp noted, and no further concerns. Around 3pm resident became flaccid on the left side of his face and speech became mumbled. Hand grasp was equal at that time and VS were stable, but B/P was elevated compared to previous recordings earlier in the day. Family did not want him sent to the hospital and asked for comfort cares. Hospice referral obtained and he will be admitted to hospice in the near future. Resident's left side of face has improved within the last 48 hours. He remains total assist with all cares.

develops symptomatic covid; develops symptomatic covid; This is a spontaneous report from a contactable physician received via a Pfizer sales representative. This physician reported similar events for two patients. This is the first of two reports. A patient of unspecified age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiry date were not provided) solution for injection, via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient developed symptomatic Covid on an unspecified date. The patient received dose #1 of a Covid-19 vaccine and contracted Covid-19 prior to dose #2. The patient underwent lab test which included Covid-19 test in which he/she developed a symptomatic Covid-19 on an unknown date. Outcome of the event was unknown. Information about batch/lot number has been requested.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate. ,Linked Report(s) : US-PFIZER INC-2021014755 Same reporter/drug/event, different patient

"flushed; hives; tongue felt ""thick""; the lump in my throat feels bigger; This is a spontaneous report received from a contactable pharmacist. A 23-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number EL0142), via an unspecified route of administration in the left arm on 22Dec2020 (at the age of 23-years-old) as a single dose for COVID-19 immunization. The patient's medical history included: allergies to medications, food, or other products (unspecified). It was unknown if the patient was pregnant at the time of vaccination. The patient's

concomitant medications were not reported. It was unknown if the patient received any other vaccine within 4 weeks prior to the vaccine. On 22Dec2020, approximately 8 minutes after vaccine administration, the patient began feeling flushed. She reported to the observation area, and the registered nurse noted hives on her left neck (22Dec2020). The patient was brought back for closer monitoring. The doctor evaluated the patient. Vital signs were monitored every 5 minutes (22Dec2020). The patient was given 50 mg diphenhydramine (BENADRYL) orally. Some improvement was noted in hives; however, the patient began to state her tongue felt ""thick"" and ""the lump in my throat feels bigger"" (both on 22Dec2020). Per doctor, 0.3 mg epinephrine (MANUFACTURER UNKNOWN) given intramuscularly with rapid improvement in hives. The patient reported feeling some improvement as well. The patient was taken to the emergency department for ongoing observation. The patient was released from emergency department after observation. The clinical outcome of flushed, hives, tongue felt ""thick"", and ""the lump in my throat feels bigger"" was recovered on an unspecified date.; Sender's Comments: Based on the compatible time association, the events flushing, urticaria, tong disorder, sensation of foreign body are possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

Egg sized lymphadenopathy under right arm 36 hours after 2D injection; flu symptoms; joint aches; muscle and joint aches; arm pain; arm pain and swelling; 1st dose of BNT162B2 on 17Dec2020 15:45/ 2nd dose on 06Jan2021 14:30; 1st dose of BNT162B2 on 17Dec2020 15:45/ 2nd dose on 06Jan2021 14:30; This is a spontaneous report from a contactable nurse (patient). A 55-year-old female patient received 2nd dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in right arm on 06Jan2021 14:30 at single dose for COVID-19 immunisation. Medical history included mild hypertension and arthritis. The patient was not pregnant. No Covid prior vaccination, no Covid tested post vaccination. No known allergies. Concomitant medication included estradiol, norethisterone acetate (COMBIPATCH), meloxicam, propanol. The patient previously received 1st dose of BNT162B2 in left arm on 17Dec2020 15:45 for COVID-19 immunisation. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced egg sized lymphadenopathy under right arm 36 hours after 2D injection (08Jan2021 03:00), after flu symptoms of muscle and joint aches, arm pain and swelling at 20 hours (07Jan2021 12:00). No treatment received for the events. The outcome of events was not recovered. This case was reported as non-serious. Information on the lot/batch number has been requested.; Sender's Comments: Based on the compatible temporal association and the drug's known safety profile, the vaccination with BNT162B2 might play a contributory role in triggering the onset of lymphadenopathy. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

She was wiped out the next day with aches and pains still.; tired; brain fog; started to get cold; shake/her hands were shaking so hard; they took her temperature and it was 100/her fever went to 101/temperature had gone to 102.6; heart rate was elevated at 100/heart rate was 110/heart rate went to the high 120s; headache; backache; nauseated; chest was hurting; The initial case was missing the following minimum criteria: Invalid for unspecified adverse event. Upon receipt of follow-up information on 08Jan2021, this case now contains all required information to be considered valid. This is a spontaneous report from a contactable nurse (patient). A 54-year-old female patient received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EK5730), via an unspecified route of administration in deltoid left on 29Dec2020 07:30 at single dose for COVID-19 immunisation. Medical history included ongoing sleep apnoea (diagnosed about 3-4 years ago, wear her CPAP religiously), Hashimoto's hypothyroid, and chronic low vitamin d (lack of sunlight). Concomitant medication included levothyroxine sodium (SYNTHROID) from 2016 and ongoing for Hashimoto's hypothyroid, ergocalciferol (VIT D) from 2018 for chronic low vitamin d; lack of sunlight (She did not take it religiously, but was supposed to take it everyday). At 10:30 AM (29Dec2020), she started to get cold and shake. She thought that this was insane and it was in her head. It became so severe she could not use her computer her hands were shaking so hard. She went back up to where they were giving vaccines, they took her temperature and it was 100. It had been normal the morning before she got the vaccine. Her heart rate was elevated at 100. They put a blanket on her and said they wanted to watch her for 15 minutes. In that time her fever went to 101 and her heart rate was 110. They took her to the ER. She was there for 5 hours. Her heart rate went to the high 120s. They did a 12 lead EKG. Her temperature had gone to 102.6, which was the highest. They gave her a liter of Normal Saline. She also had a headache, backache, and felt nauseated. The liter of fluid helped, no doubt. She was not admitted. She was wiped out the next day (30Dec2020) with aches and pains still. Their concern was they said they did not give her epinephrine because her heart was too high. She had no breathing issues. Just extreme cold. At one point she had woke up in the ER (29 or 30Dec2020) and her chest was hurting, she knows from her heart rate being too fast. She was so cold. She had on 6 blankets. The next day (30Dec2020) she still had the aches and pains, she was tired, and had brain fog. It all went away on 30Dec2020. She had nothing after that. What scared her was the heart rhythm. The ER doctor says its not great, but felt that getting the second dose was better than her having COVID. The Electrophysiologist she saw, said she was unsure if she should get the second dose. The hospital said that for this next dose, they would give her the injection, wait 15 minutes, then send her home, expecting that she would have the same thing happen. When after the first dose, she was in the ER on a 12 lead EKG with an intravenous (IV). She had no arm pain the whole time. The reporter assessed all events related. She felt fine prior, walking in to get the vaccine. But she was much better the next day and recovered completely. She was just worried about the second dose. The outcome of events was recovered on 30Dec2020.; Sender's Comments: Based on the compatible temporal association and the drug's known safety profile, the vaccination with BNT162B2 might play a contributory role in triggering the onset of the reported events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Myocardial Infarction; This is a spontaneous report from a contactable Other healthcare professional (patient). A 64-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Batch/lot number: 20201216-1), via an unspecified route of administration on 16Dec2020 08:15 at single dose for COVID-19 immunization, vaccine location provided as Left arm. Medical history included arthritis and sulfa allergy. Prior to vaccination, the patient was not diagnosed with COVID-19. The patient's concomitant medications were not reported. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced myocardial infarction on 19Dec2020 23:00. The patient was hospitalized for myocardial infarction for 3 days. The patient underwent lab test which included Covid test via Nasal Swab post vaccination on 20Dec2020 with test result Negative. Therapeutic measure Cardiac cath procedure was taken as a result of myocardial infarction. The outcome of the event was recovering. This case was reported as Serious with seriousness criteria hospitalization.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported myocardial infarction and the administration of COVID-19 vaccine, BNT162B2, based on the reasonable temporal association. However, more information is required, such as the complete medical history, clinical course, for the Company to make a more meaningful causality assessment. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

Rash over all over body, started at neck.; itching; This is a spontaneous report from a contactable Nurse. A 25-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EL3246, expiry date: unknown), intramuscular on 06Jan2021 15:15 at single dose (Left arm) for COVID-19 immunization. The patient medical history and concomitant medications were not reported. Facility type vaccine was Clinic/Facility. The patient experienced rash over all over body, started at neck and also complained of itching on 06Jan2021 15:30. Patient denied breathing difficulties. EMTs arrived and gave client oxygen and Benadryl. AE resulted in Emergency room/department or urgent care. It was unknown if patient had COVID prior vaccination. The patient was not tested for COVID post vaccination. Therapeutic measures were taken as a result of rash over all over body, started at neck and itching. The outcome of the events was recovering.; Sender's Comments: Based on the close temporal association, the Company considers the events rash and pruritus are possibly related to vaccination with BNT162B2. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

took a rapid test and it came up positive; took a rapid test and it came up positive; fever 100.8; coughing; This is a spontaneous report from a contactable consumer (patient herself). A 41-year-old female patient (non-pregnant) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, reported as Pfizer covid19 el1284), via an unspecified route of administration on 30Dec2020 14:30 in left arm at single dose for covid-19 immunisation. Medical history included asthma and

arthritis. Concomitant medication included ibuprofen and paracetamol (TYLENOL). The most recent COVID-19 vaccine was administered in public health clinic/ veterans administration facility. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had been tested for COVID-19. Patient got the vaccine on Wednesday 30Dec2020, and by Saturday (02Jan2021 22:30) she started with a little coughing that increase on Monday (04Jan2021), Monday afternoon she had fever 100.8. She thought she was experiencing side effects and reported to her supervisor and didn't work the 2 next days. She when back to work on Thursday (07Jan2021), she was sent to a covid clinic and took a rapid test and it came up positive. The patient underwent lab tests and procedures which included nasal swab (rapid antigen testing - SARS-CoV-2): positive on 07Jan2021. The events were reported as non-serious. No treatment was received for the events. Outcome of events were recovering. Information on the lot/batch number has been requested.

diebities; overweight; This is a spontaneous report from a contactable consumer. A 53-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date t a single dose for COVID-19 immunization. Medical history included 'dibeities'. The patient's concomitant medications were not reported. The patient experienced 'diebities' and was overweight on an unspecified date with outcome of unknown. The patient was not tested for COVID-19 post vaccination. Information on the Lot/batch number has been requested.

Received the first dose of the COVID Vaccine on 29Dec2020 and tested positive for COVID on 08Jan2021; Received the first dose of the COVID Vaccine on 29Dec2020 and tested positive for COVID on 08Jan2021; This is a spontaneous report from a non-contactable consumer. A 45-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730), via an unspecified route of administration on 29Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient received the first dose of the COVID Vaccine on 29Dec2020 and tested positive for COVID (Nasal Swab) on 08Jan2021. The outcome of the event was not recovered. No follow-up attempts are possible. No further information is expected.

12/31-mild facial weakness left forehead, left cheek/smile asymmetry.; 12/30-headache, left ear pain, left face pain/continued numbness tingling; 12/30-headache, left ear pain, left face pain/continued numbness tingling; 12/30-headache, left ear pain, left face pain/continued numbness tingling; 12/30-headache, left ear pain, left face pain/continued numbness tingling; 12/29-+fatigue, SOB, left sided lowback pain - severe; 12/29-+fatigue, SOB, left sided lowback pain - severe; 12/29-+fatigue, SOB, left sided lowback pain - severe; 19:00- chills, myalgias, cold sensation of b/l feet; 19:00- chills; 19:00- chills, myalgias; At 16:00- palpitations; At 16:00- palpitations, chest tightness; At 12:00 (within 4 hrs) began experiencing L sided facial and Left foot numbness/tingling and left hand.; Reported to health care provider, began steroids for early onset bell's palsy; This is a spontaneous report from a contactable other health professional (patient). An adult female patient (not pregnant) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) lot number EL1284 via intramuscular in left arm on 28Dec2020 08:30 at single dose for COVID-19 immunization. Medical history included Crohns, asthma,

migraine, GERD (gastrooesophageal reflux disease), Known Allergies: pyridium. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient did not have COVID tested post vaccination and did not have COVID prior vaccination. Concomitant medication included mesalazine (PENTASA), famotidine (PEPCID), paracetamol (TYLENOL), calcium phosphate, colecalciferol (VITAFUSION CALCIUM), ascorbic acid, biotin, calcium, choline bitartrate, chromium, copper, folic acid, inositol, iodine, iron, magnesium, manganese, molybdenum, nicotinamide, pantothenic acid, phosphorus, potassium, pyridoxine, retinol, riboflavin, selenium, thiamine, tocopherol, vitamin b12 nos, vitamin d nos, zinc (MULTIVITAMIN) , biotin, colecalciferol (VITAMIN D). Reported Event: on 28Dec2020 at 12:00 (within 4 hrs) began experiencing L sided facial and Left foot numbness/tingling and left hand. At 16:00- palpitations, chest tightness. 19:00- chills, myalgias, cold sensation of b/l feet. 12/29-+fatigue, SOB, left sided low back pain - severe. 12/30-headache, left ear pain, left face pain/continued numbness tingling. 12/31-mild facial weakness left forehead, left cheek/smile asymmetry. Reported to health care provider, began steroids for early onset bell's palsy. On 08Jan2021 continue to have paresthesia of my left face, left hand, left foot, headache, mild left facial weakness/altered sensation. The events resulted in Doctor or other healthcare professional office/clinic visit. The patient received treatment received for the adverse events on 01Jan2021. The outcome of the events was recovering.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of bell's palsy /facial paresis cannot be fully excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate

Bell's palsy; Loss of taste; Can not close one eye, no muscle movement on one side of the face.; This is a spontaneous report from a contactable nurse. An adult female (not pregnant) patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular in left arm on 05Jan2021 15:30 at single dose for COVID-19 immunization. There were no medical history or concomitant medications. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient did not have COVID tested post vaccination and did not have COVID prior vaccination. The patient had no known allergies. The patient experienced Half face paralysis, Bell's palsy. Loss of taste. Can not close one eye, no muscle movement on one side of the face. All on 08Jan2021 14:30 with outcome of unknown. No treatment was received.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of Half face paralysis/Bell's palsy cannot be fully excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate

He collapsed with left sided hemiparesis; Stroke; Rt basal ganglia hemorrhage w/ edema and mass effect.; Rt basal ganglia hemorrhage w/ edema and mass effect.; Low platelets, 114; His bp as high as

200s/100; Hand weakness; Myalgia; Fever; Severe fatigue; This is a spontaneous report from a contactable physician. A 58-year-old male patient received first dose of bnt162b2 (Pfizer BioNTech COVID vaccine), intramuscularly on 16Dec2020 at a single dose for COVID-19 immunization. Medical history included hypertension with reported med noncompliance in the last few months due to stress. Concomitant medication included hypertension medications in two weeks. The patient was presumed neg covid status prior to vaccine. He worked as a Pulm/critical care physician. He reported fever, myalgia, fatigue on 16Dec2020. Next day (17Dec2020), he took off from work due to his symptoms. The following day (18Dec2020), he came to work. He c/o ongoing severe fatigue & hand weakness in am. Staff noted him to be evaluating his hands during clinic. At 12:15, he collapsed with left sided hemiparesis. The reporter had suspicion for stroke. He was transported to the Emergency Room (ER), head CT showed Rt basal ganglia hemorrhage w/ edema and mass effect. Labs notable for Low platelets, 114 (unknown baseline) on 18Dec2020, normal coags on an unspecified date. BP recorded as 179/101, but it was noted in trauma room his bp as high as 200s/100. He had a history of hypertension with reported med noncompliance in the last few months due to stress. Patient was transferred for further care. Full course was unknown but had rebleed there with low plts. Adverse event (he collapsed with left sided hemiparesis) resulted in hospitalization (22 days), life threatening illness (immediate risk of death from the event), disability/incapacitating or permanent damage. Treatment was received for adverse events. Results of tests and procedures for investigation of the patient: on 18Dec2020, Nasal Swab test: negative. The outcome of events was not recovered. Unknown if any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient was not tested for COVID-19. Information on the lot/batch number has been requested.; Sender's Comments: Collapsed with left sided hemiparesis/suspicion for stroke are as consequences of basal ganglia hemorrhage with edema, which is caused by worsening of hypertension. Low platelet also contributes to brain hemorrhage. All these serious events are unrelated to the vaccine use. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"Sore throat, severe chest tightness and pressure, very hard to breathe in, more than 30 minutes after covid vaccine, dizziness, headache, lightheadedness; severe chest tightness and pressure; very hard to breathe in, more than 30 minutes after covid vaccine; Dizziness /lightheadedness; headache; This is a spontaneous report from a contactable consumer (patient). A 35-year-old female (not pregnant at the time of vaccination) patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EL0142), via an unspecified route of administration at left arm on 09Jan2021 10:30 at single dose for COVID-19 immunization at a hospital. The patient's medical history included migraines, asthma, diabetes, sleep apnea, low immune system, post-traumatic stress disorder (PTSD), depression, panic attacks, insomnia, borderline personality disorder, and known allergies to medications, food, or other product (10 total). Concomitant medications included adult tetanus vaccine on 04Jan2021 received at right arm, for immunization (within 4 weeks prior to the COVID vaccine); first dose of botulinum toxin type a (BOTOX) on 06Jan2021 at single (31 shots in 7 muscle groups) for migraines (within 4 weeks prior

to the COVID vaccine); and clindamycin antibiotic for infection in finger (took within in two weeks). The patient was not diagnosed with COVID-19 prior to vaccination, and had not been tested for COVID-19 since the vaccination. On 09Jan2021 11:00, the patient experienced sore throat, severe chest tightness and pressure, very hard to breathe in, more than 30 minutes after COVID vaccine, ""dizziness/lightheadedness"", and headache. The above mentioned events resulted in emergency room/department or urgent care visit, and patient received breathing treatment, oxygen for over an hour for these events. The outcome of the events was unknown. The reporter considered the events as non-serious."

complete hearing loss at the right ear, 5 hours post injection, continued till now 3 days past injection, not resolved yet prior to report; This is a spontaneous report from a contactable physician. A 72-years-old male patient started to receive bnt162b2 (BNT162B2) Lot number# ek9231 intramuscularly on 06Jan2021 12:00 at single dose for covid-19 immunisation. Anatomical Location: Arm Right. Facility where the most recent COVID-19 vaccine was administered: Hospital. Medical history included diabetes mellitus, hypertension. The patient did not received any other vaccines within 4 weeks prior to the COVID vaccine. Concomitant medication included alprazolam (AZOR [ALPRAZOLAM]), metformin hydrochloride, sitagliptin phosphate monohydrate (JANUMET [METFORMIN HYDROCHLORIDE;SITAGLIPTIN PHOSPHATE MONOHYDRATE]), atorvastatin calcium (LIPITOR [ATORVASTATIN CALCIUM]). The patient on 06Jan2021 18:00 reported complete hearing loss at the right ear, 5 hours post injection, continued till now 3 days past injection, not resolved yet prior to report. The action taken was not applicable.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported hearing loss cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Allergic reaction to vaccine; tingling to upper lip and face; tingling to upper lip and face; red rash on bilateral forearms; Patient developed Bell's Palsy 2-3 days later; This is a spontaneous report from a contactable consumer. A 45-year-old non-pregnant female patient received the first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL1284), via an unspecified route of administration on 23Dec2020 at 14:30 at single dose in left arm for covid-19 immunization. Medical history included mitral valve prolapse from an unknown date, and allergies: Cephalosporins and nut (peanut derived). Concomitant medication included epinephrine (EPIPEN) 0.3MG/0.3ML, fluticasone propionate 50MCG/ACT nasal spray. On 23Dec2020 at 14:45, the patient experienced allergic reaction to vaccine, tingling to upper lip and face, red rash on bilateral forearms. Reactions resolved with no treatment. The patient developed Bell's Palsy 2-3 days later in Dec2020. Currently being treated with high dose steroids and acyclovir. All events required emergency room visit and physician office visit. All events were reported as non-serious by reporter. The outcome of event Bell's Palsy was not resolved, outcome of other events was resolved on an unspecified date. The patient was not diagnosed with COVID-19 prior to vaccination, and it was unknown if the patient has been tested for COVID-19 since the vaccination.

fever and chills; fever and chills; blood pressure was low, about 90/50; did not feel well; syncope episode; unconscious; This is a spontaneous report from a contactable other health professional. A 27-year-old non-pregnant female patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: EH9899), via an unspecified route of administration in the left arm on 08Jan2021 at 12:00 at a single dose for COVID-19 immunization; received at a nursing home/senior living facility. The patient did not receive any other vaccines within four weeks prior to the COVID vaccine. Medical history included COVID-19 from an unknown date and unknown if ongoing. No known allergies. Concomitant medications included unspecified birth control taken for an unspecified indication from an unknown date to an unknown date; within two weeks of vaccination. The patient experienced the following events and outcomes: syncope episode in Jan2021 with outcome of unknown, unconscious in Jan2021 with outcome of unknown, fever and chills on 09Jan2021 with outcome of unknown, blood pressure was low, about 90/50 on 09Jan2021 with outcome of unknown, did not feel well in Jan2021 with outcome of unknown; all of which were assessed as medically significant. The clinical course was reported as follows: the fever and chills began about one hour after vaccination (as reported). About 18 hours after the vaccination, the patient was getting up to take more paracetamol (TYLENOL) and did not feel well. The patient had a syncope episode in the bathroom (no issues as she sat on the floor before hand). The patient was unconscious for about 1-2 minutes. The patient's blood pressure several minutes later was low, about 90/50; however, the patient took the blood pressure measurement herself, so it may not have been exactly accurate. The patient underwent lab tests and procedures which included blood pressure measurement: low, about 90/50 on 09Jan2021. Therapeutic measures were taken as a result of fever. Prior to vaccination, the patient was diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of all reported serious events cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"Heart rate shot up to 170 with numbness of feet.; Heart rate shot up to 170 with numbness of feet.; Chest pain; feeling like I was going to vomit and faint; feeling like I was going to vomit and faint; This is a spontaneous report from a contactable other hcp (patient). A 25-year-old non-pregnant female patient received the first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 06Jan2021 at 11:45 at single dose in left arm for covid-19 immunization. There was no medical history. Concomitant medication included valaciclovir hydrochloride (VALTREX), topiramate (TOPAMAX), lamotrigine (LAMICTAL), duloxetine hydrochloride (CYMBALTA), ziprasidone hydrochloride (GEODON). On 06Jan2021 at 12:30, The patient experienced heart rate shot up to 170 with numbness of feet, started to feel chest pain, and feeling like she was going to vomit and faint. The events required emergency room visit and were reported as serious per hospitalization. Heart rate at the hospital was 135-140 where two EKG were done and fluids were given. An x-ray of the heart was done and blood work was completed. The patient didn't receive treatment for the events. The patient didn't receive any

other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination, and has not been tested for COVID-19 since the vaccination. The outcome of the events was resolved in Jan2021. Information on batch/lot number has been requested.; Sender's Comments: There is a reasonable possibility that the event ""feeling like she was going to vomit"" was related to BNT162b2 based on known drug safety profile. Based on the temporal relationship, the association between the other reported serious events with BNT 162b2 can not be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

resident coded on 09Jan at 8am and expired; This is a spontaneous report from a contactable Other Health Professional. A 70-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL0140), intramuscularly in left arm on 05Jan2021 15:15 at single dose for COVID-19 immunization. Medical history included DM2(Type two diabetes mellitus), CHF(congestive heart failure), open wound, wound infection, heart failure. Allergies to medications, food, or other products: none. Concomitant medications included unspecified products (List of any other medications the patient received within 2 weeks of vaccination: yes). If the patient received any other vaccines within 4 weeks prior to the COVID vaccine: Unknown. Facility where the most recent COVID-19 vaccine was administered: Nursing Home/Senior Living Facility. The resident coded on 09Jan2021 at 8 AM and expired. The patient died on 09Jan2021. An autopsy was not performed. AE resulted in: patient died. Death cause: unknown at this time. Was treatment received for the adverse event: Unknown. Prior to vaccination, was the patient diagnosed with COVID-19: No. Since the vaccination, has the patient been tested for COVID-19: No. Serious: Yes. Seriousness criteria-Results in death: Yes. Seriousness criteria-Life threatening: No. Seriousness criteria-Caused/prolonged hospitalization: No. Seriousness criteria-Disabling/Incapacitating: No. Seriousness criteria-Congenital anomaly/birth defect: No.; Sender's Comments: The old patient had diabetes mellitus, congestive heart failure, open wound complicated by infection, all these pre-existing medical conditions contribute to the patient death. More information including complete medical history, concomitant medications and event term details especially death cause and autopsy results are needed for a full assessment of the case. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate; Reported Cause(s) of Death: resident coded on 09Jan at 8am and expired

Saturday had. Sweating. Chills. Headache. Nausea.; Saturday had. Sweating. Chills. Headache. Nausea.; Saturday had. Sweating. Chills. Headache. Nausea.; Saturday had. Sweating. Chills. Headache. Nausea.; Sunday had emergency appendectomy for actuate appendicitis.; Friday at 3pm, the patient had numbness and tingling to left hand, lips and throat; Friday at 3pm, the patient had numbness and tingling to left hand, lips and throat; Friday at 3pm, the patient had numbness and tingling to left hand, lips and throat; Friday at 3pm, the patient had numbness and tingling to left hand, lips and throat; Friday

at 3pm, the patient had numbness and tingling to left hand, lips and throat; Friday at 3pm, the patient had numbness and tingling to left hand, lips and throat; Post surgery had allergic reaction unknown reason with head to toe rash; Post surgery had allergic reaction unknown reason with head to toe rash; This is a spontaneous report from a contactable nurse (patient). A 34-year-old female patient (pregnant: No) received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via intramuscular (lot number: EL1283) on left arm on 08Jan2021 at 6:30 AM at single dose for covid-19 immunisation. The relevant medical history included celiac, anemia, known allergies: Sulfa and Gluten. Concomitant medications were not reported. The patient received first dose of BNT162B2 via intramuscular (lot number: Ek5730) on left leg on 18Dec2020 at 11:00 AM at single dose for covid-19 immunisation. The patient previously took Codeine, fish oil and experienced allergies. Friday at 3pm, the patient had numbness and tingling to left hand, lips and throat. On Saturday the patient had sweating, chills, headache, nausea. On Sunday had emergency appendectomy for actuate appendicitis. Post surgery had allergic reaction unknown reason with head to toe rash. It was also reported that the adverse event started on 08Jan2021 at 03: 15 PM (as reported). The patient had 1-day hospitalization. The patient received treatment for the events. The adverse events resulted in Emergency room/department or urgent care. The events were reported as serious due to life threatening and hospitalization. The most recent COVID-19 vaccine was administered at hospital. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The outcome of the events was recovering.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. Medications administered during appendectomy may confound reactions experienced post-surgery. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

passing out sensation; heart palpitations; sweating; diarrhea; This is a spontaneous report from a contactable consumer (patient's boyfriend). A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter reported that symptoms were related to the use of Covid 19 vaccine. The patient received the first dose on 15Jan (as reported) and the day after developed sweating, passing out sensation, heart palpitations and this morning on 11Jan2021 when she woke up she had the same symptoms plus diarrhea. The outcome of the events was unknown. Information on the lot number/batch number was requested.

severe hypertension (190/100); flushing tachycardia; flushing tachycardia; blurred vision in the left eye; This is a spontaneous report from a contactable healthcare professional reporting for self. This 65-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via unspecified route of administration on unspecified date at single dose for COVID-19 immunisation. Medical history included ongoing underlying HTN (hypertension). Concomitant medications were not reported. The patient experienced AE following administration of first dose of vaccine of including:

severe hypertension (190/100), flushing tachycardia, and blurred vision in the left eye. These symptoms started 20minutes after administration. The patient stated her PCP thought that she had underlying hypertension and had since started her on medications. She was looking for guidance with regard to receiving the second dose. The outcome of events was unknown. Information about Batch/Lot number has been requested.; Sender's Comments: The administration of BNT162B2 might have played a contributory role in triggering the onset of serious event hypertension worsened, considering the plausible temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate

"he was in AFIB for about 3 hours after receiving his first dose of the COVID19 Vaccine; he noticed the rest of the day, right up to going to bed that he felt cold; This is a spontaneous report from a contactable consumer. A 66-year-old male patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot Number: EL1284) at arm, left upper, via an unspecified route of administration on 29Dec2020 06:15 at single dose for covid-19 immunisation. Medical history included atrial fibrillation (Afib) formally diagnosed around Jan2020. There were no concomitant medications. The patient reported he got the COVID-19 Vaccine at 06:15 on 29Dec2020 and had to sit for 15 minutes afterwards before he could leave. He said everything was fine, and he walked out to the hospital lobby, and was speaking with a work associate for 10 minutes before he headed to his car. When he got ready to leave, he got in his car, and started his car. He started driving home, and realized he was in AFIB. He did have an AFIB issue. His AFIB has been pretty well controlled for a year now, as long as, he didn't do something stupid. He had a moderately aggressive run of AFIB. He said his ""smart"" watch told him his heart rate was 117. His normal heart rate is around 60-70. He was in AFIB for about 3 hours. His typical runs of AFIB are considerably shorter. He only had a total of 2 episodes of AFIB in the last year. His prior AFIB episodes would have been about 4-5 minutes. The last time he had AFIB that lasted any length of time was when he was hospitalized for AFIB around Jan2020. He said at that time, he was hospitalized overnight for observation. He received medication during the hospitalization and his AFIB broke. He didn't remember what medications were given to him during the hospitalization. He said he had flutters before that hospitalization, but the flutters were always gone after a few minutes, so he never sought treatment because there would be nothing to treat. The patient reported he noticed the rest of the day on 29Dec2020, right up to going to bed that he felt cold. His house wasn't cold, and he didn't have a fever. He said the cold feeling went away during the night while he was sleeping. He said the cold feeling easily lasted for a 12 hours. He said the cold feeling could have been something else. The outcome of ""he was in afib for about 3 hours after receiving his first dose of the covid19 vaccine"" was recovered on 29Dec2020; of ""he noticed the rest of the day, right up to going to bed that he felt cold"" was recovered on 30Dec2020."

she was diagnosed with bilateral deep vein thrombosis (DVT) and pulmonary embolism (PE); she was diagnosed with bilateral deep vein thrombosis (DVT) and pulmonary embolism (PE); This is a spontaneous report from a contactable nurse (patient). A 22-year-old female patient received 2nd dose

of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot# EK9231), via an unspecified route of administration in left arm on 06Jan2021 13:45 at single dose for COVID-19 immunisation. Medical history included allergy to all fish, and clots. The patient was not pregnant. There were no concomitant medications. The patient previously received 1st dose of BNT162B2 (lot numer: EH9899) in left arm on 16Dec2020 13:45 for COVID-19 immunisation and experienced left sided lower back pain on 20Dec2020. No other vaccine received in four weeks. It was reported that the patient had the first covid vaccine on 16Dec2020 and on 20Dec2020 started with left sided lower back pain and then received the second on 06Jan2021 and then on 09Jan2021 11:00 her legs became blue and swollen and she was diagnosed with bilateral deep vein thrombosis (DVT) and pulmonary embolism (PE). The patient otherwise healthy and had never had covid. Other than the clots, she had no other health issues. The patient underwent lab tests and procedures which included nasal swab: negative on 09Jan2021. Events resulted in doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care, hospitalization, and life threatening illness (immediate risk of death from the event), hospitalized for 2 days (in Jan2021). Adverse event treatment: heparin drip and xarelto at home. Recovered with lasting effects on an unspecified date of Jan2020. This case was reported as serious, serious criteria was life threatening, caused/prolonged hospitalization.; Sender's Comments: The underlying risk factors/predisposing condition of thrombotic diathesis have been assessed to have played a contributory role toward the events.

Resident expired on 12/30/20, dx cardiac arrest.

Resident expired on 1/2/21.

Per pt, sx onset began at 1520 with pruritus/hives of the scalp. She was in the post vaccine observation area at this time. At 1530, EE returned to vaccination room to alert staff of her reaction. Upon hearing her new onset cough, an assessment was performed immediately. Reported tingling and swelling of her lips, cough, minor difficulty breathing with mask on, facial flushing and feeling hot, and severe pruritus, especially on the scalp. 50 mg IM Benadryl administered and was taken to ED via wheelchair which is 7 minutes away. Epi Pen administered in ED and admitted overnight for observation d/t irregular HR and ST depression on monitor.

felt kind of tired; Tested positive for COVID after receiving the first dose of the COVID Vaccine; Tested positive for COVID after receiving the first dose of the COVID Vaccine; slight fever; body aches; headache; This is a spontaneous report from a Pfizer-sponsored program. A contactable nurse (the patient) reported that a 39-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EK5730) via unspecified route of administration on the left arm/shoulder on 22Dec2020 at single dose for COVID-19 immunisation. Medical history included gained weight since the pandemic started. The patient's concomitant medications were not reported. Patient received first dose of the vaccine. She had symptoms right after she got the vaccine the next day, on 23Dec2020. She had a slight fever, body aches, and a headache, which she never gets. She had these for about 2-3 days, they lingered around, and kicked back up around 26Dec2020/27Dec2020. She also felt kind of tired. She got covid 19 infection tested on 02Jan2021 and the results came back positive on 03Jan2021. Patient was calling to report this and see what to do about the second dose. She was

supposed to get her second dose next Tuesday. The outcome of events was unknown.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 cannot be completely excluded. However, individuals may not be protected until at least 7 days after their second dose of the vaccine. It is unlikely that the patient would have fully developed immunity due to the very short time lag between the first vaccine dose and the event onset.

received the first dose of the vaccine on 21Dec2020 and tested positive for Covid-19; received the first dose of the vaccine on 21Dec2020 and tested positive for Covid-19; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiration date was not provided) via an unspecified route of administration on 21Dec2020 at single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient received the first dose of the vaccine on 21Dec2020 and tested positive for covid-19 on 07Jan2021. The patient was isolated for 10 days. Outcome of event was unknown. Information on the lot/batch number has been requested.

COVID virus/on 29Dec2020 tested positive/symptoms of cough, chills, lost of taste and smell; COVID virus/on 29Dec2020 tested positive/symptoms of cough, chills, lost of taste and smell; This is a spontaneous report from a contactable other health professional (patient). A 57-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number EJ1685, expiration date: 31Mar2021), intramuscularly on 20Dec2020 17:43 at left deltoid, at single dose for vaccination. Medical history included asthma and diabetes. There were no concomitant medications. The patient received the first dose of vaccine on 20Dec2020. On 22Dec2020 she was exposed to Covid, on 28Dec2020 developed symptoms of cough, chills, lost of taste and smell, she had onset of COVID virus symptoms on 28Dec2020 with positive COVID result from COVID nasal swab test performed on 29Dec2020. She has already completed her Bamlanivimab infusion therapy to treat COVID virus on 31Dec2020. Her 2nd dose is due on 10Jan2020 and she wanted information on the use of antibody therapy with the Covid-19 vaccine. She asked if she should still get the second dose of Pfizer-BioNTech COVID-19 Vaccine as scheduled on 10Jan2021 relative to these events. She reported she still has COVID symptoms which have improved, but the symptoms she can't taste or smell are ongoing and persistent. Seriousness criteria: she thought it was serious but she was not injured or anything with it; she thought event was offset it by taking some medication and the Bamlanivimab infusion. In addition to Bamlanivimab infusion for treatment of the COVID virus she was also prescribed Azithromycin for 5 days started on 29Dec2020 which she completed; and Prednisone for 7 days started on 29Dec2020 which she stopped after 5 days of therapy because she did not like how it made her feel. The outcome of the event was recovering. Event relatedness between Pfizer-BioNTech COVID-19 Vaccine and COVID virus was unrelated.; Sender's Comments: Based on the information currently available, lack of efficacy of the suspected vaccine BNT162B2 cannot be completely excluded. However, individuals may not be protected until at least 7 days after their second dose of the vaccine. It is unlikely that the patient would have fully developed immunity due to the very short time lag between the first vaccine dose and the event onset.

positive COVID-19 test; positive COVID-19 test; positive COVID-19 test; This is a spontaneous report from a contactable pharmacist. A around 50-year-old male patient received bnt162b2 (PFIZER-

BIONTECH COVID-19 VACCINE, lot/batch number and expiration date not provided), via an unspecified route of administration on 22Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The physician reported that he knew the patient got the vaccine on 22Dec2020. On 02Jan2021, he tested positive to COVID-19. The outcome of the events was unknown. Information on the Lot/batch number has been requested.; Sender's Comments: The association between the event lack of effect (tested positive for COVID-19) with BNT162b2 can not be completely excluded.

Tufts of my hair came out by the handful - first time in my life I have experienced ANY hair loss! It is still ongoing and I am worried it will result in permanent baldness.

Cardiac arrest within 1 hour Patient had the second vaccine approximately 2 pm on Tuesday Jan 12th He works at the extended care community and was in good health that morning with no complaints. He waited 10-15 minutes at the vaccine admin site and then told them he felt fine and was ready to get back to work. He then was found unresponsive at 3 pm within an hour of the 2nd vaccine. EMS called immediately worked on him 30 minutes in field then 30 minutes at ER was able to put him on life support yet deemed Brain dead 1-14-21 and pronounced dead an hour or so later

He died nine hours later.

Patient died on 1/21-2021

1/7/2021 @ 5:00 a.m. patient woke up and couldn't move her right side (neck, arm and leg). Sister helped dress her and drove her to the hospital. During the ride the hospital the patient had 2 seizures and a 3rd seizure in the ER at the hospital. Patient states she has never had multiple, back to back seizures before. States she hasn't had a seizure for 2 years. EEG was done. Was released from the hospital on 1/9/2021 and to have outpatient MRI of head, shoulder, c-spine. Does not have full range of motion of right neck, and arm, hand and fingers and is painful. 1/14/2021 - full release back to work on 1/14/2021.

Resident had been monitored and had shown no signs or symptoms of any kind until 2 pm on 1/14/2021. Resident was found in the floor of her room. She had fallen and was having a seizure, temperature was 99.7F and Oxygen saturation was 82%.

Resident found unresponsive and without pulse at 05:45am.

on 1/14/21 patients HR 155 at 0800 per patient's home pulse ox device. arrived at ER, HR 148 at 1130. Continued to stay up even after 2 doses of 10mg iv push Cardizem and one dose of 30mg Cardizem. Cardizem drip started, heparin drip started, patient admitted to hospital

"12/23/2020: 2 hr after injection, patient noted swollen lymph nodes, nausea, room spinning (motion sickness-like) sx. Stayed home from work that day and slept. 12/24/2020: ""typical injection site pain"" 12/30/2020: injection site hot, itchy, welts 12/31/2020: area of welts doubled in size to entire upper left arm; throat starting to close up"

Patient presented herself to LPN slurring words and 'not herself'. Upon evaluation, patient denied drinking alcohol, knew she was not able to speak correctly and visibly frustrated . With great difficulty she was able to communicate that she had a headache and was slightly dizzy. Failed FAST and does have a history of CVAs. EMS called and patient was taken to ER where they admitted her for observation post Stroke. Per the hosp nurse, patient received tPA treatment and will be moved to step-down unit when a bed is available.

On 1/11/21 noted with headache, nausea/vomiting, severe melaise. On 1/12/21 resident expired.

Vaccination given 1314 and sent to waiting room for monitoring. Began to have itching at 1325. PO benadryl administered. Then with throat swelling. Epinephrine administered by EMS/Fire at 1:32pm: 0.5mg IM right arm. 1342 improving 1350 itching/throat swelling returning while EMS/Fire on phone with medical director. 1352 second dose of epinephrine administered by De Pere EMS/Fire: 0.5mg IM left arm Medical Director on site for evaluation. Client given option to transport to hospital or stay for monitoring with EMS/Dr. Condition improving, chose to stay for monitoring. Client improved and up walking halls 1513 Client cleared to be released home via private transport

EXTREME LETHERGY, NAUSEA, REFUSING TO EAT OR DRINK, ELEVATED HEARTRATE, FATIGUE, ELEVATED TEMP

Day after vaccine : mild shortness of breath, sensation of swelling in my throat/neck area. Took Benadryl 50mg before bedtime. 2 days after vaccine: woke up with voice changes, coughing/choking with speaking. Used epipen once, felt full relief for about 1-2 hours. Trouble speaking again. Then went to ER, had epipen again twice, over two hours, Benadryl 50IV and Pepcid and steroids. Sitting in the ER now debating admission. Likely being admitted., home epipen are too expensive to treat q2h by myself.

Generalized myalagias, weakness, vertigo, nausea with emesis, one episode of urinary incontinence. Admitted for observation. Patient improved without intervention with some residual dizziness on day two of symptoms.

Dec 24 felt light headed and loss of appetite, Dec 25, fever 103 and chills, Dec 26 Team member Covid hub had me do a Covid test, negative result, continue high fever, no appetite, chills and body ache, Health Hub contacted me daily with app to review symptoms, Dec 27-29 continued symptoms, unable to eat and little bit of water intake, Dec 29 appointment made with Health Urgent Care, received text from Urgent Care cancelling appointment and instructed to take sips of water and Tylenol that I was having an immune reaction to vaccine. Dec 29 virtual appointment with PCP continued symptoms, Dec 31 repeat of COVID swab along with Flu swab both negative, Jan 2-3 hospital admission for abnormal labs, jaundice, dehydration, Sodium/Potassium and Magnesium boluses given, and work up for infectious process was negative. Discharged to home Jan 3 with low grade fever, dry mouth, dry eyes, nausea, body ache and continued loss of appetite. Jan 4-7 continued worsening jaundice and appetite with low grade fever, GI Clinic consulted at Health Clinic, PCP in daily contact, repeat liver function labs on Jan 8 showed worsening labs. Jan 9-12 afebrile, started Ursodiol, low appetite better energy, continue dry mouth, GI appointment Jan 12 with plan to repeat liver functions on Jan 15, jaundice improved and able to eat liquids. No Tylenol or antipyretic taken since Jan 3 due to liver function tests.

Developed chest pressure 8.5 hours after vaccine, unrelieved after 3 hours, went to ED, elevated troponin, EKG changes. Admitted to hospital low grade fever next day

I developed severe abdominal pain 3 days after injection that turned out to be pancreatitis

71yo female resident who died after receiving Pfizer BioNTech vaccine. On 1/14/2021, VS taken at 10am, B/P 99/60, O2 sats, 95% (trach w/O2). At 11:30am, Patient showed no s/sx of distress, A&Ox3. At 11:50am, a nurse went to perform a COVID test and assessment (the facility is experiencing an outbreak), and found the patient unresponsive on the bathroom floor. CPR was immediately started; no shock advised per AED; 12:15pm EMS arrived and took over. At 12:38pm, EMT called time of death.

Has underlying dementia and often with difficulty eating. 1 week after immunization she developed a stroke with left sided weakness and difficulty swallowing. Comfort measures instituted. Not sure if this is related to the vaccine, but thought I should report

"83yo female resident who died after receiving Pfizer BioNTech vaccine. On 1/14/2021, the patient reportedly got up in the middle of the night with c/o feeling ""blah"", restlessness, and nausea. VS normal, no other s/sx. At 4:15am, the patient was asked to go back to bed, assisted by a nurse and GNA. At 6am, GNA was going to do morning VS and found the patient unresponsive, no pulse, no respirations. GNA notified the nurse. At 6:03am, CPR started and EMS called. At 6:15am, EMS arrived and took over. At or around 6:30am, EMT called time of death"

I had fatigue, headache, pain, weakness and I was so miserable decided to go to ER on (12/24/20) and then was transferred to hospital admitted (12/25/20) one day - discharged on 12/26/20 at night

Staff reported that he wasn't being himself. He was leaning more towards the right. Had symptoms similar to Bell's Palsy, some right sided facial droop, right eyelid drooping. On CT right maxillary sinusitis, ventriculomegaly.

Shortness of breath Chest pain Ongoing since

Fever to 100.4 on day 1 after vaccine, to 101.9 on day 3 after vaccine. Acute kidney injury (creatinine rose from 1.73 to 2.43) requiring hospitalization.

After first vaccine i experienced fatigue, body aches, headache and nausea for 2 days and injection site pain for two weeks. After second Vaccine given at 9:55am. tingling of feet for about 20 mins, 30 mins after the vaccine. Two hours later fatigue, body aches, headache and nausea began. At 0030 1/12/2021 I woke up with severe chills and left chest pain, temp was 101.6 and heart rate was 160. I began to see black and chest pain was severe feeling like i was having a heart atack and was going to pass out so i called 911. I then began to get short of breath and got numbess on my legs, left arm and left side of neck. Chest pressure/pain radiated to left arm and neck. I was taken by the ambulance to hospital. Arrived around 0130. My heart rate sustained at 140s in the ER so I was admitted at 0530 am. My D Dimer was a bit elevated as well as my lactic so I was given a bolus of fluids plus maintenance. I had a CXR done, CTA chest(negative for PE), UA, Labs, entire cardiac workup including an ECHO during my admission. I also began to have loose stools and wrist joint pain. MY heart rate sustained at 125-147 for

about 30 hours. Fevers on and off. After everthing was negative we determined this was secondary to the covid 19 vaccine. I was discharged 1/13/2021 at around 1:30 pm. My heart rate is still not at baseline which is 87-90. I'm 100-130 and still get very fatigued with a simple slow walking. Still having tachycardia, fevers, body aches, joint wrist pain, chest discomfort and headaches. My potassium was 3.0 at discharge so will be needing labs in a week. Also bruised a little different than I usually do with lab draws so keeping an eye on them and will be checking my platelets again in a week. Ive been taking tylenol for my fever and pain and ativan for any anxiety when my heart rate goes up. (treatment during hospital stay was normal saline bolus, nomal saline maintenance fluids at 150 cc/hr, tylenol, ativan, ice packs, rest)

Fever, joint pain, weakness. Pain at the injection site.

No reactions immediately after vaccine was given. Resident has dementia, has had multiple hospitalizations related to a renal stone recently. Had a tooth that was bothering her, went to see her dentist and it was extracted on 1/6/21. On 1/10 they noted feet and ankles are dark purple with white splotches appears to be mottling. Minimally responsive to voice and touch. Not eating. Compassionate visit with family. Family did not want hospice, did not feel it was needed, said, what more could they do for her than you're already doing? On 1/11 at 1950 was determined to be deceased.

Anaphylaxis- throat tightness , nausea , rash , pruritis , chest tightness, wheezing . 9-11 called epinephrine x 2 , decade on , IV Benadryl , duo-nebs, famotidine, admission to icu high dose prednisone , nebulizers , zofran , duo-neb nebulizers

Had no immediate issues with the vaccine. He had returned from the hospital on 12/21 and had some concerns about his weight which were shared with his physician on 1/4/21. On 1/5/21 had a visit with his cardiologist for a pacemaker check. On 1/8/21 staff were called to his room, he was on the floor, bluish skin color. No vital signs found, no heart rhythm heard at 2200.

Had COVID infection 10 days after the getting the vaccine; Had COVID infection 10 days after the getting the vaccine; This is a spontaneous report from a contactable physician. A 48-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number: EK5730), intramuscular in right arm on 24Dec2020 09:00 at a single dose for Covid-19 immunization. Medical history was reported as none. The patient's concomitant medications were not reported. The patient was not pregnant at the time of vaccination. Patient did not receive any other vaccines within 4 weeks prior to Covid vaccine. The patient was not diagnosed with Covid-19 prior to vaccination. Patient has no allergies to medications, food, or other products. Physician would like to know if her patient can receive second dose of vaccine. Patient received vaccine 10 days ago. On 05Jan2021, the patient had Covid infection 10 days after the getting the vaccine. No treatment was received for the event. Patient tested positive for Covid after receiving vaccine. The patient underwent lab test which included nasal swab: positive on 04Jan2021. The outcome of the event was recovering.; Sender's Comments: Based on the information available, a possible contributory role of the suspect BNT162B2 cannot be excluded for the reported COVID 19 infection based on the known safety profile. However the short duration of 10 days since the vaccine first dose is given it is unlikely patient would have fully developed immunity.

Caller received the first dose of covid 19 vaccine and tested positive for covid.; Caller received the first dose of covid 19 vaccine and tested positive for covid.; Caller received the first dose of covid 19 vaccine and tested positive for covid.; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A contactable other health professional (patient) reported that a female (age: 22; unit: not reported) patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the first dose of COVID 19 vaccine and tested positive for COVID on an unspecified date. She was under quarantine and wanted to know when and if she should get the second dose. Due date for second dose is 11Jan2021. The patient underwent lab tests and procedures which included Covid-19: positive on an unspecified date. The outcome of event was unknown. Information on the lot/ batch number has been requested.; Sender's Comments: The association between the event lack of effect (Covid-19 test positive) with BNT162b2 can not be completely excluded.

had her 1st dose of Covid vaccine yesterday and started experiencing all expected side effects today including lost of smell and taste/ Rapid PCR Test which came back positive; had her 1st dose of Covid vaccine yesterday and started experiencing all expected side effects today including lost of smell and taste/ Rapid PCR Test which came back positive; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not provided), via an unspecified route of administration on 07Jan2021 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient had her 1st dose of COVID vaccine yesterday, 07Jan2021 and started experiencing all expected side effects today (08Jan2021) including loss of smell and taste. She also had a Rapid PCR test done today which came back positive. She wanted to know if this could be a false positive result from the vaccine. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available.

It felt like a viral meningitis; arm soreness; feel some tension; migraine headache; body started shaking; chills/Rigors; temperature 104; I had sensitivity that I never had; headache; photophobia; Sinophobia; paresthesia/tingling sensation along my upper extremity; I felt like I was freezing; I didn't feel comfortable; vertigo; nausea; hard time to focus; This is a spontaneous report from a contactable other health professional (patient himself). A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in Jan2021 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. He didn't have any allergies. He was in good health, no underlying issue. He never had a surgery. In Jan2021, patient got the vaccine last night around. It started with arm soreness. Around 10:00 am he started to feel some tension, migraine headache. Around 11:00 he felt his body started shaking. He had chills, rigors and temperature 104. For 5-6 hours he had sensitivity that he never had. Patient had a headache, photophobia, sinophobia, paresthesia and tingling sensation along his upper extremity. he

felt like he was freezing. He didn't feel comfortable. It resolved afterwards, he felt no weakness, no facial paralysis. It felt like a viral meningitis. He also had vertigo, nausea and hard time to focus. Outcome of events were unknown. Information about lot/batch number has been requested.; Sender's Comments: Based on the temporal relationship, the association between the event viral meningitis with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

"I have latent TB and am diagnosed with herpes 1 and 2; I have latent TB and am diagnosed with herpes 1 and 2; This is a spontaneous report from a contactable other health professional. A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 11Jan2021 at single dose for covid-19 immunization. Patient had the first dose of the vaccine on 11Jan2021 and she/he had pre-existing conditions. A long time ago, she/he had 2 tachycardia episodes and was sensitive to epinephrine. Patient had latent TB and was diagnosed with herpes 1 and 2 in Jan2021. Outcome of events were unknown. Information about lot/batch number has been requested.; Sender's Comments: The association between the events ""latent PTB and Herpes 1 and 2"" with BNT162b2 can not be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

difficulty breathing and stridor; difficulty breathing and stridor; noises on inspiration; dizziness; headache; sore throat; Anaphylaxis developed within 2 hours of injection; This is a spontaneous report from a contactable other health professional (patient). A 57-year-old female patient (not pregnant) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number EL0142), via an unspecified route of administration in arm left on 08Jan2021 09:00 at single dose for covid-19 immunisation. Medical history included Idiopathic Angioedema, Hypothyroidism. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient did not have COVID tested post vaccination and did not have COVID prior vaccination. The patient's concomitant medications were not reported. Reported Event: Anaphylaxis developed within 2 hours of injection. 9:00 am injection; 9:05 am Developed sore throat, 9:20 am Developed dizziness and headache, 10:00 am developed noises on inspiration, 10:20 am Presented to Emergency Services, 10:40 am IV (intravenous) diphenhydramine (BENADRYL) and dexamethasone (DECADRON), 10:45 am difficulty breathing and stridor, 11:00 am intramuscular Epinephrine, 11:10 am Racemic Epi Nebulizer, 11:20 am Breathing improved, 14:00 Discharged home. The adverse events result in Emergency room/department or urgent care. The outcome of all the events was recovering.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of anaphylaxis reactions considering the plausible temporal relationship and the known adverse event profile of the suspect product. The underlying predisposing condition included Idiopathic Angioedema. The impact of this report on the benefit/risk profile of the

Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Receives dose #1 of the covid vaccine and contracts covid prior to dose #2; Receives dose #1 of the covid vaccine and contracts covid prior to dose #2; This is a spontaneous report from a contactable physician via Pfizer sales representative. This physician reported similar events for two patients. This is 2nd of two reports. A patient of unspecified age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiry date were not provided) solution for injection, via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that patient received dose #1 of the COVID vaccine and contracts COVID prior to dose #2 on an unspecified date. The patient underwent lab test which included Covid-19 test in which he/she tested positive on an unknown date. Outcome of the events was unknown. Information about batch/lot number has been requested.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate. ,Linked Report(s) : US-PFIZER INC-2021012928 Same reporter/drug/event, different patient

"My heart rate, I was like in AFib; very high fever of 103; dizzy, light headed; arms sore; exhausted like an extreme fatigue; palpitations; This is a spontaneous report from a contactable consumer (patient). A 38-year-old female patient received the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot Number: EH9899), via an unspecified route of administration on 30Dec2020 at 38-years-old at a single dose for COVID-19 immunization. Medical history included blood clotting disorder from an unknown date and unknown if ongoing. The patient experienced the following events and outcomes: my heart rate, I was like in AFib (medically significant) on 31Dec2020 with outcome of recovering, very high fever of 103 (non-serious) on 31Dec2020 with outcome of unknown, dizzy, light headed (non-serious) on 31Dec2020 with outcome of unknown, arms sore (non-serious) on 31Dec2020 with outcome of unknown, exhausted like an extreme fatigue (non-serious) on 31Dec2020 with outcome of not recovered, palpitations (non-serious) on 31Dec2020 with outcome of not recovered. The clinical course was reported as follows: The patient stated, ""the day after the shot I got a very high fever of 103. I was dizzy, lightheaded. My heart rate I was like in AFib, it was going from 60s to 50s all over the place. And this was the next day after the vaccination. That evening nothing my arms was just sore. But the next day all of these side effects just started in and even still today I just feel so exhausted like an extreme fatigue and I am still getting like palpitations."" The patient stated, ""So I went to urgent care and they check my vitals and stuff and when they wanted me to send me to the hospital. But I told them I will get a ride and I go by myself just because I didn't want, capable of an ambulance ride and I ended up just going home because I couldn't get a hold up anybody. So, I came home and took my blood thinner

medication because I do have blood clotting disorder."" In regard to the outcomes of the events, the patient stated, ""I am not experiencing all of them still definitely my heart is much better. I am still getting palpitations but nothing near how it was that first day. I am experiencing extreme fatigue."""

received the vaccine on 17Dec2020 the next dose is today but during this time she was positive for covid; received the vaccine on 17Dec2020 the next dose is today but during this time she was positive for covid; This is a spontaneous report from a Pfizer-sponsored program, Pfizer First Connect. A contactable nurse reported for herself, a female patient of an unspecified age who received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date unknown), via an unspecified route of administration on 17Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that patient received the vaccine on 17Dec2020, the next dose is today (07Jan2021) but during this time she was positive for covid since an unspecified date. She was asking if she would take the second vaccine or if she needed to be revaccinated with the first dose. She was also asking what should she do. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The association between the event lack of effect (positive for COVID) with BNT162b2 can not be fully excluded.

"received first dose of bnt162b2/ symptoms started on the 26th (26Dec2020) but did not test positive until the 29th (29Dec2020); received first dose of bnt162b2/ symptoms started on the 26th (26Dec2020) but did not test positive until the 29th (29Dec2020); This is a spontaneous report from a Pfizer-sponsored program via a contactable nurse (patient). A 61-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot/batch number: VAC0002881; expiration date not provided), via an unspecified route of administration on 17Dec2020 at SINGLE DOSE for COVID-19 immunisation. Patient's medical history included hypothyroidism and osteoporosis from unknown dates, both ongoing. Concomitant medications included levothyroxine for hypothyroidism and alendronate sodium (FOSAMAX) for osteoporosis. Patient reported that her symptoms started on the 26th (26Dec2020) but did not test positive until the 29th (29Dec2020). Patient further stated ""She received the first dose of Pfizer vaccine last 17Dec (17Dec2020) and 26Dec she was positive with COVID (later clarified of tested positive on 29Dec2020) because of someone else, it seems that it has been transferred, the virus has been transferred to her and then after a few days she got fully recovered, no symptoms, just fully recovered. She is just asking if she really need the second dose of vaccine if she is fully recovered right now."" It was reported that patient did not receive treatment for the event. Laboratory test included COVID-19 virus test on 29Dec2020 with positive result. Outcome of the event was recovered.; Sender's Comments: Based on the information currently available, lack of efficacy of the suspected vaccine BNT162B2 cannot be completely excluded. However, individuals may not be protected until at least 7 days after their second dose of the vaccine. It is unlikely that the patient would have fully developed immunity due to the very short time lag between the first vaccine dose and the event onset."

Tested positive for Covid, 10 days after receiving the vaccine; Tested positive for Covid, 10 days after receiving the vaccine; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender started to receive bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution

for injection, lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient tested positive for COVID on an unspecified date 10 days after receiving the vaccine. The patient underwent lab tests and procedures which included Covid test: positive on an unspecified date. The outcome of the events was unknown. The information on the batch/lot number has been requested.

coughs once in a while, may be a nervous cough every 40 min; voice hoarse; tested positive for Covid-19; tested positive for Covid-19; didn't feel well at all; bad headache; dry cough; This is a spontaneous report from a contactable consumer who reported for himself, a 70-year-old male patient who received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, lot number and expiration date unknown), via an unspecified route of administration on 06Jan2021 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient stated that he received the first dose of the Pfizer-BioNtech Covid-19 vaccine on Wednesday, 06Jan2021, and on that day he had no problem. On Thursday, 07Jan2021, he started experiencing dry cough. On Friday, 08Jan2021, he didn't feel well at all and had a bad headache. On Saturday, 09Jan2021, he felt better but he tested positive for Covid-19. Today, 11Jan2021, he stated he feels good, he coughs once in a while, may be a nervous cough every 40 min. He had not experienced fever or chills, he breathes well, he can hold his breath for 5-10 seconds, no chest pain or congestion, but his voice was hoarse. Patient wanted to know if this has been reported before, and wanted to know how long should he test himself again for Covid-19. The events were reported as non-serious. The outcome of the events was unknown. Information about lot/batch number is requested.

I was exposed to Covid-19 4 days after and tested + 9 days after dose #1; I was exposed to Covid-19 4 days after and tested + 9 days after dose #1; I was exposed to Covid-19 4 days after and tested + 9 days after dose #1; This is a spontaneous report from a contactable female nurse (patient) via Pfizer sponsored program. A female patient of an unspecified age received bnt162b2 (BNT162B2) on 26Dec2020 at single dose for Covid-19 immunisation. The patient medical history and concomitant medications were not reported. The patient was exposed to Covid-19 4 days after on 30Dec2020 and tested + 9 days after dose #1 on 04Jan2021. The outcome of events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information available, a possible contributory role of the suspect products cannot be excluded for the reported event of positive for corona virus infection for the lack of efficacy of the vaccine. However, based on the mechanism of action of the vaccine, it is unlikely the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine is given. Case will be reevaluated based on follow-up information

positive for covid19; positive for covid19; got or felt sick; This is a spontaneous report from a contactable physician reported for self and consumer. This 51-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on Dec2020 at single dose for covid-19 immunisation. As soon as patient got vaccine she got or felt sick in Dec2020 and had the test and finds out she was positive, so she stays home two weeks and doesn't have no symptom at all and wants to know when has to take a test. The day after the patient developed symptoms thought it was the

vaccine, but the symptoms continued for 2-3 days, the 3rd day the patient got herself tested. The patient was positive for covid19 at the time had the shot/ as soon as she got vaccinated she became positive. The patient hasn't had any symptoms for the past 2 weeks. The patient was scheduled to get retested. The patient was scheduled for 2nd dose of vaccine. The patient asked if there are any risks since developed covid the day after getting the vaccine. What if miss today. The patient wanted to know time after having no symptoms past two weeks, when she has to take a test. Outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Test positive for covid19 found as soon as following the vaccination, no adequate effect of the suspect vaccine thus could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag.

I've got the 1st dose of vaccine and then unfortunately, in the interim, I started feeling sick and tested positive for Covid.; I've got the 1st dose of vaccine and then unfortunately, in the interim, I started feeling sick and tested positive for Covid.; This is a spontaneous report from a Pfizer-sponsored program, received from a contactable consumer (patient). A male patient of an unspecified age received his first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiry date were not provided) solution for injection, via an unspecified route of administration on an unspecified date at a single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient reported he got the 1st dose of the vaccine and then unfortunately, in the interim, he started feeling sick and tested positive for Covid. The patient underwent Covid test and resulted positive on an unknown date. Outcome of the event was unknown. No follow-up activities are needed. No further information is expected.

13 people, who were applied the vaccine previously, were corona positive after a week; 13 people, who were applied the vaccine previously, were corona positive after a week; This is a spontaneous report from a non-contactable consumer. This consumer reported similar events for 13 patients. This is 12th of 13 reports. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; lot number and expiration date: not known), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that 13 people, who were applied the vaccine previously, were corona positive after a week on an unspecified date. The outcome of the events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021018407 same reporter, similar suspect drug and event; different patient

Positive COVID-19 test with symptoms; Positive COVID-19 test with symptoms; This is a spontaneous report from a Pfizer-sponsored program, from a contactable nurse (patient). A 35-year-old female patient (weight 55.79 kg, height 160 cm) received the first dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine, Lot. EK5730) intramuscularly, in the left deltoid, at single dose, on 23Dec2020 at 12:30, for COVID-19 immunisation. The patient had not received any other vaccines within 4 weeks prior to the BNT162B2 vaccine. Relevant medical history and concomitant medications were none. On 25Dec2020, the patient felt extremely tired (fatigue). On 28Dec2020, the patient had headache and minor cough noticed. On 29Dec2020, the patient experienced back pain and she said that it felt like sunburn soreness

more than anything else. She said that she literally slept 3 days in a row (29Dec2020, 30Dec2020, and 31Dec2020). On 31Dec2020, the patient lost her sense of smell and developed dizziness. On 01Jan2021, the patient experienced nausea and lost her sense of taste. COVID-19 virus test was found positive on 01Jan2021.The patient recovered from back pain, sunburn and sleepy on 31Dec2020, recovered from tiredness on 01Jan2021, recovered from nausea and dizziness on 06Jan2021. Clinical outcome of the events, smell loss, cough, headache, and loss of taste was recovering. Final clinical outcome of positive COVID-19 test with symptoms was unknown at time of this report. The case was assessed as serious (medically significant). She is scheduled to get 2nd dose of BNT162B2 (Pfizer-Biontech Covid-19 Vaccine) on 13Jan2021 and is wanting to know if she is supposed to get it.; Sender's Comments: Based on the current available information and the plausible drug-event temporal association, a possible contributory role of the suspect product BNT162B2 to the development of events Drug ineffective and COVID-19 cannot be totally excluded. The case will be reassessed if additional information becomes available.

Received Covid vaccine and tested positive for Covid 10 days after; Received Covid vaccine and tested positive for Covid 10 days after; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received COVID vaccine and tested positive for COVID, 10 days after on an unspecified date. The patient underwent lab tests and procedures which included sars-cov-2 test: positive on an unspecified date. The outcome of the events was unknown. Information on the lot/batch number has been requested.

started with left sided lower back pain; This is a spontaneous report from a contactable Nurse (patient). A 22-year-old female patient received the first dose of BNT162B2 (lot number: EH9899), via an unspecified route of administration at left arm on 16Dec2020 13:45 at single dose for covid-19 immunization. Medical history included allergies for All fish. The patient's concomitant medications were not reported. The patient had the first covid vaccine on 16Dec2020 and on 20Dec2020 started with left sided lower back pain. The event resulted in Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care, Hospitalization (2 days), Life threatening illness (immediate risk of death from the event). The patient received the Heparin drip and xarelto at home for the event. The patient was not pregnant. The patient received the covid test post vaccination on 09Jan2021. Test type was Nasal Swab. The result was negative. The outcome of the event was recovered with sequel on unspecified date.; Sender's Comments: From the information provided it is unclear what is the nature of the reported event and what are the reasons that have put the subject at immediate risk of death. The event is considered possibly related to the suspect product based on the positive temporal association.

throat closing up; struggled the breath; This is a spontaneous report from a contactable consumer (patient). A 44-year-old female patient (non-pregnant) received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: Pfizer EL 3302), via an unspecified route of administration on 09Jan2021 07:30 am at single dose at left arm for covid-19 immunization. Medical history included diabetes, high blood pressure, allergies. The patient's concomitant medications were

not reported. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. Since the vaccination, patient has not been tested for COVID-19. On 10Jan2021 14:30, patient woke up with throat closing up and struggled the breath. Patient immediately drank a dose of diphenhydramine hydrochloride (BENADRYL). Patient did that two more time in the evening of 10Jan2021. Patient called the doctor in the morning. Events were considered serious per life-threatening. The adverse events resulted in doctor or other healthcare professional office/clinic visit, life threatening illness (immediate risk of death from the event). Patient received treatment liquid diphenhydramine hydrochloride, epinephrine (EPI-PEN) for events. Outcome of events was recovered in Jan2021.

chills; body aches; fever; flu like symptoms; headache; was drenched in sweat; This is a spontaneous report from a contactable nurse (patient). A 46-year-old female patient received the second dose of BNT162b2 (lot: EL1283), via an unspecified route of administration in left deltoid on 09Jan2021 15:30 at single dose for covid-19 immunization. Medical history included asthma from Dec2019 and ongoing, insomnia, hypertension. Concomitant medication included ongoing hydrochlorothiazide, metoprolol tartrate (LOPRESSOR HCT) for Hypertension. The patient previously took lopressor and experienced edema. The patient previously received the first dose of BNT162b2 (Lot number: EK5730), intramuscularly in right deltoid at single dose on 19Dec2020 for covid-19 immunization. The patient experienced fever, chills, flu like symptoms, headache all day long on 10Jan2021. The above events were reported as serious as medical significant. No nausea or diarrhea. She had chills and was drenched in sweat on 10Jan2021. She woke up at 10:30 am with chills, body aches on 10Jan2021. Last night at 10 pm she finally fell asleep. She woke up this morning (11Jan2021) and felt fine. The outcome of the event sweating was unknown, other events was recovered on 11Jan2021.; Sender's Comments: Based on a close temporal relationship there is a reasonable possibility of an association between the events and the product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Moderna COVID-19 Vaccine At 2 PM I went blind in my left eye. Went to emergency room at Hospital Was told I have Blood clot in my eye causing the blindness and Ophthamologist says it will probably be permanent

At approximately 10:30pm on 1/14/2021, resident was noted to have a rash on her face, hands, arms, and chest. VS:100.2, 113, 20,108/59, 84% room air. applied nasal cannula at 4-L, telephoned Physician orders 6mg Decadron one time order, a second set of Vitals , reads 99.3, 110, 20, 106/60, 90% on 4-L N/C. On coming shift advised. At approximately 2:00am on 1/15/2021, resident congested and coughing. BP 151/70, pulse 124, temp 98.1 forehead, resp 20 and pulse oc 79% on 3L. At approximately 2:30am PRN cough syrup and breathing tx. Resident's condition began to worsen with breathing tx. This LPN updated at 0248 doctor on resident's condition. Doctor gave permission for resident to go to hospital. At 4:19am the Er called to say resident passed away.

THAT EVENING BETWEEN 10-11 PM HAD A GRAND MAL SEIZURE AND WAS UNRESPONSIVE. TAKEN TO ER WHERE BLOOD WORK WAS DONE AND CT SCAN. SENT HOME AROUND 6:30 AM ON JAN 1ST. (I DO NOT REMEMBER MUCH JUST WHAT MY FAMILY HAD TOLD ME) . I DO REMEMBER BEING SEVERLY SICK WITH VOMITING IN THE ER. CURRENTLY FOLLOWING UP WITH MY FAMILY MD AND HAVE MRI AND EEG TESTS SCHECULED WITHIN THE NEXT COUPLE OF WEEKS.

51 year old M with h/o O2 dependent COPD, Severe pulmonary fibrosis became increasingly hypoxic around 1800hours 1/7/2021. He was transported to hospital for acute on chronic hypoxia respiratory failure. On 1/12/2021 he decompensated further, and after discussing with family and palliative care, He was changed to comfort care. He expired on 1/12/2021@2325 at medical center.

Maybe 1 minute after receiving the vaccine I began to have a syncopal episode, the nurse practitioner thought that since I was heavy I began to have a vasovagal reaction. From there they asked me to sit with the others waiting 15 minutes to make sure they were ok to leave. As I sat the symptoms would come and go, as if in a pattern, and then return. The longer I sat there the more the symptoms began to grow, after sitting for an hour they decided to send me to the ER. At this time I was experiencing nausea, vomiting, sweating, I was itchy, I could not stop coughing, it was difficult to breath, and I had the worse headache. When I got to the ER they gave me drugs to reverse the allergic reaction and told me they would watch me for a while. In the next 4 hours all of the symptoms started again and I had to get another round of the reaction drugs, I ended up going through this process 4 times before I was safe enough to go home the next day. The provider that saw me and admitted me did not do any blood work or labs, they simply provided me with the reaction drugs when needed and my home medications.

Increased lethargy on 1/14/21 at 9pm, Vital signs-106/66, Heart rate-112, temp 98.2; Sent to ER for eval admitted with fever.

On 1/8 she took her 2nd dose of Pfizer vaccine around 3 PM. She went home in the evening and started sweating. She passed out. Her daughter was at home and she took her to the nearest hospital. Her BP was 60/34 and she had a temp of 100.3F on 1/8 during hospital admission. Her K was low. She received lot of fluids. She called our office on 1/10 and during the f/u she was still in the hospital. On 1/10 she has a temp of 98.4F and BP of 109/61. But she still has dizziness, nausea, anorexia and mild cough (Former smoker). COVID-19 test was done on 1/9, its negative. Dx was dehydration. Discharged from the hospital on 1/11, feels better but is tired. Will follow up with PCP on 1/16/21.

anaphylaxis by lethargy, nausea, vomiting, palpitations, funny feeling in chest, swollen lips

"Patient received Pfizer COVID-19 vaccine without any immediate complication on 1/14/21approx 1455, was then escorted to observation area for a 30 minute observation time. Pt had previously had a known reaction to contrast media. Approximately 5 -8 minutes into observation, pt had one audible cough. Nurse asked patient if this was a new onset cough. The patient stated she would try to ""manage"" cough. Pt escorted to bay for monitoring. Pt developed shortness of breath and wheezing rapidly. Rapid response team called and local 9-11 also called. Pt received albuterol nebulizer treatment, placed on O2 at 8L. O2 sat 99%, HR 115-120. Respiratory therapy assisted and Rapid Response Team monitored pt while waiting for EMS. Physician order to give Epinephrine 0.3 mg IM in right deltoid, given as directed

at approx 1515. Second epinephrine 0.3 mg IM given approx 1530-1535. HR 144, O2 sat 99%. Patient transported to local ER, pt intubated approx 1927."

Received the 2nd vaccine at 10am on 1/11/21 intramuscular in the right arm. At 3pm on the same day, I had a painful swolle lymph node on left side of neck. That same evening I developed pain, swelling, in my right armpit radiating to the right upper breast and down my right arm with a swollen lymph node under the right arm pit. The pain was about a number 7 on a scale of 1 to 10. The pain and swelling still persist today on 1/15/2021 Still painful, especially to touch. Still radiating down the arm. Lymph node still swollen The pain is about a 2 on a scale of 1 to 10

Rash, swollen tongue and 2 seizures. Admitted to hospital with diagnosis of seizure and allergic reaction.,

7:00PM fatigued, burning up fever 100., ibuprofen/tylenol dose; Sunday afternoon nausea, loss control of body, anxious, feeling of fainting, unable to move-paralyzed, pressed button for medical help, ambulance arrived, pt transported to ER -- 102. temp ambulance, RN at hosp temp 98., pt was shaky, 8:30PM erratic heartbeat per admitting doctor - pt admitted. Pt PCP/Cardiologist contacted, kept on heart monitor, pt discharged Monday afternoon. 1/14/21 chest pain, nausea, 102. fever. symptoms

#Right parietal/temporal subarachnoid hemorrhage and right intra-axial hemorrhage CT brain (1/12/21): Right parietal intra-axial hemorrhage toward the convexity measuring 2.3 x 1.1 x 1.7 cm with decompression into the subarachnoid space, mild right predominantly temporal and parietal subarachnoid hemorrhage is seen with minimal associated hemorrhage along the tentorium. Mild diffuse right cerebral sulcal effacement with minimal leftward midline shift measuring 2.5 mm. #Dural sinus thrombosis CTA head (1/11/21): Increased density within the superior sagittal sinus, inferior sagittal sinus, and transverse sinuses on noncontrasted images with no flow seen on postcontrast sequences consistent with venous sinus thrombosis #Left sided weakness 2/2 above #Recent jaw alignment procedure

Patient developed headache and nausea on 1-11-2021. She was hospitalized on 1-14-2021 at Hospital. Found to have dural sinus thrombosis of the superior sagittal and right transverse/sigmoid sinus on MRV brain. Currently admitted to ICU at Hospital, getting injectable blood thinners. Neurology and hematology have been consulted.

Hospital Course: á Patient is a 43 y.o. female patient who originally presented to the hospital on 1/3/2021 due to Left lower extremity pain and swelling. Patient found to have extensive DVT of left lower extremity and started on heparin drip. Vascular was consulted and recommended thrombolysis. Patient was also seen by IR who took patient for thrombectomy and left iliac stent placement on 01/05/2021. Patient tolerated procedure well. Patient was transitioned from heparin drip to Eliquis upon discharge. Patient given vascular follow-up as well as Hematology follow-up.

Sudden death 18 hours post vaccine .

Onset of shortness of breath and cough on 1/3 that progressively got worse. Clinical diagnosis of pneumonia without fever was made, patient started azithromycin on 1/5 and albuterol treatments every 4-6 hrs. Initially he improved, but then worsened. chest xray on 1/6 was negative for pneumonia, PCR covid test was negative, albuterol treatment did not bring much relief. He started respiratory distress on 1/10 and was taken by car to the local ER where another covid test was negative and chest CT revealed multiple bilateral pulmonary emboli. The leg US revealed blood clots in both of his legs. He had an emergency catheter-delivered thrombolysis and was discharged home from the ICU on 1/12 on oral anticoagulants. He is gradually improving, but very weak. He tires easily and gets a drop in oxygen to 90- 93%, as well as an increase in the heart rate to 120 when walking less than half a mile. He runs out of breath with exertion.

Patient developed a hoarsenss of voice and tightness of throat and flushed feeling immediately following vaccination. Epi Pen was administered and 50 mg Benadryl given p.o., EMS transport to ED after administration of solumedrol 125 mg - received Pepcid and Zofran and NS IV in the ED. Discharged from ED with prednisone 40 mg daily x 4 day with Epi Pen prescription.

Resident received Moderna vaccine on 12/23/2020 around 5 pm. At approximately 3:35 am on 12/25/2020, resident had a CVA and died on 1/1/2021 at 3:00 am.

"it hard to inject; some came out and squirted down her arm; some came out and squirted down her arm; he did not get the full 0.3mL dose; This is a spontaneous report from a contactable nurse (patient). A 74-year-old-female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot EK9231) via Intramuscular on 05Jan2021 13:00 at single dose in the left arm for COVID-19 immunisation. Medical history included COPD and high cholesterol. Concomitant medications included Symbicort for COPD. Patient took COVID vaccine (Verbatim) since precaution as frontline healthcare worker. On Tuesday, she received the first dose of the Pfizer COVID Vaccine. The nurse who was injecting found it hard to inject, and at the end of the injection, it came back and squirted down her arm. It was a decent amount. She is unable to say if she got 0.1ml, 0.2ml, but she certainly did not get full 0.3ml. The hospital said they are just going to go ahead and give her the second dose, but she wanted to call and find out what would be the safest thing. Would it be best to receive another dose or go ahead with the second dose or get a third dose. She is due in 2 1/2 weeks to get second dose. She also has COPD and is a little more concerned than if she were 25 years old. There was no prescriber provided. When asked about other medications, she stated she has a list of medications, but did not think they were relevant. She was diagnosed with COPD last year and had a series of test. Reporter seriousness for ""it came back and squirted down her arm"" is medically significant. Outcome of events was unknown.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events due to temporal relationship. There is limited information provided in this report. This case will be reassessed once additional information is available."

positive COVID-19 test with symptoms; positive COVID-19 test with symptoms; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date were not reported), via an

unspecified route of administration on 23Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received her first dose on 23Dec2020 and was subsequently exposed at work to the virus and became symptomatic and tested positive on 31Dec2020. Her next scheduled dose is on Sunday, they may have to reschedule. The patient queried on how long should they delay the next dose. The patient underwent lab tests and procedures which included sars-cov-2 test: positive on 31Dec2020. The outcome of the events was unknown. Information about Lot/Batch number is requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of suspected Covid-19 infection and suspected LOE due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

fainting spell; almost passed out; dizzy spells; weak; This is a spontaneous report from a contactable consumer (patient herself). A 22-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot: EL3246), via an unspecified route of administration on 07Jan2021 in right upper arm shoulder area at single dose for prevent covid. Medical history included ongoing acne. Concomitant medication included doxycycline from 2020 (taking it 6 months ago) and ongoing for acne. Patient stated that she got the Covid vaccine yesterday 07Jan2021 and almost passed out in her kitchen after a couple hours. Patient stated got in shower had dizzy spells and was weak 07Jan2021, she felt better now. Patient stated that she was a small girl of 105 pounds and the dose could have made her sick. She wanted to make sure she did not need to go and be seen. Patent had another spell in shower this morning and stated that the fainting spell and feeling weak started at 9:00 yesterday evening on 07Jan2021. Outcome of dizzy spells was recovering, and outcome of other events were unknown.

Body chills; fever that went up to 100.4 degrees F.; fatigue; excess mucus; bone pain 10/10; muscle pain 8/10; other vaccine same date vaccine date 05Jan2021; This is a spontaneous report from a contactable other health professional (patient). A 66-year-old female patient (not pregnant at the time of vaccination) received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiration date not provided), via an unspecified route of administration on 05Jan2021 at single dose for COVID-19 immunization. Medical history included DM type 2, hypertension (HTN), fibromyalgia, chronic asthma, Covid prior vaccination, No Allergies to medications, food, or other products. Concomitant medications received within 2 weeks of vaccination. Facility where the most recent COVID-19 vaccine was administered at Nursing Home/Senior Living Facility. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Other vaccine same date included other vaccine same date product was Pfizer, other vaccine same date vaccine date 05Jan2021. On 06Jan2021, the patient experienced Body chills, fever that went up to 100.4 degrees F., bone pain 10/10, muscle pain 8/10,

fatigue and excess mucus. No treatment received for the adverse events Body chills, fever that went up to 100.4 degrees F., bone pain 10/10, muscle pain 8/10, fatigue and excess mucus. The events were non-serious per the reporter. Prior to vaccination, the patient was diagnosed with COVID-19. Since the vaccination, the patient hadn't been tested for COVID-19. The outcome of the events Body chills, fever that went up to 100.4 degrees F., bone pain 10/10, muscle pain 8/10, fatigue and excess mucus was recovering. No follow-up attempts are possible. Information about Lot/Batch cannot be obtained.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of bone and muscle pain cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

burning of the tongue; Difficulty in breathing; headaches; Pressure in the chest area; nausea; dizziness; fast heartbeat; tiredness; Had a hard time swallowing at night from the dryness; bitter taste; her mouth went completely dry; patient received 0.45 mL, single dose (225mcg) of PFIZER-BIONTECH COVID-19 VACCINE; This is a spontaneous report from a contactable nurse (patient). A 64-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EJ1685), via an unspecified route of administration on 23Dec2020 15:00 at 0.45 mL, single dose (225mcg) at left arm to prevent COVID. Medical history included a bout of dry mouth about 7 years ago, no other relevant medical history (including any illness at time of vaccination). The patient's concomitant medications were not reported. There's no adverse events following prior vaccinations. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. From the time she got the vaccine her mouth went completely dry on 23Dec2020 and she kept thinking it would go away and she still had it. Event was reported as serious per medically significant. Had a hard time swallowing at night from the dryness. Patient had the bitter taste was also on 23Dec2020, but it went away. It lasted about 5-6 hours. Then after that the dry mouth started right after. It is tolerable but she still had it. Mentioned she had a bout of dry mouth about 7 years ago and it did go away, but she never got a diagnosis for it. Patient thought that something underlying may have triggered it again. Patient also experienced burning of the tongue, tiredness, headaches, pressure in the chest area similar to difficulty in breathing, nausea, dizziness, and a fast heartbeat on unspecified date. Outcome of event dry mouth was not recovered, outcome of event bitter taste was recovered on unspecified date in Dec2020, outcome of other events was unknown. No family medical history relevant to adverse events. No relevant tests. No history of all previous immunization with the Pfizer vaccine considered as suspect. No additional vaccines administered on same date of the Pfizer suspect. The adverse events resulted in neither doctor or other healthcare professional office/clinic visit, nor emergency room/department or urgent care. Relatedness of Pfizer BioNTech Covid-19 vaccine with dry mouth and bitter taste per primary source reporter with method of assessment of global Introspection was related. Reporter seriousness for event bitter taste was not serious.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of dry mouth cannot be excluded, considering the plausible temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures

for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

throat tightness; This is a spontaneous report from a non-contactable other healthcare professional (HCP). An 18-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot EK9231) via an unspecified route of administration on Jan2021 at a single dose in the left deltoid muscle for COVID 19 vaccination. Medical history and concomitant medications were not reported. The patient denied any history of previous adverse reactions to vaccines and denied reaction to her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) for COVID 19 vaccination on an unspecified date. The patient was seen at a COVID vaccine clinic today for her second dose of the COVID 19 vaccination. She was given the Pfizer vaccination in the left deltoid muscle. During her 15-minute waiting period after the injection, the patient began to experience throat tightness on Jan2021. Treatment included: Benadryl 25mg po (orally) and Solumedrol 125mg IM. The event did not result in death, not life threatening, did not caused/prolonged hospitalization, not disabling/incapacitating, did not cause congenital anomaly/birth defect. The outcome of the event was unknown. No follow-up attempts are possible. Information about lot/batch has been obtained. No further information is expected.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of throat tightness cannot be excluded, considering the plausible temporal relationship. Sever allergic reaction is the known risk for the product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

blood pressure skyrocketed, it was 175/110/Very high blood pressure; almost falling down; Severe fatigue; Dizzy/dizziness; Bad headache/severe headache; Neck pain; This is a spontaneous report from a contactable nurse (reporting for herself). An adult female patient (over the age for 60) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration in an unspecified deltoid on 28Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced dizzy/dizziness, bad headache/severe headache, neck pain on 28Dec2020 and almost falling down, blood pressure skyrocketed (175/110)/very high blood pressure and severe fatigue on 29Dec2020 10:00. Clinical details were reported as follows: After the vaccine the patient was there waiting for 20 minutes and when she got in her car, after about an hour after the patient was really dizzy and was driving and was going to get in the next lane and thank God did not get in an accident. The patient parked and called her family to come pick her up. She had a bad headache, neck pain and dizziness that lasted for an hour. Finally, they came in and took me home. The patient slept for 7 hours. 9 hours after, the headache, neck pain, and dizziness were gone. The next day at 10:00 at work the patient almost fell down and one of the coworkers held her. The patients blood pressure skyrocketed, it was 175/110 and the patient was very dizzy again had severe fatigue. Her blood pressure was high for about 2 hours and slowly came down, but the fatigue lasted for almost a week and it slowly got better. The patient underwent lab tests

and procedures which included blood pressure measurement: 175/110 on 29Dec2020 skyrocketed/very high. The outcome of the events was recovered on an unspecified date. The batch/lot number for the vaccine, BNT162B2, was not provided and will be requested during follow-up.; Sender's Comments: Based on the time association, the possible contribution of suspect BNT162B2 to the event blood pressure increased cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

exposed to my sister/she did not know she had Covid/I tested positive with Covid test; exposed to my sister/she did not know she had Covid/I tested positive with Covid test; This is a spontaneous report from a contactable other HCP (patient). This female patient of unspecified age reported for herself that she received dose one of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number and Expiration date were not reported) on 21Dec2020 00:00 (at unspecified age) as single dose, unspecified route, for COVID-19 immunisation. Medical history and concomitant medications were not reported. The Patient received the vaccine on 21Dec2020 and was exposed to her sister on 22Dec2020 she did not know she had Covid. Patient tested positive with Covid test on 26Dec2020. Patient is scheduled to get second dose 11Jan2021. Lab data included a positive Covid test on 26Dec2020. The outcome of exposed to my sister/she did not know she had Covid/I tested positive with Covid test was unknown. The lot number for the vaccine BNT162B2 was not provided and will be requested during follow up.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. Efficacy of suspect drug however, is documented 7 days after second dose. Patient has received only the 1st dose.

"old scar that I forgot that I have there, it just swelled up really bad; The injection site looked like ""a small pox vaccine,"" in which appear red and scabby with a blue dot in the middle; The injection site looked like ""a small pox vaccine,"" in which appear red and scabby with a blue dot in the middle; The injection site looked like ""a small pox vaccine,"" in which appear red and scabby with a blue dot in the middle; The injection site looked like ""a small pox vaccine,"" in which appear red and scabby with a blue dot in the middle; Injection site began to itch; Injection site soreness; This is a spontaneous report from a contactable nurse (patient). A 50-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EL0142 (also reported as EL0140, pending clarification), expiry date: 03Mar2021 (also reported as 31Mar2021, pending clarification), intramuscular on the right arm on 08Jan2021 06:30 at a single dose for covid-19 immunisation. Medical history included heartburn, hot flashes, Grave's disease (father also has Grave's disease), had a thyroidectomy in Dec2015, menopause, weight loss, and appetite control, allergies, compromised immune status (brother and father side with autoimmune), respiratory illness, genetic/chromosomal abnormalities, endocrine abnormalities (including diabetes) and obesity, and diabetes type 2 diagnosed in 2019 (both parents and brother also with diabetes). Concomitant medications included levothyroxine sodium (SYNTHROID) in Dec2015 for Grave's disease and had a thyroidectomy, esomeprazole sodium (NEXIUM

[ESOMEPRAZOLE SODIUM]) on 02Jan2021 for heartburn, phentermine for weight loss and appetite control, estradiol on 02Jan2021 for hot flashes and menopause, medroxyprogesterone acetate (PROVERA) on 02Jan2021 for hot flashes and menopause, prednisone for unexplained whelps (pending clarification), and cimicifuga racemosa (also reported as black cohosh) for hot flashes. The patient previously took metformin and experienced GI upset (she quit taking metformin/it was causing GI upset because they increased dose/current dose is 1,000mg twice daily increased from 500 mg twice daily) and generic levothyroxine sodium and experienced feels like crap. The patient had no previous history of immunization with the Pfizer vaccine. No additional vaccines administered on same date of the bnt162b2. No prior vaccinations within four weeks. The patient wanted to know if she can receive the second dose of the Covid vaccine after experiencing adverse events. On 08Jan2021, the patient experienced some injection site soreness, in which she took TYLENOL for. Around 14:30, she noticed that the injection site began to itch. Around 16:00, the injection site looked like ""a small pox vaccine,"" in which appear red and scabby with a blue dot in the middle. The patient also reported, ""scar that I have on my arm, it is not a reaction, it is an old scar that I forgot that I have there, it just swelled up really bad."" Event injection site looked like a smallpox vaccine was assessed as serious-other medically important condition. No emergency room or physician's office required. Therapeutic measure was taken as a result of injection site soreness. Outcome of the event injection site looked like a smallpox vaccine was not recovered. Outcome of the events injection site soreness, injection site began to itch, vaccination site erythema, vaccination site scab, vaccination site discoloration, and old scar that I forgot that I have there, it just swelled up really bad was unknown.; Sender's Comments: Based on the time association, the possible contribution of suspect BNT162B2 to the event vaccination site discomfort cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

Dizzy; headaches; flu feeling; side effects she had were like the COVID symptoms she had, like the chills and everything; lethargic feeling; weak; Nausea; the whole left side of her body went numb including even her vagina; left side of her body was so numb and weird and tingly feeling/left leg went numb; whole left side of face swelled up; left eye turned red; pressure in head; felt like someone squeezing her eyeball out; eye went black/left eye looked bruised/blackness around the eyes; whole face went numb/left side of face slightly numb; bells palsy; allergic reaction; This is a spontaneous report from a contactable consumer (patient). A 44-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in arm left on 05Jan2021 at single dose for COVID-19 immunization. Medical history included cutaneous t-cell lymphoma from 2017 and ongoing, ongoing cholesterol, ongoing thyroid, covid-19 from Nov2020 to an unknown date not ongoing (lasted about 1-1.5 months; she did not have any breathing problems) and blood cancer. Concomitant medication included bexarotene ongoing for cutaneous T-cell lymphoma, rosuvastatin ongoing for cholesterol, levothyroxine ongoing for thyriod. The patient underwent lab tests and procedures which included COVID 19: positive in Nov2020, found out tested positive around holiday. Clinical course: onset about 26 hours after administered the first dose; onset as soon as she got back to

work next day: 06Jan2021. The side effects were at their worst for at least 24-48 hours. Further described as all side effects occurred only on left side of her body: whole left side of face swelled up on 06Jan2021; left eye turned red on 06Jan2021; whole face went numb/left side of face slightly numb on 05Jan2021; eye went black/left eye looked bruised on 05Jan2021; pressure in head on 06Jan2021; felt like someone squeezing her eyeball out on 06Jan2021, within the first 24-48 hours, her 'left leg went numb'. She called to talk to physician and nurse who advised her to take Benadryl; which she did take and the Benadryl stopped the side effects; but she could not take a lot of Benadryl or anything because she was at work. She stayed at work because at least there were healthcare professionals, adults in case she passed out; at home she has 7 young children and is also raising her grandchild. The side effects did not completely go away. The arm thing was normal; The next day she was at work and had the swelling on left side of face; blackness around the eyes; arriving home she had headaches on 07Jan2021 and then her leg went numb for like 20 mins; the whole left side of her body went numb including even her vagina; left side of her body was so numb and weird and tingly feeling that she started panicking because she was driving on 06Jan2021. She calmed herself down thinking it's only the left side; you can drive with your right side to get home and be fine. It was more like left side of her body was asleep, tingling, she has never had that happen before. Everything else like the headache, flu feeling was about 48 hours later (on 07Jan2021). She had COVID already back in Nov2020 for about 1-1.5 months; the next side effects she had were like the COVID symptoms she had, like the chills and everything on 06Jan2021. She had the lethargic feeling again, her head was hurting, she felt extremely weak on 06Jan2021. Patient also felt nausea on 06Jan2021, Dizzy on 08Jan2021. Another doctor said it sounded like the side effects she experienced with the vaccine sounded like allergic reaction or Bell's palsy. Patient was asking the doctor if she could get like an Epi-pen or prescription Benadryl or something because she is afraid to get the second dose of Pfizer COVID-19 Vaccine and not have something to respond to side effects with. The outcome of event whole face went numb/left side of face slightly numb was recovered on 07Jan2021, for headaches was recovering, chills and nausea was recovered on 08Jan2021. Outcome of other events was unknown. Information about lot/batch number has been requested.

"felt like she had Covid; felt like she had Covid; stomach cramps; chills; aches; not feeling good; temp was around 101- 101.6/fever 102; Icy hot sensation; lethargy; arm was red and swollen; arm was red and swollen; This is a spontaneous report from a non-contactable nurse (patient). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. Medical history included covid-19 from Jul2020. The patient's concomitant medications were not reported. The patient got her injection on Tuesday (specified date unknown) at 3pm. Felt good but then woke up with stomach cramps. She went to work and at around 1pm she started having chills, aches and not feeling good at 4:30 pm her temp was around 101- 101.6 so she took Tylenol went to bed. She woke up with fever 102 and felt like she had Covid all over again reporting that she had covid in Jul. Having what she has heard described as ""Icy hot sensation"" and lethargy and not feeling good with chills aches. Then on Thursday her arm was red and swollen with the redness expanding swelling and her fever was going back up. The outcome of the events was unknown. No follow-up attempts are possible. Information about lot/batch number cannot be obtained. No further information is expected.; Sender's Comments: Based on the information currently available, the local reactions and flu like symptoms following

vaccination with BNT162B2 are more likely attributed to the vaccine use. Further information like diagnostic detection of virus genetic material or virus protein antigen needed for meaningful medical assessment on protective effects with the vaccine."

"convulsive chills, fever- (high); convulsive chills; fever- (high); all of my muscles and joints were flaring in extreme pain; all of my muscles and joints were flaring in extreme pain; I could NOT move my vaccine arm more than 3 inches and my whole body hurt; my vision was extremely blurry; When I tried to walk, it was slow; achy/whole body hurt; tired, and took a nap; This is a spontaneous report from a contactable consumer (patient). A 54-year-old female patient (no pregnant) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Batch/lot number: EL0142) via an unspecified route of administration on the left arm on 05Jan2021 11:00 AM at single dose for COVID-19 immunisation. Medical history included having Covid the 3rd week in Mar2020, Positive for Antibodies in early May2020. Fairly sick but not emergency situation ""Long haulers"" covid symptoms that continued through Nov2020. Patient still had skin pain. Other medical history included hashimoto's. Past drug event included known allergy to codeine. The patient's concomitant medications included 25 mg of Levothyroxine in two weeks. No other vaccine in four weeks. On 05Jan2021 at 12:30, patient felt achy, tired, and took a nap. By 2:00ish. The patient's vision was extremely blurry and continued for 2 days. At 05Jan2021 8 pm- 6 hours later of convulsive chills, fever- (high) and all of her muscles and joints were flaring in extreme pain. Patient could not move vaccine arm more than 3 inches and whole body hurt as if she had been hit by a train. When patient tried to walk, it was slow. Patient groped walls for support. Patient had a televisit with a doctor friend who said this was not a normal side effect and go to emergency room (ER). Doctor or other healthcare professional office/clinic visit. Covid test post vaccination included nasal swab, Covid -19 diagnostic on 08Jan2021 with pending result. No treatment received for events. The outcome of convulsive chills fever was unknown. The outcome of other events was recovered in Jan2021."

tunnel vision; experienced a sudden onset of vertigo; presyncope; My hands became cold and numb; My hands became cold and numb; fatigue; sore arm, leg/thigh aching; sniffles; sore throat; brief dry cough; slight headache; neck ache; This is a spontaneous report from a contactable Nurse (patient). A 34-year-old non-pregnant female patient received the first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular on 05Jan2021 at 12:30 at single dose in left arm for covid-19 immunization. Medical history included Mild ADHD/ADD. The patient's concomitant medications were not reported. Approximately 5 minutes after receiving vaccination, she was standing in the observation room (where they had all of them stay for at least 15 minutes to ensure no severe reactions) and experienced a sudden onset of vertigo, tunnel vision and pre-syncope. Her hands became cold and numb and she was trying to talk to another staff member who was arranging/scheduling her second vaccination dose at the same time when this event occurred, but it subsided quickly and she started to feel normal again. All these events occurred at 12:45 on 05Jan2021. She reported this event right away and they had her stay in the room longer. She was stable at that point but experienced these symptoms again but very mildly twice more while she walked back to her car to go home. Other side effects on 05Jan2021 that started in the evening and for the following 2-3 days included fatigue, sore arm, leg/thigh aching, sniffles/sore throat, brief dry cough and slight headache/neck ache. Very mild and tolerable symptoms. All events

were reported as non-serious by reporter. The patient did not receive treatment for the events. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination, and the patient has not been tested for COVID-19 since the vaccination. The outcome of all events was resolved in Jan2021. Information on the lot/batch number has been requested.; Sender's Comments: Based on temporal association, a possible contributory role of BNT162B2 cannot be excluded for reported events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Experienced vasovagal syncope after standing, resulting in fall; Experienced vasovagal syncope after standing, resulting in fall; Awoke with severe chills; nausea; body/muscle aches; body/muscle aches; left arm pain; extreme thirst; fatigue; This is a spontaneous report from a contactable consumer. A 44-year-old female patient (non-pregnant) received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot: EK9231), via an unspecified route of administration on 08Jan2021 14:30 in left arm at single dose for covid-19 immunization. There was no medical history and concomitant medications. Allergies to medications, food, or other products was no. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The most recent COVID-19 vaccine was administered was in hospital. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient had not been tested for COVID-19. On 09Jan2021 01:30 am, patient woke with severe chills, nausea, body/muscle aches, left arm pain, nausea, extreme thirst. Patient experienced vasovagal syncope after standing, resulting in fall. Worst symptoms were lasted about 30 minutes, muscle aches and fatigue continue about 16 hours later. All events were reported as non-serious. No treatment was received for these events. Outcome of all events were recovering.

foggy minded; on first vaccine it made him feel a little sluggish; tired; This is a spontaneous report from a contactable pharmacist. A 36-year-old male patient started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730), intramuscular from 18Dec2020 to 18Dec2020 at SINGLE DOSE for COVID-19 immunisation. Medical history included ADHD. Concomitant medication included amfetamine aspartate, amfetamine sulfate, dexamfetamine saccharate, dexamfetamine sulfate (ADDERALL) and escitalopram oxalate (LEXAPRO). On an unspecified date, the patient stated that on first vaccine, it made him feel a little sluggish, tired and foggy minded. Outcome of the events was unknown.; Sender's Comments: Based on temporal association, a possible contributory role of suspect BNT162B2 cannot be excluded for event mental dullness. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

partial complex seizure; I lost muscle tone and collapsed; severe LUE weakness; severe pain; aura; I lost muscle tone and collapsed; This is a spontaneous report from a contactable other health care professional (HCP) reporting for herself. A 40-year-old female not pregnant patient received first dose of

BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in the Left arm on 30Dec2020 h 05:00 PM at single dose for COVID-19 immunisation, lot number: EH9899. Patient did not receive any other vaccines within four weeks prior to the vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. Medical history included epilepsy (well controlled with medications) and she was allergic to phenytoin (DILANTIN). Concomitant medications in two weeks prior to the vaccination included carbamazepine, lamotrigine (LAMICTAL) and fluoxetine. It was reported that on 31Dec2020 h 14:00 (also reported as approximately 22 hours after vaccine) patient experienced severe left upper extremity (LUE) weakness and severe pain. She then experienced an aura and had a partial complex seizure. Patient lost muscle tone and collapsed. The episode lasted approximately 1.5 minutes, no treatment was given. Patient was tested for Covid post vaccination, she underwent Covid-19 PCR Test (Nasal Swab) on 04Jan2021 and on 07Jan2021, both with negative results. She also underwent a Covid-19 PCR Test on unknown unknown date in Jan2021 with unknown results. Patient recovered on 31Dec2020 from the events.; Sender's Comments: There is not a reasonable possibility that the reported events were related to the suspect product event most likely due to patient underlying contributory factors. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators as appropriate.

spontaneous rupture of membranes at 36-0 weeks; Pregnant at the time of vaccination?: Yes; This is a spontaneous report from a contactable physician. This physician reported information for both mother and fetus/baby. This is the maternal report. A 29-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular (left arm) on 18Dec2020 and 08Jan2021 at a single dose for COVID-19 immunization. Medical history included cold sores, no active cold sore at time of labor. On an unspecified date, it was reported that a healthy 29-year-old G1P0 with good prenatal care and no pregnancy complications who had spontaneous rupture of membranes at 36-0 weeks, one day after her second Pfizer CoVid vaccine (09Jan2021). She felt well after her vaccine and had no symptoms today. The mother reported she became pregnant while taking BNT162B2. The patient takes prenatal vitamins. The mother was 33 Weeks pregnant at the onset of the event. The mother was due to deliver on 06Feb2021. Therapeutic measures were taken as a result of premature rupture of membranes. The outcome of the event was recovering. Information about Batch/Lot number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported event of spontaneous rupture of membranes due to temporal relationship. However, the reported event may possibly represent intercurrent medical condition in this patient. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any

appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Within 15 minutes, I began feeling dry throat; Within 15 minutes, I began feeling dry throat, then itching, then it felt like I had a lump inside my throat.; it felt like I had a lump inside my throat.; Then I began to have difficulty swallowing my saliva.; difficulty breathing; very groggy; This is a spontaneous report from a contactable pharmacist. A 47-year-old female patient received the first dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EL0140), intramuscular in left arm on 20Dec2020 at a single dose for COVID-19 immunization. Vaccination was administered in a hospital. Prior to vaccination, the patient was not diagnosed with COVID-19. Medical history included hypertension, overweight, and known allergies to bee stings and hair dye. The patient's concomitant medication included multivitamins. On 20Dec2020, within 15 minutes, the patient began feeling dry throat, then itching, then it felt like she had a lump inside her throat. Then she began to have difficulty swallowing her saliva. And then the lump inside her throat started to feel larger and larger. By this time, the doctor had already injected the patient with Epipen and the pharmacist injected her with Solumedrol and she still felt as if she was having difficulty breathing and then she was taken to ER and she really can't remember too much after that. The patient was very groggy and then was discharged from ED about 9:30 pm. The outcome of the events was recovered on an unknown date. Treatment for the events included epinephrine, methylprednisolone, diphenhydramine. Since the vaccination, the patient has not been tested for COVID-19.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of feeling dry throat, itching, felt like having lump inside her throat, having difficulty swallowing saliva, difficulty breathing and very groggy cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. Severe allergic reaction is the known risk for the product. The underlying predisposing condition of allergies to multiple materials may put the patient at high risk of anaphylactic reactions. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

significant swelling to lymph nodes under armpit of injection side (L arm); This is a spontaneous report from a contactable consumer. A 26-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK9231), via an unspecified route of administration at the left arm on 09Jan2021 08:00 at SINGLE DOSE for COVID-19 immunization at a hospital. Medical history included asthma, food allergy with peanuts and pine nuts. No known medication allergy. The concomitant medications included albuterol and unspecified multivitamin. The patient previously took the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899) at the left arm on 19Dec2020 08:00. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination and was not tested for it since the vaccination. The patient was not pregnant. On 10Jan2021 16:00, the patient noted significant swelling to lymph nodes under armpit of injection side, swelling in the left armpit lymph nodes began approximately 32 hours after injection. Swelling measuring approximately size of a ping pong ball. At

time of this reporting (approximately 40 hours post-injection) lymph node swelling still persists, with no change in size. The patient did not receive any treatment for the events. The patient has not recovered from the events. No follow-up attempts are needed. No further information expected.

Patient was tested for Covid post vaccination/ Covid test on 28Dec2020 and resulted positive; Patient was tested for Covid post vaccination/ Covid test on 28Dec2020 and resulted positive; This is a spontaneous report from a contactable healthcare professional (patient). A 40-year-old female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK7530) solution for injection, intramuscular on left arm on 16Dec2020 12:00 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient was not pregnant. It was reported that patient was tested for Covid post vaccination. Nasal swab for Covid test was done on 28Dec2020 and resulted positive. Outcome of the event was unknown. No follow up attempts are possible. No further information is expected.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient cannot be completely excluded.

had a metallic taste; turned to swollen tongue; hives around chest and neck; difficult to breathe; tachycardia; This is a spontaneous report from a contactable other HCP (Patient). A 33-year-old non-pregnant female received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number=EL 3248), via an unspecified route of administration at right arm on 07Jan2021 16:15 at single dose for covid-19 immunization. Vaccine was administered at hospital. Known allergies included cyclobenzaprine and dairy latex. Concomitant medication included amfetamine aspartate, amfetamine sulfate, dexamfetamine saccharate, dexamfetamine sulfate (ADDERALL) 10 mg, gabapentin 300 mg, venlafaxine 150 mg. No other vaccine in four weeks. Three minutes after vaccination the patient had a metallic taste, turned to swollen tongue, hives around chest and neck, difficult to breathe, and tachycardia on 07Jan2021 16:18. The events resulted in Emergency room/department or urgent care. Treatment received included Epinephrine, methylprednisolone sodium succinate (SOLU-ME dork) and famotidine (PEPCID) also diphenhydramine HCl (BENADRYL). The outcome of the events was unknown.; Sender's Comments: Based on temporal association, a possible contributory role of suspect BNT162B2 cannot be excluded for events metallic taste, swollen tongue, hives, difficulty breathing and tachycardia. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

tested (COVID-19 virus test) positive after receiving first dose of vaccine; tested (COVID-19 virus test) positive after receiving first dose of vaccine; This is a spontaneous report from a contactable pharmacist. A patient of unspecified age and gender received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiration date not provided) via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunisation. Patient's medical history and concomitant medications were not reported. It was reported that patient tested (COVID-19 virus test) positive after receiving first dose of vaccine. It was also reported that they are looking for administration recommendations following receipt of monoclonal antibodies and interval information. Outcome of the

events was unknown. Information of the lot number/batch number was requested.; Sender's Comments: A causal association between reported event and suspect BNT162B2 cannot be excluded.

really extreme high blood pressure (202/104); feeling very sick; This is a spontaneous report from a contactable consumer (patient). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration, on 04Jan2021 at a single dose for COVID-19 immunization. Medical history included strokes and bleeding disorder (gene that makes blood clot). The patient's concomitant medications were not reported. The patient experienced really extreme high blood pressure (202/104) and feeling very sick on an unspecified date. The clinical course was reported as: The patient received the vaccine on 04Jan2021 and experienced a lot of side effects, the most concerning of which was really extreme high blood pressure. The patient went to the emergency room (ER) on an unspecified date and her blood pressure was 202/104 on an unspecified date. The patient stated that she had been very sick and in bed for days. The patient had a follow-up appointment with her doctor on the day of the report. The clinical outcome of really extreme high blood pressure (202/104) and feeling very sick was unknown. The batch/lot number for the vaccine, BNT162B2, was not provided and has been requested during follow up.

tested positive for COVID; tested positive for COVID; This is a spontaneous report from a contactable nurse (patient). A 64-year-old female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730, expiration date: 31Mar2021), via intramuscular on 21Dec2020 at 0.3 mL single in left deltoid for preventative. Medical history included she only had one kidney from 25Feb2020. There were no concomitant medications. It was reported that the patient was supposed (was scheduled) to get her second dose today (11Jan2021) but this past weekend she tested positive for COVID on 09Jan2021. The patient wanted to know if it would affect getting the second dose of the vaccine. The patient supposed to be quarantining right now and she was not symptomatic. On 09Jan2021 she found out she was positive for covid. The outcome of the event was unknown.; Sender's Comments: A causal association between reported event and suspect BNT162B2 cannot be excluded.

he is infected with COVID-19; he is infected with COVID-19; This is a spontaneous report from a contactable nurse (patient). A male patient of an unspecified age received 1st dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient called to find out if there should be a delay in the second dose because he was infected with COVID-19 on an unspecified date. His second dose was scheduled on 13Jan2021 and he was wondering if he should continue in 2 days. Outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient cannot be completely excluded.

she had a little bleed in the blood vessel of her left eye; This is a spontaneous report from a contactable other healthcare professional (patient). A female patient of unspecified age received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiration date not provided), via an unspecified route of administration on 21Dec2020 at single dose for COVID-19 immunization. The

patient's medical history and concomitant medications were not reported. The patient asking if bleeding of the eye was an adverse reaction to bnt162b2. Patient received the Covid vaccine on 21Dec2020 and on the 27Dec2020, she had a little bleed in the blood vessel of her left eye. She was supposed to get the second vaccine today (11Jan2021) at 12:30. The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported event cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

"got the first dose of the vaccine and on 25Dec2020, he started getting symptoms of possible covid; got the first dose of the vaccine and on 25Dec2020, he started getting symptoms of possible covid; This is a spontaneous report from a contactable pharmacist. A 7-decade-old (65 years or 66 years) male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 25Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The stated, ""my uncle got the first dose of the vaccine and on 25Dec2020, he started getting symptoms of possible Covid. He got tested for covid today (11Jan2021). He's supposed to get the second dose on 15Jan2021. If he is positive for covid, what does that mean for his second dose? If he is positive, and waits for quarantine, then he wouldn't be able to get the second dose until day 36."" The outcome of the events was unknown. Information on the Lot/Batch Number has been requested.; Sender's Comments: A causal association between reported event and suspect BNT162B2 cannot be excluded."

On (Dated) tested positive for Covid; On (Dated) tested positive for Covid; On (Dated) tested positive for Covid; Felt run down; This is a spontaneous report from a contactable other health professional (HCP). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 28Dec2020 at a single dose (first dose) for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient got her first dose on 28Dec2020 and on 07Jan2021, she felt run down so she decided to get tested for COVID. On 09Jan2021, she tested positive for COVID. Her second dose is due 18Jan2021 and she needed to know if it is ok for her to get her second dose. The patient underwent lab tests and procedures which included sars-cov-2 test: positive on 09Jan2021. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The association between the event lack of effect (tested positive for COVID) with BNT162b2 can not be completely excluded.

Caller tested positive on 05Jan2021.; Caller tested positive on 05Jan2021.; Caller tested positive on 05Jan2021.; This is a spontaneous report from a contactable physician (patient). A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 29Dec2020 at a single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. Patient received the first dose of the COVID 19 vaccine on 29Dec2020, second dose is due on 20Jan2021. Patient tested positive on 05Jan2021. Patient wanted

to know if he should get the second shot and if he chooses to wait the 90 days, would he need to start over. The patient underwent lab tests and procedures which included sars-cov-2 test: positive on 05Jan2021. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The association between the event lack of effect (tested positive) with BNT162b2 can not be completely excluded.

13 people, who were applied the vaccine previously, were corona positive after a week; 13 people, who were applied the vaccine previously, were corona positive after a week; This is a spontaneous report from a non-contactable consumer. This consumer reported similar events for 13 patients. This is second of 13 reports. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; lot number and expiration date: not known), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. She tested positive for Covid-19 a week later after receiving the first dose of the vaccine; She tested positive for Covid-19 a week later after receiving the first dose of the vaccine; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs) received from a contactable consumer (patient). A female patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot/batch number unknown), via an unspecified route of administration on 29Dec2020 at a single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient took the first dose of Covid-19 vaccine on 29Dec2020. She tested positive for Covid-19 a week later after receiving the first dose of the vaccine. She is scheduled to get the second dose on 19Jan2021 and she was asking what to do. The outcome of the event was unknown. Information about lot/batch number has been requested.

tested positive for COVID; tested positive for COVID/fatigue, headache, body aches again; allergies were flaring up; Coughing; congestion; body aches; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A contactable nurse (female) reported that a female patient of an unspecified age received first dose of bnt162b2, via an unspecified route of administration on 21Dec2020 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced tested positive for covid on 31Dec2020, coughing, congestion, body aches on 24Dec2020, fatigue, headache, allergies were flaring up on 28Dec2020. The caller got her first COVID-19 injection on 21Dec2020. She didn't have symptoms until 2 days after the vaccine. She then experienced coughing, congestion, body aches, but no fever. Then the next day, she felt fine. On 28Dec2020, she thought her allergies were flaring up. She started to feel fatigue, headache, body aches again. She went and got tested for the virus. She tested positive on 31Dec2020. Caller was due for a second vaccine on 11Jan2021. She was to remain in quarantine until 10Jan2021. Caller wanted to know should she get her second shot on 11Jan2021 or should she wait. The patient underwent lab tests and procedures which included Covid-19: positive on 31Dec2020. The outcome of events for tested positive for covid, fatigue, headache and allergies were flaring up was unknown, for other events was resolving. No further information was obtained. Information on lot/batch number has been requested.; Sender's Comments: A causal association between BNT162B2 and the events drug ineffective and COVID-19 cannot be excluded based on a compatible temporal relation between vaccination and onset of events.

short of breath; aching so bad again; was still short of breath, getting worse, aching so bad again; choking; got as cold as ice; throat was real swollen; started itching terribly; This is a spontaneous report from a contactable consumer (patient). A 73-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EK4176), via an unspecified route of administration

on 06Jan2021 single for COVID-19 immunization. Medical history included hypertension and had 4 heart attacks. The patient's concomitant medications were not reported. The patient just had the Covid 19 Vaccine first shot. After the shot he went to the dining room to get some lunch. He was reading since 'calculative'. He started itching terribly. Onset date for started itching terribly was reported as 06Jan2021. He got as cold as ice. He started getting real short of breath, he was choking but he managed to get them out of his throat. His throat was real swollen and choked. He went back to the clinic and the Nurse took him straight to the emergency room. He was there in his wheelchair freeze in and crawling himself, struggling to breathe for almost 25 minutes before the Nurse finally came in and helped him get him on the stretcher. She took his time, she got the IV started and gave him a steroid a shot and Benadryl. He did not know the dosage and some capsules. He did not know why the capsules and he was still struggling for a while but he found day tough for about an hour. When he came too he was still short of breath, getting worse, aching so bad again. He was struggling to breathe, he was still having some breathing problem, some choking and aching. The events was still short of breath, getting worse, aching so bad again were serious as hospitalization. Laboratory work: Work was normal. The COVID Test was negative. The outcome of events short of breath and started itching terribly was not recovered while for other events were unknown.

dehydration; This is a spontaneous report from a contactable Nurse. A patient of unknown age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on an unknown date at single dose for COVID-19 immunisation. Medical history and concomitant medications were unknown. After vaccination on an unknown date, the patient went to ER and was diagnosed with dehydration. Patient was hydrated and recovered. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

died two days after receiving the vaccine; Fever; This is a spontaneous report from a contactable consumer (patient's stepchild). A 66-year-old male patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration, on 07Jan2021 (at the age of 66-years-old) as a single dose for COVID-19 immunization. The patient's medical history was not reported. Concomitant medications included an unspecified statin. The patient experienced fever on 08Jan2021. The patient died two days after receiving the vaccine on 09Jan2021, which was reported as fatal. The clinical course was reported as follows: The patient had a fever the day after getting the vaccine and then he just died in the middle of night. It was reported that it was not clear what exactly happened, but they are looking into this. The clinical outcome of fever was unknown and of died two days after receiving the vaccine was fatal. The patient died on 09Jan2021. The cause of death was not reported. An autopsy was not performed (was reported to be taking place soon). The batch/lot

number for the vaccine, BNT162B2, was not provided and has been requested during follow up.; Reported Cause(s) of Death: died two days after receiving the vaccine

Pt. with dizziness, then Afib with RVR, then massive cerebral hemorrhage Pt. non oriented & unable to give history - History provided by S.O and daughter

Accelerated decline in condition with decreased input, decreased responsiveness, somnolence, and death

Received vaccine in left deltoid within minute felt throat tighten self administered personal epi pen.

I had no side effects after my vaccine on 12/24/20 until 1/8/21. On Friday, 1/8/21 at 830pm I began with severe abdominal pain, low grade fever, nausea and loss of appetite. My abdominal pain persisted and worsened over the next 24-36hours. I presented to the ER on Sunday, January 10, 2021 at 8am with severe right lower quadrant pain, pelvic pain, nausea and low grade fever. I was promptly diagnosed with appendicitis and taken to the OR at approximately 2pm on the same day. In the OR my appendix was gangrenous, there was pus in the pelvic area nd fluid in my peritoneum. My appendix was not ruptured. My appendix was removed as well as part of the omentum. I remained in the hospital on IV Metronidazole and Ciprofloxacin for 2 days and was discharged on 1/13/21 at 9pm. I am continuing to recvoer at home on the same 2 antibiotics in oral form. I have a JP drain that is still in place. Of note I had two negative COVID 19 tests on 1/9/21 and 1/10/21. Both were PCR tests.

Tingling and throat swelling to Moderna COVID-19 Vaccine EUA

Patient had no immediate effects from the vaccine, but died approximately 8 hours after receiving first dose of vaccine.

positive for Covid; positive for Covid; This is a spontaneous report from a contactable healthcare professional (patient). A 48-years-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number EH9899, expiration date unknown), via an unspecified route of administration in right deltoid, on 18Dec2020 07:15 at a single dose for Covid-19 immunization. Medical history included ongoing hypothyroidism and hysterectomy. Concomitant medications included estradiol (taking after hysterectomy) and levothyroxine for hypothyroidism, both ongoing. The patient has no any other vaccinations within four weeks prior to the first administration date of the suspect vaccine. The patient stated that she received the Covid vaccine mid- Dec2020. She stated she was supposed to receive the 2nd dose 2 days ago, 06Jan2021. On 03Jan2021, she started feeling bad the day before testing positive, went to urgent care to be tested, thought she had the flu. She tested positive for Covid on Monday 04Jan2021, so she has been in quarantine. She was unable to receive her 2nd dose because she was in quarantine. She wanted to know if it's ok to delay the second dose or if she needs to re-start the series. The reporter assessed the event relatedness was unknown, patient stated that she doesn't know the causality, she has not been in contact with anyone that was known to be positive, but she is a healthcare worker who sees multiple patients a day, so one of them could have been asymptomatic. Outcome of the events was not recovered.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the

events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available.

received first dose of bnt162b2/by the 3rd (03Jan2021), he was diagnosed as covid positive; received first dose of bnt162b2/by the 3rd (03Jan2021), he was diagnosed as covid positive; patient lost his sense of smell and taste; patient lost his sense of smell and taste; This is a spontaneous report from a contactable nurse (patient). A male patient of an unspecified age received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiration date not provided), via an unspecified route of administration on 17Dec2020 at SINGLE DOSE for COVID-19 immunisation. Patient's medical history and concomitant medications were not reported. The patient reported he needs advice on the second dose of the vaccine. Patient stated he is an ER nurse and received the first dose of the vaccine on 17Dec2020. On 31Dec2020, patient lost his sense of smell and taste and by the 3rd (03Jan2021), he was diagnosed as covid positive. The patient underwent lab tests and procedures which included Covid test: positive on 03Jan2021. The patient is asking how safe it is to get the second dose now and if there's a time period that he should wait so that he can get the second dose. Outcome of the events was unknown. Information about lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient cannot be completely excluded. Further information like diagnostic detection of virus genetic material or virus protein antigen needed for meaningful medical assessment.

"she tested positive for COVID-19 on Monday 27Dec2020; she tested positive for COVID-19 on Monday 27Dec2020; This is a spontaneous report from a contactable nurse (patient herself). A female patient of an unspecified age received her first dose of bnt162b2 (BNT162B2 also reported as Pfizer-Biontech Covid-19 Vaccine, lot/batch number and expiry date not reported), via an unspecified route of administration on 19Dec2020 at single dose, for Covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient was scheduled for her second dose today 09Jan2021. However, she tested positive for COVID-19 on Monday, 27Dec2020. She stated that she has still some of the symptoms of COVID-19 even though she has been declared fit to work. She was asking if she could take the second dose today. Information about batch/lot number has been requested.; Sender's Comments: Based on available information, a possible contributory role of BNT162B2 cannot be excluded for reported event ""she tested positive for COVID-19""."

Resident was found without a pulse and not breathing 20 minutes after vaccine administration. Upon MD review, no signs of anaphylaxis were noted.

About 10 minutes after getting my vaccine I noticed the roof of my mouth itching as well as my tongue and back of my throat. I waited to see if it would go away and then a couple minutes later noticed my lips started itching and swelling and from there it just got worse. I told the nurse practitioner that I think I was having a reaction, she had me take a seat told her my entire mouth throat & lips felt swollen and itching and she looked and said it was full blown anaphylaxis reaction. Administered EpiPen, benadryl and called ambulance where they took me to medial emergency department.

Patient had just recovered from COVID and ended quarantine on 1/1/21. On 1/4/21, she received the first COVID vaccination. While driving home on 1/6/21, she experienced an MI diagnosed in the emergency room 30 minutes later. She was admitted to the hospital and underwent a heart catheterization and received a STENT. She had previous cardiogenic shock in 2003.

Pfizer-BioNTech COVID- 19 Vaccine EUA Received communication that patient experienced a stroke and received alteplase at a non-facility (Medical Center) 5 days after receiving COVID-19 vaccination.

increase weakness and fatigue, weakness in extremities, incontinent, jerky arm movements, within first 24 hours, continue to decline sent to hospital returned weaker, within 24 hrs hours BP dropped, low pulse oximeter reading, diaphoretic, lung sounds diminished, loss consciousness and passed away. 01-12-2021

01/11/2021- Found lying on bed in apartment, incontinent, lethargic, unable to respond to questions, unable to do hand grasps. sent to hospital. 01/14/2021- remains in hospital- confusion and disorientation continues, poor verbal skills, limited ability to feed self, out of bed to sit in chair. uncertain of return to facility status.

Abdominal pain, Headaches, chest pain, loss of appetite, confusion, elevated liver enzymes 1/8-1/15/21

01-09-2021 Very confused, nauseous, sweating profusely. sent to hospital- admitted with encephalitis, severe cognition decline. 01-13-2021 still in hospital, cognition Improved.

Death Chest pain; irreg heart rhythm; evening of vaccine; death on toilet on 1/13/21

Initially headache and body aches. Within 24 hours developed chest pain, dyspnea on exertion and shortness of breath. Patient still currently hospitalized.

Patient reportedly expired the day following receipt of the vaccine.

Observed in her room having seizure activity and unresponsive to stimuli. BP of 200/120, oxygen level dropped to 86%, HR was 116. She was transferred from Hospital A and later transferred to Hospital B and placed on a ventilator. This remains her current status

We (myself and 2 other pharmacists) were conducting a COVID-19 vaccine clinic. The patient is on staff at the clinic and came in for her 1st dose of the Pfizer/BioNTech COVID vaccine. 10 minutes post-vaccination, patient started experiencing SOB, tingling fingers and face, and swelling of her lips and tongue. She moved herself outside to cooler air and then sent someone back inside to ask us for help. I ran outside with an EpiPen and immediately noted her pulse of 158 on her watch and she appeared to be experiencing an anaphylactic reaction. Patient stated she did not want to use the EpiPen but wanted to try chewing Benadryl instead first. I asked the staff for a blood pressure monitor and pulse oximeter. The 1st readings, approximately 12 minutes after vaccination, were HR 158, BP 155/105, and pulse ox 97%. Patient stated the Benadryl was working and her swelling was decreasing. The patient was not having trouble breathing at the time. I continued monitoring vitals and talking with the patient and approximately 20 minutes post-vaccination, she was improving (BP down to 134/80 and HR 120) but

agreed we should call 911. She decided she wanted to move inside and lie down. I escorted her with support to a bed. Her vitals then increased again to BP 152/95 and HR 133 and her lips and tongue started swelling again. The patient appeared to be more labored in breathing then but still refused the EpiPen. Roughly 5 minutes after lying down, the medics showed up and took over and I went back to the vaccination area. I learned later that the patient refused to go to the hospital and after more observation was eventually allowed to leave with a friend/coworker driving her home.

Patient was at work on 1/15/21 after having received the vaccine on 1/12/21. She complained of being diaphoretic and her heart rate was 156. She was taken to Hospital. She is being admitted to hospital and has reported that her heart rate is 122 and she has a temperature of 99.4 and elevated lactic acid levels.

1/5/2021 0718 Pt received 2nd COVID vaccine 1/4/21. Oral temp 100.6, near syncope, muscle aches and head aches. Per EMS NSR, denies SOB, and chest pain. 500 ml bolus received in route. In ED, Pt c/o nausea. Pt anxious, sweating and uncomfortable. 0855 Pt resting comfortably, reports decease in pain/body aches 4/10. 1043 Discharge disposition: home. Accompanied By: self. Mode: walk. --Hospital

Expired on 1/12/2021; unknown cause of death

We got a call from a home health nurse Brandu Talamo, stating that the patient passed away.

5-6 HOURS AFTER VACCINATION. CONVULSIONS/SEIZURE, HIGH BLOOD PRESSURE, INCREASED HEART RATE,

Severe pain at injection site with some swelling, lethargy, and fever to 101.6 degrees F the day after the injection. He was given acetaminophen, which reduced fever to normal. Low grade fever (99-100 degrees F) two days after vaccine. On the third day after vaccine, on 12/31, he became confused and anxious. Temperature was 104.8 degrees F. He was given acetaminophen and oral hydration overnight. He continued to have a fever to 102 on the following day and was taken to the ED. He was COVID-positive and admitted to the hospital for treatment of COVID-19.

Initially started as shortness of breath followed by fevers, aches, muscle cramps. Ultimately ended up in the hospital with hypoxemia, pleural effusions. Laboratory values showed evidence of acute renal insufficiency, eosinophilia. Physical exam consistent with pulmonary edema and lower extremity macular rash. Entire presentation concerning for DRESS syndrome

Resident had lunch on 01/14/21 and after lunch around 2:00pm, he vomited and stopped breathing. We coded the resident and 911 paramedics came. They pronounced him dead at 2:18pm.

Around 00:50am on 01/15/21, C.N.A. reported that the resident looked different and not responding. Initiated Code Blue and started CPR. 911 arrived and pronounced resident dead at 1:01 am.

"The patient stated "" I just feel Blah"". vital signs obtained. 156/75 p-84 spo2 94% via NC 2L. T-96.7, c/o feeling restless, c/o nausea with no vomiting. Patient observed at 0600 nonresponsive, CPR initiated, and EMS notified Patient expired"

Received Pfizer vaccine, first dose on Wed. 01/13/21 between 12 and 1 P.M. Thurs. 01/14/21 in the afternoon he began to note that he had difficultly walking. Went to bed when he woke up at 5:48 A.M. he reported he had ataxia. Patient reported having to walk in tiny steps to stay upright. He went to the emergency room. Had CT scan of head and found blood clots. MRI performed. Stroke found in right PCA territory, but no loss in strength in left lower extremity. Sensation and vision intact. Strength in all four extremities is 5 out of 5.

At 6 days after my second COVID-19 Pfizer vaccine (first dose given 12/17/20), I had acute onset of chest pain and shortness of breath prompting a trip to the Emergency Department. A chest CT Angio to rule out pulmonary embolus was done and negative for pulmonary embolus. My EKG showed some mild ST changes and a troponin I level was elevated at 0.08 (normal 0.04). Subsequent troponin levels 90 minutes apart showed a rising troponin at 0.18 and 0.38. An echocardiogram was performed which showed regional wall motion abnormalities consistent with Takotsubo cardiomyopathy and an ejection fraction of 45%. I was then taken to cardiac catheterization lab for coronary angiograms which were normal. My LV angiogram was consistent with Takotsubo cardiomyopathy and my LVEDP was elevated. I was started on a beta blocker and sent home the following day.

This patient has been under hospice care for over 2 years at the nursing home. She has had a steady decline with gradual weight loss. She was totally dependent in her care needs. She received the vaccine on 1/2/2021 as part of the facility vaccination campaign. No adverse events noted initially. On 1/3/2021 at 6:06 pm, she was noted on vital sign checks (done every 4 hours for first 72 hours after vaccination) with BP 64/52 but otherwise asymptomatic. Subsequent BP improved. On 1/4/2021 at 4:45 am, pt found with respiratory rate of 30 with otherwise normal vital signs. Tachypnea persisted, so she received liquid morphine 2.5 mg without improvement. Supplemental oxygen was applied. Tachypnea persisted. She had poor oral intake after that point had persistent tachypnea and worsening hypoxemia despite clear lungs on exam. She remained under hospice care and comfort measures were continued. No blood testing or imaging tests were done. She required increasing amounts of oxygen, became hypotensive, and died peacefully on 1/8/2021 at 7:45 pm.

Veteran was found by family slumped over and unresponsive at the breakfast table on 1/13/21, had expired

Anaphylaxis

Pt had 3 vessel CABG on 1/14/21 after presenting to ED with chest pain on 1/9/21. Pt is critically ill following OR after cardiogenic shock, bleeding. Requiring inotropes and Impella.

vertigo nausea / vomiting diarrhea low-grade fever pain at injection site

Bells Palsy 1st injection on 12/20/21 symptoms started 1/7/21, 2nd dose on 1/10/21 immediate numbness in mouth and tightness in throat which triggered bells palsy symptoms immediately

Patient information was reviewed. Patient was asked if they ever had any form of severe reaction to anything they had had in the past. Patient did not state yes to anything other than having a reaction that

was managed at home to shellfish as a child. They stated their throat had swollen as a child during the event. Patient was told that it was an anaphylactic reaction and shouldn't have been managed at home as a child by nurse and should have been taken to the hospital. Patient was told they would be monitored for 30 minutes after receiving the vaccine. Within 2-3 minutes after receiving the vaccine the patient reported tingling or burning around the site of injections. Within 5 minutes they stated to be feeling tired and that their arm had felt numb. After this the patient began starring into the distance and was unresponsive. Called for help and advice by turning around as patient had syncoped. Got nurses and other team members attention and had an epi-pen ready just in case it was needed. Patient began having notable distress with respiration and administed an epi-pen. Advised for a nurse to call EMS for patient and crash cart/oxygen was also obtaine dby the facility. Oxygen was required. Patient was not responsive after the first dose and was given a second as they remained un-alert with notable distress. The patient became alert a while after receiving the second shot and not long after that the EMS arrived to the event.

Resident reported loose stool, not feeling well, resident complaint of lost taste. Hospitalization on 01/14/2020.

Vomiting

"Per husband, was in usual state of health on the AM of 1/10/20, AOx3 able to perform all I/ADLs. At around 2:30pm that day was complaining of chills and generalized malaise. Then at ~9:30pm when husband returned home from work found patient diaphoretic, confused (stating things like ""not now, I want to go to lake""), and complaining of chills and weakness. Unable to provide any additional hx regarding other sx. Initially presented to ED, where mental status had deteriorated to AOx0, unable to respond to verbal commands. Initial vitals notable for T102.6F (unclear other vitals). Patient is now AOx0 most concerning for encephalopathy."

Patient 101 years old, nursing home resident, received vaccine 1/11, on 1/13 found on floor without obvious trauma, unresponsive. Brought to ED and was bradycardic, hypotensive, hypothermic and refractory to aggressive medical management. No obvious cause of death found on exam or labs, cxr. Unknown if event could be related to vaccine or not. Medical Examiner accepted case although initially unknown that patient had recently received vaccine. ME updated with that information today as soon as discovered.

Throbbing head ache, difficulty breathing, lips numbness, chest discomfort, upper back, lower legs, fingers tingling/numbness, high blood pressure 148/83, underarm sweating, feels weak

Nausea with emesis, headache, upper abdominal pain.

Patient suffered a cardiac arrest and was unable to give details about her symptoms. Per husband, patient did not complain of any symptoms after vaccine administration. She began seizing without warning which was complicated by cardiac arrest of uncertain etiology

Right arm weakness 2 hrs after vaccine and then right leg weakness later that evening

"On 1/15/2021 at 1800, resident noted to be lethargic and shaking, stating ""I don't care."" repeatedly. C/O head and neck pain. T100.6. Given Tylenol with no relief of pain. Order received for Aleve and administered.. Assisted to bed as usual in evening. Monitored during night shift and noted to be resting comfortably/sleeping.. Noted agonal breathing at 4:10 AM 1/16/2021 , T 99.4, Absence of vital signs at 4:15AM 1/16/21 and death pronounced at 4:40AM 1/16/21."

"""Moderna COVID-19 Vaccine EUA"" It has been reported to me that pt. had gone into hospital for a heart catheterization on 1/12/2021. It was found during this procedure that pt. had suffered a MI. She was release to home the following day and passed away at her residence on 1/15/2021."

anaphalactic shock reaction, epi injection by hospital emergency staff at vaccine site, emergency room admission . We were very lucky vaccine site was Hospital was concerned that this might happen as patient had a previous anaphalactic shock by antibiotic injection few years ago

Right thumb joint pain. I can't hold unto things in my right hand that requires me using pressure from my thumb. Pain is a 9/10 when holding, grabbing, or using the thumb in any way. When not using the thumb there is no pain at all. I work out everyday and I am no longer to lift weights using my right hand because of the excruciating pain when I try to.

Patient had COVID-19 infection April 2020, ataxia and myoclonus developed, treated with IVIG and steroids at that time. June 2020 had full recovery after PT. Pt received Pfizer COVID-19 dose 1 on 12/22/20 and developed similar symptoms to above on 1/7/2021. Ataxia and tremor on examination, no myoclonus at this time.

Appendectomy Narrative: Developed abdominal pain with nausea on 12/24/2020, went to ER and noted to have appendicitis, resulting in an appendectomy

Swollen tongue and sob with decreased swallow

Vaccinated at 8:55am, Per Nurse Practitioner note patient started experiencing itching upper chest, medicated with Benadryl P.O., started with throat itching, medicated with Benadryl IM, EPI IM, EMS called, placed on O2, diminished breath sounds bases, slight stridor, EPI IM, Solumedrol IM, EMS transported to local ED. Patient called NP later in day and said she was admitted to the hospital.

Pt had witnessed arrest by wife. Pt wife started CPR and called EMS. CPR started at 15:12. Continued by EMS. Pt arrived to medical center asystole with CRP in progress and ventilated via igel device. He was in refractory ventricular fibrillation and continued CPR for a total of 1 hour. At that point, we checked a bedside ultrasound which showed his heart at a standstill. He was unresponsive to verbal and tactile stimulus and had fixed unreactive pupils. He was pronounced at 16:13.

Tachypnea, Angina, Tachycardia, Sore Muscles Narrative: Started feeling ill on the 28th. Drove himself to get checked out at the hospital. Hospital sent him home. Called EMS at 12/30/2020 @ 0200 and was hospitalized for 1 day. He is more stable now but still has these symptoms at a moderate level.

ADVERSE REACTION REPORTED AS TEMPERATURE OF 100.0, CONFUSION, AND VERTIGO. PATIENT WAS TAKEN TO HOSPITAL, UNAWARE OF CURRENT STATUS, TREATMENTS, OR OUTCOME.

After vaccination on 1.8.21 felt fatigue, metallic taste, and intermittent tingling. on 1.15.21 at approximately 8 am developed occipital headache (4/10 pain) inability to move right upper or lower extremities and slurred speech. No evidence of intracranial hemorrhage on CT. Patient administered Alteplase and transferred to higher level of care

Day 1-3 after the dose flu like symptoms Day 3-7 swelling in lymph nodes on left side of body (baseball sized) took ibuprofen and Tylenol Day 8 angioedema, anaphylaxis. Received epi subq, IVP 50mg Benadryl, Pepcid 20mg IVP, liter of NS Day 9 raised red rash all over body and face still going on Day 16-present: severe joint pain and fever, unable to obtain any relief

Muscle Spas; Weakness in both limbs. Pressured speech

Pounding headache, heart racing to over 145 bps, chest burning and tightness and hard to breath. I was taken to the Emergency Room at Hospital immediately. Reaction occurred within 30 minutes of the injection. An EKG was administered. I was prescribed prednisone and Benadryl. I was diagnosed with Anaphylaxis.

Patient had slow progression of kidney disease but since vaccine had unexpected acute kidney failure. He had to have dialysis and may need biopsy of kidney to confirm if he needs lifelong dialysis. He is still being hospitalized.

Numbness and tingling sensations in both hands and sometimes radiating up my forearms, more severe in right hand and right thumb; these symptoms still didn?t go away since 1/11

Death

After 2nd dose in the afternoon at 2:30pm pt collapse in the unit V/S was high blood sugar was high. Pt was held over at work for 16 hours. Shot was given at 6:45am. Paramedics was called. Sent to ER.

Remarkable Myalgia of extremities and back, interfering with rolling or sitting. Spasmodic twitching of upper extremities, These resulted in Hospitalization.

Resident expired

On 1/9/2021 started to have Postural Orthostatic Tachycardia Syndrome and PVCs associated with SOB and chest tightness and not recovered yet.

Headache after dose was given at 10:00 a.m Died at after 7:30 pm the same night the dose was given.

On January 14, 2021, I noticed generalized petechiae all over my body. I went to seek medical care and was found to have platelet count of 2. I was hospitalized for idiopathic thrombocytopenic purapura. I was given platelets which increased my platelets to 4. Next day, given IVIG dose. Also receiving 4 doses of decadron. Day after IVIG, platelets to 20. I am still in the hospital getting treatment today.

Moderna COVID-19 Vaccine EUA. Patient has tested positive for Covid 19 as of 1/10/2021, when he was hospitalized. Patient's wife had been rushed to the ER previously, and they discovered she was Covid positive when she was admitted. Patient immediately notified public health and was being restricted and followed up with. During his quarantine, he started developing symptoms (08Jan2021). On 10 Jan, he was rushed to the ER and diagnosed with pneumonia due to Covid. He was also experiencing painful stomach cramps, low oxygen saturations and fluctuations in blood pressure. He spent 3 days inpatient in the Covid wing then was discharged to resume resting at home. Our provider immediately reached out to the member and checked in with them. At this time, the patient's only real complaint is lack of energy or getting winded when doing projects around the house. Patient will isolate at home and monitor his symptoms. Public health and the provider will follow up with the member and her family periodically to ensure recovery.

PATIENT GOT HER FIRST COVID PFIZER VACCINE AT 12/31 IN THE AM. HAD GOTTEN FLU LIKE SYMPTOMS AND HAD BEEN SICK FOR A COUPLE OF DAYS. HAD NAUSEA AND VOMITTING DURING THIS TIME AS WELL. ON 1/3 THE CARE GIVER WENT TO CHECK ON HER PT AT HER LTC FACILITY WHERE SHE LIVES AND SHE WASN'T ACTING RIGHT. SHE WAS UNABLE TO DO A STROKE EXAM. PT HAD NO MOVEMNET IN ARMS OR LEGS AND WAS UNABLE TO SPEAK. PT WAS VITALLY STABLE AT THE TIME. EMS RECORDED THAT THEY THOUGHT DIAGNOSIS WOULD BE STROKE, PNEUMONIA OR SEPSIS. AFTER ARRIVAL AT THE HOSPITIAL DETERMED THAT SHE HAD A STORKE, ACUTE KIDNEY INJURY, ABNORMAL LFTS.

allergic reaction- skin rash , throat itching. patient visited the ER and was given episode and steroids but returned because symptoms were not improving. She was hospitalized on 1/11 for this reason

12/29/2020 Vaccination 12-13 minutes later started left arm was tight and sore. Wasn't feeling right; hot, hives, rash at injection site up neck and face; tightness in throat; tachychardic, BP increase. I took benadryl and Pepcid . Sat for another 30-45 min. Palpitations, heaviness. Transported to ER. IV and medications. Stayed till 1:30, went home, and then came that evening. 5:00 that same night, hives, chest pressure, burning sensation, 'didn't feel right', anxious. Benadryl. Tachychardic; admitted to hospital that evening. Stayed in house admission till the 12/31/2020. Went back to admission in house, 1/3/2021 - 1/4/2021. Two hospital admissions.

Approximately 28 hours after vaccine, I began to feel tingling in my right eye Approximately 12 hours after that, my face started drooping and was numb so I went to ER. Today is Sunday, and the numbness and drooping was called Bells Palsy at the hospital.

Injection given without unusual pain, but appeared to be at higher site than usual for other vaccinations patient has received. No immediate reactions. No redness or swelling at injection site. Approximately 3 hours later with restriction of abduction of left arm, which became worse over 24 hours. No numbnness, pain 4-5/10 diffusely over deltoid and in acromium, posterior suprascapular area.. Able to passively move arm, treated with topical Voltaren gel, Naproxyn 500 x 1 dose. D2 with increased ROM, but still restricted.

New onset leukopenia/neutropenia with fever, unclear if related to vaccination, but temporally occurred the day after receiving 1st dose. No labs immediately prior to vaccination, so leukopenia may have

preceded vaccine. No other new medications to explain neutropenia. Off chemotherapy since 8/2020. Possible relapsed disease though no other evidence in support of this as remainder of CBC stable.

Shortness of breath, Congestive heart failure, Afib

RespDepression found to have low potassium Narrative: Patient reports experiencing shortness of breath 24 hours after the vaccine was administered, went to ER and admitted for one night. Informed her supervisor she had low potassium.

Patient presented with diffuse petechiae, easy bruising and oral bruises. She has a history of stable ITP with her last required infusion of IVIG 12 years prior during pregnancy and monitors her CBC every 6 months. Her baseline platelet count is ~50-60k. She received treatment with dexamethasone 40 mg IVPB x 3 doses and IVIG 95 grams (1 gram/kg) IVPB x 2 doses.

3 days after receiving the first dose of the vaccine on 12/21/2020, experienced flu-like symptoms that lasted 24 hours. About 17 hours after receiving the second does on 1/11/2021, flu-like symptoms reoccurred. The following day (1/13/2021) severe chills, and difficulty breathing occurred. Patient was admitted to Medical Center, where blood work, EKG, and oxygen were given and ordered. After overnight observation, the patient was discharged and informed that he had a severe reaction due to the Pfizer vaccine for Covid-19. As of 1/17/2021, patient still recovering and feeling generally weak and tired without much appetite.

Vaccine was administered on 1/12/21 at Memory Care. On 1/15/21 at 12:30 he developed slurred speech at his facility and slumped to his left side. Out of concern for stroke he was sent by ambulance to Hospital. There he was found to have no evidence of stroke on MRI or CT angiogram. He was admitted to the hospital due to fever and elevated inflammatory markers (ferritin, CRP) and transaminases. He was found to have a positive SARS-CoV-2 PCR and IgG. His symptoms resolved the following morning and may have represented a TIA. He had many markers consistent with COVID-19 and his CT pulmonary angiogram did show ground glass opacities but no pulmonary embolism. It was difficult to assess if this was a reinfection with COVID-19, persistent PCR positivity from November, or an adverse event to the vaccine.

I received the dose at 1:45 pm on 1/13/2021 at Medical Center. Almost 1 hour post vaccine I started to feel a lump in my throat, as the minutes passed my throat started to feel tighter and fight and flight mode kicked in. It was hard to swallow, my tongue was swelling and I called EMS at 2:40 pm 1/13/2021. EMS noticed hives on my chest and left arm where I got the first dose of Moderna. I received epinephrine IM and IV benadryl in the ambulance. I was sinus tachycardic with heart rate in the 140s oxygen was 99% room air, lungs clear.. I was taken to ER where I was on observation for 2 hours. I was discharged around 5:10 pm on 1/13/2021. On my car ride home around 5:40pm I again started to feel my throat tighten, tongue swell, and heart race. I called EMS again, and was treated with IV benadryl, and epinephrine IM. I was taken to Medical Center where I was given IV solu-medrol and got blood taken and a pregnancy test done. My potassium was 3.1 and I took 2 potassium tablets to supplement. My EKG was normal sinus tach, oxygen 100% room air, blood pressure 140s/90s and got down to

120/80s. I was transported to another Medical Center for overnight observation because first Medical Center was full.

"Narrative: Patient with severe aphasia and only able to say ""hey, hey, hey"" or ""uh huh"" or shake his head no as a way to communicate. Patient previously able to ambulate with significant limp and hyperextension of right knee, but mostly wheelchair bound over last several years as he had had a slow and steady decline in overall health and mobility. Patient developed aggressive behavior of shouting ""hey"" and grabbing of groin in 2016. This was worked up with CT scans, labs, referral to urology, neurology, and referrals to psychiatry. The exact etiology of this action was never able to be affirmed, but thought to be more psychiatrically related. It improved significantly with addition of antipsychotics, worsened when antipsychotics were reduced, and improved again with addition of injectable antipsychotic on 12-10-2020.Patient suffered from falls on occasion given his significantly impaired physical mobility. His last documented fall was 8-31-2019. Patient began utilizing wheelchair most of time following that fall. No significant injuries noted in documentation of the falls. In the last 3 months, patient would often refuse medications. He would sometimes indicate that they would cause dizziness, and other times he would simply refuse. We attempted to hide medications in his food/fluid (with wife's blessing) and when he detected this he would occasionally refuse to eat. Patient previously on DOAC. After pharmacy review in 12/2020 it was recommended to discontinue this as no clear indication to continue use. He was high fall risk and would often refuse this medication as well since 10/2020. Noted to be in NSR on EKGs and decision made to discontinue the DOAC. Patient had no evidence of adverse effects noted after vaccination on December 28th. Patient seen by provider on the morning of his death (1/4/2021) with no noticeable significant change in health condition. Temperature 36.8Con January 4th at 19:45. During routine bedtime cares, patient suddenly collapsed and death was pronounced January 4, 2021 at 20:05. Autopsy was requested from next of kin and no autopsy was granted. Symptoms: & DEATH Treatment:"

Narrative: Symptoms: Palpitations & Syncope Treatment: EPINEPHRINE 1 MG ONCE ,EPINEPHRINE 1 MG ONCE ,SODIUM BICARBONATE 50 ML ONCE

Ventricular fibrillation- Code blue

Severe Right sided chest pain, right sided muscle spasms and difficulty breathing two weeks after vaccine was administered Diagnosis of bilateral pulmonary embolism was made on presentation to ER. No personal or family history of clots in arteries or deep veins or any risk factors in patient. Received heparin drip, pain medications, muscle relaxants inpatient. Pain progressively improved over days. Was discharged after 6 days on admission. Was discharged on oral anticoagulant (Rivaroxaban aka xarelto)

Developed dizziness and nausea within 90minutes of vaccine; then developed tingling, and flushing of my skin. Then rapid heart rate and chest tightness by 2.5hrs post vaccine. I went to urgent Care and they thought it was an allergic reaction (BP 182/90, HR 82) and gave me 125mg solumedrol and Benadryl intramuscularly which caused worsened dizziness and a racing heart which caused me to collapse and they gave me a epi pen and called 911. I was transferred to ER and they completed EKG which was

normal and monitored vitals for a few hours and I was released. I continue to remain extremely dizzy and nauseated 2days after the vaccine.

"2.5 hours after receiving vaccine, I started getting dizzy and vomiting. I vomited 6 or 7 times. I was so dizzy I couldn't open my eyes without getting sick. We called ER and explained that we thought I was having a reaction to the vaccine, and their response was they had never heard of that type of reaction. I was sick all night, called my primary Dr in the am and they told me to go to ER. We had to call ambulance to take me there because I was so sick and couldn't open my eyes without having to vomit. Room spun in circles. My arrival at ER, they did MRI, EKG, blood work. My blood pressure was very high, so they connected me to a heart monitor. I had low Magnesium due to vomiting so much. I was treated with Valium and anti-vert medication and fluids. I stayed overnight in hospital- had PT Jan 13th for DX of Vertigo. Then referred to Outpatient PT for Vertigo. Dr's felt it was a ""coincident"" that I got Vertigo shortly after vaccine, and strongly felt it was not related. . Today is Jan 17th, and I am still dizzy, but feeling better. I have an appointment with my primary Jan 18th and not sure if I should take the 2nd dose. That is the question."

Acute Appendicitis

Heart attack death medical test

Resident expired 1/17/21

29yo female patient reports feeling her throat tingling and closing sensation in her throat with a metallic taste and diaphoretic approximately 3 minutes after receiving vaccine. She did not report these sensations until about 15min after injection. EMS assist was immediately called and pt was brought into one of the patient rooms. She was given Epipen injection approx. 20min after injection and EMS arrived to transport patient down to ER within 1-2 minutes after Epipen administered. Patient was monitored in ER and recovered well

rash on the arm and side of my body where the injection was given. i took some Benadryl on 01/14/2021 the rash came back and the injection spot became really warm and harden. i took Benadryl again it went away. the rash came back 01/16/2021 and i took more Benadryl and the itcing stop. isaw a few red spots on my arm today bot no itching.

lymphadenopathy on left side (starting in axillary and progressing to supraclavicular and eventually neck as well. swollen and extremely tender) in addition to normal side effects of chills, fatigue. also was having irregular heart rhythm (reason for hospitalization) do not know if the heart rhythms are related to the vaccine or not, onset was a few days after vaccination (ER 12/30/2020, then another hospital 1/1-1/2). but the hospitalization below is referring to the heart rhythm not the lymphadenopathy.

The patient received her first Moderna COVID-19 vaccination on 12/29/2020. However the patient was diagnosed with a positive COVID-19 test on January 4, 2021. Patient complained of nausea, vomiting, back pain, and sharp chest pain. On January 13, the patient presented to the emergency department again with shortness of breath and sharp, stabbing left-sided chest pain radiating to her back and right

side. Initial work up ruled out cardiac etiologies. CTA chest demonstrated COVID-19 pneumonia. The patient complained of bilateral lower extremity weakness which had been progressing since her COVID-19 vaccination, per patient report. However, during her hospitalization the patient's bilateral lower extremity weakness began to accelerate. On the 13th, the patient was able to ambulate to and from the bathroom herself. Then on January 14 the patient required maximum assistance. Neurology was consulted and work up initiated for suspected possible Guillain-BarrT syndrome (GBS) secondary to recent COVID-19 infection. On January 15, 2021, the patient became obtunded and unable to protect airway. She was emergently intubated for acute hypercapnic respiratory failure secondary to GBS. Neurology started GBS treatment with IVIG. Patient also developed NSTEMI and Takotsubo cardiomyopathy. Patient remains critically ill requiring mechanical ventilation.

The day after receiving the second vaccination, I began to have mild intermittent abdominal pain2-3/10. The pain gradually increased, became more intense, and more constant. Mild fever and chills started happening, and I took Ibuprofen. By about 4 days after the vaccine, the abdominal pain was severe enough that I had some difficulty walking and I couldn?t sleep at night. Pain was 6-8/10. I went to the ER, and CT scan with IV contrast showed 18 mm appendicitis. I underwent laparoscopic surgery and it was found to be perforated. It was removed. I am currently recovering in the hospital. I received the vaccine as a health care provider at my hospital, specifically I am a practicing pediatrician physician for over 10 years.

I felt quite sick, like I had the flu; became very lightheaded and dizzy; passed out; felt quite sick; This is a spontaneous report from a contactable consumer (patient). A 69-year-old non-pregnant female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 08Jan2021 at 12:30 at single dose in left arm for covid-19 immunization. Medical history included R.A.D., osteopenia, migraine with aura, the patient had previously suffered episodes of vasal vagal syncopy when she got the flu or other severe illnesses, and the patient was diagnosed with COVID-19 prior to vaccination. Concomitant medication included atenolol, atorvastatin, azelastine, and fluticasone. The patient previously took gramicidin, neomycin sulfate, polymyxin b sulfate (NEOSPORIN) and experienced allergies. The morning after receiving the vaccine, she felt quite sick, like she had the flu. When she got up from bed and went to the bathroom to urinate, she became very lightheaded and dizzy. She attempted to return to bed, but passed out on the bedroom floor before she could get to the bed, and seized while she was unconscious. Once she came to, she was helped to bed and, after about 90 minutes, felt much better, and got up, and ate food and had coffee. All events occurred at 07:30 AM on 09Jan2021. All events were reported as non-serious by reporter. The patient did not receive treatment for the events. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient has not been tested for COVID-19 since the vaccination. The outcome of the events was resolved in Jan2021. Information on the lot/batch number has been requested.

Blacked out; Fainted; Felt very unwell; Nauseous; Chills; Fell; Knocked out, hit her nose, started to bleed; Humongous scar on her nose; In her hand there's a rash with different dots/red; She has petechiae/rash on the forearm; hit her face; knocked out, hit her nose; This is a spontaneous report from a contactable physician. This physician reported that a 30-year-old female patient (daughter) received second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on

08Jan2021 at single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient experienced blacked out, fainted, felt very unwell, nauseous, chills, fell, knocked out, hit her nose, started to bleed, humongous scar on her nose, in her hand there's a rash with different dots/red, she has petechiae/rash on the forearm, all on an unspecified date in Jan2021. The Caller wanted information on side effects specifically looking at platelet or clotting or bleeding issues. Her daughter, (female, age 29 date of birth) received the 2nd dose of Pfizer vaccine, received it at the (State name), last night. She felt very unwell, nauseous, chills, and then blacked out, fell, knocked out, hit her nose, started to bleed; fainted and hit her face, didn't stop bleeding for 2 hours. There's a humongous scar on her nose. It took 2 hours to stop bleeding. She's going to urgent care today. Her daughter was healthy, yesterday was 2nd dose. In her hand, there's a rash with different dots/red. She has petechiae/rash on the forearm. Thankfully it (bleeding) did stop. The outcome of events for 'knocked out, hit her nose, started to bleed' was resolved on an unspecified date, for other events was unknown. The case was reported as non-serious. Information on the Batch/Lot number has been requested.; Sender's Comments: Based solely on a chronological association a causal relationship between events blacked out and fainted and BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), cannot be completely excluded. The case will be reevaluated should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

fist dose on 21Dec2020, second dose on 07Jan2021; pain and stiffness radiating from injection site all the way down arm,into breast, and middle of back; pain and stiffness radiating from injection site all the way down arm,into breast, and middle of back; pain and stiffness radiating from injection site all the way down arm,into breast, and middle of back; Started having chills; Severe headache; collapsed on the way back to bathroom and was unable to get up for about 20 minutes; tachycardia; extremely fatigued entire day; This is a spontaneous report from a contactable Pharmacist who reported for herself. A 30-year-old female patient received her second dose of BNT162B2 (Pfizer/ BioNTech Covid-19 vaccine, lot number Ej1685) at a single dose at 09:45 AM 07Jan2021 at left arm for Covid-19 immunization in a hospital. The patient had her first dose of Pifzer Covid-19 vaccine on 21Dec2020 at 12:00 PM at left arm, and experienced very mild reactions which included mild pain at injection site and runny nose/sneezing day after vaccine. The paitent had a medical hisotry of rash to penicillin as a child. Concomitant medications were not reported. The patient did not receive any other vaccines within 4 weeks prior to her first dose of Pfizer COVID vaccine. In the evening of second vaccine (around 17:00), pain and stiffness radiated from injection site all the way down arm, into breast, and middle of back. She started having chills. Around 10 hours after dose chills became somewhat violent despite being under 4 blankets. Severe headache also started. In the middle of the night to go to bathroom, she collapsed on the way back and was unable to get up for about 20 minutes. She also suffered from tachycardia overnight. her baseline heart rate runs in 60s- 70s, but was in 110s-120s (based on Apple Watch monitoring). Day after vaccine, she was extremely fatigue entire day and spent all but a few hours in bed. Arm pain mostly gone. Headache was very strong and persistent through the day. On second night chills not as bad but still occurred overnight. HR still elevated in 80s overnight. Morning of day 2 still had

headache and fatigue. The patient did not receive any treatment for the events. The outcome of collapse and unable to get up for 20minutes, pain and stiffness radiating from injection site all the way down arm,into breast, and middle of back was resolved, chills and tachycardia was resolving, headache, fatigue was not resolved. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. The reporter considered that the events was non-serious.; Sender's Comments: Based on a chronological temporal association and known BNT162B2 vaccine safety profile, causality between events fainting, violent chills and severe headache and BNT162B2 ((Pfizer/ BioNTech Covid-19 vaccine) cannot be completely excluded. The case will be reevaluated should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

anaphylactic reaction/anaphylaxis; This is a spontaneous report from a Pfizer Sponsored Program from a contactable pharmacist. A female patient of an unspecified age received first dose of bnt162b2 (Pfizer BioNTech COVID vaccine, lot number: EK4176), via an unspecified route of administration on 09Jan2021 at 0.3 mL, single (standard like 0.3ml by injection once to deltoid, side unknown) to prevent from getting COVID. The patient's medical history and concomitant medications were not reported. The patient experienced anaphylactic reaction/anaphylaxis on 09Jan2021. Clinical course: The patient got the vaccine while waiting to go into the watch room, to be watched for a few minutes, and she experienced anaphylactic reaction/anaphylaxis, she went down, they gave her an Epinephrine, she didn't respond to the first dose, a second dose was given in the arm where the vaccine was given, then she was picked up by an ambulance. Agent stated the caller has been on hold for almost an hour. Caller clarifies dose was given in the arm, it occurred on Saturday with the same lot. Saturday and it went away on Saturday, the patient was worried about it coming back, thus why she asked about Epinephrine pen, the patient was taken to the hospital, and given Epinephrine a couple more times, and it resolved eventually, the patient was not admitted, she went to the Emergency Department. It could have required hospitalization but would most likely say life threatening had she not been treated. Reporter seriousness for anaphylaxis is life threatening. The outcome of event was recovered on 09Jan2021. Relatedness of bnt162b2 to reaction anaphylaxis is related for primary source.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset anaphylactic reaction/anaphylaxis cannot be excluded, considering the plausible temporal relationship and the known adverse event profile of the suspect product. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

developed symptoms for Covid/tested positive after receiving the vaccine; developed symptoms for Covid/tested positive after receiving the vaccine; developed symptoms for Covid/tested positive after receiving the vaccine; This is a spontaneous report from a contactable physician (patient) and a

consumer (patient's spouse). A 67-year-old male patient received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; lot number: EH9899; expiration date: not known), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The physician had a question. As a patient, he received the first dose of Pfizer BioNTech vaccine and on an unspecified date, two days later, he developed symptoms for Covid and tested positive after receiving the vaccine. He stated this had nothing to do with vaccine but had to do with the timing. He wanted to know if should take or delay vaccine. He is doing fine now. His second dose is coming up next week. The outcome of the events was recovered on an unspecified date.; Sender's Comments: The association between the event lack of effect (he developed symptoms for COVID and tested positive) with BNT162b2 can not be completely excluded.

got the first vaccine and then tested positive for the virus; got the first vaccine and then tested positive for the virus/fairly sick; This is a spontaneous report from Pfizer-sponsored Program IBCC (Inbound Call Center for HCPs). A contactable physician reported similar events for two patients. This is the first of two reports. A patient of unspecified age and gender received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; lot number and expiration date: not known), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter is a cardiologist. He is inquiring about the COVID-19 vaccine. He had several patients (pending clarification) who got the first vaccine and then tested positive for the virus. He is asking when can they get the second dose after testing positive. He had two patients that are fairly sick now. He has had patients who have monochromal antibodies (pending clarification). He is asking when they can get the vaccine after that treatment. The outcome of the events was unknown. Information about lot/batch number has been requested.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events.,Linked Report(s) : US-PFIZER INC-2021022171 same reporter, similar suspect drug and event; different patient

got the first vaccine and then tested positive for the virus; got the first vaccine and then tested positive for the virus/fairly sick now; This is a spontaneous report from Pfizer-sponsored Program. A contactable physician reported similar events for two patients. This is the second of two reports. A patient of unspecified age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; lot number and expiration date: not known), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The reporter is a cardiologist. He is inquiring about the COVID-19 vaccine. on a compatible temporal relation between vaccination and onset of events.,Linked Report(s) : US-PFIZER INC-2021022153 same reporter, similar suspect drug and event; different patient

The day following vaccination, the patient experienced nausea/vomiting, shortness of breath, followed by extremity paresthesia, and increased heart rate. The patient went to the emergency room and was assigned an overnight admission for a potential post-vaccination adverse event. Patient was discharged the following day.

The day of vaccination, the patient presented to the emergency room with a complaint of dizziness and syncope. Reported that she became dizzy, presyncopal feelings, and had a witnessed syncopal event. The patient stated she does have vasovagal syncopal events after blood draws in the past. The patient was assigned an overnight admission for a potential post-vaccination adverse event, new onset atrial fibrillation, dehydration, and syncope. Patient was discharged the following day.

Myalgia Narrative:

Patient became sick 3 hours after the vaccine and was found deceased 1 day after his vaccination. He passed away in his sleep.

nausea and vomiting possible cause of diabetic ketoacidosis and svt

Jan 11-vaccination day. On Jan 14, in afternoon had tinnitus and muffled hearing that went away. The next morning Jan15, complete sudden hearing loss on left ear. Tinnitus and muffled hearing that has not went away.

Patient experienced abdominal pain on January 12th. She reported having a headache and joint pain as well. Her temperature was 103.5. On January 14th the patient was admitted for acute appendicitis with perforation, localized peritonitis, and gangrene. Patient was discharged on January 16th post appendectomy.

Patient received Moderna Covid vaccine on Friday evening 1/8/21. She awoke Saturday am around 2AM with a severe headache. She also developed a fever during the day. She did not seek treatment until Sunday and went to Hospital ED. She was treated and released same day. She went back to hospital on Monday as she felt worse and she was admitted at that time and treated for a bloodstream infection and meningitis. We are not sure it was caused by the vaccine. She consulted her PCP and her PCP feels it may be more coincidental given her medical HX.

A few days after the vaccine I began to have a cough about mid morning which changed to SOB. Covid test on 12/27 which was neg. I went to work on 12/28 but woke up 12/29 with a low grade fever and felt like my throat was on fire. so on the 29th I went and got a Strep and flu test which were negative. I was feeling so bad so on the 6th of Jan do I went to the stand alone ER and got a chest xray and CT scan which revealed I did have pnemonia. I went back home but was feeling worse and was taken to and admitted in hospital for 2 days. Initially I was admitted into the COVID unit but never was diagnosed COVID positive so I was moved off the COVID unit. I was given albuterol pills to try to help with the symptoms but didnt work causing me to have to be admitted and was given several doses of steorid and other antibioics and had to use O2 at night because my stats kept falling.

Patient reported to the emergency room from fever and shortness of breath the day after receiving the COVID-19 vaccine. Patient was found to have a UTI and possible sepsis. Unknown if truly related to COVID vaccine.

Severe fatigue, Headache frontal and temporal, dizziness/vertigo, tinnitus,

"Pt is 33 yo female with h/o multiple drug allergies , including allergy to benadryl. She has received first dose of COVID vaccine made by Phfizer at 3:45. She reports about 10 minutes after the vaccination she started feeling tingling in her lips, throat and prickly sensation on her chest and feeling ""off"". Felt dizzy, developed small hives on her chest. She was attended to immediately at the vaccine site and our team was called to white code. Pt was sitting on the floor, alert , breathing comfortably. Her BP was 151/84, HR 90, O2 Sats 100%. Her lungs were clear the whole time, no wheezing, no difficulty swallowing or talking. Patient received 125 mg of IV solumedrol and 20 mg of pepcid in vaccination room, she felt the same, still breathing comfotably, speaking full sentences, hives faiding away. She was transported to Urgent Care clinic on wheelchair. Pt kept her EpiPen by her site the whole time but refused to used it, states she is afraid to use it and wants to hold off or get it in ER if necessary. About 16:30 patient reported her tingling, prickly sensation In her chest is getting worse, developed sensation of lump in her throat, able to swallow and breath without problems, lungs exam clear. Again recommended to give Epipen but patient again refused as she feels very anxious about getting new medicine. She was able to speak full sentences and breathing well, O2 Sats 100% the whole time, she repetitively refused EpiPen. EMS called and patient transported to ER, ER notified. Pt left in stable condition."

On 01/13/2021 at about 11pm I began having pain in both arms and across my chest. Also nausea and vomiting. At midnight I went to the Emergency room and was diagnosed with a heart attack, underwent emergency catheterization and stent placement. I had complete occlusion of the right coronary artery

Patient is 39-year-old male with no significant past medical history who works at long-term care facility. He received COVID-19 vaccine on 1/13/2021 and immediately developed numbness and tingling in the area of injection which was the left shoulder. Over the next 15 to 30 minutes numbness and tingling expanded to the left side of his body including face arm and leg and the left side of his trunk. He began to feel foggy and had some slurred speech. He presented to the Emergency Room and tests were performed to rule out a stroke. The patient denies any other symptoms such as fever chills myalgias. He

did not have any weakness of the extremities. He did not have any speech disturbances or visual disturbances. This morning on examination he states his symptoms are much better. He still has some residual numbness in his leg and arm. Facial numbness is almost all gone. As of 1/18/2021, residual numbness and tingling is only in his left ring and pinky finger.

"Patient with PMH of depression and GERD who presented 1/8 with constipation, abdominal discomfort and worsening dyspnea. Symptoms began around 12/29. COVID vaccine 12/19. Previously quite active, marathon runner, gained some weight over last couple years but was still in good enough shape to complete 10K in New Orleans in early February. In late February, had a flu-like illness, as did one of his friends from church. 2020 was hard on him - weight gain, decreased activity, stress, overall deconditioning. No issues apart from sore arm after COVID vaccine 12/19 but then starting getting abdominal fullness/discomfort around 12/29, which steadily worsened, also develop worsening dyspnea on slight exertion. No known sick contacts.. Work-up notable for pericardial effusion, pleural effusions. Echo with severe diffuse LV hypokinesis, concern raised for myocarditis. COVID PCR negative, serology negative. RVP negative. . Concern raised that COVID vaccine may have played a role in myocarditis. He was found to have the following conditions Acute heart failure with reduced EF NYHA FC II, non-ischemic cardiomyopathy. Myocarditis appears subacute per MRI hypertension obesity small pericardial effusion-asysmptomatic no pericarditis suspected obstructive sleep apnea. .Started on the following medications. Continue Carvedilol 12.5mg BID, Farxiga 5mg daily, Digoxin 0.125mg daily, Entresto 97-103mg BID, and Spironolactone 25mg daily. Per MD note. While it remains uncertain, team is doubtful COVID vaccine played a role in his cardiac issues. Given the MRI findings are not acute, more likely that the cardiac insult occurred weeks to months ago - potentially in the setting of the February 2020 illness. Perhaps his ""deconditioning"" in 2020 was related to worsening cardiac function. Nevertheless, will hold on 2nd COVID vaccine dose given absence of a clear explanation for his myocarditis. conversation with team will continue to determine if candidate for second covid vaccine. If consensus is that myocarditis pre-dated vaccine, might be able to proceed with dose 2 of vaccine."

"PATIENT RECEIVED VACCINE 1/7/21 AT 1000. THE NEXT DAY, PATIENT PRESENTS TO ER ON 1/13/21 WITH COMPLAINTS OF PALPITATIONS AND DIZZINESS OCCURING SINCE HER FIRST DOSE OF VACCINE. ""The patient states she has had these episodes for the last 6 days and they started when she got her COVID vaccine. The patient states she has had numerous episodes over the last 6 days of this that lasts between 2 and 4 hours. The patient can feel her heart fluttering and she gets a little dizzy with it. The patient has not had any nausea, shortness of breath or chest pain with these episodes however. The patient has not had any prior episodes of this. The patient takes no regular medications apart from vitamins."" PATIENT WAS DIAGNOSED WITH NEW FOUND A. FIB WITH RVR. ADMITTED TO HOSPITAL FOR OBSERVATION. PATIENT RETURNED TO NORMAL SINUS RHYTHM THE NEXT DAY AFTER INITIATING DILTIAZEM AND ELIQUIS."

EDD July 4, 2021 January 15th baby no longer had a heartbeat after two previous visits confirming heartbeat and EDD.

DVT in right leg 4 days after injection, severe pain in thigh/calf, difficulty walking Placed on Xarelto 15mg 2X daily for 21 days and then 20mg daily for 9 days. Next Doctor visit is 1/26/2021 at 9:00am Next scheduled Covid 19 vaccine is scheduled for 2/5/2021 at 7:15am

After I received the vaccine went home rested temp went up one time 99.0. The next day woke up heart was pounding check my BP 150/80 laid back down. I woke up around 5pm my BP had elevated to 160 (don't remember diastolic reading) pulse rate normal limits. I informed my spouse of what was happening called 911. At the hospital checked vitals, EKG, CT Scan, Chest X-ray, Blood work and Potassium was low took 2 Potassium pills. I went back home on 12/31 returned to work did fine that day. On New Years day everything started back again discomfort went back to ER. I felt like force in my chest the doctor collected my information and I was placed on a low dose BP medication until I return to my PCP, cardiologist(stress test). I followed up with PCP via Telehealth about my BP concerns, my dosage was increased to 25 mg and due to my symptoms I was placed on leave from work 2 wks. I also have a appointment scheduled with Neurologist.

Daughter call in for VAERS report to file for father whom committed suicide 1/16/2021 in the AM after reportable ae of COVID 19 vaccine administered 1/14/2021. Patient sought care twice at ER; first visit by ambulance around 5PM and Friday 1/15/2021 Medical Center: Emergency Room. 1st Discharge summary diagnosis: adverse reaction to COVID shot; 2nd Discharge summary diagnosis: adverse reaction to COVID shot, fever, Panic Disorder-- ER. Medical Center Discharge summary diagnosis: Adverse reaction to the vaccine, acute anxiety. Reportable patient symptoms at, 1st visit : fever, shaking stomach cramps, breathing issues. Medical Center -- No fever, confusion and dementia type, patient would not stay in patient bed; patient would get up and sit down again repeatedly, agitated and anxious. Attempted to urinated hospital bed. Patient committed suicide in home.

Anaphylaxis (urticaria, tongue swelling, subjective difficulty breathing) starting approx. 24hrs first moderna dose. No prior episodes of anaphylaxis/allergic rxn. Treated with Benadryl 100mg PO (prior to arrival, pt administered), famotidine 20mg IV, Epinepherine 0.3mg IM. Monitored in ED, complete resolution of symptoms, discharged home.

Weakness, Low O2, death. Positive for COVID on 1/12/21, dies on 1/16/21

Patient presented to ED with complaint of chest pain, radiating down left arm, not relieved with Tums. Symptoms started at 0530 1/12/2020. Patient presented to ED b/c of strong family history of CAD, with father having MI in his 50s.

On 1/17/2021 at 4:35 am resident found apneic and pulseless, at 4:40am death confirmed

I was vaccinated at 3:30pm . At 5:27pm while driving home i felt a cold sensation in the back of my neck and back of my throat which began spreading to the back of my head . My heart felt as if I was startled by something. I looked at my smart watch and my heart rate was 145. I began trembling and having abdominal cramping . The back of my head felt like I had swelling or collection of fluid. I opened my windows and began taking slow deep breaths to bring down my heart rate . It took quite a while to get it below 100. I felt as if I was going to pass out. After deep breathing for what felt like atleasr 15 to 20

minutes , my pulse came down and I closed my windows . As soon as my body warmed back up in the car , the symptoms returned and my heart rate went back up to 130s , 140s . I had to keep my windows down and deep breathe the entire way home which took an hour . My body was trembling. When I got home I felt as if I was too week to get out of the car . I still felt that startled feeling in my heart and was afraid of what could happen next . My lips and face were swollen. My lips were also slightly itchy. I called 911 for help . By the time they arrived my vital signs had stabilized but I still had swelling in my face and lips . My EKG , vital signs and oxygen levels checked out normal so I did not go to the ER. That night I took benadryl and Tylenol. Day 2 post vaccine the collection of fluid or swelling in the back of my head had now spread to the top . That night I had the feeling that my throat was swelling do I took benadryl and Tylenol and my face and lips were still slightly swollen . Day 3 post vaccine I woke up with slightly blurry vision. The swelling in my head now feels like it has encompassed my entire head and have a slight headache. I went to the urgent care requesting an MRI of the head and an epi pen . I was given Medrol dose pack , an RX for epi pen for emergencies and advised to continue benadryl and Tylenol. Day 4 post vaccine, slight headache continues. Slightly blurry vision

12/29/2020 Vaccination. Within minutes blurry vision, dizzy, tx to stretcher. EXTREME HA, coughing, sensitivity to light. EPI pen in ER. I fell asleep. Woke up, don't remember much. Admitted to hospital. Chest pains started within 2 hours, SOB, HA. Admitted for 2 nights, 3 days. Discharged home. Still having SOB and referred to Pulmonologist. Waiting on appt. *did NOT have problems before this vaccine. I was fine. Now i am completely different person, I have to monitor my walking, etc.

"80YO male who htn, cva, epilepsy, ckd, cerebral avm s/p repair, cad s/p cab, cva (left sided hemiplegia) , hx of prostate cancer recent admission for pna on abx presents to ED on 1/11 with dizziness, hypoxia. CT with Bilateral PE ""Large bilateral pulmonary artery emboli in the right and left main pulmonary artery extending into the right and left main pulmonary artery branches bilaterally. Findings are associated with right-sided heart strain."" ""Patchy alveolar airspace disease within the lungs highly suspicious for COVID pneumonia"" Covid negative. Patients wife recovered from Covid-19 infection within last month. Patent thus far has tested negative. Doppler lower extremity revealed Acute occlusive vein thrombosis of the entire course of the gastrocnemius vein and soleal vein. Patient received covid vaccine on 1/4/21. Patient has several risk factors for clot - age, previous CVA, hx of prostate cancer. Also had positive covid exposure though tested negative"

Resident was seen by MD on 1/11/2021 due to increasing in edema and shortness of breath. Lasix 40 mg STAT given. New orders to get a STAT CBC, CMP, and BNP. Resident has been dependent on Oxygen since his diagnosis of COVID-19 on 11/23/2020. Labs were abnormal. Continued on the lasix 40 mgs. Resident remained short of breath with exertion and on oxygen. He was assisted to the toilet on 1/15/2021 in the morning where he subsequently passed away.

hives on her face; This is a spontaneous report from a contactable healthcare professional (physician assistant). A 42-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot number: EK5730), via an unspecified route of administration, on 24Dec2020 as a single dose (reported as 0.3) for COVID-19 immunization. The patient had no medical history or concomitant medications. The patient experienced hives on her face in Dec2020, which was reported as

medically significant. It was reported that within 24 hours of vaccination, the patient had hives for 48 hours. The event was reported as a moderate systemic reaction. The clinical outcome of hives on her face was recovered in Dec2020.; Sender's Comments: Based on the compatible time association, the event hives on her face is possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"a low grade fever; cough; doesn't feel very well; feeling yucky; soreness in the arm where vaccine was given; This is a spontaneous report from a contactable Nurse (reporting for herself). A 29-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE solution for injection, bacth/lot no: EK9231 while expiry date was unknown), intramuscular on left deltoid on 07Jan2021 16:45 at a single dose for covid-19 immunization. There were no medical history and concomitant medications reported. Patient has no prior vaccination within 4 weeks.The patient got her first dose of the COVID 19 vaccine yesterday (07Jan2021) from her employer. She started ""feeling yucky"" today (08Jan2021) around noon with a low grade fever,and developed a cough that was not persistent. Patient has soreness in the arm where vaccine was given. She was asking what should she do about it? Outcome of the events low grade fever, cough, feeling unwell, feeling abnormal were not recovered while vaccination site pain was unknown. The events low grade fever, cough, feeling unwell were considered serious medically significant and related to vaccine.; Sender's Comments: Based on the time association, the events fever, cough and malaise are possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

generalized weakness; flushing; my BP is high; dose 1 start date 19Dec2020; dose 2 start date 8Jan2021; This is a spontaneous report from a contactable pharmacist. A 34-year-old female patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EL3246), intramuscular in left arm on 08Jan2021 at a single dose for COVID-19 immunization. Medical history included chronic HTN and allergies to baclofen and statins. The patient's concomitant medications were unspecified medications taken for hypertension. The patient previously received the first dose of bnt162b2 on 19Dec2020 via intramuscular in left arm, lot EL0140. On 08Jan2021, the patient was brought into ER as code MET. Patient was receiving her second vaccine for COVID-19 when she experienced generalized weakness and flushing. She stated that she knew her BP was high. Endorses hx chronic HTN, reports she took all three medications this AM. The patient denied any headache, new visual change, CP, SOB, or focal weakness. The events recovered on an unknown date in Jan2021. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19. No treatment was received for the events.; Sender's Comments: Based on the time association, the events asthenia, flushing and hypertension are possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer

procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Profuse watery vaginal bleeding 12 hrs after injection. Bleeding lasted approximately six hours. After first injection and vaginal bleeding, gynecology exam completed for abnormalities; This is a spontaneous report from a contactable physician (patient). A 55-year-old female patient received the first dose of BNT162B2 (Pfizer-BIONTECH Covid-19 Vaccine), intramuscular in the left arm on 22Dec2020 at 16:00 at a single dose; and the second dose via intramuscular in the left arm on 08Jan2021 at 08:00 at a single dose as COVID-19 vaccine. Medical history included a known latex allergy and previous spontaneous cerebral artery dissection x 3 (nonspecific connective tissue disease). The patient was not pregnant at the time of vaccination and did not receive any other vaccine within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to the vaccination and was not tested for COVID-19 post vaccination. Concomitant medications (reported as other medications within two weeks of vaccination) included estrogens conjugated (PREMARIN), micronized progesterone, colecalciferol (Vitamin D), folic acid (FOLATE), and diphenhydramine hydrochloride (BENADRYL). On 23Dec2020, the patient experienced profuse watery vaginal bleeding 12 hours after the injection. The bleeding lasted approximately six hours. After the first injection and vaginal bleeding, a gynecology exam was completed for abnormalities. Previously diagnosed uterine fibroids present and some free fluid in the pelvis by ultrasound. Bleeding resolved by the end of post-vaccine day 1. After the second vaccine, heavy vaginal bleeding started 10 hours after a injection. It was reported that the adverse event result in a doctor or other healthcare professional office/clinic visit. Treatment for the event involved removal of the IUD. Outcome of the event was recovering. The case was reported as non-serious (did not result in death, was not life-threatening, did not cause/prolong hospitalization, was not disabling/incapacitating, and did not result to any congenital anomaly/birth defect). Information about the lot/batch number has been requested.; Sender's Comments: There is reasonable possibility that the event vaginal hemorrhage is related to suspect drug BNT162B2 based on a compatible temporal relation between vaccination and the onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

few enlarged and abnormal lymph nodes believed to be reactive in nature; patient was pregnant at the time of vaccination; large mass appeared in right axilla; mass was painful to touch; large mass appeared in right axilla; mass was painful to touch; This is a spontaneous report from a contactable healthcare professional (patient). A 36-year-old female patient received the first dose of bnt162b2 (COVID 19, brand: Pfizer) lot no: EJ1685, via an unspecified route of administration in right arm on 23Dec2020 07:15 at a single dose for COVID-19 immunization in a hospital. The patient had no relevant medical history and no known allergies. The patient was pregnant at the time of vaccination, last menstrual date was on 05Oct2020, delivery date will be on 12Jun2021, gestation period: 11. Concomitant medication includes daily multivitamin. The patient did not receive other vaccines within 4 weeks prior to the COVID vaccine.

The patient was not diagnosed with COVID-19 prior to vaccination and was not tested for COVID-19 since the vaccination. On 30Dec2020 04:00 am, 7 days after vaccine (as reported), a large mass appeared in right axilla. The mass was painful to touch. Overnight mass more than doubled in size on 31Dec2020 the mass took up her entire arm pit, went to immediate care and was given antibiotics. The mass decreased in size but has not gone away. She followed up with primary care. She had bloodwork and ultrasound of axilla and right breast. Blood work was normal. Ultrasound showed a few enlarged and abnormal lymph nodes believed to be reactive in nature. Largest lymph node as of 08Dec2020 2.5 x 0.9 x 2.2 cm. The events were reported as non-serious. The events resulted in doctor or other healthcare professional office/clinic visit and emergency room/department or urgent care. Outcome of the events was unknown.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

Syncopal event; Nausea; Vomiting; This is a spontaneous report from a contactable nurse. A 29-year-old female received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number:EL1284), via an unspecified route of administration on the right arm on 08Jan2021 12:15 at single dose for COVID-19 immunisation. The patient medical history was not reported. Concomitant medication included influenza vaccine (INFLUENZA VACCINE) on 13Dec2020. The patient previously took first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899) on 18Dec2021 12:15. The patient experienced syncopal event, nausea and vomiting on 09Jan2021 05:00. The patient received no treatment. The outcome of the events was recovering. No follow-up attempts are possible. No further information is expected.; Sender's Comments: Based on the compatible time association, the event syncope is possibly related to suspect drug BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

allergic reaction; large red itchy rash on her neck / chest area; trembling; This is a spontaneous report from a contactable pharmacist. A 33-year-old female patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via unspecified route of administration (lot number: EL1283) in the arm right on 07Jan2021 09:00; at single doses for COVID-19 immunization. Medical history included known allergies: latex. Concomitant medications included magnesium oxide (MAG OXIDE) at 200 mg, daily (every day) and cetirizine hydrochloride (ZYRTEC) at 10 mg, daily (every day); and toprolol at 25 mg, every day (pending clarification for the drug). The patient previously received first dose of BNT162B2 on 17Dec2020 (lot number: EK5730) for COVID-19 immunization. Patient was not diagnosed with COVID-19 prior to vaccination; and has not been tested for COVID-19 since vaccination. Within the 15-minute observation period on 07Jan2021, the patient developed a large red itchy rash on her neck and chest area; she stated she felt fine but was observed trembling. She was transported to ED

(emergency department, 5 min transport). She was treated with diphenhydramine hydrochloride (BENADRYL) at 25mg IV X1 (intravenous), and methylprednisolone (SOLUMEDROL) at 60mg IV X1 and famotidine 20mg IV X 1. Patient diagnosis was allergic reaction on 07Jan2021. Patient improved after treatment and was discharged (after being in Emergency room/department or urgent care) as she was observed from 09:11 until 10:33. Final outcome of the events was all recovered on unspecified date.; Sender's Comments: Based on the time association, the allergic reaction, rash erythematous and trembling are possibly related to suspect BNT62B2 administration.The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

couldn't differentiate the tingling in hands and feet from shot or from that; sharp pain jolt behind eyes/eyes hurt; icreamed; Her hand eye coordination was off as well and she wasn't able to be accurate on keyboard and her cursive was off; Whole body still weak; sharp pain jolt behind eyes, left one in particular so bad she screamed and the nerves went all the way to finger tips; Twitching of face when do certain movements; brain zaps and brain buzzing began; numbness to right side of face to neck/made its way to left side; Horrible headache; fatigue; felt pressure behind her right eye; felt in a fog; forgetful mid conversation; This is a spontaneous report from a contactable other health professional (patient). A 42-year-old female patient (not pregnant at the time of vaccination) received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, EL0140), intramuscular on 23Dec2020 08:00 at single dose at right arm for COVID-19 immunization; prednisone via an unspecified route of administration from an unspecified date to an unspecified date (for 4 days) at 50 mg for an unspecified indication. Medical history included Known allergis: latex, contrast dye. Concomitant medication included the first dose of influenza vaccine (FLU) on 30Nov2020 at single dose at right arm for immunization. Facility where the most recent COVID-19 vaccine was administered at Hospital. The patient received other vaccines within 4 weeks prior to the COVID vaccine. It was reported that Day 1: on 23Dec2020 08:15, the patient felt pressure behind her right eye after shot, felt in a fog, forgetful mid conversation. Day 2. (24Dec2020) Horrible headache started, fatigue. Day 3 (25Dec2020) brain zaps and brain buzzing began, headache, fatigue, numbness to right side of face to neck. By day 5 (27Dec2020) made its way to left side. Twitching of face when do certain movements. Her Dr gave her Prednisone and she took 50 mg for 4 days and stopped because she couldn't differentiate the tingling in hands and feet from shot or from that. Still brain zaps, newest issue sharp pain jolt behind eyes, left one in particular so bad she screamed and the nerves went all the way to finger tips. Her hand eye coordination was off as well and she wasn't able to be accurate on keyboard and her cursive was off. Whole body still weak, eyes hurt. Head a lot better than a day ago but still having buzzing and twitching. Today was day 18. She was awaiting an MRI with contrast on Friday hoping it got moved sooner as she was scared to what was going on. The adverse events result in Doctor or other healthcare professional office/clinic visit and Emergency room/department or urgent care. Treatment received for the adverse events included CT/MRI/Optic Nerve Scan/Pain Shot/Meds for Zaps. The events were non-serious per the reporter. Prior to vaccination, the patient wasn't diagnosed with COVID-19. Since the vaccination, the patient had been tested for COVID-19. The patient underwent lab tests and procedures which

included Nasal Swab: negative on 28Dec2020. The action taken in response to the events for prednisone was permanently withdrawn on an unspecified date. The outcome of the events reported as not recovered.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of all these reported serious events might not be fully excluded, considering the plausible temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

"Heart fluttering; chest pressure; This is a spontaneous report from a contactable nurse (patient). A 55-year-old female patient received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; lot number: EK5730; expiration date: not known), via an unspecified route of administration in the left arm at hospital on 31Dec2020 10:00 at at single dose for COVID-19 immunization. Medical history included known allergies with sulfa. The patient is not pregnant. The patient's concomitant medications were not reported. The patient previously took clarithromycin (BIAXIN), metronidazole benzoate (FLAGYL), and sulfamethoxazole, trimethoprim (BACTRIM), and all but experienced allergies (reported as ""known allergies: Biaxin, Flagyl, sulfa, Bactrim""). No COVID prior to vaccination and no COVID tested post vaccination. The patient experienced heart fluttering and chest pressure on 04Jan2021. There was no treatment received for the reported events. The outcome of the events was not recovered.; Sender's Comments: A causal relationship between the reported heart fluttering and the use of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) cannot be completely excluded due to temporal relationship. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

Tachycardia up to 150 resting; Nausea; Vomiting; Diarrhea; Headache; Migraine; Body aches; Chills; Fever up to 102; This is a spontaneous report from a contactable nurse (patient). This 26-year-old female patient (pregnant: no) received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number: EL3248), intramuscular on 08Jan2021 at 07:45 AM at single dose on right arm for COVID-19 immunisation. Medical history included anxiety and depression. No known allergies. Concomitant medication included fluoxetine hydrochloride (PROZAC), bupropion hydrochloride (WELLBUTRIN), diphenhydramine hydrochloride (ZZZQUIL). No other-vaccine-in-four weeks. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE, lot number: EK5730), intramuscular on 22Dec2020 at 08:00 PM on right arm for COVID-19 immunisation. The patient experienced tachycardia up to 150 resting, nausea, vomiting, diarrhea, headache, migraine, body aches, chills and fever up to 102. Symptom onset around 7PM on 08Jan2021 and stopped around 12PM 09Jan2021 except for headache which was still persisting as of 9PM 09Jan2021. No treatment was received for the events. The outcome of headache was not recovered. The outcome of other events was

recovered on 09Jan2021 at 12PM. The patient did not have COVID-prior-vaccination. The patient did not have COVID tested post vaccination.; Sender's Comments: The reported tachycardia was probably related to the use of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) due to temporal relationship. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Bell's palsy onset within 48 hours of second vaccine, R side of face; First dose of vaccine on 20Dec2020 and second dose received on 06Jan2021; First dose of vaccine on 20Dec2020 and second dose received on 06Jan2021; This is a spontaneous report from a contactable healthcare professional reporting for himself from a Pfizer sponsored program. A 24-year-old male patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; lot number EJ1686) via an unspecified route of administration, on 06Jan2021 at 11:30am on left arm, single dose for COVID-19 immunization. Relevant medical history and concomitant medications were reported as none. The patient had no known allergies. The patient had no other vaccine in four weeks and no other medications in two weeks. The patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number EL0140) at right arm on 20Dec2020 10:30am for COVID-19 immunization. On 08Jan2021 at 12:00pm, the patient experienced facial droop 2 days after taking the 2nd dose of the vaccine. The patient went to the hospital for doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care and were advised to take Valtrex and Prednisone and told its Bell's palsy. Bell's palsy onset within 48 hours of second vaccine, R side of face. Wanted to confirm if there will be a problem once they take these drugs since the paient have just received the vaccine recently or wanted to know if the new medications prescribed will affect the vaccine's effectivity. The patient was not diagnosed with COVID prior vaccination and was not tested for COVID post vaccination. Outcome of the event Bell's palsy was not recovered.; Sender's Comments: Facial droop/ Bell's palsy occurred 2 days after taking the 2nd dose of the BNT162B2 vaccine, a possible causal association between administration of BNT162B2 and the event onset thus might not be fully excluded, considering the plausible temporal relationship. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

7 days later diagnosed with pneumonia; 3 days after developed hives on my stomach and arm; felt tired; confused; unwell; This is a spontaneous report from a contactable healthcare professional (patient). A 37-year-old female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: Ek5730), via an unspecified route of administration on the left arm on 28Dec2020 12:00PM at a single dose for COVID-19 immunization at hospital facility. Medical history included Hashimotos disease. The patient had no known allergies and has not had COVID prior to vaccination. The patient's concomitant medications were not reported. The patient reported that she felt tired and confused and unwell on day of injection, 28Dec2020. After three days (31Dec2020), she developed hives on her

stomach and arm and seven days later (04Jan2021), she was diagnosed with pneumonia and continued to have hives all over her legs and arms to this day. The patient was treated with antibiotics for pneumonia. She underwent Covid test/ Nasal swab post vaccination on 09Jan2021, pending result. The outcome of the events was not recovered.; Sender's Comments: The reported pneumonia was more likely an intercurrent disease, and unlikely causally related to the use of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE). The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

difficult breathing; Pain on the chest; Not being able to move my upper neither lower body; itchiness all over my body; unconscious; Headaches; major anxiety; depression; very light-headed; weak; almost faint; This is a spontaneous report from a contactable Other HCP (patient). A 28-years-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 08Jan2021 12:00 at single dose on Left arm for COVID-19 immunisation. Facility type vaccine was Hospital. Medical history was none. The patient's concomitant medications were not reported. No other vaccine in four weeks. The patient experienced Not being able to move my upper neither lower body, Headaches, major anxiety, and depression, unconscious, very light-headed, weak, almost faint, Pain on the chest, difficult breathing, itchiness all over my body on 08Jan2021. AEs resulted in Emergency room/department or urgent care, Hospitalization. Received injected fluids as treatment. The outcome was Not Recovered. No COVID prior vaccination. No COVID tested post vaccination. Information on the lot/ batch number has been requested.; Sender's Comments: Based on a close temporal association, a causal relationship between reported events and BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

I had a very early miscarriage at five weeks; I had a very early miscarriage at five weeks; I had a very early miscarriage at five weeks; This is a spontaneous report from a contactable Physician (patient). A 31-year-old female patient received BNT162B2 first dose of (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EJI685) intramuscular at arm right on 19Dec2020 06:30 at single dose for covid-19 immunization. Facility type vaccine was hospital. Medical history was none. The patient had no known allergies or other medical history. There were no concomitant medications. No other vaccine in four weeks and no other medications in two weeks. The patient experienced a very early miscarriage at five weeks on 01Jan2021. The event result in doctor or other healthcare professional office/clinic visit. No treatment received. The outcome of the event miscarriage was recovered in Jan2021. No covid prior vaccination and no covid tested post vaccination.; Sender's Comments: All pregnancies have a risk of birth defect, loss, or other adverse outcomes. The data on BNT162B2 administered to pregnant women is insufficient to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this

report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

almost pass out; Chills; nausea; diarrhea; abdominal pain; clammy; elevated heart rate; dizzy; This is a spontaneous report from a contactable consumer (patient's parent). A 24-year-old female patient (pregnant: No) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK9231) via an unspecified route of administration on left arm on an unspecified date in Dec2020 at single dose for COVID-19 immunization. The relevant medical history included asthma, migraines and anxiety all from an unspecified date. Concomitant medications included ethinylestradiol, etonogestrel (NUVARING), topiramate (TOPAMAX), verapamil and sertraline hydrochloride (ZOLOFT). The patient experienced chills, nausea, diarrhea, abdominal pain, clammy, elevated heart rate, almost pass out, dizzy, all on 05Jan2021. The patient had no treatment for the events. No covid prior vaccination. The patient underwent lab test included heart rate showed elevated on 05Jan2021, Nasal Swab showed negative on 06Jan2021. The outcome of the events was not recovered.

Rash on lower legs similar to that seen with Thrombocytopenia.; Rash on lower legs similar to that seen with Thrombocytopenia.; This is a spontaneous report from a contactable Other HCP (patient). A 21-year-old female patient (not pregnant) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection, Lot number= EJ1686), via an unspecified route of administration at Left arm on 05Jan2021 10:00 AM at single dose for covid-19 immunization. The COVID-19 vaccine was administered at Hospital. The patient's medical history and concomitant medications were unknown. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient experienced rash on lower legs similar to that seen with thrombocytopenia on 09Jan2021 at time of 12:00 PM. No treatment received for the events. Prior to vaccination, the patient was not diagnosed with COVID-19 and since the vaccination, the patient was not been tested for COVID-19. The outcome of the events was not recovered.; Sender's Comments: A possible contributory effect of suspect drug on reported thrombocytopenia cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

Fatigued; Sore in her throat; Lost her voice (hoarse); Reddish nose; Intermittent coughs; she went to work to a COVID unit which she usually didn't do; described her symptoms as a chest cold; Feeling strange like coming down; swelling and soreness in the injection site for a day or two; swelling and soreness in the injection site for a day or two; This is a spontaneous report from a contactable nurse reported for self. This 41-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number unknown) via unspecified route of administration on 07Jan2021 13:30 PM at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not provided. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number unknown) for COVID-19 immunization on an

unspecified date. On 07Jan2021 after second dose vaccination, the patient started experiencing swelling and soreness in the injection site for a day or two. On 08Jan2021 the next day, she went to work to a COVID unit which she usually didn't do. On 08Jan2021 the next day after her shift at 15:00 PM, she started feeling strange like coming down. On 09Jan2021, she felt totally fatigued. The symptom that bothered her the most is the sore in her throat which has gone 10Jan2021, she said she lost her voice (hoarse). She was also experiencing a reddish nose and intermittent coughs. She described her symptoms as a chest cold. The patient also stated she didn't have fever or chills. She's afraid she might be sick. The outcome of event the sore in her throat was resolved on 10Jan2021. The outcome of other events was unknown. Information about lot/batch number has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported chest cold cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

"tingling sensation in right eye and mid cheek area,Unable to wink, or scrunch right eye; muscles on the right side of my face were noticeably weaker; This is a spontaneous report from a contactable nurse (patient). This 48-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot # EH9899), via an unspecified route of administration, on 23Dec2020 at 04:00 PM at single dose for COVID-19 immunisation. Vaccine location was right arm. The patient was vaccinated at Public Health Clinic/Veterans Administration facility, age at vaccination was 48-years-old. No other vaccine was received in four weeks. Medical history included gastrooesophageal reflux disease (GERD). Known allergies included levofloxacin (LEVOFLOXACIN), pethidine hydrochloride (DEMEROL), phenobarbital, cefalexin monohydrate (KEFLEX), charithromycin (BIAXIN). Concomitant medications included dexlansoprazole (DEXILANT), estradiol, phentermine, ergocalciferol (VIT D), calcium. The patient was not tested for covid prior or post vaccination. On 23Dec2020 at 04:45 PM, after leaving the clinic, the patient felt tingling sensation in right eye and mid cheek area. Within 1.5 hours, muscles on the right side of her face were noticeably weaker. Unable to wink, or scrunch right eye. The events resulted in doctor or other healthcare professional office/clinic visit, and emergency room/department or urgent care. The patient was treated with prednisone. Outcome was recovering.; Sender's Comments: Based on a close temporal relationship causality between events ""tingling sensation in right eye and mid cheek area"" and ""muscles on the right side of her face were noticeably weaker"" and BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

She is still freezing to death; Sick as a dog; Fever; Chills; cannot eat and have no appetite; nauseous; This is a spontaneous report from a contactable nurse (patient). A 79-year-old female patient received first dose of bnt162b2 (also reported as Pfizer Covid vaccine, lot number: EK4176), intramuscular into left arm on 05Jan2021 16:00 at single dose indicated as presentation because she is a nurse/Covid-19

immunization. Medical history included Type 2 Diabetes, about 2 years ago in 2019 in which she takes metformin 1,000mg twice daily. Concomitant medication included metformin on unspecified date at 1,000mg twice daily for Type 2 Diabetes. There was no history of all previous immunization with the Pfizer vaccine nor there were additional vaccines administered on same date of the Pfizer Covid vaccine. The patient received the Pfizer COVID vaccine last Tuesday and since 06Jan2021 at 06:00, she has been sick as a dog. She is running a fever, has chills, can't eat and has no appetite because she is nauseous; all on 06Jan2021 at 06:00. This is the third day of it. She would like to know what she can she do. She said that it all started Wednesday morning when she got up. It just gets worse every day. It looks like it would get better by now, but it hasn't. She never runs a temperature, but she has now (unspecified date). She is still freezing to death on unspecified date. She usually has a good appetite. Even the thought of food makes her sick. She further reported that she has had nothing but chills, fever, and nausea and states it will not go away. She is treating it with ibuprofen. She confirms she already talked to a nurse in this department to report this and she was transferred to see what she could do and states they never answered. This is her first dose and she does not know if she should get the second dose. The patient can't calm down since she has been sick since last Wednesday. She stated that she needed some help because she is so sick. She was suggested to call again calling Pfizer medical information department. She stated that she had called back three times, but there is no such number. The events sick as a dog, fever, chills, can't eat and has no appetite, and nauseous were considered serious (Other medically important condition). The outcome of the events sick as a dog, fever, chills, can't eat and has no appetite, and nauseous was not recovered, and the outcome of the remaining event was unknown.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be completed based on known safety profile and a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

palms of my hands were bright red; very warm flush feeling; nausea; swelling of the throat; rash on my arms and abdomen; This is a spontaneous report from a contactable nurse (patient). A 49-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EH9899 and expiration date not provided), intramuscular in the left arm on 06Jan2021 16:00 (at the age of 49 years old) at a single dose for COVID-19 immunization. Medical history included psoriasis, microscopic colitis, allergies to shellfish, and coconut. The patient's concomitant medications were not reported. The patient previously took estrogen patch, etanercept (ENBREL) and sulfamethoxazole, trimethoprim (BACTRIM) and experienced allergies to all. The patient was not pregnant at the time of vaccination. The patient did not receive any other vaccine within 4 weeks prior to the COVID vaccine and did not take any other medications with 2 weeks of vaccination. Prior to the vaccination, the patient was not diagnosed with COVID-19. On 06Jan2021 16:15, the patient experienced a very warm flush feeling, nausea started and by 15 minutes, she had swelling of the throat and rash on her arms and abdomen and the palms of her hands were bright red. The events resulted in Emergency room/department or urgent care visit. The patient was treated with diphenhydramine hcl (BENADRYL), steroids (unspecified), famotidine (PEPCID) and ondansetron (ZOFRAN) in response to the events. The patient assessed the events as non-serious.

The outcome of the events was recovered with sequel on an unspecified date in Jan2021. The patient has not been tested for COVID-19 since the vaccination.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

glaucoma; This is spontaneous report from a contactable consumer (patient). A female patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiry date unknown) via unspecified route of administration on unspecified date at single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received the first shot and was scheduled to receive the second dose on 27Jan2021 however, she has an eye surgery for glaucoma scheduled on 22Jan2021 and 25Jan2021. The patient wanted to know if she re-schedule the eye surgery. The outcome of the event glaucoma was unknown. Follow-up activities are possible, information on the batch number has been requested.

"Stevens Johnson Syndrome; rash was starting to peel; developed a rash all over her neck/ the rash has spread to face eyes, cheek; developed a rash all over her neck, ""looks like its peeling and taut""; developed a rash all over her neck, ""looks like its peeling and taut""; This is a spontaneous report from a contactable nurse (patient). A female patient of an unspecified age (Age: 48, Unit unknown) received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 10Jan2021 at single dose for covid-19 immunization. Medical history included she had an allergic reaction to sulfa and developed Stevens Johnson syndrome from an unknown date and unknown if ongoing. The patient's concomitant medications were not reported. The patient experienced Stevens Johnson Syndrome, developed a rash all over her neck/ the rash has spread to face eyes, cheek; ""looks like its peeling and taut""; and the rash was starting to peel, all in Jan2021. The patient received 1st dose of vaccine on 10Jan2021, developed a rash all over her neck, ""looks like its peeling and taut"". She had an allergic reaction to sulfa and developed Stevens Johnson syndrome, this looks similar to that (Experience of Stevens Johnson Syndrome). The patient was asking if she did take the steroid dose pack from her dermatologist for the skin rash will it prohibit her from taking the second dose of the vaccine. She called yesterday and reported a rash after receiving the first dose of the COVID-19 vaccine. She stated that she went to her Dermatologist this morning because the rash has spread to face eyes, cheek and the rash was starting to peel. She stated that the dermatologist wanted to know if it was safe to treat her with a prednisone dose pack after receiving the vaccine. Her rash was worsening so she went to her dermatologist for treatment. She was asking if she should get the second dose. The outcome of events for developed a rash all over her neck/ the rash has spread to face eyes, cheek was not resolved, for other events was unknown. Information about lot/batch number has been requested.; Sender's Comments: A possible causal association between administration of BNT162B2 and the onset of suspect Stevens Johnson Syndrome presented as skin reactions cannot be excluded, considering the plausible temporal relationship. Severe allergic reaction is the known risk for the vaccine. The underlying

predisposing condition of an allergic reaction to sulfa developed Stevens Johnson syndrome may put the patient at high risk of the similar occurrence. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate"

following day around 7pm lip swelling; tongue tingling; body hives; chills; After first dose of Covid vaccine face flushing; increased HR about 45 mins. went away on its own; hours later left eye swollen; This is a spontaneous report from a contactable Nurse (patient). A 31-years-old female patient received first dose of bnt162b2 (BNT162B2, Lot number: EK9231), via an unspecified route of administration on 06Jan2021 15:00 at single dose on Left arm for covid-19 immunisation. Medical history included Known allergies: Shellfish, IV contrast dye, Penicillin. There were no concomitant medications. No other vaccine in four weeks. No other medications in two weeks. The patient experienced after first dose of covid vaccine face flushing; increased hr about 45 mins. went away on its own since 06Jan2021 16:00; hours later left eye swollen on 06Jan2021; following day around 7pm lip swelling, tongue tingling, body hives, chills on 07Jan2021 19:00. The patient underwent lab tests and procedures which included heart rate: increased on Jan2021. Ae resulted in: Doctor or other healthcare professional office/clinic visit, Emergency room/department or urgent care. Ae treatment: Steroids, IV fluids, Benadryl. No COVID prior vaccination. No COVID tested post vaccinate. This report was reported non-serious. The event outcome of increased hr about 45 mins. went away on its own was recovered on 06Jan2021 16:45, outcome of other events were not recovered.; Sender's Comments: Based on the compatible time association, the serious events are possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

kidneys weren't acting/kidney issues; not having the feeling to urinate; Light-headed; This is a spontaneous report from a contactable consumer (reported for herself). A 91-year-old female patient received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; lot number: EL3248; expiration date: not known), via an unspecified route of administration in the left arm on 07Jan2021 at single dose for COVID-19 immunization. Medical history included high blood pressure and blood thinner. Concomitant medication included apixaban (ELIQUIS) for blood thinner. The patient is asking if there were any reports of adverse events with kidneys and the vaccine. She received the 1st shot last Thursday (07Jan2021) and told that yesterday (10Jan2021), she had an episode where kidneys weren't acting. She also mentioned that she is on a blood thinner, ELIQUIS. She is due to receive the 2nd shot on 28Jan2021. She said that she wouldn't want to receive the 2nd dose if this was related to her adverse reaction. The issue with the kidney started after on 10Jan2021, yesterday she was really having problems, she went to church then came home by that time she would have to go to the bathroom, but she did not go, she ended up cooking dinner which was 3 hours later, she was noticing that she was not urinating. She drank some Gatorade and that made it little better, she is wondering if it's a side effect.

On 10Jan2021, when she noticed the kidney issues, she did not know for certain if it started before that, she didn't pay attention. Also, yesterday (10Jan2021), she got sick in which she had to grab the counter, she felt bad, she wasn't dizzy, but felt light-headed. The symptom of not having the feeling to urinate had improved a little today but she is concerned and wanted to know if this was a side effect. Her being light-headed only occurred on 10Jan2021, it was a onetime occurrence yesterday. However, she was also just sitting around, laying around, after that yesterday. The outcome of the event 'light-headed' was unknown; while outcome of other events was recovering.

difficulty thinking; Extreme fatigue; dizziness; This is a spontaneous report from a contactable nurse (patient). A 42-year-old female patient received her second dose of BNT162B2(PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 10Jan2021 11:15 at single dose at Arm Right for COVID-19 immunisation. Medical history included hypothyroidism, thyroid cancer, hypertension from an unknown date and ongoing, Known allergies: Latex, aluminium, nickel.The patient was not pregnant. Concomitant medication included gabapentin, propranolol, levothyroxine sodium (SYNTHROID), and pantoprazole. The patient has previously received her first dose of BNT162B2 on 20Dec2020 08:45 PM for COVID-19 immunisation at Arm left. There was no any other vaccines within 4 weeks prior to the COVID vaccine.The patient experienced difficulty thinking, extreme fatigue and dizziness resulted in Doctor or other healthcare professional office/clinic visit. All the events occurred on 11Jan2021 09:00 with outcome of recovering. No treatment was received. Prior to vaccination the patient was not diagnosed with COVID-19 and since the vaccination, the patient has not been tested for COVID-19.The events were considered as non-serious. Information about lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the mental impairment and other reported events due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

concern for injection to the subcutaneous tissue/concerned about improper administration/patient has a mark where you can see the vaccine and it's higher up where you expect it to be; induration at the injection site; felt induration was moving down his/her arm/can feel it migrated down her arm, 7 inches below injection site; This is a spontaneous report from a contactable pharmacist. A patient of unspecified age and gender received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number: EK4176), subcutaneous (reported as injection to the subcutaneous tissue to deltoid) on 09Jan2021 at 0.3 mL, single to prevent from getting COVID. The patient's medical history and concomitant medications were not reported. The patient previously took the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) on Dec2020 for COVID-19 immunization. On 09Jan2021, within a couple hours after, the patient experienced induration at the

injection site. The patient felt induration was moving down his/her arm with concern for injection to the subcutaneous tissue. The patient can feel it migrated down his/her arm, 7 inches below injection site. The reporter assessed that the causality was yes for the suspect drug and the patient was concerned about improper administration. The reporter was unsure if it is administration or vaccine, the patient has a mark where you can see the vaccine and it's higher up where you expect it to be. Outcome of the vaccination site induration and induration was not recovered. The events were considered medically significant by the reporter.; Sender's Comments: Based on the available information a causal relationship between reported events induration at the injection site / induration and incorrect route (subcutaneous) of BNT162B2 vaccine administration cannot be excluded. The case will be reevaluated should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Slight left sided facial weakness/droop 4 days post vaccination; Slight left sided facial weakness/droop 4 days post vaccination; Tingling in injected arm and facial tingling in cheeks/lips same day of vaccination/Tingling to lower extremities; Tingling in injected arm and facial tingling in cheeks/lips same day of vaccination; Tingling in injected arm and facial tingling in cheeks/lips same day of vaccination; This is a spontaneous report from a contactable consumer (patient herself). A 36-year-old female patient received her first dose of bnt162b2 (BNT162B2 also reported as COVID 19 brand Pfizer, lot EK9231), via an unspecified route of administration in the left arm on 04Jan2021 13:00 at single dose, for Covid-19 immunisation. The vaccine was given in a Nursing Home/Senior Living Facility. Medical history was none. No known drug allergies. No other vaccine in four weeks. No Covid-19 prior vaccination. Concomitant medication included naproxen sodium (ALEVE). The patient experienced tingling in injected arm and facial tingling in cheeks/lips same day of vaccination (04Jan2021). Tingling to lower extremities the day after vaccination (still continuing). Slight left sided facial weakness/droop 4 days post vaccination (04Jan2021). Tingling to left arm continuing on and off. No treatment reported. On 04Jan2021, she was negative to PCR covid test post vaccination. She went to the Emergency room/department or urgent care. The outcome of events was not recovered.

"slurring speech; rash around his neck and upper chest; his earlobes were bright red, as was his nose; mouth was dry; nose was dry; dry throat; almost ""drunk""; Only abnormal finding was BP 159/94; This is a spontaneous report from contactable pharmacist. A 36-year-old male patient received second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number=EL1283 and Expiration Date unknown) via Intramuscular on 08Jan2021 11:25 at single dose for COVID-19 immunisation. The patient's medical history was reported toradol made him feel lightheaded and foggy (similar to his first Pfizer BioNTech covid vaccine), Attention deficit hyperactivity disorder (ADHD). History vaccine included first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number =EK5730 and Expiration Date unknown) via Intramuscular on 18Dec2020 at single dose for COVID-19 immunisation. Patient did report that on first vaccine it made him feel a little sluggish, tired and foggy minded. The concomitant medications were reported as amfetamine aspartate, amfetamine sulfate, dexamfetamine saccharate,

dexamfetamine sulfate (Adderall XR) at 25mg twice a day (BID) and escitalopram oxalate (LEXAPRO) oral (PO) at 10mg every day. No other vaccine in four weeks. Patient was vaccinated at 11:25. Patient was observed for 30 minutes. Pharmacist checked on patient at 17 minutes after vaccination - he was fine able to communicate and showed no signs of distress. Pharmacist came back and checked on patient at 25 minutes after vaccination (11:50) and patient was slurring speech, had developed rash around his neck and upper chest, his earlobes were bright red, as was his nose - mouth was dry, reported dry throat - no visible swelling of the lips or tongue. Patient was transported to ED (2 min) Home meds: Adderall XR 25mg BID [Twice a day], Lexapro 10mg Q [every]PM. Only abnormal finding was BP 159/94 - after initial workup patient was noted to be almost ""drunk"" as reported by Emergency Room (ER Doc). Patient was offered diphenhydramine declined several times but eventually agreed. Approx 30 min after diphenhydramine patient fully recovered and stated ""I'm back"". The second dose reaction was much more exaggerated and lasted much longer. No COVID prior vaccination and no COVID tested post vaccination. The adverse event result in Emergency room/department or urgent care. The outcome of events was recovered in Jan2021 after treatment was given.; Sender's Comments: Based on the time association, all events are possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

SOB; leukocytosis; acute onset of fever (101.2); CXR = bilateral vascular congestion; This is a spontaneous report from a contactable consumer. An elderly NH resident patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on an unspecified date, at single dose, for COVID-19 immunization. Medical history and concomitant medications were not reported. On an unspecified date the patient experienced shortness of breath (SOB), leukocytosis (17,800), acute onset of fever (101.2), bilateral vascular congestion. The patient was admitted with acute onset of fever (101.2), leukocytosis (17,800, no eosinophilia) and SOB, all beginning 3-4 hours after BNT162B2 administration. CXR showed bilateral vascular congestion. No facial or SQ edema. No evidence of myocardial damage or CHF based on BNP and troponin, respectively. The patient was treated with brief (3 days) pulse of methylprednisolone sodium succinate (SOLUMEDROL) with improvement. Chalking it up to acute capillary leak syndrome 2^2 vaccine. The final events outcome was unknown. Information on lot/batch number has been requested.

Blood in stool; Fever; Night sweats; Chills; Ache; This is a spontaneous report from a contactable physician reporting for herself. An adult (reported as 30-something year old) female patient received the 1st dose of bnt162b2 (BNT162B2), via an unspecified route of administration, on 30Dec2020, at single dose, for COVID-19 immunisation. The patient's medical history was none. Concomitant medications were not reported. The patient experienced blood in stool in Jan2021 with outcome of unknown, chills on 31Dec2020 with outcome of unknown, ache on 31Dec2020 with outcome of unknown, fever in Jan2021 with outcome of unknown, night sweats in Jan2021 with outcome of unknown. The patient reported that 24 hours after vaccination she experienced chills and aches, and after the 24 hours experienced some significant fevers that wouldn't break and chills. Then, after about 2 hours, the fever

would break and come back and it was like a cycle. Also had night sweats and blood in her stools after that. The information on the lot/batch number has been requested.; Sender's Comments: The female patient received the 1st dose of bnt162b2 (BNT162B2) on 30Dec2020, and experienced blood in stool in Jan2021 with outcome of unknown. The information available is limited, and case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Patient presented to our Emergency Department via EMS in full code status; asystole. Patient expired. Per nursing, husband stated patient awoke this AM and reported pain in back between shoulders and in bilateral shoulders. Patient then went unresponsive and husband called EMS.

1/11/21 at 8:57 Resident with fever and at 11 am saturation down to 83 O2 to 10 liters. Resident continued to decline until CTB on 1/14/2021 at 1325

I was diagnosed with COVID-19 on 12/7/2020. My course of symptoms lasted 16 days, meaning I started feeling healthy again on 12/23/20. I am a pharmacist with a healthcare system and they have been offering the Pfizer/Biontech COVID-19 vaccine for essential associates. I received by first dose of vaccine on 12/31/20. On 1/1/20 I woke up with very noticeable muscle aches and fairly profound lethargy, which last 18-20 hours. I was not able to do much on 1/1/21 because of the way I was feeling. I'm not sure if this reaction is normal for patients who receive their COVID-19 vaccine close to their illness/infection with COVID-19, which is why I'm reporting this to the FDA.

Heart rate slowed significantly down to 32bpm Tightness in chest, trouble breathing Elevated blood pressure

injection site became red & swollen, the size of a softball. Employee started having seizure like symptoms on 1/14/21 and was admitted to hospital. DC from hospital on 1/16/21 and on 1/17/21 started having seizures again and readmitted back to hospital. Employee has no history of seizures.

I received the Pfizer vaccine on 12/21/20 without adverse events other than soreness in deltoid. On 12/31/20 I began to notice pain, redness and swelling in second toe on R foot from base of toe to base of nail. I initially thought it was gout and self medicated with ibuprofen 400 mg BID x 1 day on 01/01/21 with some improvement. I did not take anything on 01/02/21 and woke up on 01/03/21 with return of swelling, redness and pain. I took another 400 mg of ibuprofen and it felt better but after examining the toe, I questioned whether I had developed pernio (COVID toe).

patient began with vomiting and diarrhea the day after administration, leading to bowel and urine incontinence. patient was hospitalized on 01/16/20 with sepsis. no origin discovered yet. still waiting on blood/urine/stool cultures.

Patient was living in a nursing home with positive cases when administered. His age and chronic condition was such that he did not have time after the vaccination to avoid exposure or develop immunity.

Resident had seizure like activity that was about 30 minutes in duration where her upper/lower extremities were shaking uncontrollably. Resident had to be admitted into hospital for observation.

blistering rash - bullous pemphigoid, steroids, admitted to hospital pending further evaluation.

1day after vaccine,developed severe headache & later blister in head officially Shingle . Then decreased platelet count fatally to 29(ITP).now hospitalized getting treatment.

Was feeling anxious right after vaccine given. Laid in cot for a short time, then stated her throat felt like it was closing.

Severe rash. Platelets drop to almost needing transfusion

1252 Resident rang with complaints of chest pain and shortness of breath. BP 126/70, Temp 97.5, pulse 72, resp. 20, O2 sats on room air 90%. While awaiting transport complained of increasing shortness of breath. Resident transported to Community Hospital via Ambulance with 3L O2 . Resident placed on ventilator and transported to Medical Center

severe body aches; severe chills; night sweats; Fatigue; This is a spontaneous report from a contactable Physician (patient). A 55-year-old male patient received the second dose bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 06Jan2021 at 12:00 at single dose in left arm for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient previously received the first dose bnt162b2 in Dec2020 three weeks ago at 12:00 noon in the left arm for covid-19 immunization and experienced mild pain at the injection site which lasted two days and then was gone. The patient experienced severe body aches, severe chills, night sweats, and fatigue on 07Jan2021. Event details: The patient reported that he received the first dose of the Pfizer COVID 19 vaccine three weeks ago at 12:00 noon in the left arm. He did not know the exact date. After the first dose there was mild pain at the injection site which lasted two days and then was gone. He received the second dose of the Pfizer COVID 19 vaccine on 06Jan2021 at 12:00 noon in the left arm. He noticed 12 hours later severe body aches, severe chills, and night sweats. He also felt fatigue. Everything had mostly resolved except for the night sweats and they were still pretty severe. All events were reported as serious by reporter per medically significant. The outcome of event night sweats was not resolved, outcome of other events was resolved on 10Jan2021. Information about lot/batch number has been requested.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported severe body aches, severe chills, fatigue and night sweats, and the administration of the COVID 19 vaccine, bnt162b2, based on the reasonable temporal association. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.

eosinophil count is 12.2%; Congestion; rhinitis; Cough; This is a spontaneous report from a contactable consumer. A 68-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot/batch number unknown), via an unspecified route of administration on 21Dec2020 at a single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient who is an MD received the COVID vaccine on 21Dec2020. She quickly developed rhinitis, cough, and congestion which have persisted. Her eosinophil count is 12.2%. She received a Medrol pack, but it did not relieve her symptoms. She has delayed her second injection for now. The outcome of the events was unknown. Information about lot/batch number has been requested.

resident expired; This is a spontaneous report from a contactable healthcare professional. An 82-year-old male patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE; Lot number: EL0140), intramuscular in the left arm on 05Jan2021 15:00 at a single dose for COVID-19 immunization. Medical history included metabolic encephalopathy from, failure to thrive (FTT), diabetes mellitus (DM) 2 , chronic obstructive pulmonary disease (COPD), arthritis, weakness, hyperlipidemia, chronic kidney disease (CKD), dementia. Known allergies was none. The patient took unspecified concomitant medication. On 11Jan2021, the resident expired. The patient underwent lab tests and procedures which included nasal swab: negative on 09Jan2021. There was no treatment given for the event. The patient died on 11Jan2021. An autopsy was not performed.; Sender's Comments: Lacking information on the cause of patient's demise, the Company cannot completely exclude a causal relationship between COVID 19 vaccine, BNT162B2, and patient's death of unknown cause, as a cautionary measure and for reporting purposes. The patient's pre-existing medical condition of metabolic encephalopathy from, failure to thrive (FTT), diabetes mellitus (DM) 2 , chronic obstructive pulmonary disease (COPD), arthritis, weakness, hyperlipidemia, chronic kidney disease (CKD), dementia may have provided the contribution to the event in this 82-year-old male patient. The impacts of this report on the benefit/risk profile of the product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.; Reported Cause(s) of Death: resident expired

Facial paralysis; This is a spontaneous report from a contactable consumer (patient herself). A 36-year-old female patient received bnt162b2 (COVID-19 Vaccine by Pfizer, lot EK9231, expiry date was not reported), via an unspecified route of administration on 08Jan2021 at SINGLE DOSE for Covid-19 immunisation (to prevent the COVID). Medical history was none. There were no concomitant medications. The patient experienced facial paralysis on the left side of her face upon waking up on 09Jan2021. The outcome of event was not recovered.

"Congestion in my lungs; I am coughing up junk; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date was not reported) via an unspecified route of administration on an unspecified date at single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient experienced congestion in lungs and was reportedly coughing up ""junk"" on an unspecified date. It was also reported that the patient

woke up this morning with a pretty bad side effect. Outcome of events was unknown. Information on the lot/batch number has been requested."

"Started to have symptoms and fainted; Hit her nose and has a scar now; She blacked out; hit her nose, got the scar in the nose, àshe was bleeding from that scar; hit her nose, got the scar in the nose, àshe was bleeding from that scar; She started to feel unwell; Chills; Nausea; Rash in her arm; She had little red in her bumps; This is a spontaneous report from a contactable physician. A 29-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE Solution for injection, batch/lot no. and expiry date: unknown), via an unspecified route of administration on arm on unspecified date at a single dose (2nd dose) for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. Physician stated, ""she had no medical conditions, she was in very good you know very like standing with herself."" Patient had her 1st dose of Covid vaccine on unspecified date for COVID-19 immunization. Physician (reporter) stated, ""I am the parent of someone who got the COVID dose, the second dose yesterday. I am very concerned because my daughter yesterday (08Jan2021) started to have symptoms and fainted at 4:00 in the morning and hit her nose and has a scar now. She had her second dose yesterday (pending clarification), after the second dose last night she started to feel unwell, getting chills, nausea and when she got up to go to the bathroom, she fainted, she blacked out. She lives alone, she is an adult, she hit her nose, got the scar in the nose, and the bleeding wouldn't stop, she was bleeding from that scar. She told me it took two hours for bleeding to stop from that scar."" When asked when the events started, Physician stated, ""Last night (08Jan2021), at 4:00 am she took the shot during the day while she was at work. She said, she started to getting chills and then she was nauseated."" When asked if patient was still experiencing the event, the parent reported no as patient was just resting. Also stated, ""She didn't take any treatment but she said she took Tylenol."" Physician further added, ""I am concerned, we are going to be taking her to the urgent care now but I am concerned about what is going on with platelets and all of that because of what had happened, last night the bleeding wouldn't stop for two hours and she was alone at the night and weekends. She said, she had to lay down and then her dad is there now because he is closer, he is going to be taking care of the urgent care but I want Pfizer to know what my daughter has gone through last night after she took this second dose."" Physician further added, ""she is having a rash in her arm, she had little red in her bumps as well. I want her to go get checked up as soon as possible in urgent care."" Patient was taking some Ibuprofen (later clarified that patient took Tylenol as treatment). She was not taking any other medication. Outcome of the events was unknown. Information Requested on Lot/ Batch number.; Sender's Comments: The reported faint was most likely due to an accident, and less likely causally related to the use of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE). The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

1) Skin rash over 80% of my body including, face and lips; started to change my voice sound and started to compromise my airways. 2) Uncontrollable shakes, but not sure if this was related to Covid-19 itself.

Was given steroids via injection into my blood stream, within minutes the shakes stopped and within 2 hours the rash was gone.

12/22 Vaccine 12/23 ER. Admitted to hospital for 7 days. Dr stated was due to fluid. Radiology stated no fluid present. Couldn't breath. Pulmonologist put on 2nd inhaler. Coughing a lot. Not able to walk more then 6 steps without stopping to catch breath. *Has had 2nd vaccination on 1/13/2020

1/12 vaccination 1/13 swelling and pain at injection site. Admitted for 4 days.

patient suddenly developed pneumonia 7 days after vaccination and died the evening of developing pneumonia

Couple hours after the vaccine, experienced elevated temperature, difficulty taking full deep breathes (attributed to fatigue). Temperature improved but fatigue and shortness of breathe continued until 1/16/21. a bilater arm rash occurred and employee went to the Emergency Department for an assessment. At this time, she was having chest tightness, shortness of breathe. Lab - troponins elevated. Other labs - within normal limits. Admitted to hospital for observation and discharged next day. Today, during cardiac follow-up appt, was having decreased oxygen saturation levels, increased pulse rate. Admitted again today for obsevation with cncern of acute endocarditis.

Death

1 hour post injection patient returned with redness and borderline hives in her left arm, chest, neck and face. She complained of feeling very hot and with mental confusion. We administered 50 mg of diphenhydramine, and 15 minutes later sent her to the ED. At the ED they diagnosed her with a minor anaphylaxis reaction, gave her methylprednisolone and epinephrine.

"Individual felt fine except a sore arm until 1/5/2021 legs became weak and dizziness and light headed and did t"" feel well"" and passed out. had general muscle weakness and went to ER. She was given fluid for possible dehydration and went home and weakness increase and went back to ER and was admitted to hospital for testing."

Individual had no side effect except sore arm for 5 days then on 1/5/2021 became weak and dizzy and passed out. had not felt well in am. she had continued weakness and extreme leg weakness and taken to ER for evaluation. She states got IV fluids and sent home but weakness increase and went back to ER on 1/5/2021 and admitted to hospital.

patient started to decline 1/10/2021, patient seen at facility by medical professional - patient deceased 1/13/2021

REPORTING ONLY AS RESIDENT EXPIRED ON 1/17/2021 3 DAYS AFTER. S/S HYPOXIA/CONGESTED LUNG SOUNDS

ventricular fibrillation cardiac arrest. Witnessed collapse. Bystander CPR performed. Paramedics performed ACLS with defibrillation x 6 before ROSC

PVCs with compensatory pauses, postural orthostatic hypotension associated with chest tightness, shortness of breath, dizziness and blurry vision

The day following the vaccine, the patient complained of throat issues and anxiety. This was not new... however . That evening he reported difficulty breathing and was placed on oxygen; a COVID test was performed and was negative. On 12/30/2020, patient complained of sternal pressure and was transferred to the hospital. The patient died 12/31/2020 and records obtained from the hospital indicated the patient died from a massive myocardial infarction.

Seizure

WITHIN 30 SECONDS OF RECEIVING VACCINE PATIENT STATED THAT SHE DID NOT FEEL WELL. HER FACE BECAME FLUSHED. HER LIPS BECAME NUMB AND HER TONGUE AND THROAT STARTED SWELLING. AN EPIPEN WAS ADMINISTERED AND 911 CALLED. AFTER THE EPIPEN SYMPTOMS BEGAN TO RESOLVE. EMS CHECKED HER OUT AND SHE REFUSED TRANSPORT.

8 hours after vaccine severe injection site pain/swelling, severe body aches, 101.0 temp. 16 hours after vaccine woke up from sleeping with flushed skin, facial swelling, and throat swelling. I immediately took 100mg of Benadryl and went to hospital emergency room. Approximately 30-40 minutes later symptoms started to lessen. Once at the ER, at the same time symptoms began to resolve, I was given PO Solumedrol and Pepcid. I was monitored and then discharged with RX for prednisone, and EPIPEN (to use if needed). No other issues with allergic reaction. Mild injection site soreness, mild body aches, 99.3 temp persist at 36 hours post injection.

Received Moderna COVID vaccine 12/31/20, 3 days later noticed generalized joint pain all over. Day 4 noticed both knees were red and tender and could palpate pockets of fluid. Had bilateral ankle and foot pain, right ankle swollen. Overnight 1/5-1/6/21 was in severe pain and unable to sleep, very difficult to walk on ankles and feet, stairs were very painful. Motrin relieved symptoms to where able to walk more comfortably but generalized achiness and tenderness to ankles and knees remain.

Anaphylaxis after Covid 19 vaccine #1. Pfizer Lot # EH9899

71 year old woman at rehabilitation center for physical therapy with history of cirrhosis of the liver, asthma, and heart condition was tested for COVID-19 on 01/07/21, received 1st dose of Pfizer COVID-19 vaccine on 01/08/21, positive test result for COVID-19 received on 01/09/21. She was sent to the hospital and admitted on 01/12/21 after O2 was 70% and was in a confused state. Patient passed away on 01/17/21.

Received shot Wednesday night, developed arm soreness and mild flu like symptoms on left side of my body and facial paresthesias on the left side of my face. Twelve hours later, after waking up those same symptoms were only on the right side of my body. Friday morning, mostly normal physically just with some overall fatigue. Friday afternoon I started to get hives on my chest and overnight into Saturday they were on my lower back, sides, and legs. I took 50 mg of Benadryl every 6-12 hours until Monday mid-day when Benadryl was not helping reduce the hives and so I had full body hives. I did try an

drugstore cortisone cream which did not help. Sought treatment at an urgent care as I was feeling anxious and could not control the itching. I and was diagnosed with likely allergic reaction to the covid-19 vaccine.

She woke up soaking wet. She had sweats kind of.; Tested positive for COVID; Tested positive for COVID; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A contactable nurse (patient herself) reported that a 64-year-old female patient received her first dose of bnt162b2 (BNT162B2 also reported as PFIZER-BIONTECH COVID-19 VACCINE, lot EK5730, expiry date not reported), via an unspecified route of administration in the upper left arm on 21Dec2020 17:00 at SINGLE DOSE for Covid-19 immunisation. Medical history included ongoing hypertension (blood pressure high). She was a former smoker, a teenage smoker. She has not smoked since the age of 19 years old. Concomitant medication included amlodipine for high blood pressure. The patient informed that she was vaccinated on 21Dec2020. On 05Jan2021, she had a positive COVID Test and she was wondering when she should have the second dose of the COVID Vaccine. She thought initially she just had a cold. She took the COVID test as a precaution. It started out with a stuffy nose. She had a congested cough, upper airway cough, nothing deep in the lungs. She had a low grade fever. It was like 99.9. It was possible it was higher, but she had taken Ibuprofen at night. She woke up soaking wet. She had sweats kind of. Her temperature however never registered a true fever if a fever was considered 100.4. She was not really having body aches any more unusual than one would have for a 64 year old. She has a very mild sore throat. Her stuffy nose had improved, it's still there slightly, but not like it was the first few days. The outcome of events was unknown.; Sender's Comments: Test positive for covid19 found 14 day following the first dose of COVID-19 vaccination, bnt162b2, no adequate effect of the suspect vaccine thus could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag.

"received the first dose of vaccine in a hospital on 18Dec2020/tested positive for COVID on 01Jan2021; received the first dose of vaccine in a hospital on 18Dec2020/tested positive for COVID on 01Jan2021; This is a spontaneous report from a contactable nurse (patient) via Pfizer-sponsored program, Pfizer First Connect. A 43-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection, Lot number: EK5730, expiration 31Mar2021) , via an unspecified route of administration in left arm, on 18Dec2020 at 15:00, at 0.3 mL, single, for COVID-19 immunization. Medical history and concomitant medications were reported as none. The patient received the first dose of vaccine in a hospital on 18Dec2020 at 15:00 as she works in emergency room and tested positive for COVID on 01Jan2021. The patient stated that the second dose is scheduled this afternoon (08Jan2021) and wants to know if she should proceed with the vaccine. The patient is looking for guidance on whether or not to get the second dose or wait. The patient has been directed to receive second COVID vaccine. No additional vaccines administered on the same date. The event required a visit to urgent care. The patient did not have prior vaccinations within 4 weeks. No events prior to vaccination. The patient underwent lab tests and procedures which included COVID 19: positive on 01Jan2021. Outcome of the events was unknown. The event was assessed as serious (medically significant). The event ""Tested positive for COVID"" was assessed as unrelated to COVID vaccine as her husband was COVID positive before her.; Sender's Comments: The information currently provided is too

limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available."

She reported being exposed to her husband, who tested positive for COVID, and that she tested positive following her first vaccine dose; She reported being exposed to her husband, who tested positive for COVID, and that she tested positive following her first vaccine dose; She reported being exposed to her husband, who tested positive for COVID, and that she tested positive following her first vaccine dose; This is a spontaneous report from a contactable female nurse (patient). A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE Solution for injection, batch/lot no. and expiry date unspecified) via an unspecified route of administration on 23Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient was asking if it is safe to get the second dose of the vaccine after being exposed to or having COVID? She reported being exposed to her husband (on an unspecified date), who tested positive for COVID, and that she tested positive following her first vaccine dose. She got her Covid-19 vaccine on the 23Dec2020 and tested positive for Covid-19 on the 28Dec2020. She was scheduled to get the next dose on Wednesday and wants to know if she should still get it. Outcome of the events drug ineffective, COVID-19 and Exposure to COVID-19 was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 23Dec2020, and COVID-19 test positive on 28Dec2020. No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the positive COVID test was likely associated with being exposed to her husband, who had COVID-19. Further information is needed for full medical assessment.

She had sniffles and post nasal drip; Got first dose then went to (Entertainment complex name) and contracted COVID/tested positive after getting the 1st dose; Tested positive after getting the 1st dose; She returned home with sniffles, fatigue, and no taste/She had sniffles and post nasal drip; This is a spontaneous report from a contactable nurse (patient) via Pfizer-sponsored program: IBCC (Inbound Call Center for HCPs). A 53-year-old female patient received first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EK5730, exp date not reported), via an unspecified route of administration on 19Dec2020 for given since patient works with COVID patients (COVID-19 immunisation). The patient had no relevant medical history. There were no concomitant medications. Nurse called asking if she can get the 2nd dose of the vaccine 6 days after the 21st day. She tested positive on 05Jan2021 after getting the 1st dose and was still in quarantine. The nurse works at a hospital. She received her first dose of the COVID-19 Vaccine on 19Dec2020, and afterwards donated blood on the same day. She got the vaccine through her place of work. She said when she donated blood on 19Dec2020, her blood was tested for the COVID-19 Virus antibodies, and her blood was negative for the virus antibodies. She lives about 30 mins from work, so she thought she would get both done in the same day. She gave blood right before she got the vaccine. She gave the blood then went and got the Vaccine. She said on 26Dec2020 she went to Entertainment complex as it was her vacation. Her and her family went for 4 days. On 30Dec2020 she returned home with sniffles, fatigue, and no taste. She said she tested positive for the COVID-19 Virus on 05Jan2021. On 30Dec2020 they got back,

and on 02Jan2021 she had sniffles and post nasal drip. On 03Jan2021 she did not wanna get out of bed. She was profoundly fatigued. She also lost her smell. She had to go back to work on 07Jan2021, but did not want to go back in unless she was sure she was okay because she works with babies. She had no other symptoms after 03Jan2021, except no smell and no taste. She got tested for COVID and was positive on 05Jan2021 (also reported as 06Jan2021 [pending clarification]). Her and her husband were both positive, but her kids were not. The weird thing was she also on 06Jan2021 got her results back from giving blood and she was negative for COVID on 19Dec2020 prior to getting the vaccine. Caller clarifies that her COVID test was a nasal swab. Patient thought her age may have contributed to her feelings of fatigue. She had indicated she worked in either a hospital NICU or nursery, and that is why she had to quarantine for 14 days. She probably would not have even gotten tested for COVID if she was not a nurse and did not know that losing taste and smell were a sign. She feels fine. She said she was scheduled for her second dose of the COVID-19 Vaccine on 12Jan2021. She said she was now in quarantine for 14 days due to testing positive for the COVID-19 Virus, and her quarantine period ends on 14Jan2021. Since now she is in quarantine, she will miss her second dose which was supposed to be on 12Jan2021. She said she rescheduled her second dose of the COVID-19 Vaccine to 18Jan2021, which was 6 days later than when she was supposed to receive the 2nd COVID-19 Vaccine dose. She asked if getting the dose 6 days late was okay. The events were considered as non-serious by the reporter. The outcome of the events was unknown.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

tested positive for COVID; tested positive for COVID; achiness; Chills; not feeling well; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect. A contactable consumer (patient's wife) reported similar events for four patients. This is the first of four reports. A 48-year-old male patient received his first dose of bnt162b2 (BNT162B2 also reported as Pfizer-Biontech Covid-19 Vaccine, lot/batch number and expiry date were not reported), via an unspecified route of administration on 17Dec2020 at single dose, for Covid-19 immunisation. Medical history was none. There were no concomitant medications. The patient received the vaccine last 17Dec2020. The following day, 18Dec2020, he was not feeling well. Clarified those side effects as achiness and chills. He had been working so hard and thought initially were getting side effects from the COVID Vaccine. He was tested positive for COVID on 22Dec2020. He was in bed basically until 31Dec2020. His wife wants to know if he should get the second dose. The outcome of events was recovered. Information on the Lot/Batch number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021019513 same drug, similar events, different patient;US-PFIZER INC-2021019535 same drug, similar events, different patient;US-PFIZER INC-2021019534 same drug, similar events, different patient

"tested positive for SARS-COV-2; tested positive for SARS-COV-2; This is a spontaneous report from a Pfizer-sponsored program Pfizer First Connect, received from a contactable nurse (patient). A 31-year-

old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot/batch number and expiry date were not reported), via an unspecified route of administration on 18Dec2020 at a single dose for an unspecified indication. The patient's medical history and concomitant medications were not reported. The patient received first dose of vaccine on 18Dec2020 and tested positive for SARS-COV-2 20Dec2020. She reported ""las major symptom"" on 27Dec2020 and asked if it was okay to take the second dose. Outcome of the events was unknown. Information about lot/batch number has been requested.; Sender's Comments: Positive SARS-COV-2 came back 2 days following the vaccine use is compatible with COVID 19 infection. No adequate effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag."

Fevers; Chills; he is suspecting that he got infected with the Covid-19 though he already received the 1st dose; he is suspecting that he got infected with the Covid-19 though he already received the 1st dose; Body aches; Patient suspected that he has gotten infected also from his spouse; This is a spontaneous report from a contactable physician (patient). A 48-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 05Jan2021 (Tuesday) at single dose for covid-19 immunization. The patient medical history and concomitant medications were not reported. Patient reported body aches developing the evening of receiving the vaccine, and it has persisted for three days. Patient started to get the chills on Wednesday (06Jan2021). Patient said his wife has been tested positive after he took the 1st dose and he is suspecting that he got infected with the Covid-19 though he already received the 1st dose. Patient thought that he may have been infected by his spouse. He got the vaccine on Tuesday and on Wednesday had fever and chills and still has them. Stated that his spouse lost her sense of smell and taste and tested positive for Covid on Wednesday. Patient stated that this was the day after he received his vaccine. Patient suspected that he has gotten infected also from his spouse and was not aware when he got the vaccine. Stated that now that he is having expected side effects of fever and chills. The outcome events was not recovered. This case was reported as non-serious. Information on the lot/batch number has been requested.; Sender's Comments: The subject received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 05Jan2021, and suspected got COVID-19 infection via exposure to COVID-19 living with his wife, who lost her sense of smell and taste and tested positive for COVID on 06Jan2021. No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Further information is needed for full medical assessment.

exposed to her 6 month old grand daughter who was positive; tested and received a positive test result, without symptoms.; tested and received a positive test result, without symptoms.; This is a spontaneous report from a contactable consumer. A 59-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EJ1685), via an unspecified route of administration at the right arm on 30Dec2020 at a single dose for COVID-19 immunization. Medical history included high blood pressure from 2001 and ongoing. There were no concomitant medications. Patient had the flu, shingles and pneumonia vaccines and a booster for MMR in the past 6 months. Patient was exposed to COVID-19 on 01Jan2021. Patient was tested on 07Jan2021 and received a positive test result on

08Jan2021. Patient does not have any symptoms. She was exposed to her 6 month old grand daughter who was positive. The doctor said he thinks it was a false positive. Outcome of the events was unknown.

Tested positive for the Covid virus; Tested positive for the Covid virus; This is a spontaneous report from a contactable nurse. A male patient of an unspecified age received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 29Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient received the first dose of the vaccine on 29Dec2020 and four days ago, he tested positive for the Covid virus (02Jan2021). The outcome of the event was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Test positive for the Covid virus found 4 day following the vaccination, no adequate effect of the suspect vaccine thus could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag.

"the symptoms as ""having Covid all over again""; the symptoms as ""having Covid all over again""; headache; nausea; severe joint and body pain; body pain; coughing; fever; This is a spontaneous report from a contactable other healthcare professional (HCP) reporting for herself. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. Medical history included covid-19 from an unknown date. The patient's concomitant medications were not reported. The patient just got the Covid vaccine and was experiencing side effects. She described the symptoms as ""having Covid all over again"", mentioned headache, nausea, severe joint and body pain, coughing and fever on an unknown date. Want to see how long these side effects last. The outcome of the events was unknown. Information regarding lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further information like confirmative virus genome /nucleic acid detection is needed for meaningful medical assessment."

caller was rushed to the emergency room and was tested positive for COVID-19; caller was rushed to the emergency room and was tested positive for COVID-19; caller became symptomatic and experienced headaches; This is a spontaneous report from a contactable physician. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 18Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that the patient received the first dose on 18Dec2020 and is scheduled for the second dose today, 09Jan2021. However, on 24Dec2020, she became symptomatic and experienced headaches. On Saturday, she was rushed to the emergency room and was tested positive for COVID-19. Her physician told her that she could get the COVID-19 vaccine if she has no symptoms anymore. She wanted to know the guidance per Pfizer. The patient underwent lab tests and procedures which included SARS-COV-2 test: positive on 09Jan2021. The outcome of the events was unknown. Information about lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient cannot be completely excluded.

got a positive test on 31Dec2020. Her 2nd dose is due on Wed and she is currently symptomatic.; got a positive test on 31Dec2020. Her 2nd dose is due on Wed and she is currently symptomatic.; This is a spontaneous report from a contactable consumer via Pfizer-sponsored program . A female patient of an unspecified age received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot and expiration date unknown), via an unspecified route of administration on an unspecified date at a single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. On 31Dec2020, the patient got a positive test. Her 2nd dose was due on wed and she was currently symptomatic. Patent would to know if she should get second dose on her scheduled date even though she still was feeling unwell. The outcome of the events was unknown. Information about batch/lot number has been requested.

COVID test result as positive; COVID test result as positive; Chills; Body aches; Headache; Weakness; This is a spontaneous report from a contactable nurse (patient). A 46-year-old female patient received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection, Lot number: 49899, unknown expiration), intramuscular in right arm, in Dec2020 at 09:00 AM, at single dose, for COVID-19 immunization. Medical history included asthma, hypothyroid, and interstitial cystitis. The patient has no known allergies. Concomitant medication included influenza vaccine in right arm (lot number: US47SAA) on 08Dec2020 for immunization. Patient also received other unspecified medication within two weeks of vaccination. COVID-19 vaccine was administered in a hospital. On 23Dec2020 at 01:30 AM, the patient woke up with chills, body aches, headache and weakness. On 31Dec2020, the patient had nasal swab for COVID with COVID test result as positive post vaccination. Patient is not pregnant at the time of vaccination. The patient did not have COVID prior to vaccination. The patient received ibuprofen for the events chills, body aches, headache and weakness. The patient recovered from the events chills, body aches, headache and weakness on unspecified date; while unknown outcome for the remaining events.; Sender's Comments: The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 23Dec2020, and nasal swab for COVID-19 test positive on 31Dec2020. No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, the positive COVID likely represents the pre-existing infection prior to vaccine use. Further information is needed for full medical assessment.

maybe she could have COVID too; maybe she could have COVID too; a rash on her leg; some shortness of breath; This is a spontaneous report from a contactable consumer. A 72-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiry date were not reported), via an unspecified route of administration on 06Jan2021 at a single dose for Covid-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that the patient received her first dose of COVID-19 vaccine on Wednesday, 06Jan2021 and today, on 09Jan2021, the patient started having a rash on her leg, some shortness of breath. She used an asthma inhaler. She experienced some of the symptoms before Wednesday. The reporter was concerned that maybe the patient could have COVID, too. The reporter heard that with COVID, sometimes rashes and/or shortness of breath can come, too. The outcome of the events was unknown. Information on the lot/batch number has been requested.

severe headache behind the eyes; Initially extreme fatigue; started to have shortness of breath; muscle aches; cough; second dose on 05Jan2021 08:30; This is a spontaneous report from a contactable physician (patient). A 39-year-old female patient received second dose of BNT162B2 (Lot number: EL3246), intramuscularly on 05Jan2021 08:30 in left arm at single dose for COVID-19 immunization. Medical history included known allergies: latex and asthma. Patient did not have COVID prior vaccination. Concomitant medications included sertraline hydrochloride (ZOLOFT), drospirenone/ethinylestradiol (YASMIN), melatonin, and ibuprofen (MOTRIN). Patient previously took montelukast sodium (SINGULAIR) and experienced allergy. Patient received first dose of BNT162B2 (Lot number: EK5730), intramuscularly on 18Dec2020 09:00 in left arm at single dose for COVID-19 immunization. Patient experienced initially extreme fatigue, then muscle ached all within 12-24 hours, severe headache behind the eyes. Then when thought was getting better, she started to have shortness of breath, worsening fatigue, and cough; all on 05Jan2021 12:00. These events were resulted in emergency room/department or urgent care. COVID was tested post vaccination. COVID test type post vaccination was nasal swab. COVID test name post vaccination was COVID 19 nasopharyngeal swan. COVID test date was on 08Jan2021. Test result was pending. Treatment received included nebulizer treatment, and steroid course. Patient was not recovered from these events.; Sender's Comments: Based on a compatible temporal relationship and known product safety profile, causality between events severe headache and extreme fatigue and BNT162B2 vaccine cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Hospitalized for stroke on 31Dec two days after vaccine.; sudden loss of hearing to right ear; dizzy and lightheaded/severe dizziness/felt like fainting; difficulty breathing; vomiting; This is a spontaneous report from a contactable nurse (patient). This 43-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), (Lot number: EL1285) via intramuscular route on 29Dec2020 14:30 at single dose on the left arm for COVID-19 immunization. Medical history included anxiety. No known allergies. Concomitant medications were not reported. Patient was not pregnant. Facility type vaccine was Nursing Home/Senior Living Facility. No other vaccine received in four weeks. Patient hospitalized for stroke on 31Dec2020 two days after vaccine (Days of hospitalization: 4). Day of vaccine-6 hours after patient had dizzy and lightheaded for about 45 min then went away. On 31Dec2020 at 19:15 had sudden loss of hearing to right ear and severe dizziness, difficulty breathing, vomiting, and felt like fainting. Paramedics were called-sent to ER, had CTA which showed partial blockage and received TPA. Treatment included TPA, fluids, medications, hospital stay, outpatient follow ups, physical therapy. Patient was not diagnosed with COVID prior to vaccination. Patient has been tested for COVID post vaccination. The patient underwent lab tests and procedures which included Nasal Swab: Negative and Pixel: Negative on 08Jan2021. Outcome of the events was recovering.; Sender's Comments: The Company cannot completely exclude the possible causality between the reported events including stroke, dizzy/lightheaded/felt like fainting, difficulty breathing, vomiting, and sudden loss of hearing to right, and the administration of the COVID-19 vaccine, BNT162B2. More

information regarding the patient's underlying medical conditions, relevant lab tests would be helpful for the Company to make a more meaningful causality assessment.

fever 102 F; headache; chills; body aches; This is a spontaneous report from a contactable Nurse reported for herself. A 63-years-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) at single dose on 22Dec2020 14:30 and the second dose single dose (lot number=EK9231) on 09Jan2021 19:15 for COVID-19 immunization. Vaccine location=Left arm, dose number 1 and dose number 2. Facility-type-vaccine: Hospital. Medical history included asthma. The patient's concomitant medications were not reported. On 10Jan2021 at 14:00 the patient experienced headache with outcome of not recovered, fever 102 ¦F with outcome of not recovered, chills with outcome of not recovered and body aches with outcome of not recovered. The action taken was not applicable. Tylenol was received as therapeutic measures for fever.; Sender's Comments: Based on a compatible temporal association and known product safety profile, a causal relationship between reported events and BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Developed chest tightness around right side of chest into back and SOB 50.5 hours after vaccination. Went to local ER and found to have a right lower lobe pulmonary embolism. Treated with Xarelto and sent home with outpatient follow up.

Temperature spike to 104.6; received first dose of bnt162b2 on 20Dec2020 and second dose on 08Jan2021 13:15; This is a spontaneous report from a contactable consumer. A 38-year-old male patient received the second dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were not reported), via an unspecified route of administration, on the left arm on 08Jan2021 13:15 at a single dose for COVID-19 immunization. Medical history included prediabetic kidney disease. Concomitant medications included salmo salar oil (OMEGA-3 [SALMO SALAR OIL]), lisinopril, furosemide, escitalopram, and rosuvastatin calcium (CRESTOR). The patient is reported to have received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) on 20Dec2020 15:45, on the left arm, for COVID-19 immunization. The patient had no prior Covid vaccination. The patient was not tested for Covid post vaccination. The patient had no known allergies. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. It was reported that the patient received first dose of bnt162b2 on 20Dec2020 and second dose on 08Jan2021 13:15. On 09Jan2021 at 04:30, the patient experienced temperature spike to 104.6, brought down with TYLENOL to hover around 101.0 to 102.0 for 24 hours, normal after that. The patient called a nurse who instructed to go the emergency room/physician office visit. Outcome of the event Temperature spike to 104.6 was recovered on unspecified date in Jan2021. Information about lot/batch number has been requested.

tested positive for COVID; tested positive for COVID; This is a spontaneous report from a non-contactable consumer. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH

COVID-19 VACCINE), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient who is a nurse visited last weekend in the reporter's home for a few hours was advised that she tested positive for COVID today (unspecified date) and her family as well. She was vaccinated recently with the Pfizer vaccine. The outcome of the events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

I tested positive for COVID 8 days after my first dose.; I tested positive for COVID 8 days after my first dose.; This is a spontaneous report from a contactable consumer (patient). A 55-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiration date were not reported), via an unspecified route of administration on an unspecified date in Dec2020 at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient got his first dose of Pfizer COVID 19 vaccine 21 days ago in Dec2020. He mentioned that he tested positive for COVID 8 days after his first dose in Dec2020. He stated that he got the second dose yesterday (unspecified date) and queried if should he not have gotten it. The outcome of the events was unknown. Information about Lot/batch number has been requested.

9th: cold (?fever?), restless, body aches (especially headache, neck pain, bilateral knee pain), nausea, vomiting 10th: profound fatigue, hives, intermittent vertigo 11-17th: vertigo, mild headache and neck pain, nausea, vomiting 18th-current: vertigo, nausea, vomiting *Hospitalized from 17-18th, diagnosed with vestibular neuritis secondary to the vaccine

positive COVID-19 test with symptoms; positive COVID-19 test with symptoms; This is a spontaneous report from a Pfizer-sponsored program, Pfizer First Connect. A contactable 39-year-old male healthcare professional reported to have received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 02Jan2021, for COVID-19 immunization. Medical history and concomitant medications were not reported. On an unspecified date in Jan2021, after the first dose of vaccine, the patient felt sick at some point, so he took a rapid test which came back positive. He stated that the test if testing the antigens (as reported). Antibody testing was not currently recommended to assess for immunity to COVID-19 following Pfizer-BioNTech COVID-19 vaccination. Events outcome was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with BNT162B2 in this patient cannot be completely excluded.

13 people, who were applied the vaccine previously, were corona positive after a week; 13 people, who were applied the vaccine previously, were corona positive after a week; This is a spontaneous report from a non-contactable consumer. This consumer reported similar events for 13 patients. This is first of 13 reports. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Solution for injection; lot number and expiration date: not known), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that 13 people, who were applied the vaccine previously, were corona positive after a week on an unspecified date. The outcome of the events was unknown. No follow-up attempts are possible; information about lot/batch number

After getting the first shot and the patient test positive for Corona virus; After getting the first shot and the patient test positive/perhaps positive; This is a spontaneous report from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A contactable pharmacist reported that a patient of unspecified age and gender started to receive BNT162B2 (PFIZER BIONTECH COVID-19 VACCINE), via an unspecified route of administration, first dose on an unspecified date at single dose for COVID-19 vaccination. The patient's medical history and concomitant medications were not reported. A pharmacist in a hospital wanted to know if after getting the first shot and the patient test positive for Corona virus, how long do they have to wait to get the second? A colleague is perhaps positive. He doesn't know if they got tested. Outcome of the events was unknown. Information on the lot/ batch number has been requested.; Sender's Comments: A causal association between reported event and BNT162B2 cannot be excluded.

Tested positive for COVID; Tested positive for COVID; Phlegm in throat; Cough; Runny nose; cold; Sneezing; Body aches; Nausea; Chills; Headache; This is a spontaneous report from a contactable consumer (patient). A 51-year-old female patient received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 29Dec2020 14:50 at single dose at right arm for covid-19 immunization. No additional vaccines administered on the same date. Patient didn't receive any other vaccines within 4 weeks prior to the COVID vaccine. Medical history included ongoing migraine. Concomitant medication included acetylsalicylic acid, caffeine, paracetamol (EXCEDRIN EXTRA STRENGTH) for migraine, patient had been alternating this with paracetamol (TYLENOL) while she has been recovering. She clarified the symptoms she experienced as the same day she got the vaccine that evening she had a headache on 29Dec2020. It eventually became a migraine and she left work early. On 30Dec2020 she had body aches, little nausea, and chills. On 31Dec2020, she had more chills, a runny nose, she felt like she was coming down with a cold. She was sneezing, had more chills, more body aches. On 01Jan2021 she felt like she noticed she had phlegm in her throat, but she did not have any pain. The phlegm was causing her to cough more. She had a runny nose the next morning as well. She did the rapid test for COVID on 02Jan2021 evening, and it was positive. She had a headache almost every day. The body aches had pretty much worn off. Runny nose and sneezing

resolved in Jan2021. Phlegm in throat confirmed with no pain. This also resolved, as well as coughing. Outcome of event tested positive for COVID was unknown, outcome of event headache was not recovered. outcome of event nausea was recovered on 07Jan2021, event chills was recovered on 08Jan2021, outcome of other events was recovered on unspecified date in Jan2021. The adverse events resulted in neither doctor or other healthcare professional office/clinic visit, nor emergency room/department or urgent care. Information of lot/batch number has been requested.

Positive COVID test; Positive COVID test; This is a spontaneous report from a contactable consumer (patient's wife). This consumer reported similar events for 2 patients. This is the 2nd of 2 reports. A male patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not reported), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient was an Odontist and received COVID vaccine on Monday. He was scheduled to have a cath done on Thursday, but that was not happening now. The patient has positive COVID test. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021013678 same reporter/drug, similar event, different patient

Her stomach is still weirded out/sour stomach; feeling sick; arm pain; She was sick to her stomach; kidneys were hurting; body aches; tested positive; tested positive; The arm wasn't swollen it was just burning.; This is a spontaneous report from a contactable consumer (patient). A 51-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number EL1284) via an unspecified route of administration on 29Dec2020 at single dose for COVID-19 immunization. Medical history was none. The patient's concomitant medications were not reported. At first, she thought she was having a reaction, but then she started feeling sick so she got tested. She was positive so she wasn't having a reaction. She was scared from the pain of COVID. She experienced sickness. Her stomach was still weirded out. She did experience arm pain from the vaccine. Her doctor told her it was fine that it needed to air out. She left the bandage on too long. She didn't have a prescribing doctor. She received the vaccine on the 29Dec2020. She tested positive 02Jan2020. The arm wasn't swollen it was just burning. She was sick to her stomach when she got the stomach. The sick to the stomach lasted maybe two days, but then she got COVID. The burning was around the arm. It wasn't that bad. It lasted for a day. It started the day she got the shot (on the 29Dec2020). On 07Jan2021, she went to the hospital because her kidneys were hurting. The doctor said her kidneys were good. They did labs which were good. She was still going through body aches. She was told she was currently in the worst part of the virus. She still had a sour stomach going on from the virus as well. The outcome of the body aches and sour stomach was not recovered, for other events was unknown.

tested positive after receiving the vaccine; tested positive after receiving the vaccine; she did not think symptoms were related to COVID like leg pain. She noticed that it was a lot worst; she did not think symptoms were related to COVID like leg pain. She noticed that it was a lot worst; This is a spontaneous report from a contactable consumer (patient herself). A 27-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE Solution for injection, batch/lot no. EH9899 and expiry date Mar2021), via an unspecified route of administration on 05Jan2021 on her left arm at a single dose

for covid-19 immunization. Medical history included leg pain. There was no reported concomitant medications. On an unspecified date, patient received COVID vaccine. She stated that she was symptomatic during the vaccine and somewhere after confirmed that she was COVID-positive. She wanted to know if there are any health concerns with getting the vaccine while COVID positive. She added that this was her first dose. she did not think symptoms were related to COVID like leg pain. She noticed that it was a lot worst but did not think that it was a symptom. She stated that she does not recall the first time ever that she had leg pain but stated that the leg pain was really bad the night before the vaccine. She added that she was isolated until 14Jan2021. Outcome of the events drug ineffective, COVID-19 virus test positive and leg pain were unknown.; Sender's Comments: Leg pain is considered intercurrent and unrelated to suspect BNT162B2.

COVID-19 or flu-like symptoms following COVID-19 vaccination/COVID-19 results were to be positive; COVID-19 or flu-like symptoms following COVID-19 vaccination/COVID-19 results were to be positive; COVID-19 or flu-like symptoms following COVID-19 vaccination; This is a spontaneous report from a contactable Other-HCP. A 61-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via unspecified route of administration on unspecified date at single dose for COVID-19 immunization. Patient medical history and concomitant medications were not reported. On unspecified date, COVID-19 or flu-like symptoms following COVID-19 vaccination was reported for the patient. COVID-19 results were to be positive on unspecified date. Changing diet to vegan was reported. Outcome of the events was unknown. Information on the lot/batch number has been requested.

contracted COVID two days after receiving vaccine; contracted COVID two days after receiving vaccine; This is a spontaneous report from a non-contactable nurse. A patient of unspecified age and gender received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. It was reported that the patient got their first dose of the COVID vaccination. The patient contracted COVID on an unspecified date two days after receiving the vaccine. The outcome of the events was unknown. No follow-up attempts are possible. Information about lot/batch could not be obtained. No further information is expected.; Sender's Comments: A causal association between reported event and suspect BNT162B2 cannot be excluded.

tested positive for covid; tested positive for covid; This is a spontaneous report from a contactable consumer (patient) via a Pfizer sponsored program Pfizer Connect. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date not reported), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient works for a hospital. Said had 1st dose of vaccine. Had tested positive for covid on an unspecified date and is under quarantine. The patient would like to know when she should get 2nd dose. The patient underwent lab tests and procedures which included sars-cov-2 test: positive on an unspecified date. The outcome of the events was unknown. Information on the lot/Batch number has been requested.

got sick and tested positive with COVID; got sick and tested positive with COVID; This is a spontaneous report from a contactable consumer via Pfizer Sponsored Pfizer First Connect. A contactable consumer reported similar events for four patients. This is second of four reports. A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot and expiration date unknown), via an unspecified route of administration on an unspecified date at a single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. It was reported that the patient got sick and tested positive with covid on an unspecified date. It was further reported that patient who received the COVID vaccine, tested positive for COVID, and experienced side effects afterwards. The outcome of the events was unknown. Information about batch/lot number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021013589 same drug, similar events, different patient

got sick and tested positive with COVID; got sick and tested positive with COVID; This is a spontaneous report from a contactable consumer via Pfizer Sponsored Pfizer First Connect. A contactable consumer reported similar events for four patients. This is fourth of four reports. A patient of unspecified age and gender received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, batch/lot and expiration date unknown), via an unspecified route of administration on an unspecified date at a single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient got sick and tested positive with covid on an unspecified date and experienced side effects afterwards. The outcome of the events was unknown. Information about batch/lot number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021013589 same drug, similar events, different patient

got sick and tested positive with COVID after getting the first dose of the COVID vaccine; got sick and tested positive with COVID after getting the first dose of the COVID vaccine; This is a spontaneous report from a contactable consumer received from Pfizer-sponsored program Pfizer First Connect. This consumer reported similar events for four patients. This is 3rd of four reports. A patient of unspecified age and gender received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were not reported), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient got sick and tested positive with COVID after getting the first dose of the COVID vaccine. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021013589 same reporter, same product, similar events, different patient.

caller tested positive on covid a week after taking the 1st dose of vaccine; caller tested positive on covid a week after taking the 1st dose of vaccine; This is a spontaneous report from a contactable consumer (patient) via Pfizer-sponsored program Pfizer First Connect. A female patient of an unspecified age received the 1st dose of bnt162b2 (BNT162B2) at single dose on an unspecified date for Covid-19 immunisation. The patient medical history was and concomitant medications were not reported. The patient was tested positive for Covid a week after taking the 1st dose of vaccine on an unspecified date. The outcome of events was unknown. Patient wanted to know if she can get the second dose. Information on the lot/batch number has been requested.

"COVID-19 virus test positive; COVID-19 virus test positive; This is a spontaneous report from a Pfizer-sponsored program ""Pfizer First Connect"" from a contactable consumer reporting for himself. A male patient of an unspecified age received the 1st dose of bnt162b2 (BNT162B2), via an unspecified route of administration, on 22Dec2020, at single dose, for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient experienced COVID-19 virus test positive on an unspecified date with outcome of unknown. It was reported that the patient was scheduled to get his second dose on 12Jan2021, however between 22Dec2020 and 12Jan2021 the patient experienced the adverse event. The information on the lot/batch number has been requested."

Got the first dose and was contracted with COVID; Got the first dose and was contracted with COVID; This is a spontaneous report from a contactable consumer (patient) from a Pfizer-sponsored program IBCC (Inbound Call Center for HCPs). A female patient of an unspecified age received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 20Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient was contracted with covid on an unspecified date in Dec2020 (27Dec2020 or 28Dec2020) with outcome of unknown. Information about lot/batch number has been requested.

throat swelling; headache; Pain; little bit of chills; GI upset; This is a spontaneous report from a contactable nurse. A 48-year-old female patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot: EK9231, expiry: 30Apr2021), via an unspecified route of administration on an unspecified date at 0.3 mL, single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received her first dose of bnt162b2 on an unknown date for covid-19 immunization and experienced pain at the injection site. On an unspecified date, the patient experienced head ache, throat swelling, gastrointestinal (GI) upset, pain, and little bit of chills (don't believe to have had fever). It was clarified that the event took place after use of product. The outcome of the events was unknown.; Sender's Comments: The information in this report is limited, and does not allow a full medically meaningful assessment of the case. Considering temporal relationship, a causal relationship between the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE) and the reported events including throat swelling cannot be excluded. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

five employees in a nursing home have gotten the first dose of the vaccine, and then tested positive for COVID; five employees in a nursing home have gotten the first dose of the vaccine, and then tested positive for COVID; This is a spontaneous report from a contactable nurse. This nurse reported similar events for five patients. This is the first of five reports. A patient of unspecified age and gender received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; lot number and expiry date not reported) via an unspecified route of administration, on an unspecified date, single dose for COVID-19 immunization. Relevant medical history and concomitant medications were not reported.

It was reported that five employees in a nursing home have gotten the first dose of the vaccine, and then tested positive for COVID on an unspecified date. They would like to know if they still get the second dose. Outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on available information, a possible contributory role of the subject product, BNT162B2 vaccine, cannot be excluded for the reported events of Covid-19 virus test positive and suspected LOE due to temporal relationship. There is limited information provided in this report. Additional information is needed to better assess the case, including complete medical history, diagnostics, counteractive treatment measures and concomitant medications. This case will be reassessed once additional information is available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2021021909 Same reporter/ drug/ event for different patients.;US-PFIZER INC-2021021910 Same reporter/ drug/ event for different patients.;US-PFIZER INC-2021021911 Same reporter/ drug/ event for different patients.;US-PFIZER INC-2021021912 Same reporter/ drug/ event for different patients.

five employees in a nursing home have gotten the first dose of the vaccine, and then tested positive for COVID; five employees in a nursing home have gotten the first dose of the vaccine, and then tested positive for COVID; This is a spontaneous report from contactable nurse. This nurse reported similar events for 5 patients. This is the second of five reports. A patient of unspecified age and gender received first dose BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection; lot number and expiry date not reported) via an unspecified route of administration, on an unspecified date, single dose for COVID-19 immunization. Relevant medical history and concomitant medications were not reported. It was reported that five employees in a nursing home have gotten the first dose of the vaccine, and then tested positive for COVID on an unspecified date. five employees in a nursing home have gotten the first dose of the vaccine, and then tested positive for COVID; five employees in a nursing home have gotten the first dose of the vaccine, and then tested positive for COVID; she had felt weird; This is a spontaneous report from a contactable nurse. This nurse reported similar events for five patients. This is the fifth of five reports. A female patient of an unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; batch/lot number and expiration date unknown), via an unspecified route of administration on an unspecified date at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The nurse reported on behalf of her sister (patient). It was reported that the patient called right before Christmas and she had gotten the Pfizer COVID Vaccine. She reported that she had felt weird and had side effects to the vaccine. The patient works in a nursing home type thing, and she said she has had people who have gotten the first dose of the vaccine, and then tested positive for COVID. The patient called to ask the reporter if they should still get the second dose. The only other details that her sister (patient) provided her was that this has happened with several people; 5 employees and several or 9 patients. She is unsure if she said several patients or 9 patients, but there were 5 employees. The outcome of the events was unknown. Information on the lot/batch number has been requested.; Sender's Comments: The information currently provided is too limited to make a meaningful medical assessment hence, the events are conservatively assessed as related to the suspect drug BNT162B2 until further information becomes available. Committees, and Investigators, as appropriate.,Linked Report(s) : US-PFIZER INC-2021021881 Same reporter/ drug/ event for different patients.

Diarrhea; nausea and vomiting; nausea and vomiting; rash on her right arm, like a hive or whelp; Fever; Headache; really sore right arm; right arm felt numb; This is a spontaneous report from a contactable nurse (patient). A 44-year-old female patient received the first dose of BNT162B2 (Pfizer COVD 19 vaccine), lot number: EL0142, via an unspecified route of administration on 07Jan2021 17:00 at single dose in right arm for COVID-19 immunisation. Medical history included blood pressure abnormal, had a cough from having COVID 19 on 16Dec2020, cough was ongoing and unknown for COVID-19. Concomitant medication included amlodipine from an unspecified date (taking for 2 years) and ongoing at 10mg once daily by mouth for blood pressure abnormal. No other vaccines were administered on same date and no prior vaccinations (within 4 weeks). Registered nurse (patient) was calling regarding Pfizer COVID 19 vaccine. Reported she received the first dose last Wednesday 07Jan2021 17:00 in the right arm. Reported she noticed the next day (08Jan2021) fever and a headache. On 08Jan2021, Friday she had a really sore right arm and her right arm felt numb. On 09Jan2021, Saturday, she experienced nausea and vomiting and also noticed a rash on her right arm, like a hive or whelp. On 10Jan2021 Sunday, again with the fever, nausea, vomiting and she had diarrhea. Today she stated she woke up a new woman. She feels felt with no fever and her arm was better. She still had a cough from having COVID 19 on 16Dec2020. Stated she was used to coughing. Added she treated the fever with Tylenol 1000mg. Stated she didn't remember exactly but she took a little everyday starting on Thursday the day after the vaccine. Stated she was unsure if she would have the next dose. The events didn't require a visit to physician office or emergency room. The outcome of fever was recovered on 10Jan2021, of Headache, sore arm, rash on right arm, nausea and vomiting was recovered on 11Jan2021, of arm numb was recovered on 09Jan2021, of diarrhea was recovering. Serious criteria for fever was reported as yes, medical significant, for Headache, sore arm, arm numb and Diarrhea was non-serious, for rash on right arm, nausea and vomiting was unspecified.; Sender's Comments: Based on the compatible time association, the event fever is possibly related to suspect BNT162B2 administration. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

COVID-19 confirmed by positive COVID-19 test; COVID-19 confirmed by positive COVID-19 test; This is a spontaneous report from a contactable consumer (patient). A patient of unspecified age and gender received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient develop Covid-19 diagnosed by PCR about may be six or seven days after received the vaccine. The patient recovered from the event. Information on the lot/batch number has been requested.

after the patient got vaccinated his relative tested positive; after the patient got vaccinated his relative tested positive; This is a spontaneous report from a Pfizer-sponsored program . A contactable nurse (relative of the patient) reported for a patient of unspecified age and gender received the first dose of

bnt162b2 (also reported as Pfizer Covid-19 Vaccine, lot no. and expiry date was not reported), via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The nurse called in because his relative got the 1st dose of vaccine but after the patient got vaccinated his relative tested positive on unspecified date. The nurse called in if the patient can take the 2nd dose of vaccine. The outcome of the event was unknown. Information on the Lot/Batch number has been requested.; Sender's Comments: The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) but after the patient got vaccinated his relative tested positive on unspecified date. The case will be reassessed should additional information become available.

Tested positive for COVID; Tested positive for COVID; This is a spontaneous report from a contactable nurse (patient). A male patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date not provided), via an unspecified route of administration on 22Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and patient's concomitant medications were not reported. The patient received his first dose on 22Dec2020 then, nine days later, on 31Dec2020, he tested positive for COVID. He is scheduled for his second dose on 12Jan2021. However, he is still out of work. He called to see if he could get his second dose a couple of days later or does it have to be exactly 3 weeks from the first shot and if it is okay to go a little longer. During the call, he stated he just wanted his question answered about the second shot, if can he wait a little longer. The outcome of the events was unknown. Follow-up attempts are completed. The following information on the batch number has been requested.; Sender's Comments: A causal association between reported event and suspect BNT162B2 cannot be excluded.

Got my Covid vaccine on the 20th and then I came back positive for Covid last week; Got my Covid vaccine on the 20th and then I came back positive for Covid last week; This is a spontaneous report from a contactable consumer. A patient of unspecified age and gender started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, solution for injection, lot number/expiration date unknown), via an unspecified route of administration on 20Dec2020 at a single dose for COVID-19 immunisation. The patient's medical history and concomitant medications were not reported. It was reported that the patient got the COVID vaccine on the 20th (20Dec2020) and then came back positive for COVID on an unspecified in Jan2021 (reported as last week), then tested negative on 08Jan2021 and was due for vaccine on 09Jan2021. It was asked if the patient will be able to get the vaccine. The outcome of the events was recovered on 08Jan2021. Information on the lot/batch number has been requested.

"diagnosed with Covid; diagnosed with Covid; This is a spontaneous report from contactable other healthcare professional via a Pfizer sales representative. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot number and expiry date was not reported) via an unspecified route of administration on 04Jan2021 at single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. It was reported that the patient received the vaccine on 04Jan2021 and was diagnosed with COVID on 07Jan2021. Outcome of the event was unknown. Information about Lot/Batch number has been requested.; Sender's Comments: Although, BNT162B2 vaccine immunogenicity is not in full effect after short time (3 days in this case) from the first dose administration, a causal relationship between event

""diagnosed with COVID"" (coded to Drug ineffective / COVID-19) and BNT162B2 vaccine cannot be completely excluded."

Patient received 1st dose on 28Dec and presented symptoms on 05Jan; Patient received 1st dose on 28Dec and presented symptoms on 05Jan; This is a spontaneous report from a contactable pharmacist reporting for self via Pfizer field representative (Field Medical Director). A patient of unspecified age and gender received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (lot number and expiry date not reported) on 28Dec2020 via an unspecified route of administration for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient presented COVID-19 symptoms on 05Jan2021. No lab tests reported. The outcome of the event was unknown. Information about lot/batch number has been requested.; Sender's Comments: The patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE) on 28Dec2020, and patient presented COVID-19 symptoms on 05Jan2021. No effect of the suspect vaccine could be reasonably achieved to protect from the targeted infection/disease due to the very short time lag. Instead, patient's COVID-19 symptoms on 05Jan2021 likely represents a pre-existing infection prior to vaccine use. Further information is needed for full medical assessment.

This morning he is diabetic. His sugar it was elevated, it was up to 300 which is he said much higher than normal; This is a spontaneous report from a contactable consumer (patient) from a Pfizer-sponsored program Pfizer First Connect. A male patient of unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 09Jan2021 at single dose for COVID-19 immunisation. Medical history and concomitant medications were not reported. He has his first dose of the COVID Vaccine yesterday and this morning he is diabetic. When he woke up this morning to test his sugar it was elevated, it was up to 300 which is he said much higher than normal and wants to know if that would be a symptom. Outcome of event was unknown. Information on the lot/batch number has been requested.

1/16/21, Covid vaccine injection at 12:09 PM Minute 1: dizzy and light headed (like drinking a beer on an empty stomach) Minute 10: Nausea Minutes 23-25: Neck tightness (like doing unsupported crunches and holding my head up) Minute 27: Inability to swallow and inability to speak EMS on site administered EpiPen auto-injection to left thigh, immediate improvement in symptoms Transport to hospital via ambulance Hospital monitored me for several hours and discharged same day

itching, hives, short of breath, numbness and tingling to lips with hives to bottom. headache.

On 1/13/2021, resident had sudden emesis. Immediately following emesis he was noted without a pulse and pronounced deceased. No acute symptoms noted prior to this episode. Resident does have a significant cardiac history.

Started with severe chills, body aches and feverish. The. Slight leg pain which worsened with time , swelling on the right leg calf, warm to touch and difficulty breathing. Got hospitalized on 1/16 21 with multiple clots in my right leg and clot in the lung. Still in the hospital now.

She had the first dose of Pfizer vaccine at the Campus on Friday 1/15 at 4:30 pm. After the vaccine, she had no new symptoms or signs of vaccine reaction and MD friend reports that he checked her pulse which was not elevated from baseline. On 1/16, she awakened and continued to feel at her recent baseline. However, in the early afternoon, she complained of headache, nausea/epigastric pain, and chest heaviness. These apparently were not unusual symptoms for her to feel intermittently. Per her niece, who has a home O2 sat device, her 02 sat that morning was 97 with a HR of 87 irregularly irregular. She was afebrile. (continue on page 2)

Aphasia, ,right-sided weakness and garbled speech

"Had severe body aches m, fever, headache, progressed into dizziness and ""foggy memory"", started to have some chest pain. Felt as if I was intoxicated, lasted the whole day. Woke up the next morning and still felt ""out of it"" and weak but thought it would get better, went to work (im a nurse). Started having continous vomiting, shortness of breath and chest pain at work. As well as severe tremors. I was taken to the hospital, given fluids and my QT was prolonged with my heart which i have never had before . Was given iv magnesium and waited for my heart rhythm to improve. Was told not to take anymore of my prescribed medications or nausea medications and follow up with my pcp the next day. Im still feeling horrible, nausea, body aches, low grade fever and I am 72 hours out. Now I have huge hospital bill to pay, can't work currently because I still feel bad and my heart has a weird rhythm. Hoping this helps as if this was what I was expecting I would have never got it."

Pt complained at ED of Headache, Nausea, SOB, felt like had been running. Pt in AFIB started on cardizem admitted to hospital 1/15 discharged 1/17

Patient tested positive for COVID 19 on Jan 5th 2021 Patient was admitted to the hospital January 9th for pneumonia due to COVID

Acute liver injury requiring transplant evaluation and acute kidney injury

Anaphylaxis after Covid 19 vaccine #1. Pfizer Lot # EH9899

Two days after her shot, she was sitting down working on her computer paying bills. She became nauseas and dizzy and then fainted. She hit the tile floor.

Lot number for the first dose was EK5730. After receiving the 2nd dose on the 01/11/2021 went to lunch and in the evening started feeling nausea and was throwing and abdominal pain. Went to work sick Tuesday and Wednesday low grade fever, nausea and abdominal pain, wasn't eating was to sick to eat. Thursday early morning hours the pain was unbearable so she went to the ER and the cat scan. It was determined that she had appendicitis and they removed my appendix same day. Feels so much better now.

"After receiving Moderna vaccine, pt became increasingly tired, withdrawn, and confused, refusing to walk at home. He has begun to have mild memory changes after suspected COVID illness (covid testing negative) in November, but daughter of patient, with whom he lives, states that his memory and orientation now significantly changed- he seems to have forgotten the last ""3 years"" of memory.

Presented to ER 1/16/21 as she checked his O2 and found him to be hypoxic in 60s. He is being treated for possible CAP with underlying perviously undiagnosed ILD vs post-covid lung changes (per pulmonology), and his energy and ability to walk have returned but memory is significantly impaired, confabulating and oriented only to self despite good oxygenation on 5L O2 by NC."

About 22 hours after the shot, I had a mini stroke that required going to the emergency room by ambulance. I was transported that evening to the stroke division that same evening for further evaluation, tests and care. I have never had a mini stroke before this.The doctors said it may have been from the vaccination, or it may not have been precipitated by it. They said they don't have enough information on the Moderna vaccine to make that call.

Patient was vaccinated in right arm. Within 5 to 10 seconds after vaccination, patient started clinching his hands tightly and became unresponsive. Patient was lowered to the floor and did not exhibit a pulse. CPR was initiated and 911 was called. An AED was used and healthcare professionals onsite continued compressions until the paramedics arrived.

Death

Received vaccination on 12/30/2020, had positive Covid test result on 1/6/2021, was hospitalized with respiratory issues on 1/11/2021, and discharged home from the hospital on 1/18/2021

12:52 PM resident rang her call bell with complaints of chest pain and shortnes of breath. BP 126/70, Temp 97.5, Pulse 72, Resp. 20, O@ stats on room air 90%. resident requesting transport to ER. EMS called at their arrival resident had increasing SOB o2 on at 3L Nasal Canula. Transported to hospital. Resident placed on ventilator and tranported to different hospital.

"Felt tachycardia immediately, thought she was anxious. After 35-45 minutes she felt like she was having a hard time swallowing which progressed to tongue swelling, all taste buds popped up and sore, hives on face & neck, reddened face. Itchy neck and face. Took double dose of Atarax and went to bed. Felt extremely fatigued unsure if double dose of Atarax. Woke with swelling all over body. Woke up feeling heaviness as if she had ""sumo wrestler"" on her body. 24 hours post vaccine heaviness started to lift but felt as if she had a vise on her lungs. Continuing to take Atarax every 6 hours per MD order."

Resident received vaccination on January 15, 2021. She was found unresponsive with shallow respirations on the morning of January 16, 2021 and was sent to ER via ambulance. The resident was admitted to medical center ICU where she passed away later that day.

resident had a pressure ulcer to RT hip, was getting treatment on. Was scheduled to have wound debrided and wound vac applied on 1-19-2021. Appetite was poor, not wanting to get out of bed, and decline in alertness. Passed away on 1-16-2021

patient received vaccine 12/29. Unexpected death 1/5.

Patient had received second Pfizer vaccination after no reported issues with the first dose. Patient was observed post vaccination without incident and released. Patient developed wheezing and attempted to

treat with her albuterol inhaler but did not improve. patient presented to the ED approximately 2 hours after vaccination and was admitted for respiratory failure and placed on BiPAP for a brief period of time. patient has known history of Asthma Exacerbation requiring hospitalization and intubations. D/C diagnosis Asthma Exacerbation

Systemic: Anaphylaxis-Severe; symptoms lasted 1 day

Systemic: Anaphylaxis-Severe, Systemic: Seizure-Severe

Temp of 104.5, hospitalization

COVID 19 Vaccination administered by pharmacy staff. No adverse effect at the present time. Staff will continue to observe adverse reaction. Will continue to monitor. Patient at start of shift awake in the bed. Pt at 3am was on the commode leaned to the side. Patient body still warm to touch no pulse. Called for assistance Asap. Cpr started promptly. Cpr given patient on floor 911 arrived at the scene at 3:10am Cpr rotated Between Nursing and EMT on Scene. Cpr was given to patient for over 45 minutes. Patient was pronounced at the scene at 3:50am. Call placed to Pt family by supervisor on shift. MD to be notified. AT 3:00am, I was notified by the nurse that resident is unresponsive. Upon entering room, resident was sitting on the commode unresponsive with absent respiration and pulse. Resident lowered down on the floor with 4 person assist. CPR initiated, AED pads placed on chest with no shock indicated. 911 called and EMT and paramedics arrived around 3:10am. ACLS performed until code stopped and pronounced death at 3:48am. I called and notified family member of his demise and awaiting for family to call us back for funeral arrangements.

One week after the shot (1-14-2021) Patient (19 y.o.)reported side pain and appeared constipated, Laxatives given along with Tylenol, on further assessment Patient was noted to have left leg redness and abdominal fullness. Dr. was updated and we had orders for close monitoring, the next day when she got up, her leg appeared better, and she had passed a small BM, but by lunch she had developed significant pain and edema in her left leg, and the color of her leg was reddened again. She was sent to the emergency room with her symptoms. She was admitted back to our facility yesterday, her diagnoses included Acute provoked left external illiac, femoral, popliteal, and peroneal DVT. Elevated Factor II levels, Elevated APC resistant, May-Thurner Syndrome, history of developmental disabilities, fecal impaction and urinary retention - suspected related to her fecal impaction. Vascular surgery was consulted, and pt. was started on a heparin drip, and mechanical thrombectomy was needed for both legs due to multiple clots. She was started on Eliquis and Plavix, and thigh high compression stockings were ordered, ace wraps being used until these are supplied. Her Fecal impaction was addressed also and the urinary retention resolved.

Death

Hx Covid infection Had Covid vaccine #1 - no problems Within 1 hr after Covid vaccine #2 progressed to SOB, pruritis throat tickle TxT-ed self with Benadrl but symptoms persisted Went to ED txt with Bendryl, prednisone, zyrtec.

"right sided weakness with numbness from her face down her entire body; right sided weakness with numbness from her face down her entire body; right sided weakness with numbness from her face down her entire body; bad headache; pain at the injection site; This is a spontaneous report from a contactable consumer (patient). A female patient of an unspecified age (reported as 41 unknown unit) received the first dose of bnt162b2 (BNT162B2) via an unspecified route of administration on an unspecified date at a single dose for covid-19 immunization. The patient's medical history and concomitant medications were not reported. The patient wanted to know how long side effects last after receiving the first dose of the Covid vaccine. The patient received first dose of Covid vaccine on Thursday (unspecified date) and reported side effects. She reported side effects of right sided weakness with numbness from her face down her entire body. She describes the feeling as if she's been ""shot up with novocaine on the right side of her body."" She was also experiencing a really bad headache and pain at the injection site. She reported that the side effects do not seem to be wearing off. She wanted to know if this has been reported as a common side effect. Outcome of the events was unknown. Information on the lot/batch number has been requested."

Severe headache from 12-36h post administration impairing ability to perform ADLs with inability to turn head from side to side or to change positions without lancing temporal pain and a/w photophobia; Severe headache from 12-36h post administration impairing ability to perform ADLs with inability to turn head from side to side or to change positions without lancing temporal pain and a/w photophobia; Severe malaise; Severe headache from 12-36h post administration impairing ability to perform ADLs with inability to turn head from side to side or to change positions without lancing temporal pain and a/w photophobia; loss of appetite; Transient dysgeusia; Mild nausea; Pleuritic chest pain; This is a spontaneous report from a non-contactable physician. This 27-year-old female physician (patient) reported that she received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number=E15249), via unspecified route at left arm on 08Jan2021 07:30 AM at single dose for COVID-19 immunization. Medical history was none. Concomitant medication was not reported. The historical vaccine included the first dose of BNT162B2 for COVID-19 immunization. Facility type of vaccine was hospital. No other vaccine in four weeks. No Covid prior vaccination. No covid tested post vaccination. On 08Jan2021 06:00 PM, patient experienced severe headache from 12-36h post administration (as reported), impairing ability to perform ADLs with inability to turn head from side to side or to change positions without lancing temporal pain and a/w photophobia (nearly meningeal signs); mild nausea; pleuritic chest pain; severe malaise; transient dysgeusia; loss of appetite. Treatment for events included initially NSAIDs until had difficulty tolerating was received. Outcome of events was recovering. No follow-up attempts are possible. No further information is expected.; Sender's Comments: Based on the time association, the possible contribution of suspect BNT162B2 to the events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

tachycardia; shortness of breath; elevated blood pressure 165/90; tired; stomach upset; felt unwell; This is a spontaneous report from a contactable other health professional (patient). A 25-year-old female

patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 31Dec2020 at single dose for COVID-19 immunization. The patient medical history and concomitant medications were not reported. The patient experienced on 04Jan2021 felt unwell, tired, stomach upset (it continued all week) and on 07Jan2021 tachycardia and shortness of breath. Clinical course: she was feeling very like short of breath and her heart racing, had elevated blood pressure 165/90, usually it was normal. The patient was sent to the emergency room (ER) and got worked up, she had a complete blood panel, everything came back normal; she had a chest X-Ray and 2 bags of fluid, then the patient was discharged. The patient outcome of the events was recovered. The information on the batch number has been requested.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

started having a lot of left eye pain/he diagnosed her with Scleritis; This is a spontaneous report from a contactable other healthcare professional (HCP) a Nurse Practitioner, who reported for herself. A 35-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; Batch/lot number: EJ1685 also reported as ES1685), intramuscular in left deltoid on 24Dec2020 at single dose for COVID-19 immunization. Medical history included ongoing anxiety diagnosed years ago, maybe when she was 23. Concomitant medication included ongoing celecoxib (CELEXA) for anxiety started about a year, or year and a half ago. She did not take other vaccines on the same day as the COVID vaccine. She had no recent labs. On 02Jan2021 the patient experienced scleritis. Event was described as follows: patient got her first COVID vaccine on 24Dec2020 and on 02Jan2021 she started having a lot of left eye pain. She went to her Ophthalmologist and he diagnosed her with Scleritis. She had no history of anything with her eyes or any vascular or autoimmune issues; no eye disorder history or rheumatology history. Patient is due to get her second dose of the vaccine on 14Jan2021, and she spoke with her primary care doctor and her ophthalmologist, and neither of them have any answer on if she should get the second dose or not, they did not have much guidance for her as this was such a new product. Patient reported that scleritis was persisting, but it has improved and she was on Prednisone eye drops. Event scleritis was considered serious as Medically significant because of what it is and what it can do, but this was not a severe case (as reported). Final outcome of scleritis was recovering.; Sender's Comments: The reported scleritis was more likely an intercurrent disease, and less likely causally related to the use of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE). The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics committees and Investigators, as appropriate.

Appendicitis; Vomiting; Nausea; Chills; This is a spontaneous report from a contactable consumer. A consumer reported that her 65-year-old mother received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 mRNA VACCINE; Lot number Unknown), into the arm at single dose on 31Dec2020 for COVID-19 immunization. The patient did not have any medical history and did not receive any concomitant products. On 31Dec2020 the same evening of vaccination, the patient experienced vomiting, nausea and chills that were considered flu like. On 03Jan2021 or 04Jan2021 her appendix ruptured. She entered emergency room on 07Jan2021 and was diagnosed with appendicitis. She was admitted to hospital on 07Jan2021. She has been given hospital care for past four days. She will have surgery in 6 weeks to repair and right now they are cleaning ruptured area. Her care team is wondering if she should get second dosage. The patient is currently hospitalized. The patient recovered from the event vomiting on 31Dec2020, recovered from the events Nausea and Chills on 07Jan2021 and was Recovering from the appendicitis. Information on the lot/batch number has been requested.

"Bell's Palsy; This is a spontaneous report from a contactable consumer. A 63-years-old female patient received the first dose of BNT162B2 Pfizer-BioNTech COVID-19 Vaccine, Batch/lot number: ELD14D, via an unspecified route of administration, in left side of arm, on 04Jan2021 at single dose for COVID-19 immunization. Medical history included early breast cancer from 2017 and ongoing. Concomitant medication included tamoxifen citrate 20 mg tablet by mouth once daily from 2017 and ongoing for breast cancer (cancer pill, she has to be on it for 5 years). The patient received the vaccine as she is ""with fire department, thought she needed to take it, she had early breast cancer, is around lots of people"". On 09Jan2021 the patient was diagnosed with Bell's palsy, assessed as medically significant and in Jan2021 she experienced earache (she thought it was an earache, but it was more than that, but it made her ear hurt, and she has no infection), her mouth was drawled a little, further detailed as numbness and ""the eye, it is messing with it, when she is trying to see out of it, she can see, but it's blurry like"" and, ""where the ear thing is"", on the back of the lymph node was real sore and her face was kind of puffy, which is the reason she went to the doctor. The patient had to go to her doctor, he told her she had a reaction to the shot, he called it Bell's Palsy, and said to let Pfizer know. Her doctor gave her something to take for mouth drawled/numbness, which is supposed to help, and she has to go back in a week. The event Bell's palsy outcome was unknown at the time of the report."

Doesn't feel like eating; Fever; Chills/ Chilled; Nausea; Severe Headache/Dull headache/Frontal headache; Fatigue; Body aches; This is a spontaneous report from a contactable Nurse (patient). This 61-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Lot number EJ1686), via intramuscular, on 06Jan2021 (at 14:30) at single dose at left deltoid for COVID-19 immunisation, administered at hospital. Age at vaccination is 61-year-old. Historical vaccine included Diphtheria and Tetanus vaccine (intramuscular, at single dose) on 15Dec2020 for immunization; and Shingles vaccine (intramuscular, at single dose) on 15Dec2020 for varicella immunization. Relevant medical history included usual tenderness. No relevant concomitant medications were provided. On 07Jan2021, she woke up at 2:00 in the morning, she had a high temperature, she was chilled, she had a severe headache, nausea, fatigue, and body aches. She got up and took ibuprofen (ADVIL). She was basically in bed, she had to cancel all her appointments in the morning, she just laid in bed and the following afternoon her fever broke at about 4:30 in the afternoon then she just had a low grade

temperature and a dull headache, nausea through the next day, Friday the 08Jan2021. She still has a very dull headache and just not right, kind of like a flu bug. She had no fever; she had not had any fever after Friday afternoon or Saturday. Fever started at 2 in the morning 07Jan2021 and she experienced the chills until after fever broke. Fever went above 102 degrees. She still had a little of the nausea, she just didn't feel like eating. She still had the dull headache. The nausea and headache have improved when compared to how it was on the 07Jan2021. She was back to work now she just has a dull frontal headache. The reporting nurse assessed all the events, except of 'Doesn't feel like eating', serious for disability. She stated she may have had usual tenderness but nothing like this. The patient had recovered from the event fever on 08Jan2021 and from the event 'chills/chilled' on 07Jan2021; the patient was recovering from 'nausea' and 'severe Headache/Dull headache/Frontal headache', while the outcome of the remaining events was unknown.; Sender's Comments: A possible contribution role of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) to the onset of the reported events cannot be excluded due to temporal relationship. It is worth noting that patient had other vaccines not far ago, including Diphtheria and Tetanus vaccine and Shingles vaccine on 15Dec2020 for immunization. The case will be reassessed should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics committees and Investigators, as appropriate.

throat and tongue started to feel weird and tight/throat got to the point of so swollen and itchy I couldn't swallow; throat and tongue started to feel weird and tight/throat got to the point of so swollen and itchy I couldn't swallow; throat and tongue started to feel weird and tight/throat got to the point of so swollen and itchy I couldn't swallow; throat and tongue started to feel weird and tight/throat got to the point of so swollen and itchy I couldn't swallow; This is a spontaneous report from a non-contactable consumer (patient) via a Pfizer-sponsored program Corporate (Pfizer) Social Media Platforms. This patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration at single dose on an unspecified date for covid-19 immunisation. The patient medical history and concomitant medications were not reported. On an unspecified date, the patient experienced throat and tongue started to feel weird and tight/throat got to the point of so swollen and itchy I couldn't swallow. The patient condition was life threatening. The patient described the events as follows: 40 min after injection my throat and tongue started to feel weird and tight. Pharmacy at my work hospital gave me 25 mg Benadryl and 650mg Tylenol. At about 1 hr 45 min after injection my throat got to the point of so swollen and itchy I couldn't swallow. I went to nearest emergency room hospital they administered Decadron orally, Pepcid P.O. (orally), and Toradol via IM (Intramuscular). The outcome of the events was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.

"Have a cut in my leg which is very unusual; Saw a big cut in my feet; I was bleeding from somewhere; It was quite a lot of blood drawing out of my body; This is a spontaneous report from a contactable consumer (patient). A 62-year-old male patient started to receive single dose of BNT162B2 (Solution for injection, batch/lot number and exp date not reported), via an unspecified route of administration on

23Dec2020 09:00 for COVID-19 immunization; and adalimumab (HUMIRA), via an unspecified route of administration from an unspecified date at unspecified dose (injection every other month) for arthritis. Medical history included arthritis, blood pressure (abnormal), and blood cholesterol (abnormal). Concomitant medication included rosuvastatin for blood cholesterol, olmesartan medoxomil, metoprolol succinate (TOPROL XL), and vitamins: ascorbic acid, ergocalciferol, nicotinamide, retinol, riboflavin, thiamine hydrochloride. Patient stated, ""The reason I am calling, I have just a concern that something happened to me. I did not pay much attention but now I have read the news one doctor died after getting this COVID Vaccine (Further details were not available over the call) I have a small incident happened to me the day after I received my first dose of the COVID Vaccine. I just wanted to get some information. You know what happened the next day night, in the evening I was taking a shower and all of sudden I was bleeding from somewhere. Lot of blood was coming out while I was toweling my body out. I couldn't find out where the blood is coming from. I checked, it's not from my urine, not from my rectum but it was quite a lot of blood drawing out of my body. Immediately, I called my wife into bathroom, then I squeezed my body then the bleeding stops. It was on 24Dec2020. You know my kids were at home. I don't want them to find it. The bleeding stopped and everything went away. Then I thought maybe it is something related to my GI. I went to my GI doctor yesterday to have a checkup, they don't know anything either but I am due for my second dose for next week Wednesday. Now I had this news about thrombocytopenia on this doctor died (Clarification unknown). So I am just afraid if there is anything related this. Do you have any explanation on how I bleed and where it bleed? It was lot of bleeding even my towel was full of blood."" Patient wanted to see if anybody else had similar experience or if he get the second dose and he get the complication again. Patient was a medical technologist. He was doing ultrasounds. He was working in a pediatric hospital. Patient was not prescribed/recommended vaccination. ""Nobody recommended it. During my hospital. I am healthcare professional. So everybody in my hospital. I just went there and get it. I didn't ask my doctor."" Patient added, ""You know everything I read about this case and then you know, I have a cut in my leg which is very unusual. I have never seen that. I don't know how it happened. You know all of sudden oneday I wake up and I saw a big cut in my feet also. So, I am just afraid (onset date not reported)."" The action taken in response to the events for adalimumab was unknown. The outcome of the events was unknown. Information about Lot/Batch number is requested."

Possible Bells Palsy; Arm/neck soreness; Arm/neck soreness/ neck are painful; travel up neck to side of face/around temple/ Side of head/face/cheeks/jaw; travel up neck to side of face/around temple/ Side of head/face/cheeks/jaw; travel up neck to side of face/around temple/ Side of head/face/cheeks/jaw; Feel numb; Sore-all on same side as injection; This is a spontaneous report from a contactable consumer (patient). A 52-year-old female patient received first dose of bnt162b2 (Pfizer COVID 19 vaccine, lot number: EL3246) , via an unspecified route of administration on 13Jan2021 17:00 at single dose on left arm for covid-19 immunisation . The patient medical history was not reported. Concomitant medication included fluticasone propionate (FLONASE), pantoprazole. The patient experienced arm/neck soreness, travel up neck to side of face/around temple; side of head/face/cheeks/jaw, neck are painful, feel numb, and sore-all on same side as injection; and possible Bells Palsy on 14Jan2021 02:00. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. Prior to vaccination, the patient was not diagnosed with COVID-19. Since the vaccination, the patient has not been tested for COVID-19.

No allergies to medications, food, or other products. No treatment was received for the events. The outcome of the events was not recovered.

his platelet levels dropped and he had a hemorrhagic stroke; his platelet levels dropped and he had a hemorrhagic stroke; This is a spontaneous report from a contactable consumer. A male patient of unspecified age received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on an unspecified date at single dose for COVID-19 immunization. The relevant medical history and concomitant medications were not reported. The patient died 2 weeks after his COVID shot because his platelet levels dropped and he had a hemorrhagic stroke. No further information provided. The autopsy was unknown. The outcome of the events was fatal. Information on the lot/ batch number has been requested.; Reported Cause(s) of Death: his platelet levels dropped and he had a hemorrhagic stroke; his platelet levels dropped and he had a hemorrhagic stroke

expired before receiving the second dose; This is a spontaneous report from a contactable nurse. This nurse reported similar death events for 8 patients. This report is for 5th of 8 patients. A patient of unspecified age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 22Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient expired before receiving the second dose on an unspecified date. The patient died on an unspecified date. It was unknown if an autopsy was performed. Information on the lot/batch number has been requested.; Sender's Comments: The limited information provided in this report does not allow a full assessment of the case. The event death with unknown cause is assessed as related to the suspect drug per company guidance. This case will be reassessed when additional information, particularly the clinical course before death, complete medical history and concomitant medication and autopsy report, becomes available.,Linked Report(s) : US-PFIZER INC-2021034595 same drug, reporter and event but different patient; Reported Cause(s) of Death: expired before receiving the second dose

passed unexpectedly; This is a spontaneous report from a contactable nurse communicated to a Pfizer colleague. This nurse reported similar death events for 8 patients. This report is for 8th of 8 patients. A patient of unspecified age and gender received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 22Dec2020 at single dose for COVID-19 immunisation. The patient medical history and concomitant medications were not reported. The patient passed unexpectedly on an unspecified date. The patient died on an unspecified date. It was unknown if an autopsy was performed. Information on the lot/batch number has been requested.; Sender's Comments: The limited information provided in this report does not allow a full assessment of the case. The event death with unknown cause is assessed as related to the suspect drug per company guidance. This case will be reassessed when additional information, particularly the clinical course before death, complete medical history and concomitant medication and autopsy report, becomes available. The case will be reassessed if additional information becomes available. 2021034595 same drug, reporter and event but different patient; Reported Cause(s) of Death: passed unexpectedly

allergy; Short of breath; Tachycardia/my heartrate was like 140 - 150; Blood pressure was like 165 over 114/my blood pressure just like skyrocketed; Upset stomach; Tired; Started to feel not very good/not feeling like wonderful/overall sickness; Muscle ache; This is a spontaneous report from a contactable consumer (patient). A 25-year-old female patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), lot number: EL014 (can't really tell), via an unspecified route of administration on 31Dec2020 at single dose for COVID-19 immunization. Medical history included allergy and heartburn. Concomitant medication included omeprazole for heartburn, cetirizine hydrochloride (off-brand for Zyrtec) as allergy medicine and a birth control medicine. Consumer stated, she just was calling this number because she didn't necessarily know if she had an adverse reaction or a symptom. She just wanted to report it and see if maybe you had any insight if this has happened to anybody else. Consumer further stated, she had an adverse reaction where she had to go to the emergency room. So, she didn't know if it was from the Vaccine or not because her reaction was very delayed. She got her vaccine on 31Dec2020, New Year's Eve and then starting on Monday after the vaccine on 04Jan2021. She started to feel not very good, it was mostly just like overall sickness, just as muscle aches, tired, having upset stomach so that was after 4 days. Patient had allergy from an unspecified date. And then on 07Jan2021, a week after she got the vaccine, she had signs of tachycardia and her blood pressure just like skyrocketed, her blood pressure was like 165 over a 114 and her heartrate was like 140 - 150. And she worked in healthcare, which was why she was one of the first ones to get the vaccine and she went to the ER and got worked up and they couldn't find, nothing was abnormal with her labs or blood work. She even had a chest X-ray and they couldn't find anything and they just gave her fluids and sent her home. And she was home now and still not feeling like wonderful, she felt better though but she just wanted to report that and see if there was any correlation. She didn't really know because it was so delayed, a week later. So she just wanted to report it. Consumer further stated, she forget to tell one thing, she was also short of breath on 07Jan2021. So that was why they had sent her to ER because of Tachycardia, shortness of breath and her blood pressure was really high. They didn't give her any medicine they just gave two big bags of fluid and then they discharged her. Consumer stated, she was scheduled to have her second one, she thought it was 14Jan2021. She wanted to know if she should get the second one. Consumer stated, when she went into the ER she had a lot of lab work. She didn't even know what all they did but a lot like, blood panels, she checked everything was there, that was on Thursday, last week, 07Jan2021. Consumer stated no treatment was received for the events. Outcome of the events was unknown.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

Approximately 3 days after my injection I began experience severe tremors Ib bilateral arms, bilateral legs, head, and vocal cord tremors as well as blurry vision and memory impairment. Unfortunately, the symptoms don't seem to be improving. My MD prescribed metoprolol, which I will begin today.

a couple hours after the vaccine, I experienced a bit of rapid heart rate, which resolved after a few minutes. The following day around 3 pm I began to have chills and felt like I had the raid heart rate again. By 5 pm I was beginning to feel really bad, I was freezing, chills and my heart rate was now extremely fast, I was having trouble speaking complete sentences, my husband drove me to the emergency department. I had a very high heart rate and high fever, I was admitted and in the hospital until Sunday afternoon. The diagnosis was pneumonia, I don't really believe this, as I felt fine and had no symptoms prior to the onset of the fever.

Patient died 1 week after vaccination. According to family was having very rapid decline in status in recent weeks and they did not think related to vaccination.

Anaphylaxis less than two hours after vaccination. I had no symptoms immediately after vaccine however did develop symptoms within one minute of completing a run. Developed b/l hand swelling and tingling, diffuse hives and itching, tachycardia, elevated blood pressure, lips tingling and swelling which required emergency room visit and EpiPen, IV fluids, Benadryl and IV steroids. This is similar to previous reactions I have had to running previously. Symptoms resolved within one hour after treatment in ED.

Severe headaches, vomiting, dehydration, shortness of breath ... led to trip to Emergency Room at Hospital on 1/16/21 at 10:45 am; diagnosis for treatment was Diabetic Ketoacidosis (DKA); patient was admitted to ICU to address critical fluid and electrolyte imbalances , headaches, body aches, dehydration, nausea, shortness of breath. DKA is medical emergency.

Pt brought to the ER with SVT. He was given 2 doses of adenosine by EMT's. Pt was found to have hypomagnesemia and hypophosphatemia in the ER. He was admitted for observation and evaluated by Cardiology. He remained stable with NSR during admission. Pt has a follow up appt with Cardiology EP clinic on 2/18/21.

Fatigue, wheezing, soreness, palpitations

38 year old female - healthy with no significant past medical history. Morning of 1/15/21, pt woke up with difficulty speaking (would be talking and then unable to articulate words which were replaced by grunting sounds) and tingling to her face. No changes to breathing, no numbness/tingling to extremities, equal facial symmetry. Slow onset of symptoms. Pt went to the ED, where she received a CT, MRI (inconclusive reading), lab work reported as normal per pt, EKG and chest x-ray. Symptoms self resolved while in the ED, however MD staff wanted to admit patient for 24 hours of observation and to complete an echocardiogram. Pt left AMA the evening of 1/15/21 due to resolution of symptoms and wanting to follow up with her cardiologist for the echocardiogram. Pt told by MD staff symptoms were likely caused by either TIA, possible reaction to vaccine or migraine presentation (no report of headaches/auras). Plan

was to have patient on blood thinners x 30 days then baby Aspirin thereafter. Pt still needing to follow up with PCP and cardiologist for further work up.

Received vaccine on 1/16/21, on 1/17/21 started with coughing, white phlegm, SOB and on 1/18/21 developed fever to 101 and increased need for oxygen. Home requirement increased from 3L O2 to 6L O2. On 1/18/21 presented to hospital. Quickly defervesced with steroids and cefepime. Possible post-obstructive pneumonia vs immune response to vaccination.

Patient could not open and close hand after the first day of vaccination. On the third day his arm turned purple and could not be moved and was numb. A week and a half after vaccine, arm hurt and was numb. Patient was hospitalized.

Systemic: Pt monitored by nursing for 30min after inj,pt was stable/no reaction.At ~1hr post inj pt was unresponsive.Pt was a hospice/dnr per director

9 to 36 hours. Lymphnode swelling , pain left axilla. Fever, chills ,muscle aches, brain fog. 1 week post Facial paralysis, fatigue, vocal cord weakness, feeling of unwell.

12/28/2020: generalized weakness and fell twice at home, cough, nausea,1/04/2021: cough, nausea, fever and chronic pain when she fell from being weak. admitted to hospital with Covid pneumonia, shortness of breath, covid postive, 1/09/2021: pt on bipap, 1/15/2021: pt was intubated, on TPN, pt DNR, 1/18/2021: was extubated and put on comfort measures and passed away

Patient was vaccinated for SARS-CoV-2 on 6-Jan-21 at his site of employment, a Nursing Home. Patient presented to Urgent Care on 15-Jan-21 complaining of left sided chest pain that started the evening before with an associated slight cough. Pt was afebrile with a heart rate of 88 and an O2 sat on room air of 98% in triage. His EKG showed a sinus tachycardia of 114 with a slightly prolonged QTc of 463 ms. Physical exam was significant for bibasilar crackles and X-ray showed bibasilar infiltrates consistent with COVID pneumonia but bacterial pneumonia could not be excluded. The patients BP was documented as 97/64. He was treated with Zofran for nausea and tylenol. He was prescribed a five day course of Azithromycin, an Albuterol inhaler, guaifenessin with codeine cough syrup, and Zofran. Labs were drawn and he was discharged. His lab results were reported after his departure and were significant for a white blood cell count of 1.33, platelet count of 73, 2% myelocytes, 1% metamyelocytes, an absolute neutrophil count of 0.75 K/ul, a creatinine of 1.83, total bilirubin of 1.3, with direct bilirubin of 0.8, alkaline phosphatase of 294 and AST of 112 with ALT noted to be within normal limit. His COVID nasopharyngeal swab from the visit was reported as negative and a swab performed at his employment on 13-Jan-21 was also reported to be negative. Patient could not be reached by phone after discharge from Urgent Care about these labs. On the evening of 16-Jan-21, Police Department received a 911 call about an adult at the patient's address who was found unresponsive. Upon arrival on scene, the patient was found to be deceased and a decision was made not to attempt to resuscitate. The death was deemed to be non-suspicious and the patient's body was transported to a funeral home. On 19-Jan-21, I contacted the State Medical Examiner's Office. They have decided to perform an autopsy and have recovered the CBC and chemistry specimens obtained for further testing.

27-year-old female with past medical history of anxiety, allergic to shellfish, presented for COVID-19 vaccination, developed shortness of breath after COVID-19 Moderna injection, felt lightheadedness and noted with cyanosis as per nursing, received epinephrine injection and transferred to ED. In ED she received solumedrol, benadryl and pepcid. Vitals in the ER Revealed tachycardia HR 95-105 , Sat 96% on room air not in distress. Patient was admitted for further observation

1. Shaking 2. Whole body tingling 3. Left arm tense (injection was provided in right arm) 4. Felt clammy Walked over to hospital attached to the facility and was discharged the same day. All symptoms resolved.

"Patient called this nurse stating she had an allergic reaction to COVID vaccination given on Friday 1/15/21. States she felt fine for the 15 minutes post immunization, was on her way home and started feeling dizzy, short of breath, chest heavy, throat felt full ""like a ball in it"". She came back to clinic which was closed but sat in the parking lot for a while. While in parking lot trying to figure out what to do, her symptoms lessened. She got home safely but started to feel jittery/shaky and her BP was very high (couldnt remember exact number). She then went to urgent care where they told her she was having an allergic reaction and given a pill of something and steroid for 6 days. Went home from urgent care and BP still high but got better at bedtime. Saturday she had a ""really bad headache and just layed around all day. I was not able to function at all."" Sunday she still had a headache and added muscle aches. Monday she started feeling ""a lot better"" until 8 PM when she was walking around doing her nightly routine and started to feel a wave of dizziness, throat felt funny so she sat down and took her BP with result of 207/131. Says this reaction felt worse than Friday's reaction so she went to ER where she was again told she was having an allergic reaction and the steroid given to her at Urgent Care was not helping and to stop taking them. Given Benadryl in the waiting room, had labs and EKG which came back ""normal"", and given a different med Vistaril to take with any future symptoms. Was also told to NOT take the second dose of COVID vaccination. Says she has not had to take the Vistaril yet and has not had any sign of reaction today so far. Said she did report the initial headache on the V-safe app."

Anaphylactic

At approximately 4pm on Jan 11, 2021, I began to have hard chills and fever that reached 104.9. I was admitted to ICU at the Hospital. My blood pressure dropped to dangerous levels. I was diagnosed with sepsis and the doctors determined it was caused by the vaccine.

Pulmonary Edema, fever, nausea, vomiting

Moderna COVID- 19 Vaccine. Vaccine recipient reported on 1/19/2021 that they received the Moderna Vaccine on 1/8/2021. The following week on 1/15/2021, they reported while driving, their area around their right eye became numb and they began to have blurry vision. The numbness spread to around their face/mouth. They pulled over and their spouse drove him to the hospital. Roughly 20 minutes after the initial symptoms, they developed chest pain and patient reported that the ED noted an abnormality on their EKG. The patient had to be admitted overnight for observation. The patient reported that on 1/18/2021, they still had mild chest pain and facial numbness remains around the right eye, left mouth/cheek area, and tongue. They did develop fever and a headache. The patient reported that on

1/19/2021, they are waiting on results, additional testing, and further follow-up appointment with their provider.

Visited Provider appx 500 pm 1.14.2021 DVT - left calf - 2 clots via ultrasound on Eliquis now

Lacunar infarct (CVA) of right thalamus

Patient developed symptoms of Guillain-Barre syndrome on January 15, 2021 and was admitted the Hospital. She was diagnosed and eventually required ICU level care and has been treated with plasmapheresis. She is currently still in the ICU but is stable.

Family was told that Patient expired in his sleep during the early morning hours of 1/15. I spoke with him the evening before (on 1/14), which was a day after he had received the Covid vaccine. He was not having any symptoms of allergy or reaction then. He did say that he felt tired, but he often complained of feeling tired over time.

Hypoglycemia(40mg/dL) and required ICU admission.

Resident was noted unresponsive, no respiration, no blood pressure, no pulse, code blue called according to facility protocol, resident is full code, CPR started, 911 called, arrived and took over from staff. Resident was pronounced dead at 1:16pm 1/18/21

"""Patient states that he received the Covid vaccine today on left arm. Immediately after receiving it, felt his left arm went numb, then felt his lips on the left side going numb. Sensation progressed to his whole face, and down his neck, and back down to the whole left arm. He states that he even felt his truncal area, kidney, and part of his right foot going numb. States that he went to the ER for further evaluation, and while waiting there for about an hour, the sensation resolved. He denies any tingling or painful sensation. Does not think he was weak at the time."""

Resident was found deceased in his bed at 7:15 am.

Tachycardia, Shortness of breath, headache, dizzyness, weakness, chills, nausea, fever

Dizziness, Headache, Myalgia, Tachypnea, CoughWheeze, NauseaVomiting, Palpitations & Tachycardia & Narrative: Patient stated that after receiving injection on 01/06/2021, tasted metal in her mouth. No reaction noted in clinic after vaccine administered. Patient states that after returning home, she began to have chills, headache, and muscle aches. Could not sleep. On 01/07/2021. Patient continued to experience above symptoms. Approx. 13:50 on 01/07/2021. Patient presented with respiratory difficult, tachypnea stridor, and stated she felt as if her airway was closing. Patient was vomiting and was tachycardic. Epi-pen administered via left lateral thigh. Patient administered 50mg of PO Benadryl, and 2 puffs of albuterol inhaler. Continuous V/S initiated. Patient began to experience relief of symptoms. HR and blood pressure remained elevated, but this was expected side effect of epi. SpO2 stabilized around 99% on room air. Patient was monitored for 60 minutes. Transportation home was arranged and family was present to observe overnight.

mi Narrative: patient with asymptomatic covid 19, covid positive 12/10/2020.

dose given 1/13/21, patient hospitalized with high blood sugar, hyperkalemia, hypernatremia on 1/15/21 after being lethargic with shallow breathing. Patient still hospitalized as of 1/19/21 and diagnosed with Diabetes

Severe dissociative event (psychotic break) beginning <72hr after administration of vaccine, and continuing another 48 hours before resolution. Patient has no prior adverse psychiatric history. Transported to local ER on Monday 11th upon worsening of condition. Administered Haldol in the ER as a sedative after becoming combative during dissociative state. Patient woke up Tuesday the 12th with recurrent, but significantly diminished, dissociation, which had largely resolved by late Tuesday. Patient transported to Mental Health on a 5150. Released Friday the 15th around noon. No recurrent symptoms since.

Resident reported she didn't feel well. She started running a fever of 103. Resident complained her stomach and genitals were burning and pain in her legs. Resident has been vomiting today and diarrhea. EMS was called and resident transported to Hospital today 1/19/21

COVID 19 vaccine, unknown which company Chronically ill in a skilled nursing facility found diaphoretic, hypotensive, hypoxia to 85% arrived to Emergency dept in cardiac arrest Died within 65 minutes of nursing finding patient in distress Wife felt it may have been related to vaccine date of vaccination 1/6/20 hx covid 19 PNA in April 2020

hypoxia, secretions,cough, dyspnea Narrative: ALS patient on hospice with ongoing history of aspiration pna, receiving tube feeds. Developed incr in secretions, hypoxeia, temp and with recently noted clogged feeding tube.

pneumonia Narrative: On 11/9/20, Patient had a presumptive positive COVID (COBAS) screen as part of routine CLC screening and then on 11/13/20, he had a repeat COVID (CEPHID) that was negative. Then on 12/22/20, he received his first COVID vaccine. On 12/26/20, he began to have c/o hurting all over. Noted history of aspiration and COPD. On 12/29/20, he began to have coughing, increased shortness of breath and runny nose with course breath sounds in his bilateral lower lobes. A chest xray was done and he was initiated on oral azithromycin and cefepime for a bilateral pneumonia. On 1/3/21, he continued to decline with increasing shortness of breath and was subsequently transferred to acute care medicine. All COVID tests have been negative since the presumptive positive on 11/9/20. He did have a CTA that ruled out PE but did show bilateral pneumonia. His antibiotics have been changed to meropenem, vancomycin and IV azithromycin. He remains on acute care at time and has not required ICU care.

COVID positive Narrative: Patient is a resident and received his first COVID vaccine on 12/28/20. On 1/4/21, he had a COVID routine screen done that returned positive on 1/6/21. Per notes, he was asymptomatic at the time; however for isolation purposes, he was transferred to acute care medicine services. On 1/7/21, he was noted to have a slight increase in BUN/creatinine ratio thought to be due to volume depletion and has been ordered IV fluids. He still remains free of any respiratory symptoms at this time.

The patient had severe shortness of breath resulting in cardiac arrest on the 5th day after the vaccine. Shortness of breath started 12 hours after injection. On the 5th day, the patient was discovered to also have a rash throughout his body, but it is unknown when this rash started.

Diarrhea & NauseaVomiting Narrative:

Pt is 39 y/o female. Pt is casual RN for ED. Pt received COVID-19 vaccination here on the 23rd of December. Pt began feeling weak on the 17th of January. On the 18, Pt began experiencing numbness and tingling in hands and feet. Pt has been seen at facility and her PCP prior to coming to ED. Pt PCP called me and told me she is concerned that the Pt might have Guillain Barre syndrome and referred her here. Pt now c/o numbness and tingling from feet to mid abdomen and numbness/tingling up entire arm. IV was established and labs drawn, CT Head normal. Pt to IR for LP for definitive Dx of Guillain Berre. Pt admitted to room 202. Director of ED notified.

COVID-19 Vaccine

Sudden death without warning symptoms 4 days after vaccine. Many medical problems which most likely explain the outcome but spouse feels it is related and it is a new vaccine. Monitor for pattern?

Excruciating abdominal pain, left arm pain, chest pain. Gangrenous appendicitis requiring emergency surgery and followed by admission for complicated acute abdomen.

"Resident experienced chest pain the evening he received the vaccine and requested to go to the hospital as he stated his ""chest is pounding""."

Resident received 1st on 1/11/21 at 12:10am (1/12/21) resident was found unresponsive. Code Blue, 911 called at 12:11am. FD and EMS arrived, resident pronounced at 12:51am.

24 hours after the vaccine administration, patient began experiencing respiratory (asthma) symptoms. She was treated with nubulizer treatment and albuterol HFA inhaler.

Hypotension, Prolonged seizure with bowel incontinence, cough, weakness and delirium, resulting in 911 transport and admission to hospital for intubation and mechanical ventilation for acute respiratory hypoxia.

Appendicitis

received first dose of COVID vaccine on 18Dec2020 and tested positive on 30Dec2020; received first dose of COVID vaccine on 18Dec2020 and tested positive on 30Dec2020; she had a 5 day migraine after the first dose; This is a spontaneous report from a contactable other healthcare professional (patient). A female patient of an unspecified age started to receive BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) Solution for injection (lot number and expiry date were unknown), via an unspecified route of administration on 18Dec2020 at first single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient received first dose of COVID vaccine on 18Dec2020 and tested positive on 30Dec2020. The patient stated her isolation will be over

the day that she was to receive her second dose. The patient stated that she had a 5-day migraine after the first dose. Outcome of the events was unknown. Information on the lot/batch number has been requested. Follow-up (06Jan2021): New information received in response to query via mail includes confirmation of the primary reporter's last name. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 in this patient cannot be completely excluded. Further information like confirmative virus genome /nucleic acid detection needed for meaningful medical assessment.

Pregnant at the time of vaccination; Pregnant at the time of vaccination; Miscarriage (symptoms started 08Jan2021, confirmed 10Jan2021); This is a spontaneous report from a contactable physician (patient herself). A 37-year-old female patient received her first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiry date were unknown), via an unspecified route of administration on the right arm on 06Jan2021 12:30 at a single dose for COVID-19 immunization at the hospital facility. The patient had no relevant medical history and no known allergies. Concomitant medication included azelastine;fluticasone nasal sprays, prenatal. The patient did not have any other vaccine in four weeks. She did not have COVID prior to vaccination. The patient was 6 weeks pregnant at the onset of the event. Last menstrual date was on 11Nov2020 and Gestational period was 7. The patient was due to deliver on 26Aug2021. The patient reported miscarriage (symptoms started 08Jan2021 06:00 PM, confirmed 10Jan2021). The event resulted in doctor or other healthcare professional office/clinic visit, Congenital anomaly or birth defect. Treatment and event outcome were unknown. The patient had not been COVID tested post vaccination. Information on the lot/batch number has been requested.; Sender's Comments: Based on a close compatible temporal association, contributory role of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) to patient's miscarriage cannot be completely excluded. The case will be reevaluated should additional information become available. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

tested positive after 1st dose; tested positive after 1st dose; This is a spontaneous report from a contactable nurse reporting for herself. This nurse reported similar events for 2 patients: this is the first of two reports. This 39-year-old female patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) on 28Dec2020 for COVID-19 immunization. Medical history and concomitant medications were not reported. On an unknown date, the patient tested positive after first dose. Outcome was unknown. Information on the lot/batch number has been requested.; Sender's Comments: Based on the information currently available, a lack of efficacy with the suspected vaccine BNT162B2 cannot be completely excluded. However, it is unlikely that the patient would have fully developed immunity due to the very short time lag between the first vaccine dose and the event onset.,Linked Report(s) : US-PFIZER INC-2021021888 same reporter/drug/AE, different patient.

"Between then and now I tested positive; Between then and now I tested positive; This is a spontaneous report from a contactable consumer (patient). A male patient of an unspecified age received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot/batch number unknown), via an

unspecified route of administration on 28Dec2020 at a single dose for COVID-19 immunization. The patient's medical history and concomitant medications were not reported. The patient stated, ""I have taken the vaccine (1st dose) on 28Dec2020 at the hospital. Between then and now I tested positive on the 04Jan2021, the hospital sent me home for 2 weeks. The 2nd part of the vaccine is coming up, it isn't until the 18Jan2021."" The outcome of the events was unknown. Information about lot/batch number has been requested."

"Hypertensive Emergency (BP 219/114) with no previous blood pressure issues; Radiating chest pain, left arm pain; jaw pain; This is a spontaneous report from a contactable other Health Professional (patient). A 40-year-old non-pregnant female patient received the first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number: EX5170), via an unspecified route of administration on 16Dec2020 15:00 at single dose in left arm for covid-19 immunization. Medical history included symptomatic PVC's (Premature ventricular contractions), tachycardia, bradycardia, CVA (cerebrovascular accident) from 2018 to an unknown date, asthma and rhythm. Concomitant medication included flecainide, spironolactone, metoprolol for rhythm. The patient had known allergies included hydrocodone bitartrate, paracetamol (VICODIN), eletriptan and adhesive. Prior vaccination, the patient had no covid. On 22Dec2020 18:00, the patient experienced hypertensive Emergency (BP 219/114) with no previous blood pressure issues. Radiating chest pain, left arm pain, and jaw pain. Admitted to the hospital where an echocardiogram and angiogram was performed showing clear coronary arteries and no hypertensive remodeling of the heart. Issue has been ongoing since, despite interventions. The events result in emergency room/department or urgent care and hospitalization from an unspecified date for 1 day. The patient received the treatment for the events included frequent nitroglycerin, hydralazine and metoprolol. The patient underwent curative-SARS-Cov-2 Assay RT-PCR on 01Jan2021 with negative result. The outcome of the events was not recovered.; Sender's Comments: Based on the information available, contributory role of BNT162B2 ((PFIZER-BIONTECH COVID-19 VACCINE,) to event ""hypertensive emergency (BP 219/114) with no previous blood pressure issues"" cannot be excluded. The events chest pain and pain in jaw are attributed to underlying medical conditions and assessed unrelated. BNT162B2 ((PFIZER-BIONTECH COVID-19 VACCINE,). The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

having symptoms, tested covid+(positive); having symptoms, tested covid+(positive); This is a spontaneous report from a contactable consumer (patient). This 57-year-old female patient received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unknown route, on 17Dec2020 at single dose for COVID-19 immunization. No relevant medical history and concomitant medications were provided. The patient started having symptoms on 23Dec2020 and she was tested for COVID 19 on 27Dec2020 and resulted positive. The outcome of the event was unknown. Information on the batch/lot number has been requested.; Sender's Comments: Linked Report(s) : US-PFIZER INC-2021015240 Same patient/reporter, 2nd dose of drug, different AE

tested + 9 days after dose #1; tested + 9 days after dose #1; exposed to Covid-19 four days after vaccination; This is a spontaneous report from a contactable patient. A patient of unknown age and gender received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration, on 26Dec2020 at single dose for COVID-19 immunisation. Medical history and concomitant medications were unknown. The patient was exposed to Covid-19 four days after vaccination and tested positive (+) nine days after dose 1 on 04Jan2021. The patient would like the advice for receiving the second dose. Outcome was unknown. Information about batch/lot number has been requested.

"I still have uncomfortable feeling in my arm/I was finally able to raise it above my head, my left arm, after two days but it was not comfortable to do it, it was painful; I have severe pain in my arm/it started hurting and then it continued to get worse and worse and it was severe; It was the worst pain I have ever had and I could not move my arm; It continued to get worse and that night I went to bed and I cannot sleep, it hurts so bad/I could not sleep on the right side or on a left side; This is a spontaneous report from a contactable consumer (patient). An 82-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot number and expiration date was not provided), via an unspecified route of administration (left arm) first dose on 30Dec2020 10:30 at single dose for covid-19 immunisation. The patient's medical history and concomitant medications were not reported. The patient stated that I had the vaccine back a week and half ago on 30Dec2020 and was due to get the booster this month and wanted to report severe pain arm for two days. The patient stated that he had many vaccine (Unspecified Vaccine) over the years and have never had anything that hurts so bad after about six hours. The patient just wanted to know that was that normal. Consumer further stated, ""I took the vaccine about 10:30 in the morning and about four hours later, it started getting sore but that thing was normal you know some vaccines (Unspecified Vaccine) do that but along with that it started hurting about four hours after the vaccine and it continued to get worse and that night I went to bed and I cannot sleep, it hurts so bad. The patient even have thoughts about getting up and go in to the emergency room. It was the worst pain I have ever had and I could not move my arm. I could not sleep on the right side or on a left side and all I did was take Tylenol as prescribed and that helped a little bit but not much but I did not go to the emergency room, I am not going to do that but I felt like it because it hurts so bad but I made it through the night and next day it continued to hurt really bad. I just keep taking Tylenol every four hours and that continued for two days and then finally I was able to raise my arm up above my head without little pain, it was discomfort, but it was not hurting so bad."" The patient stated that the event started about two hours later it started, it started hurting and then it continued to get worse and worse and it was severe, that is the reason why I am calling that it was severe. I wanted a shot or morphine to relieve myself that how bad it was."" (no clarified further). The patient stated that the vaccine was given in my left arm only about one inch below the top of my shoulder which I think that might have been the problem, I don't know if you can answer that or not but I have never received the vaccine or shot anywhere near that area, it is always three or four inches down in my muscle, on my arm either on left or right, this was given in my left arm but this was given almost in my joint I am wondering if that would cause pain."" The patient stated it was given only one inch below the tip above shoulder may be that is causing so much pain."" The patient just wanted to report the severe pain, that was for two whole days and then it was subsided and it lasted for four days and I still have

uncomfortable feeling in my arm. I was finally able to raise it above my head, my left arm, after two days but it was not comfortable to do it, it was painful."" The outcome of the events was unknown. Information on the lot/batch number has been requested."

"Spot on arm where I got the vaccine probably 4 days ago is continuing to increase in size and is red, swollen and hard; it's huge and it's purple and red and it feels like bee sting, it feels like an allergic reaction; purple and red; continuing to increase in size and it is red and swollen and hard now; Made me really, really sick like bedridden for 2 days; Spot on arm where I got the vaccine probably 4 days ago is continuing to increase in size and is red, swollen and hard; This is a spontaneous report from a contactable Other HCP (patient). An unknown age and gender patient received BNT162B2 (lot# unknown) on Jan2021 at single dose for COVID-19 immunization. Medical history and concomitant drug were not reported. Patient stated, ""I just have a question, my Pfizer COVID Vaccine made me really, really sick like bedridden for 2 days which I am finding out is probably normal. But the spot on my arm where I got the vaccine, it was probably 4 days ago that I got it and it's continuing to increase in size and it is red and swollen and hard now. Like I am a Nurse Practitioner, this is not like a normal injection site reaction, it's huge and it's purple and red and it feels like bee sting, it feels like an allergic reaction, should I be concerned, do I need to go to the hospital?"" Outcome of the event was unknown. Information on the lot/ batch number has been requested.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate."

"Tested positive for Covid/had the (Covid) infection; Tested positive for Covid/had the (Covid) infection; Swollen lymph nodes under my right arm; This is a spontaneous report from a contactable nurse. This 42-year-old female nurse (patient) reported for herself that she received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, lot#: nurse stated she thought she had a lot# it looked like EK5703), via unspecified route at right deltoid on 21Dec2020 at single dose for COVID-19 immunization. Medical history included blood pressure (patient had taken blood pressure medicine but hadn't taking currently because her blood pressure was being controlled). Concomitant medications included unspecified vitamins. Patient was tested positive for Covid on the 29Dec2020. She stated she didn't know about causality, she was saying no but she did have swollen lymph nodes under the right arm before getting sick (Dec2020), now she thought that might get from her vaccination but in her understanding she could get it from Covid so, she couldn't answer that, she tested positive, she didn't think it's from vaccination but her concern was because she had got the vaccination the first one then had the (Covid) infection and right now she should get the second one or not. Regarding treatment, patient stated she was taking methylprednisolone sodium succinate (SOLU-MEDROL) and salbutamol (ALBUTEROL) inhaler, taking over the counter Vitamin D3, Zinc and Vitamin C and acetylsalicylic acid (ASPIRIN). Patient reported she did go to the physician office/ emergency room. Outcome of events was unknown.; Sender's Comments: Based on the mechanism of action of BNT162B2 vaccine, it is unlikely

the patient would have fully developed immunity for the vaccine to be effective, due to the number of days passed since the vaccine was given (8 days in this case). However, a causal relationship between events ""Tested positive for Covid/had the (Covid) infection"" (coded to Drug ineffective / COVID-19) and swollen lymph nodes and BNT162B2 vaccine cannot be completely excluded.The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate."

I am a registered nurse at hospital. On 12/25, seven days after receiving the shot I started to get right lower leg pain and I kept complaining about it till New Years Day. I had no symptoms of a DVT. I triaged on 1/1/21 and the doctors ordered labs/imaging and the results were as followed: D-Dimer biomarker (+) , Ultrasound of the Rt lower leg (-) , CTA showed a PE (segmental right upper lobe pulmonary artery consistent with pulmonary embolus). I was discharged on Xarelto and advised to follow up with a hematologist. On 1/5/2021, I went to hematology and they did a whole bunch of labs. I was sent to get a ultrasound of the leg because the pain persist and they found a clot hidden by my soleus. The plan is to continue on the Xarelto for 6 months. Come back in 3 weeks to scan my leg again and get my lab results. On 1/12/2021, I received the 2nd shot of the Pfizer vaccination.

"Client was administer 2nd dose of Moderna COVID-19 vaccine at 1:32pm. Client reported has ""sore arm from first dose"", but denied any other issues from 1st dose. At 1:44pm, client reported was feeling flushed and slightly dizzy/light headed. Client appeared flushed, clammy and was slightly confused. Client was sitting in chair and was assisted to the floor and clinical assist code was called. VS were: BP: 149/84 and pulse ox was 97% on RA. Initially, HR was in the low 30's, but after lying down, came up to 86 and stayed in the 80-90's during assist. Client began to report chest tightness and feeling foggy and remained slightly confused and at times speech was garbled. Client denies sensation of throat closing and denied shortness of breath. Client was assisted to a cot and transported by ER staff and MD to the ER for evaluation."

Presented to Urgent Care for weakness and confusion, transferred to ED, patient had a cardiac arrest and was unable to be resuscitated

"""I received the Pfizer Covid vaccine Wed afternoon around 4pm. Thursday morning around 9:30 I started with severe pain in my left leg. The pain worsened through the day and my leg began swelling. No other symptoms at all. This morning my leg was twice the size of my right leg so I went to the ER. I live in so I'm at ED. I have a massive blood clot running the the length of my leg - from my thigh to my ankle. I'm very lucky I got here so fast! I?m a very healthy 49 year old with no history of DVT or blood clots so they dug further to find out why. A cat scan showed I have a congenital condition called May Thurner Syndrome. I?m so relieved to have an answer and it?s fixable! The vascular doctors are not 100% convinced that?s not all that was going on as I was born with the syndrome and I?ve gone this long without a clot. So they are doing lots of labs to see if anything else shows up. This is where we are at. I?m being admitted to take care of the clot."""

Pt woke up with tongue swelling morning following her vaccine. Was admitted for angioedema.

Rapid heart Rate that began about 12 hours after the injection. Heart rate of 123 all night and went to ER next morning after calling Nurse on Call system. I was admitted and the Dr ordered bag after bag of fluids to and kept me in the unit overnight for observation. Did may hear tests (EKG, ECHO STRESS,CTA chest) and results all came back good. I was released on 1/19/21 at 2pm and my hear rate is back to normal (82 bpm).

Extreme fatigue since getting shot - effecting ability to work

Started with cough, mild shortness of breath and feeling terrible in evening of 1/19.

Death 3 days after receiving 2nd dose of COVID vaccine, unknown if related to vaccine administration.

Approximately after 20 minutes after vaccine administration, my throat felt numb and i could not swallow my saliva, no acute breathing difficulty , I could not swallow water , I was very anxious and went back to facility I got vaccine , The attending doctor administered Benadryl I 50 mg IM , and then EPI 0.3 mg . EMT was called , and ED at Hospital i was attended , and Solumedrol 1.25 mg was administered IV and Pepsid for GERD , i also had, I was observed for a few HRs and skript for Prednisone and Benadryl was issued. I was then feeling better,

My arm was a little sore after the vaccination but no other symptoms. And on 12/30 I woke up with a sever fever, vomiting and diarreah. Went to the ER and was diagnosed with CHF because my feet were so swollen and was given lasix and released. I continued to feel bad so on that Sunday 1/3 I went back to the hospital and was admitted and tested positive for COVID-19. I spent from Sun-Wed in the hospital

Patient has end stage renal disease and rapidly worsening dementia, family could no longer care for him at home, and he was admitted for 14-day quarantine prior to admission to inpatient hospice. Received vaccine on 1/12 without apparent adverse reactions. Patient started refusing oral intake on 1/16, and CMP on 1/17 showed hypernatremia 165 (new issue). His BUN 138 CREAT 6.93 K 5.2 were his baseline. He was found to be deceased on 1/18 at 11:18 pm.

Pt found unresponsive at home, respiratory distress. Had reported nausea and vointing for two days prior to admit which started 1/15. Acute metabolic encephalopathy and acute renal failure Currently at time of this report still in critical care

Myalgia Narrative:

Shaking and then became unresponsive

Headache and stoke

Stroke-like symptoms approximately 2-3 hours after receiving shot (aphasia), BP bottomed out, was transported by EMS and is currently on a ventilator in hospital. CT scan clear; MRI pending.

The next morning I felt chills, really cold, my arm never hurt at all. I was freezing. I had no energy. Very lethargic, with a blanket around me. Never had a fever. All of a sudden, around 2:30PM all dissipated, it was all gone and I was fine. A week later I called my PCP because the symptoms came back - the lethargy. He suggested me to go to the ER. I went and could barely write my name on the sign in sheet at the hospital. They did 5 COVID tests and 4 of them were negative. I was at the ER for 3 days and finally was admitted and stayed for 11 days. I was sent home with oxygen and my levels are finally getting back to 92/93. I can't walk at this time. I lost 17 lbs and if I try to walk my lungs shut down. (I went to the ER n 01/07 and was discharged on the 17th - I was also at the ER the week before when they tested me and it kept coming back negative) My pulmonary MD

death by suicide Narrative: death by suicide; 12/26/20, self inflicted gun shot wound; found deceased by family member

Started with HA/fever/fatigue and body aches on date of vaccine on 1/5/21. Also had shakes,and had numbness loss of feeling to leg leg. Was admitted to Hospital for 5days. Had intermittnet seizure type episodes. Has had labs and imaging tests that have been neg Under the care of the A Neuro Group. MRI scheduled for 1/20/21. As of 1/20/21 feeling better but still weak.

Fainting, dizziness and weakness, trembling, BP 168/129. HR 145

Patient received Vaccine and during observation period began starring forward and not responding to staff. Patient was taken to the emergency room and evaluated and noted to have a flat affect and general weakness. Patient did not loos consciousness or have any signs of distress. Was admitted to the hospital and noted that she had been in out of country for a week (possibly had cosmetic surgery)

Around 10pm on Tuesday I started to have severe neck pain, headache, fatigue. I ended up going to the emergency room after my shift but due to the physicians recommendations I deferred the lumbar puncture while there. Later Thursday night, the neck pain continued, and I started having fevers with a max of 102.1 so I returned to the ER the following day for the lumbar puncture. I was admitted to the hospital for aseptic meningitis.

severe temporary paralysis from the neck down.

Resident was noted to have increase weakness on 1/15/2021. Resident was warm to touch with low grade fever of 99.3 F. Resident was up propelling self in w/c on 1/16/2021 he was pleasant, accepted medications and ate lunch. He was found slumped over in his w/c not responding and vital signs absent.

Pt was 18 weeks pregnant at the time of the vaccine. Second pregnancy. Pt is a physician. Pregnancy was entirely normal up to that time. On 1/18/2021, she began to have heavy vaginal bleeding probably due to a placental abruption and subsequently delivered at 18 weeks. Baby was stillborn. Ultrasound done 1/15/2021 normal. Lethal event for the fetus. The patient did well.

sinus arrhythmia; Night sweats; Heart rate low; Dyskinesia; This is a spontaneous report from a contactable nurse (patient). This 36-year-old female patient the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), intramuscular at single dose in the left arm on 07Jan2021 10:00 for

covid-19 immunisation. Medical history included hypotension, rheumatoid arthritis, asthma. Concomitant medication included clonazepam, methylprednisolone. On 07Jan2021 21:00, the patient experienced sinus arrhythmia, night sweats, heart rate low, dyskinesia, all with outcome of recovered with sequelae. Therapeutic measures were taken as a result of the events included Inderal 10mg. The events were assessed as congenital anomaly. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. The patient had not been tested for COVID-19 since the vaccination. The patient was not pregnant at the time of vaccination. Information on the lot/batch number has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported events cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

postural dizziness; dyspnea; paresthesia; This is a spontaneous report from a contactable Physician. This Physician reported for a 28-year-old male patient received 2nd dose of BNT162B2 Intramuscular on 10Jan2021 07:30 on Left arm for covid-19 immunization. Medical history and concomitant drug were not reported. No other-vaccine-in-four weeks. No other-medications-in-two weeks. Historical Vaccine was first dose of BNT162B2 on an unspecific date. Patient experienced Moderate reaction: postural dizziness, dyspnea, and paresthesia on 10Jan2021 09:00 AM that resolved with H1 and H2 antagonists and IV hydration. AE-resulted-in Emergency room/department or urgent care. Outcome of the event was recovered. No covid-prior-vaccination. No covid-tested-post-vaccination. Information on the lot/batch number has been requested.; Sender's Comments: A causal association between BNT162B2 and the reported events cannot be excluded based on a compatible temporal relation between vaccination and onset of events. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RAs, Ethics Committees, and Investigators, as appropriate.

passed out; dizzy; hit the ground; nausea; pain at injection site; fever; chills; tired; severe headache; vomiting x 2; cold; experienced orthostatic hypotension; This is a spontaneous report from a contactable other HCP. A 65-years-old female patient started to receive bnt162b2 (BNT162B2; Lot # EK9231) vaccine , intramuscular in the left arm on 07Jan2021 11:00 at single dose for Covid-19 immunisation . Medical history included rubber sensitivity (Latex). The patient's concomitant medications were not reported. On 09Jan2021 12:00 the patient experienced orthostatic hypotension , passed out with outcome of recovered , dizzy with outcome of recovered , hit the ground with outcome of recovered. These events were considered serious because medically significant. On 09Jan2021 12:00 the patient also experienced the following non serious events: nausea with outcome of recovered , pain at injection site with outcome of recovered , fever with outcome of recovered , chills with outcome of recovered , tired with outcome of recovered , severe headache on with outcome of recovered , vomiting twice with outcome of recovered , cold with outcome of recovered. The reporter stated the patient attempted to get out of

bed and she passed and hit the floor. Caller states she think she may have experienced orthostatic hypotension. Caller stated if she had stayed in bed she probably would not have fallen. Her husband found her laying in vomit The patient underwent lab tests and procedures which included body temperature: 99.6 fahrenheit on unknown date.; Sender's Comments: Based on a chronological temporal association a causal relationship between events orthostatic hypotension , passed out dizzy and falling down and BNT162B2 vaccine cannot be completely excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to Regulatory Authorities, Ethics Committees and Investigators, as appropriate.

Several back operations of stimulator in the back and in pain management; This is a spontaneous report from a contactable Consumer. This adult female Consumer(patient) reported that: An adult female patient received bnt162b2 (BNT162B2) at single dose on an unspecified date for Covid-19 immunisation. Medical history was none. No known allergies. The patient's concomitant medications were not reported. Patient was not pregnant a time of vaccination. The patient had not received any other vaccines within 4 weeks prior to the BNT162B2 vaccine. The patient had not experienced Covid-19 prior to vaccination. The patient experienced several back operations of stimulator in the back and in pain management on an unspecified date, resulted in disability or permanent damage. Post the vaccination, the patient has not been tested for COVID-19. The outcome of events was unknown. Information on the lot/batch number has been requested.

"I began to pass out and yelled for my husband, he said when he came in I was sitting on the toilet with my head back, eyes rolling back not responsive.; I had my 2nd vaccine at work early Sat the 9th and felt increasingly worse all day; I woke up at midnight and felt extreme malaise; I was covered in sweat; vomited; I checked my temp and it was 99.7¦F; sore; I think I had either a seizure or a vasovagal response.; This is a spontaneous report from a contactable nurse (patient). This 58-year-old female patient received the second dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot EJ1685 or FJ1685), intramuscular at single dose in the left arm on 09Jan2021 06:00 for Covid-19 immunisation. Medical history included atrial fibrillation on unknown date (1 episode), allergic to Keflex. There were no concomitant medications. The patient previously received the first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) (Lot EJ1685 or FJ1685), intramuscular in the left arm on 22Dec2020 for Covid-19 immunisation. On 10Jan2021 01:00 AM, the patient experienced: I began to pass out and yelled for my husband, he said when he came in i was sitting on the toilet with my head back, eyes rolling back not responsive (loss of consciousness) (medically significant), I had my 2nd vaccine at work early sat the 9th and felt increasingly worse all day (feeling abnormal), Iwoke up at midnight and felt extreme malaise (malaise), I was covered in sweat (hyperhidrosis), vomited (vomiting), I checked my temp and it was 99.7¦F (pyrexia), sore (pain), I think I had either a seizure or a vasovagal response (seizure). No treatment required. The outcome of the events was recovered. The events were described as follows: I am healthy RN with no active medical problems. I had my 2nd vaccine at work early Sat the 9th and felt increasingly worse all day, I expected this so was not alarmed and went to bed around 10pm. I woke up at midnight and felt extreme malaise and went to the bathroom in case I might vomit, etc. and I tried to

have a BM. I began to pass out and yelled for my husband, he said when he came in I was sitting on the toilet with my head back, eyes rolling back not responsive. He yelled at me for about 10 seconds and I came to, I was covered in sweat. I asked him to walk me back to the bedroom where I again passed out, fell to the floor and hit the bed, then was unresponsive again for about 10 seconds then came to again and vomited. After this I felt completely relieved of my malaise. I checked my temp and it was 99.7¦F. After this I was sore but otherwise completely okay, the next day I had a temp of 99.5¦F. Today I am back to normal. I think I had either a seizure or a vasovagal response. The vaccine was administered at Hospital Facility. The patient did not receive any other vaccines within 4 weeks prior to the COVID vaccine. The patient was not diagnosed with COVID-19 prior to vaccination. The patient had not been tested for COVID-19 since the vaccination. The patient was not pregnant at the time of vaccination.; Sender's Comments: Based on the close temporal relationship, the association between the event ""began to pass out"" with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

"suddenly lost mobility of left arm; Continue paresthesia and proprioreceptive deficits of left arm; Continue paresthesia and proprioreceptive deficits of left arm; This is a spontaneous report from a contactable nurse (patient). This 46-year-old female patient received the first single dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE; lot EK5730) intramuscular, in right arm, on 16Dec2020 at 14:00, for COVID-19 immunization. No other vaccine was given in 4 weeks. Medical history included hypothyroidism, migraine headaches, IBS and COVID-19 (on an unspecified date prior to vaccination). Past drug history included allergy to morphine. Concomitant medication included levothyroxine sodium (SYNTHROID). On 23Dec2020 at 09:30 the patient experienced suddenly lost mobility of left arm, continue paresthesia and proprioreceptive deficits of left arm. She was transported to the ER and was admitted to hospital for 2 days. CT of brain X3, MRI of brain X2, MRI of C-spine and Brachioplexus were performed with unknown results. The patient was not tested for COVID19 after vaccination. The events resulted in: Doctor or other healthcare professional office/clinic visit, emergency room/department or urgent care, hospitalization, disability or permanent damage. No treatment was administered. The events had not yet resolved.; Sender's Comments: Based on the temporal relationship, the association between the events "" lost mobility of left arm, continue paresthesia and proprioceptive deficits of left arm"" with BNT162b2 can not be fully excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate."

thrombocytopenia; This is a spontaneous report from a contactable other health professional (patient). A 59-year-old male patient received first dose of BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration in arm left on 04Jan2021 13:30 at single dose for COVID-19 immunization. Medical history was none. The patient's concomitant medications were not reported. The

patient did not have COVID tested post vaccination and did not have COVID prior vaccination. The patient experienced thrombocytopenia on an unspecified date with outcome of unknown. It was reported he had thrombocytopenia but did not experience any side effects. Information about lot/batch number has been requested.; Sender's Comments: A possible contributory effect of suspect BNT162B2 on reported thrombocytopenia cannot be excluded. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to regulatory authorities, Ethics Committees, and Investigators, as appropriate.

on 1/12 started body aches and chills, took Tylenol and felt better, Wednesday felt short beat and irregular and heart beat not regular. checked pulse and it was irregular, that night 9-9:30 I went to ER close to house and pulse and heart rate abnormal after 2 hours went home and advised to contact cardiologist, he said to come in Thursday and the irregular beats were off and on atrial flutter, on Friday I came home and went back to hospital and got the shot cardio version or ablation to revert the rhythm and because the rhythm was back and forth I was observed until released on 1/19/21. Surgery was in 2017 and never had problems and they stated heart was compromised and maybe this is your reaction to the vaccine.

The patient was seen in my office on 1/19/21 with complaint of heavy vaginal bleeding. A CBC was obtained which revealed an H/H of 12.2/36.1 and a platelet count of 1 (not 1K, but 1 platelet!) and this was confirmed on smear review. She was immediately sent to the Hospital ED and repeat CBC confirmed the critically low platelet count. She is currently hospitalized and she has received platelet transfusions but her platelet count is still critically low. She is also receiving steroids and immunoglobulin and is under the care of MD (Heme/Onc)

Resident became lethargic, general weakness outside baseline, unable to walk, bumbled speech. Elevated HR and Temp of 105.2F

Death on 1/15/2020

Patient developed right facial numbness and facial droop on 1/7/21. She came to the TMH ED and was admitted. She was afebrile; neurologic exam was consistent with a peripheral facial palsy on the right.

Sudden Death within 24 hours of vaccine

Hemorrhagic Stroke, Right Basal Ganglion

12:00 noon my arm was super sore and swollen and I could barely raise it. By the evening on the 24th I was super tired. Christmas , the 25th,I was really fatigued. 26th, I was very fatigued and no energy - like I almost had the flu. 27th - the same - couldn't get out of bed. 28th - started getting a dry, hacky cough and then it went away. 29th - tried to go to work and I didn't feel good at all and I just wasn't feeling myself. Had brain fog. Went to work - things that I know that Know wasn't there because of brain fog. Felt really like flu symptoms that night. 30th - body aches; headache and eyes felt like pressure behind

them. Sent me to COVID and it was positive - was out 2 weeks from work. Went to back to work last week - but I still had shortness of breath, brain fog and fatigue and cough on Moday the11th; super tired still and I kept pushing myself to try to work and by Friday, 15th, I was just done. Exhausted. 16th - still having fatigue and 17th I thought I felt better when I woke up but still had my shortness of breath, cough and brain fog. At 2:00 pm I started feeling dizzy and faint like. I ate and within 20-30 min after food started throwing up, pounding headache. Every time I started trying to drink I would throw up. Monday, 18th, I went to work and I noticed whenever I moved around I was dizzy and short of breath and I couldn't eat or I would throw up. So slept the rest of the day. About 4:pm on Monday I thought I was going to pass out. 02 level at 86. Heartrate - Palpitations at 130. It was bouncing. Hving chest pressure, dizzy, pounding heart - 02 86 and Heartrate145. ER at 5:00 pm at Medical Ctr. Nausea medicine: Phenergan and Zofran. Did IV to hydrate me as I was dehydrated. Gave me Pepsid. I was a direct admit. They kept giving me hydration and nausea med and med for headaches and cardio workup - cardio came back normal. Severe lung inflammation. Was in the hospital until evening of 19th.

Patient woke apx 0200 complaining of nausea to group home staff. Vitals were checked at that time and WNL. Patient went back to bed. When staff went to wake patient apx 0530, he was unresponsive and had no pulse. Chest compressions were started and EMS called.

Patient got her 2nd dose of Pfizer covid vaccine on 1/8. On 1/11 she had intermittent chest pain that lasted a few days and started to notice small purpura rash on left breast. She didn't think much of it but noticed the same type of rash on her pant line and then right thigh. On 1/15 she called Occupational Health who advised her to go straight to the ED.

On 1/9/2021 observed with elevated respirations of 38-42 per minute, BP manually 72/50. pulse is jumping rapidly between 110-16 bpm. oxygen sat 76% RA, resident refusing oxygen at first attempt, allowed oxygen to be placed, is now 84% on 4L. resident shaking head yes that he is hurting, and yes that he would take medication for pain. Dr. notified, branch block. Received order for morphine 2mg per hr as needed for elevated respirations and pain. Dr. also gave orders to D/C Tamsulosin and finasteride. Resident continue with decreased O2 sats and elevated respirations. Absence of vital signs on 1/10/21 at 826PM.

Jan 4, 2021 received shot at work in morning around 11:00 am- felt fine at work all day. Around 7:00 that night began to have back pain, fever reached up to 102 around 2:00 am and took Tylenol. Felt very weak, headache, difficulty walking and decreased balance. On Jan 5, 2021 still had back ache and headache. On Jan 6, 2021 I felt better and began to have abdominal pain after eating dinner. I assumed it may be because of eating more then I had in past few days and did not attribute to much but the pain gradually increased to a strange burning/pressure across my upper abdomen that night. Very nauseous and ran low grade fever (99.45). Next morning I had less diffuse pain and could localize it to right lower quadrant.

Tinnitus started in right ear within hour after receiving first vaccination but resolved within a couple of day. Within 24 hours of receiving second vaccination had muffled hearing, Jan 3, 2021. Symptoms were ignored thinking they would resolve. When symptoms persisted and evaluated patient was noted to

have a severe right sided low frequency hearing loss with poor word recognition score. Patient was started on high dose steroids with partial recovery of symptoms.

Idiopathic intracranial HTN - IIH

Unknown as to any correlation with vaccine as this was a hospice patient that was already experiencing decline. Patient became Jaundice for approximately one week prior to expiring.

Unrelenting headache, chills, nausea, body aches, fever of 101.3F. Onset 14 hours after vaccine. Fever 20 hours after. Relieved with Tylenol and Motrin, ice packs.

Patient received COVID 19 vaccine 01/14/2021. Patient died in his sleep 01/16/2021.

Patient received COVID-19 vaccination on 1/14/2021. On 1/17/2021, patient was transferred to Hospital s/p multiple cardiac arrests. Patient was hyperkalemic and in acute renal failure at time of transfer. Hyperkalemia was treated, but the patient suffered PEA vs VFib. At the time of transfer, patient was on vasopressin, norepinephrine, and epinephrine. The patient had an EF of 40-45% and elevated troponins. Patient was made DNR and placed on comfort care. Patient passed away on 1/18/2021. Ultimately we suspect that the patients condition was a direct result of his underlying disease states, but wanted to make sure reporting was made available.

Thursday 1/6/21 body aches, fever, chills Fri, Sat, Sun- Vomiting and diarrhea. Low blood pressure (average 70/40 Went to ER Sunday for hydration and low BP Wednesday 1/20/21 diarrhea x 25 episodes while at work, Sent home at 3:30pm. Body aches, chills, sever abdominal pain.

Patient died 4 days after immunization. Probably unrelated to immunization, as patient has been in poor health and was receiving hospice services. I have no details related to his illness or symptoms. Daughter is the HIPAA/emergency contact and will have all the information needed.

Sudden Sensorineural Hearing Loss in left ear. Symptoms began Friday evening Jan. 8, 2021. Sounded like muffled sound in my ear, water running, ringing. Then on Saturday Jan.9, 2021 my left ear felt like it had to pop and I felt my hearing was impaired. By Sunday evening Jan. 10, 2021, I could barely hear out of my left ear. I called MD immediately Monday morning, Jan. 11, 2021 and was seen that afternoon. I was examined and had a hearing test. I was diagnosed with SSHL and started treatment of a series of steroid injections directly into my eardrum to save my hearing immediately. I have had 2 injections and hearing test since then. The doctors feel this was a side effect of the COVID vaccine due to my compromised immune system, but not an allergic reaction, but a side effect. I had the same condition about 15 years ago from a virus.

Pt passed away the day after the vaccine was given.

12 hours after vaccination began experiencing fever, chills, body aches, slight head ache - lasted around 12 hours Had slight pain above eye prior to getting vaccination Saw PCP on 01/08/2021 due to eye pain - had CT scan for possible aneurysm, found 2 spots on brain, thought patient had shingles On 01/10/2021 shingles rash appeared

I was having episodes of dyspnea and non productive cough starting from 1/1/2021. On 1/13/2021 I experienced severe dyspnea and had loss of consciousness for 5 seconds and was found down. I was rushed to the hospital and diagnosed with multiple pulmonary embolus (about 9) which was treated with direct TPA via catheterization. I then recovered in the ICU and transitioned to oral anticoagulation and discharged home on 1/15/2021.

Anaphylaxis Allergic reaction COVID-19 vaccine: dizziness, vomiting and shortness of breath. Received vaccine and about 5/10 minutes later developed symptoms of chest tightness shortness of breath wheezing. Arrived to ED at 1156 and discharged at 1507. Given epi IM Solu-Medrol, Pepcid, Benadryl, albuterol.

1/4/21- Patient stated she had tenderness on the back of her left lower leg with redness then 1/8/21 started to have shortness of breath and made a doctor's appointment for 1/13/21. Seen by provider on 1/13/21 and was sent to ED and admitted to the hospital [ICU] with NSTEMI, acute deep, occlusive venous thrombosis left femoral vein and saddle embolus of pulmonary artery. Transferred to another acute care hospital for removal of thrombosis. Patient started on Eliqus and no intervention for removal of the thrombosis.

Patient received her first dose of the Moderna COVID-19 Vaccination on Saturday January 16th 2021 at approximately 12pm. She completed all necessary screening forms and was deemed to be at low risk for serious allergic reactions. She tolerated the vaccination well, and no complications or immediate adverse events occurred. She was observed for a full 15 mins per CDPHE/CDC guidelines and left the Clinic in stable condition after her observation period was complete. On the morning of Tuesday, January 19th, 2021, the patient was found unconscious and unresponsive by her husband. She was transferred by Ambulance to Hospital shortly thereafter. She was diagnosed with a brain bleed that was determined to be inoperable. She was transferred to other Hospital for higher level care. She was seen by neurosurgery and diagnosed with a ruptured aneurysm. She was treated in the ICU for 24 hours, at which point her team determined that the severity of her brain bleed would not respond to treatment. Supportive cares were withdrawn on Wednesday Jan 20th, and she passed away shortly thereafter.

Resident has increase weakness and lethargy with abnormal labs. He was transferred to the ER. He was admitted to the hospital and treated for worsening AKI and hypotension.

Appendicitis, presenting as periumbilical tenderness at onset (26 hrs after vaccine admin) migrating to RLQ approx 20hrs later (46hrs after vaccine admin) accompanied by fever, chills, sweats, and nausea. Presented to ER that evening and CT confirmed appendicitis (52hrs after vaccine admin). Surgery following day laparoscopic appendectomy (69hrs after vaccine admin). Recovery and clinical improvement over next 8hrs (77hrs after vaccine admin). Discharged following day (96hrs after vaccine admin)

3 days post = tremors; 4 days post= pneumonia; 6 days post= hospitalized

Patient unresponsive post vaccine. Taken to hospital. Please contact facility for full Report.

Per Nursing Staff- patient died within 24 hours of receiving the vaccine. patient has hospice. Please contact director of nursing for more details.

Started itching within (left arm) 15 minutes. THey said I was fine and to go back to work. About an hour later, I started breaking out in hives and whole body itching. I went back in and they gave me to full strength Benadryl and it was not helping and my BP was 190/140 (stroke level) and they tried to bring that down. About 10:15 my face was starting to swell and I was short of breath and 10:30 they took me to ER - and gave me Cortisol shot. And IV fluids. And I was in ER for two hours. They wrote me a prescription for six days for 2 prednisone for every day for one week. The PA saw me at the ER and he prescribed. I went home but couldn't drive home because I couldn't see straight so got a ride home. They tested my O2 levels before they left me. Oxygen was 96. My blood pressure was down to 140/95 - so it was down but still elevated. I still had facial swelling for 3 days. But after three or four days it resolved the face swelling. Had a weakness from the shot and still itching but nothing like it was that day still after the four days. Dr. told me I couldn't get second dose. It was an anaphalactic reaction. Dr - prescribed me an EpiPen in case I have another bad reaction to anything.

per staff at facility patient died 24 hours post vaccination. Please contact Director of Nursing for further details.

Swelling all over her body, ear popping all the time, hands and feet are numb, torso swollen and numb, face swollen and red. Taking steroids for four days. Went to hospital. Then went to other facility.

short of breath Narrative: patient complained of shortness of breath prior to getting covid vaccine, patient and wife stating it was his norm. After vaccine he complained of increasing shortness of breath, and hypoxic with bluish nail beds, lips, and greyish in color. Applied O2 via mask, and nail beds, lips, and facial color returned, sent patient to local ER for treatment and evaluation.

"Narrative: Patient seen in ED 1-17-21 with c/c of ""bloated with epigastric pain"". Patient with complicated medical history including stage 1B pancreatic cancer (was currently on chemotherapy mFOLFIRINOX), and a leadless permanent pacemaker implantation on 1-11-21 for long episodes of SR with complete heart block following symptoms of syncope (other cardiac history: CAD s/p CABG 2009, PAF, and HTN). Regarding ER visit for epigastric pain, nothing notable was found on workup and patient was to discharge home to rest. There were available doses of COVID-19 Vaccine following a vaccine clinic that same day, and patient was offered and agreed to a dose of vaccine. Patient was monitored for 15 minutes post vaccine with no notable issues. The following day, Monday 1-18-21, patient's caregiver called facility at 22:30 to report he had a fever of 102.8 degrees and that he had been ""feeling kind of bad all day"". Patient was advise to seek urgent medical care and reported back to ED on 1-19-21 at 00:55. Patient wasd admitted for SIRS (tachycardia and febrile) -- patient also reported diffuse myalgia. WBC WNL, CXR unremarkable for infection, UA neg for bacteria, LFTs WNL, blood cultures negative. Procalcitonin elevated at 17.8 -- suggesting inflammatory response. Patient initially reported feeling better on the morning of 1-19-21, but around 13:00 began rapidly declining (confusion, unable to walk) and started experiencing EKG changes (9 beats of SVT). Patient then coded and resuscitation was

attempted for approximately 30 minutes. Patient did not survive the code. Coroner has been notified and family is considering autopsy at time of this report."

Vaccine was administered very high, presumably in the joint space, rather than the deltoid. Patient experienced intense pain in the entire shoulder area for 24 hours following administration. After initial 24 hours, pain remained more localized in the joint itself. Pain is intensified when moving out of the neutral position.

significant facial/lip angioedema first noted ~20 hours post vaccination, leading to intubation in ED due to concern for airway protection. extubated and discharged in 2 days

Admitted in Hospital for Anaphylaxis.

Noticed small area of burning sensation at right side of wrist and the vein there was very enlarged and sticking out.

Began itching and wheezing approximately 5 minutes after the injection. Gave first epi dose. Throat started tightening, and nausea presented. Gave second epi 5 min after the first. Gave third epi 5 min after the second. EMS arrived, gave 4th epi in ambulance. ER treated with breathing treatment, IV steroids, IV Benadryl, IV Pepcid and IV zofran. Was observed for 6.5 hours.

Patient came to ED at 1600 with right upper lip swelling and finger swelling after getting covid vaccine earlier. Angioedema of lips, initial encounter; History of allergic reaction; Lip swelling; Vaccination side effects, initial encounter. Pt has history of rheumatoid arthritis. Was treated & discharged home on 1/12/21

Slurred speech started morning of 1/8 and patient went to ED after dialysis appointment. Admitted for TIA (transient ischemic attack). Discharged home on 1/10 with follow up appts with Neurology.

Presented to ED 1/12 with primary complaint of Fatigue starting that AM. Being treated for Stage IV Sacral Decubitus Ulcer w/ possible osteomyelitis, Still admitted

Pt reported difficulty in swallowing and wife noticed left-sided facial droop morning of 1/10. Patient admitted for concerns of TIA. Symptoms resolved prior to hospitalization. Patient had MRI brain without contrast of the find evidence of acute infarct. Neurology recommended treatment patient has TIA and having dual anti-platelet therapy for 21 days followed by monotherapy of Plavix for stroke prevention. Patient was stable discharge to home 1/12/21

Patient was receiving dialysis and had low grade fevers on the morning on 1/15/2021. Patient was sent to the hospital's emergency room and was found to have a temperature of 103. The patient also had mental status changes. It is unsure what caused the mental status changes and fevers.

Pt presented to ED with Left facial numbness and concern for stroke. Observed over night. MRI brain negative for acute process. Stable at baseline neuro status 1/10/21, discharged home.

Pt Rec'd Covid vaccine and injection in Lt eye for macular degeneration. Monday 1/11 slurring speech/jumbled words since dinner, went to bed, wife states improved from last night but still difficult clearly communicating. Also reports difficulty writing. Came to ED and admitted for stroke evaluation. Stable for discharge home 1/13 with neurology follow up visits.

Pt presented to ED 1/12 complaining of shortness of breath and nonproductive cough which onset approximately 8 days ago. Tested positive for COVID. Remains admitted for management of COVID.

Stated since Xmas he has not feeling well after a family gathering. His wife in hospital for Covid-19 pneumonia. He reports for about 1 week, his SOB worsen, not eating well at all for the past 3 days. Which prompt him to visit the ED. Admitted to Hopital for Dehydration; Dyspnea; Pneumonia due to COVID-19 virus; COVID+ 1/10/21; still admitted

expired before receiving the second dose; This is a spontaneous report from a contactable nurse. This nurse reported similar death events for 8 patients. This report is for 1st of 8 patient. A patient of unspecified age and gender received first dose of bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 22Dec2020 at single dose for covid-19 immunisation. The patient medical history was and concomitant medications were not reported. The patient expired before receiving the second dose on an unspecified date. It was not reported if an autopsy was performed. Information about Lot/Batch number is requested.; Sender's Comments: Current information is very limited for full assessment. The patient died following the vaccine use; further information such as patient demographics, complete medical history, concomitant medications, concurrent illness and event term details especially death cause and autopsy results are needed for meaningful evaluation. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. platelets dropped so low/thrombocytopenia; Hemorrhagic stroke/brain hemorrhage; This is a spontaneous report from a contactable nurse. A 56-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE) via an unspecified route of administration on 18Dec2020 at single dose for covid-19 immunisation. Medical history and concomitant medications were unknown. The reporter read about the doctor that died that developed thrombocytopenia after taking the vaccine, stated it was in the news yesterday. The patient received the Pfizer Covid vaccine on 18Dec2020, and he died 16 days later from a brain hemorrhage. Autopsy stated that said he had a hemorrhagic stroke on 03Jan2021. His platelets dropped so low that he had specialists that tried to get his platelet count back up again and they could not get his platelets back up again and he ended up having the hemorrhagic stroke. The

reporter already had thrombocytopenia and she was debating what she should do about getting vaccine. Outcome of the events was fatal. Information on the lot/batch number has been requested.; Sender's Comments: Very limited information is currently available. Lacking patient's underlying medical conditions, clinical course, relevant lab data, the Company cannot make a meaningful causality assessment. The reported hemorrhagic stroke following low platelet count are managed as related to the suspect, BNT162B2, for reporting purpose only. The impact of this report on the benefit/risk profile of the Pfizer product is evaluated as part of Pfizer procedures for safety evaluation, including the review and analysis of aggregate data for adverse events. Any safety concern identified as part of this review, as well as any appropriate action in response, will be promptly notified to RA, IEC, as appropriate.; Reported Cause(s) of Death: Hemorrhagic stroke/brain hemorrhage; platelets dropped so low/thrombocytopenia

"died; tested positive for COVID; tested positive for COVID; This is a spontaneous report from a contactable consumer from a Pfizer-sponsored program, Pfizer First Connect. A 97-year-old male patient received the first dose of the bnt162b2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration on 30Dec2020 at 97-years-old at a single dose for COVID-19 immunization; administered by the nursing home. Medical history included glaucoma from an unknown date and unknown if ongoing. Concomitant medications included: ""used a sav for skin tears"", and ""eye drops for glaucoma"" from an unknown date to an unknown date. On 07Jan2021, the patient experienced: tested positive for COVID (medically significant). The patient died (death, medically significant) on 17Jan2021. The clinical course was reported as follows: The reporter stated that in regard to the patient's height and weight: ""was probably getting down to about five foot eight. Shrinking."" The reporter stated that If she remembered correctly, they were trying to maintain the patient's weight 135 to 136 pounds. The reporter stated that her father was in a nursing home. The patient received his first dose of the COVID vaccine on 30Dec2020. The patient died on 17Jan2021. The reporter stated that she ""wanted Pfizer to know that the little old people in the nursing might not be strong enough for the vaccine."" The reporter stated that she was ""not calling to complaining."" The reporter stated that there was nothing wrong with her dad. He was elderly with no health issues. ""He was literally on no medications. The only reason he was in the nursing home was because he was afraid to walk."" The reporter stated that she received a call about giving the patient the vaccine and she said yes because she wanted him to have the vaccine. One week after the vaccine, the patient tested positive for COVID ""like all the other people"" (no further details provided). The reporter stated that her dad had no symptoms of COVID. The director of nursing said the patient was doing so well. The patient ate his lunch, he laid down for nap, and at 14:30 he was gone. The patient ""went peacefully in his sleep."" The reporter then again stated that the patient literally had nothing wrong with him. ""They were shocked. They fed him and he took a nap. He was sleeping, but it was eternally."" The reporter stated that, ""it might not have been the Pfizer vaccine, maybe his heart wore out."" In regard to an autopsy: the reporter stated that they would get it done if needed. The patient underwent lab tests and procedures which included COVID-19 virus test: positive on 07Jan2021. History of all previous immunization with the Pfizer vaccine considered as suspect: none. It was unknown if there were additional vaccines administered on the same date of the Pfizer suspect, but the reporter doubted it. There were no prior vaccinations within 4 weeks. There were no adverse events following the prior vaccinations. The clinical

outcome of the event, died, was fatal. The clinical outcome of the event, tested positive for COVID, was unknown. The patient died on 17Jan2021 due to an unknown cause of death. An autopsy was not performed. The batch/lot numbers for the vaccine, PFIZER-BIONTECH COVID-19 MRNA VACCINE, were not provided and will be requested during follow up.; Reported Cause(s) of Death: died"

At approximately 930am I arrived at Memory Care. I met with the director of the facility and she directed me to where my team would be setting up. My team consisted of (technician), (nurse) and I. As we were setting up, the director asked how she can help. I explained to her that we would need a designated area for patients to be monitored after vaccination for 15 minutes and maybe even longer . I also explained that we would need one of her staff monitoring while we vaccinate. She agreed, and proceeded to designate her staff and the cafeteria area, facing the vaccination station,the monitoring station. Throughout the day, nurse and I were both vaccinating,while the staff of the facility would monitor the vaccinated patients. I would also stop occasionally to mix the vaccine and check the temperature of the aero safe. At approximately 12:50pm, the director rushed in and stated that a patient is not responding, and that she had been vaccinated. At that point, I grabbed epipens and a thermometer and I also instructed nurse to grab an Epipen and come with me. We followed the director to pt's room. Once we got to the room, the patient was in bed and there were 4 staff members standing bedside and one of them turned and stated the patient has passed. At that point I asked the staff how long ago did the patient get the vaccine, they stated about 30 minutes ago. They also stated that the patient was a hospice patient and that the patient had declined, and was rapidly detiorating and had not eaten or drank anything all day . They also stated that the patient had been monitored for 15 minutes post vaccination. I then left the room and grabbed the patients COVID Vaccine intake consent form. I looked at the answered questionaire and all the responses were circled NO. Patient had a temp of 96.5 at the time of vaccination.The vaccine administration information for Immunizer Section was filled out by Nurse. I then proceeded to ask the director once again if there were staff that was monitoring her for 15 minutes, the director stated they had staff monitoring her. She also stated the Hospice nurse has to announce her death, so they waited for the Hospice Nurse to come. I then called Corporate and explained the situation. After speaking to corporate, I also asked nurse, if she remembered the patient. She stated that she did and at the time of the vaccination the patient was not alert, there were two staff members with the patient. She was non oriented and she kept closing her eyes. At that point, Nurse stated that she asked the two staff members with her if this is how she usually is and if its ok to vaccinate her. Both Staff members stated that it its ok,this is how she is. The Nurse then proceeded to vaccinate. At approximately 3:10pm, as I was leaving I spoke to the director, and one of her Staff members. Staff that the patient has actually not eaten/ or drank anything for the past several days, including today(01/18/21). Staff also stated that on Friday, Jan 15th,2021, they had informed the family that the patient was rapidly detiorating. Staff also stated that the family knowingly gave the consent to vaccinate her. She also stated that the hospice Nurse believes that the death was primarily caused by her detiorating state. She also stated that the hospice Nurse informed that the death was not due to the Vaccine. Per Lead Pharmacist at the clinic.

Extreme Fatigue

Patient developed 104.4 temp approximately 48 hours after being given the vaccine. I treated him with antibiotics, IV fluids, cooling methods. CXR does show a new right perihilar infiltrate. However, his fever came down within the next 24-48 hours. Unfortunately, he suffered a cardiac arrest on 1/21/21 in the early morning and expired.

Resident returned to the memory support unit at 1500. Resident was than toileted and transferred in to bed per his request. At 1515 resident was observed face down beside bed, resident sustained a 1inX1in eccyhmotic/hematoma to the forehead. Neuro Checks with in normal limes Vital signs: 100/52, 100, 97.2, 28. Resident sent to ED for further medical evaluation via EMS.

possibly got it at clinic, possibly who administered shot. Pts. daughter said the pts boyfriend denied any symptoms the whole day but that in the middle of the night the pt passed away.

This is a 94-year-old male who is brought in by ambulance after being found on the floor with unknown downtime. He was in asystole upon EMS arrival. He remains in asystole. No advanced airway is in place. The patient is getting compressions from Lucas device upon arrival. It was reported that he was last talked to by family at 2 PM. The patient got his SARS-CoV-2 vaccination this morning. The patient is evaluated emergently. CPR was ongoing with 3 rounds of epinephrine given. The patient remains in asystole. He has rigor mortis. The patient's pupils are fixed and dilated. The patient has compressions paused and ultrasound is used to evaluate for cardiac activity. None is detected. The patient has no electrical activity on monitor. The patient's time of death is 2113.

approximately 3 hours prior to expiring the patient was experiencing forceful emesis. later was found to have expired, patient was comfort care only.

1/13/2021 12:00 PM: Patient received COVID-19 Vaccine. 1/14/2021 21:00: Nurse performed routine rounds and the patient appeared okay. 1/14/2021 22:00: CNA discovered patient unresponsive in bed, began CPR, and called 911. 1/14/2021 23:08: Pronounced deceased.

Narrative:

"Narrative: Was pt previously covid positive?- Yes. Initial- 10/27/2020, 11/29/2020, 12/22/2020 Are there any predisposing factors for patient experiencing adverse drug event?- Yes, patient had multiple co-morbidities including GI bleed, hepatitis congestion due to cardiac issues, treatment for PE, NSTEMI, or antibiotics for PNA, also on concurrent medications APAP, Atorvastatin, Mirtazapine and Duloxetine. Pt with 2 doses of covid-19 vaccine, second one on 01/08/2021, 2 days pre-death Any occurrence of an ADR at time of administration? Did not specify injection site issues, per RN admin note- Vaccine ""administered without complications."" Did patient recover from event? Not s/p dose on 01/08/2021. First dose given on 12/21/2021, LFTS increased ~01/01/2021, peaked on 01/03/2021 and were

decreasing on 01/07/2021 Was there an ADR between observation period and date of death? No Did patient recover from event? No (01/08/2021 event, died 01/10/2021) Was patient hospitalized prior to vaccination? Yes, in between inpatient and nursing home Was patient hospitalized prior to death--was hospitalization attributable to ADE? Yes re-admitted to inpatient on 12/31/2020. GI bleed Is there an alternative cause of death? Yes, as noted above. Quite a complicated case with many comorbidities/concurrent medications as noted above. Primary Diagnosis: Upper GI Bleed in the death note from 01/10/2021"

tired; legs felt heavy; stopped breathing; This is a spontaneous report from a Pfizer-sponsored program a non-contactable consumer. A 93-year-old male patient received bnt162b2 (PFIZER-BIONTECH COVID-19 VACCINE), via an unspecified route of administration on 04Jan2021 11:00 at single dose for covid-19 immunisation. The patient medical history and concomitant medications were not reported. Patient received vaccine around 11:00 a.m. About two hours later, he said he was tired and couldn't continue with the physical therapy he was doing. He was taken back to his room, where he said his legs felt heavy. Soon after, he stopped breathing. A nurse declared a do-not-resuscitate order. The patient died on 04Jan2021. It was not reported if an autopsy was performed. Outcome of stopped breathing was fatal. Outcome of tired and legs felt heavy was unknown. No follow-up attempts are possible; information about lot/batch number cannot be obtained.; Reported Cause(s) of Death: stopped breathing

died; This is a spontaneous report from a Pfizer-sponsored program. A contactable consumer reported that an 83-year-old female patient (reporter mother) received BNT162B2 (PFIZER-BIONTECH COVID-19 VACCINE, Solution for injection), via an unspecified route of administration on an unspecified date at single dose for covid-19 immunization. Medical history included hospice care and dementia. The patient's concomitant medications were not reported. The patient died one day after getting vaccine. She was reportedly in good health the day before receiving vaccine. She was on hospice, frail, but in good condition and checked by a hospice nurse the day before which she reported her in good health considering. She was with dementia but stable in her health. The reporter read investigating 23 deaths of people receiving vaccine in similar conditions. The patient died on an unspecified date. It was not reported if an autopsy was performed.; Reported Cause(s) of Death: died

"Called to schedule second vaccine and daughter reports that he died on01/19/2021 with ""COVID"""

"Patient's wife called this morning stating that her husband has passed away last night. After receiving first dose of Pfizer COVID-19 vaccine at around 0830, patient remained in the Immunizations Department for the 15-minute monitoring period. Per wife, patient's only complaint was pain at the injection site. At 1300, wife states that patient complaint of dizziness which ""dissipated after a few minutes"" followed by a headache which ""dissipated after a few minutes"" as well. Then patient complained of nausea, no vomiting and ""couldn't relax."" Per wife, from around 1400/1500, patient stayed on his recliner while still having a conversation with her--""he didn't get up to eat."" Last conversation they had was around 2000/2100. Per wife, at around 2100/2200, patient was quiet and when she checked on him, ""he wasn't responding anymore."" Wife then called 911, ""but they couldn't revive him."""

Admitted to hospital after vaccination with Acute hypoxemic respiratory failure, Septic shock; Aneurysm of arteriovenous dialysis fistula; expired 1/16/2021

We do not believe that the patient's death was an adverse event from the vaccine. Patient received COVID vaccine from Pfizer Dose #1 12/19/2020 (lot # EK5730) and Dose #2 1/7/2021 (lot # EL1284). No side effects or adverse events noted; lived in 24/7 care facility and monitored twice daily for reaction. Patient died 1/10/2021 from chronic respiratory failure and congestive heart failure after recent aspiration pneumonia requiring hospitalization. Death was anticipated and not sudden. We were told to report his death to VAERS even though his death was anticipated and not related to his vaccination.

Patient deceased

Patient did not have any adverse reaction to the COVID vaccine, but we were asked by our health dept to submit a VAERS report since the patient died between his first and second dose. Received Pfizer Dose #1 12/17/2020. No side effects or adverse events noted; lived in 24/7 care facility and monitored twice daily for reaction. Date of death 12/23/2020 from aspiration pneumonia complicated by end-stage heart failure and ischemic cardiomyopathy. Death was anticipated and not sudden.

patient expired 1/15/2021; had been treated as outpatient for pneumonia, likely COVID-19 but no positive test result in December 2020. PMH diabetes

Admitted 1/14/21: Patient is an elderly 93-year-old female with multiple medical problems including chronic combined CHF, P 80, diabetes mellitus, HTN, hyperlipidemia, CKD stage 3, has been complaining of generalized weakness, fatigue, decreased appetite for the past few days. She had an outpatient COVID-19 vaccine earlier today. Within 2 hr of admitting the patient to the hospital, condition clinically deteriorated. Patient elected to be DNR/DNI while in the ED. Patient was pronounced dead at 10:30 p.m. earlier today. Preliminary cause of death: Hypoglycemia induced lactic acidosis.

Pt received second dose of COVID vaccine on 01/20/2021 at 1430. At 1600 Pt developed a wet productive cough with coarse crackles. Pt ate dinner at 5 pm cough persisted. At 18:30 the nurse went to Pt's room to give him his medications. Pt still had a cough, denied shortness of breath. Pt was in a good mood and joking with staff. Pt asked to be shaved. At 19:45 Pt was sitting in the lounge and a CNA noticed that Pt was pale/white in color and clammy. 02 Sat was 85%. Respirations were labored. Pt was placed on 4 L of 02. Increased to 5 L via face mask and 02 sat was 89-90%. Ambulance was called at unknown time. Pt arrived at Medical Center at 2120 and was pronounced dead at 2127.

On Saturday, 1/16/2021, Patient went to the grocery store. Upon her return, she indicated she was experiencing N/V and some throat swelling. Patient subsequently collapsed and expired before she could be brought to an emergency room. During investigation by Coroners Office, it has been reported that Patient may have gotten some takeout food while she was out. Labs are pending and the Coroners investigation is ongoing. Spouse believes that her death was caused by the vaccine.

No immediate reaction. Patient-reported deceased four days later on Jan. 19, 2021. As of this date cause of death is unknown to our clinic.

unknown. Event occurred after leaving vaccination site

presented to ED 1/9/21 with abdominal pain, progressive worsening weakness and fatigue and new onset A fib with RVR likely due to hypertensive urgency . Patient progressed clinically with severe hypoxia and transferred to ICU and started on BiPAP; progressive decline with decreased urinary output with uremia likely secondary to sepsis. Concern with patient worsening clinical decline, palliative care had been consulted on end of life care. Patient expired 1/17/21

Narrative:

Fever, Tachypnea, HYPERtension, Tachycardia & HYPERglycemia Narrative: Was inpatient overnight in a telemetry until. DC with diagnosis of DM and CHF

1/11 asymptomatic COVID Positive test Narrative:

Narrative: Symptoms: & Cardiac Arrest; Death Treatment: EPINEPHRINE

shaking, altered consciousness Narrative: One day after pt received his first covid vaccine, pt experienced upper extremity shaking leading to ED visit and subsequent hospitalization with concern for seizure. Examination and labs were not consistent with seizure. He had features of lewy body disease and parkinsonism. Labs were significant for leukocytosis, but pt had no other signs/symptoms of infection or findings to indicate a source of infection. Pt referred to Neurology.

Patient diagnosed with COVID on January 9, 2021 after being exposed to family member that was under quarantine in the same household. Admitted to the hospital and was discharged on January 14, 2021 with home hospice. Patient passed away on January 18, 2021

Patient passed away on 01/18/2021

Patient died unexpectedly 5 days after receiving vaccine (1/10/2021).

Patient deceased on 01/17/2021

Death; This is a spontaneous report from four non-contactable consumers via a Pfizer-sponsored program Corporate (Pfizer) Social Media Platforms. A 78-year-old male patient received BNT162B2 (PFIZER-BIONTECH COVID-19 MRNA VACCINE), via an unspecified route of administration, on 28Dec2020 at a single dose for COVID-19 immunization. Ongoing medical history included Alzheimer's Disease, encephalopathy, hypertension, acute kidney failure, urinary retention and recent urinary tract infection (UTI), all from an unspecified date. Concomitant medication included acetaminophen (MANUFACTURER UNKNOWN), bisacodyl (MANUFACTURER UNKNOWN), bupropion (MANUFACTURER UNKNOWN), escitalopram (MANUFACTURER UNKNOWN), hydrocodone bitartrate, paracetamol (HYDROCODONE/ACETAMINOPHEN), loperamide (MANUFACTURER UNKNOWN), ondansetron (MANUFACTURER UNKNOWN), senna alexandrina (SENNA PLUS), vitamin d3 (MANUFACTURER UNKNOWN). The patient had no known drug allergies. The patient experienced death on 30Dec2020. The vaccine was given on 28Dec2020 with no adverse events and no issues on 29Dec2020. The patient

died on 30Dec2020, at approximately 2:00 AM. It was unknown if an autopsy was performed. It was unknown if the event was related to the suspect drug, the administrator marked as natural causes. No follow-up attempts are possible; information about batch/lot number cannot be obtained.; Reported Cause(s) of Death: Death

Pt died 4 days after vaccine, no known reaction to the vaccination

Death, which I believe is unrelated to vaccination

Narrative:

Death - Hospice patient with metastatic CA admitted to facility and received vaccine during stay. No adverse sequelae noted from vaccine administration, but reporting as required because pt died 7 days later. Narrative: Reporting this event because patient died 7 days after receiving vaccine in the facility where he was in hospice care for metastatic cancer. Vaccine was administered by protocol without complications. The patient had been asked and denied any prior severe reaction to this vaccine or its components and gave permission to receive it. No vaccine adverse sequelae were documented after the immunization as monitored for 15 minutes nor in facility notes for 7 days after the immunization. The patient's death was felt to be due to underlying terminal illness.

Pt on hospice in facility for severe cardiomyopathy unable to perform interventions received vaccine without adverse sequelae died 5 days later. Reporting as required. Narrative: Reporting as required patient death 5 days after immunization with Pfizer vaccine. However, no adverse sequelae were noted to the vaccine in the 15minute observation period, nor in the days following the immunization related to the vaccine. The patient denied any prior severe reaction to this vaccine or its components, and the patient gave verbal consent to receive the vaccine. Patient had been in the facility on hospice since 11/18/20 for severe decompensated HF and newly diagnosed cardiomyopathy, unable to perform interventions, also LE ischemic wounds with very poor potential to heal due to advanced PVD.

Narrative: Temporary restriction on driving until further evaluation due to symptoms of seizures.

loss of consciousness; respiratory distress Narrative: Patient tolerated his 1st dose of the COVID-19 vaccine well, on 12/16/2020, and received his 2nd dose on 1/6/2021. Patient had some mild clinical decline the past few days prior to 2nd vaccination, with a decreased appetite and some increased fatigue per nursing report, but no significant changes. He experienced nausea on the evening of 1/6/21, which was effectively managed, but by early morning he spiked a fever of 102.9 with a sat of 86.1%. He continued to deteriorate from that point on and died 1/7/21 @13:20. Clinically, the presentation was most consistent with an aspiration pneumonia.

Death on 1-5-21

Death 1-15-21

Note: Submitting a report to VAERS does not mean that healthcare personnel or the vaccine caused or contributed to the adverse event (possible side effect).
